Decussa'tion [from the Lat. *decussis*, a Roman coin valued at ten *asses* (see As), and represented by the letter X], in anatomy, a crossing of nervous filaments, so called from a fancied resemblance to the letter X. The innermost fibres of the anterior pyramids and lateral columns of the *medulla oblongata* decussate freely from side to side; so that disease in one side of the brain frequently leads to paralysis of the opposite side of the body. Another decussation occurs between the optic nerves; this is often called the *chiasma*, also from its resemblance to the letter X (the Greek *chi*). The crossing of rays of light, etc. is also called decussation.

Ded'ham, a post-township of Hancock co., Me. P. 448.

Dedham, the shire-town of Norfolk co., Mass., is situated on Charles River and on two branches of the Boston and Providence R. R., and is 10 miles S. W. of the State-house in Boston. It has a granite court-house, jail, house of correction, and town-hall, two insurance companies, a national bank, a savings bank, one weekly newspaper, eight churches—two Unitarian, two Baptist, one Orthodox Congregational, one Methodist Episcopal, one Protestant Episcopal, and one Roman Catholic. Dedham has two large woollen-mills, one extensive brush manufactory, one pianoforte manufactory, and one foundry. The New York and New England R. R. passes through a section of the town, and it has also a branch connecting the town with Norwood. The town has a large Roman Catholic institution under the care of the Sisters of Charity, and a home for fallen women, which receives the assistance of the State and of many philanthropic people. Pop. of township, 7342. S. H. Cox, Ed. of "Dedham Transcript."

Dedica'tion [Lat. *dedicatio*, from *dedico, dedicatum*, to "dedicate"], a complimentary address to a particular person, prefixed by an author to his work. This custom was in use at a very early period. Horace, Virgil, Cicero, and Lucretius were among the number of those who practised it. At the period of the revival of letters in Europe few works were published without dedications. Many of these are remarkable for their elegance and purity of style, and, from the matter which they contain, are of more value than the treatises to which they are prefixed. But the practice became perverted, and many authors of the succeeding generations employ them chiefly with the view of securing the patronage of the great. Dedications were most abused in France under Louis XIV., and in England from 1670 to the accession of George III. Dryden was a great dedicator, and Johnson wrote dedications for money. Corneille got 1000 louisd'ors for the dedication of "Cinna." Some of the most beautiful dedications are those prefixed to the different volumes of the "Spectator" by Addison, and in more recent times those with which each canto of Sir Walter Scott's "Marmion" is prefaced. A complete history of dedications would be of great value, as throwing light upon the history and character of many distinguished persons, which are now involved in obscurity.

Dedication, in law. See Hereditaments Incorporeal, by Prof. T. W. Dwight, LL.D.

Deduc'tion [from the Lat. *de*, "from," and *duco, ductum*, to "draw"] is the mental operation which consists in drawing a particular truth from a general principle already known. It is opposed to *induction*, which consists in rising from particular truths to the determination of a general principle. The syllogism is the form of deduction. (See Syllogism.) Before we can deduce a particular truth we must be in possession of the general truth. The mathematical and metaphysical sciences are founded on deduction; the physical sciences rest on Induction (which see).

Deed [from the Ang.-Sax. *ded*, "done;" hence, as a noun, "something done" or "executed"], a writing on

paper or parchment, sealed and delivered. This is its most general signification. In a restricted sense it means an instrument for the conveyance of real estate. According to Lord Coke, it should possess the following requisites: writing, parchment or paper, a person able to contract, a sufficient name, a person able to be contracted with, a sufficient name, a thing to be contracted for, apt words required by law, sealing, and delivery. Deeds pursue a regular form—containing the premises, *habendum*, *tenendum*, *reddendum*, conditions, warranty, covenants, and conclusion. The premises express the names of the parties, the consideration to be paid for the conveyance, and a description of the property conveyed. This should be minute and accurate. The "habendum" expresses the interest which the grantee is to have, whether it be an estate in fee, for life, or an inferior estate. The "tenendum" refers to the tenure upon which the land is to be held, and is at present of no practical importance. The "condition," "warranty," and "covenants" are not found in all deeds. They may be inserted whenever required to carry out the intention of the parties. When a condition is resorted to, it may be either precedent or subsequent. (See CONDITIONS.) The covenants vary with the nature of the conveyance. In a conveyance in fee six covenants may be inserted (see COVENANTS); and in such case the instrument is called a deed with full covenants. In some instances the single covenant of warranty is introduced, when it is ordinarily termed a warranty deed. In many cases there are no covenants at all, the object of the transaction being only to convey whatever interest the grantor may have. It is a rule of the common law that some words in a conveyance used by a grantor will imply a covenant. This doctrine tends to mislead grantors who are not familiar with the rules of law, and it has been abrogated in some of the States—*e. g.* New York. There is, however, an important rule that a promise may be implied on the part of the grantee from his acceptance of an instrument containing words purporting to create a personal liability. Thus, if there are words to the effect that the grantee assumes the payment of a certain specified mortgage, he becomes liable by his acceptance, though he does not execute the instrument. Whether he is liable upon an implied *covenant*, or only upon a promise, is not clear upon the authorities.

A deed may be either an indenture or a deed poll. The leading distinction between these terms is, that an indenture purports to be the act of both parties, a deed poll of only one. An indenture commences with the third person, a deed poll with the first. In an indenture the date is found at the beginning of the instrument, in a deed poll at the end. An instrument in the form of a deed poll may be in substance an indenture if there be acts to be done by both parties. Between a strict deed poll and an indenture there is claimed to be an important difference in the construction of doubtful or ambiguous words. In the former these are interpreted against the grantor; the grantee may take the construction most favorable to himself if the words will reasonably bear it. To an indenture the rule has no application, and it is not regarded in any case with as much favor in modern law as formerly. In a country like our own, where many men not lawyers undertake to draw their own deeds, questions frequently arise as to the effect of omissions or insertions by mistake, or of alterations or erasions. These occur in many instances through mere inexperience, and without any evil intent. In the case of an omission or insertion of a clause by mutual mistake, an application may be made to a court of equity (see EQUITY) to rectify the conveyance and make it what the parties intended it should be. The case of an alteration by one of the parties creates more difficulty. One of the most perplexing questions presented is, whether the fact of an erasure or other alteration raises any presumption that it was made after execution, or whether the opposite view should be taken, that there can be no presumption which would lead to the conclusion that the grantee has committed a wrong. The better view would seem to be that the attendant circumstances should go to a jury, without any presumption either way, and should be passed upon as a matter of fact. A fraudulent alteration would in general vitiate the instrument, though it would not divest a title to land which had already become the property of the grantee. As to all instruments which did not confer an estate, but only created an easement or conferred a right of action, the alteration would be fatal. Conveyances in the U. S. are in general registered or recorded, their execution for that purpose being attended with prescribed formalities. (See REGISTRATION and RECORDING.) The instrument is in general valid between the parties without registration, its object being to protect subsequent purchasers or incumbrances. The requisites and validity of a deed of land in any particular State depend upon the law of the place where the land is situated, though the question concerning them be raised in the courts of another State. (See also WARRANTY, QUIT CLAIM, COVENANT, BARGAIN AND SALE.)

T. W. DWIGHT.

Deems (CHARLES F.), D. D., born in Baltimore, Md., Dec. 4, 1820, graduated at Dickinson College, served in the Methodist ministry of the South during several years, and has been professor in the University of North Carolina and in Randolph-Macon College, and president of Greensboro' and Centenary Colleges. He is now (1873) the successful pastor of the Church of the Strangers, New York City. He has been an abundant and able contributor to the "Southern Methodist Quarterly Review," and is the author of a volume of sermons, a "Life of Dr. Clark," "Devotional Melodies," "Home Atlas," a volume of poems entitled "Triumphs of Peace," and a "Life of Christ."

Deem'ster, or Doomster, formerly an officer in Scotland who read the sentence of condemned persons in open court. Deemsters in the Isle of Man and Jersey are judges who give decisions without writings or process. In the former island the two deemsters are the chief magistrates.

Deep Bottom, a point on the N. side of James River, in Henrico co., Va., about 12 miles by land and 20 miles by water below Richmond, opposite the peninsula of Jones' Neck, and between Three- and Four-Mile creeks, and near the battle-ground of Malvern Hill. It was occupied by part of the troops of Gen. B. F. Butler, June 20, 1864, and a pontoon bridge was thrown across the river. Near this point several important actions were fought during Aug. and Sept., 1864, the general result being favorable to the Union forces. Deep Bottom remained an important strategic point until after the fall of Richmond.

Deep Creek, a township of Clinton co., Ia. P. 1081.

Deep Creek, a township of Edgecombe co., N. C. Pop. 1706.

Deep Creek, a township of Jackson co., N. C. P. 553.

Deep Creek, a township of Yadkin co., N. C. P. 1236.

Deep Creek, a post-township of Norfolk co., Va. Pop. 2202.

Deep River [Indian, *Sapponah*], a river of North Carolina, flows south-eastward through Randolph co., and nearly eastward through Chatham co., until it enters the Cape Fear River at Haywood. Coal abounds on its banks. Length, estimated at 120 miles.

Deep River, a post-village of Saybrook township, in Middlesex co., Conn., on the Connecticut River and Connecticut Valley R. R., 34 miles S. S. E. of Hartford. It has a national and a savings bank.

Deep River, a post-township of Poweshiek co., Ia. Pop. 799.

Deep River, a post-township of Guilford co., N. C. Pop. 1071.

Deep River Coal-Beds, a tract of coal-bearing lands in Chatham and Moore cos., N. C., in the valley of the Deep River, above noticed. They are probably of triassic, and certainly not of the true carboniferous, age. The area of the productive basin is over forty square miles, though the beds can be traced through Granville and Wake counties, in a southward and westward direction, almost across the State, and extending a few miles into South Carolina. Indeed, the Dan River coal-beds of Rockingham and Stokes counties are believed to be the same beds, though detached from the larger area. The quality of the coal is always good, though variable, some being an excellent and highly bituminous gas-coal, some good semi-bituminous coal, and some anthracite; while some is metamorphosed into graphite. The total amount of available coal in the Deep River field proper has been estimated at 240,000,000 tons. These coals have hardly been disturbed as yet, though they have been known for over 100 years. They have additional value from the fact that good iron and copper ores exist near them, the iron being often found in the same mines with the coal. By a system of slack-water navigation on the Deep and Cape Fear rivers the coal could be cheaply transported to Fayetteville, the present head of steamboat navigation on the latter river. With this point Wilmington, N. C., is connected by steamers; so that the Deep River beds might easily supply that city and her steam marine with excellent coal at a very low price.

The bituminous coal of this field is clean and does not soil the fingers. It is a caking coal, makes an excellent coke for manufacturing purposes, is free from sulphur, yields an abundant illuminating gas of good quality, and is useful for the blacksmith's forge, for the generation of steam, and for domestic uses.

Deep-Sea Dredging. The use of iron dredges for procuring oysters, etc. in shallow or moderately deep water has long been known to the fishermen of all civilized countries.

The instrument used for this purpose is large and heavy, usually consisting of a stout iron frame, several feet across, with one scraping edge, which acts something like a hoe; the arms to which the drag-rope is fastened are usually rigid, and behind the frame there is a net with large meshes of twine or wirework. This instrument is very efficient for dredging large objects, like oysters, etc., for which alone it is intended; but for scientific purposes it would be of little use, for all the small kinds of animals, which constitute the greater part of the animal life of the ocean, would pass through the coarse meshes and be lost. Moreover, in sinking such a dredge in very deep water the chances are that it would frequently fall wrong side up, and thus the time and labor would be lost. Consequently, various modifications of this primitive form of the dredge have been devised by naturalists, in order to obtain a complete knowledge of the life of the bottom of the ocean at all depths, and several forms have been used with wonderful success. The two main points to be observed are: 1st, to have a net or bag of a texture open enough to let the water pass through freely, but fine enough to retain even the smallest animals sought for; and 2d, to have the dredge provided with two scraping edges, so that it will work equally well either side up.

The naturalist's dredge was first systematically used, if not invented, by Otho Frederick Müller, previous to 1780, on the coasts of Norway and Denmark. This dredge appears to have been square, with four scraping edges, but otherwise similar to those still in use. Some naturalists have used a triangular form with three scraping edges, but, like those with a square frame, this form gives too wide a mouth, so that the contents are liable to wash out, though it is still advantageously used for some purposes.

The dredge now generally used by naturalists, even for the deepest work, consists of a narrow rectangular frame, with two somewhat flaring scraping edges, the ends of the frame being of round iron, and each supporting a forked iron arm, each fork being bent around the end-piece of the frame at the corners, so as to turn freely upon it. The other end of each arm is furnished with a ring or eye, to which the drag-rope is attached. To the back of the rectangular frame a bag-like net of stout twine, with small meshes, or else a bag of some kind of stout open cloth, is securely attached, either directly by means of holes drilled through the back part of the scrapers near the edge, or to small iron rings inserted into such holes. For dredging in shallow water or on rocky bottoms it is usual to protect the inner net or bag with an outside bottomless bag of stout canvas or some similar material, otherwise the rocks will quickly destroy the net. To prevent the net from twisting or turning over the mouth of the dredge during its descent, a transverse bar of wood or iron, a little longer than the dredge-frame, is sometimes attached across the bottom of the outer bag; others use a U-shaped loop of stout wire, with an eye at each end by which to tie it to the middle of each end of the dredge-frame, the loop passing down into the net. The drag-rope is usually attached securely to one of the arms of the dredge, while the other arm is tied to it by a smaller rope or by spun-yarn, so that in case the dredge becomes wedged between or under rocks the strain upon it may break away the weaker fastening, allowing the frame to straighten out and thus free itself. One or more weights are usually attached to the rope at a short distance in front of the dredge, partly to help sink the rope, partly to keep the edge of the dredge down upon the bottom in its proper position; the amount of weight must be varied according to the depth of water, velocity of currents, character of bottom, size of boat or vessel, weight of dredge, and size of the rope. In very deep water several hundred pounds are sometimes used, attached several hundred feet from the dredge. The size and weight of the dredges vary greatly, according to the depth of water, size of the vessel employed, and means of hoisting.

A dredge suitable for use on board an ordinary sailboat or small steamer, when the hoisting is done by hand, which has done good service at all depths down to 430 fathoms, has the following dimensions: length of frame, 20 inches; width across back, 8 inches; across front or outer edge of the scrapers, 9 inches; length of arms, 14 inches; width of sides or scrapers, 2.5 inches; thickness of scrapers at back, .5 of an inch; holes for attachment of net, 1 inch apart; the ends of the dredge-frame are of five-eighth-inch round iron; the arms, half-inch round iron. All parts should be of the strongest bar iron. The net for the dredge just described is of stout twine, three feet deep, and just large enough at the mouth to go around the outside of the dredge-frame without stretching. Its meshes are a quarter of an inch on the sides of the net, but smaller towards the end. The outer bag is of stout canvas, and a little longer than the inner one. The drag-rope is of the best hemp, 1.75 inches in circumference. For shallow water a smaller rope would do, especially if used with a sailboat; and manila rope can also be used, though it is not so suitable for deep water, on account of its buoyancy and greater liability to kink.

For the deep-sea dredging, and also for shallow water when large vessels are employed and steam-power used for hoisting, much larger and heavier dredges can be used. The English expedition on the Porcupine used a dredge with a frame 4 feet 6 inches long, and 6 inches wide at the back, weighing 225 pounds. Weights amounting to two hundredweight were attached to the drag-rope at 500 fathoms from the dredge. But Dr. Wyville Thomson, who had charge of the dredging in the deepest water (2435 fathoms), thinks that this dredge was too heavy.

In all cases the dredge must be drawn very slowly over the bottom, either by the "drifting" of the boat or vessel by the force of the tide, or by the wind without sails, or by an occasional turn of the wheels of a steamer. With a small boat or vessel, when there is but little wind or tide, a small amount of sail is often necessary.

The writer in 1871 introduced a new form of dredge, known as the "rake-dredge," for use on muddy and sandy bottoms to procure burrowing animals. This has two stout iron bars, each provided with several thin, sharp teeth, 6 or 8 inches long, arranged like those of a rake; these bars are bolted, back to back, to the lower ends of the side-pieces of a stout A-shaped iron frame; the drag-rope is attached to a ring at the apex of the A-shaped frame; following the rake, at the distance of two or three feet, is a large but light rectangular frame of half-inch round iron, a little larger than the rake; to this frame a net is attached, as to the frame of the ordinary dredge. This has been used very successfully for the special purposes for which it was designed.

The English deep-sea dredging expeditions introduced the use of "tangles" in connection with the dredge, and these proved to be very valuable adjuncts. The "tangles" consist of pieces of frayed-out hemp rope, a few feet long, tied together at one end, so as to form large brushes. They generally fastened these to the iron rod attached across the end of the dredge-bag, so that they dragged over the bottom behind the dredge, and caught up all objects having rough or spiny surfaces; but many of the objects thus caught had been already broken or injured by the dredge. The writer has devised some improved forms of the tangles, and used them successfully during the summer of 1871 and '72 in connection with the U. S. Fish Commission. In these the tangles were used independently of the dredge, and in the best form the frayed-out ropes were attached along several small iron chains, which were fastened by one end to an iron bar; and the latter was raised from the bottom by being bolted to the legs of the A-shaped frame already mentioned, at about a foot from the lower end of the side-pieces. This form of apparatus can be used on very rough and rocky bottoms, where the ordinary dredge cannot be safely employed. It is very useful for procuring star-fishes, echini, corals, sponges, etc., but cannot be depended upon for shells.

During the past twenty-five years dredging has been extensively carried on along nearly all parts of the European and North American coasts, and in many other parts of the world, in waters of moderate depth, or from the shore to 50 or 100 fathoms, and in some few regions down to 200 or 300 fathoms, or even somewhat more. But within the past five or six years these investigations of the life of the bottom have been carried on successfully at far greater depths, both on the American and European sides of the Atlantic Ocean. On the coast of Norway and at the Lofoden Islands extensive collections were made at depths between 250 and 450 fathoms by Dr. G. O. Sars, and in 1868 his father, Prof. M. Sars, published a list of 427 species of animals living at those depths. In the year 1867 extensive deep-sea dredgings were commenced by Mr. L. F. de Pourtales of the U. S. Coast Survey in the Gulf Stream between Florida and Cuba. The important results of this expedition were published in December, 1867. In 1868 and 1869 these investigations were continued in that region by Mr. de Pourtales with great success and very important results. In these explorations dredgings were made on several lines across the Straits of Florida, from the shores to the deepest waters, but seldom in more than 600 fathoms. Large collections, including many novelties, were made at all depths, and have been in part described in the publications of the Museum of Comparative Zoology. In 1868 the English government fitted out the steamer Lightning, under the scientific direction of Dr. William B. Carpenter and Dr. Wyville Thomson, for the purpose of deep-sea dredging. They dredged between Scotland and the Faröe Islands, and to the south-west of those islands, at various depths down to 650 fathoms, with very interesting results, for life was found to be abundant at the greatest depths, and many new and remarkable forms were discovered. In 1869 the Porcupine was fitted out for the same service, and made three cruises—first, off the W.

coast of Ireland, under the scientific direction of Mr. Gwyn Jeffreys, during which dredgings were made down to 1470 fathoms; second, under Dr. Thomson, off the S. W. of Ireland to a point off the Bay of Biscay, where dredgings were made in 2090 and 2435 fathoms; third, under Dr. Carpenter, between the Faröe Islands and the Shetland Islands, and N. of Scotland, where numerous dredgings were made at various depths to 767 fathoms. Large numbers of animals were obtained in all these dredgings, many of them new and remarkable. In 1870 the same vessel made a cruise to the Straits of Gibraltar under the scientific direction of Mr. Jeffreys, which was afterwards continued in the Mediterranean under Dr. Carpenter. On the first part of this cruise dredgings were carried down to 1095 fathoms off the coast of Portugal, and in the Mediterranean to 1412 fathoms. In 1870, Mr. Marshall Hall dredged in deep water off the coasts of Spain and Portugal in his yacht Norna, with valuable results. In 1869, Dr. F. A. Smitt and Dr. A. Ljungman, naturalist of the Swedish frigate Josephine, dredged at many localities on both sides of the Atlantic, and especially off the Azores, and made important discoveries. In 1871–72 the late Dr. William Stimson dredged in the Gulf of Mexico on board the U. S. Coast Survey steamer Bache, and in 1872, Mr. S. I. Smith and O. Harger, on board the same steamer, made the deepest dredgings yet accomplished off the northern coast of the U. S. This was in 430 fathoms, off St. George's Bank. In 1871–72, Mr. J. F. Whiteaves dredged in the deepest parts of the Gulf of St. Lawrence down to 310 fathoms, and made some interesting discoveries. Other dredgings have also been made in deep water within two or three years past, of which the results have not yet been published. In fresh-water lakes comparatively little dredging has been done. The most important are the dredgings in Lake Michigan by Dr. William Stimson and others in 1870, and those in Lake Superior accomplished by Mr. S. I. Smith in 1871, in connection with the U. S. Lake Survey, on the steamer Search. Mr. Smith made numerous dredgings from shallow water down to 169 fathoms, which is the deepest water in the lake. Numerous interesting animals, mostly of small size, were found at all depths. Much more work of this kind should be done in our great lakes, as well as on our coasts. (See DREDGING, by GEN. Q. A. GILLMORE, U. S. Army.) A. E. VERRILL.

Deep-Sea Soundings. It is difficult to define precisely what is to be understood by the expression "deep-sea soundings." There are places in the ocean very near to the most frequented shores, like the Gulf Stream off Cape Hatteras, where it has been found difficult, if not impracticable, to determine the depth of the water with certainty, owing to the rapidity of the current, combined with the great depth; or the same stream within a few miles of the N. shore of Cuba, where the depth of less than 1000 fathoms, combined with the strength of the current, for a long time baffled the skill of the best officers of the American navy in their efforts to obtain a section across the straits between Cuba and Key West. And on the other hand, there are areas extending hundreds of miles seaward from the coasts of continents, like the plateau off the coast of Ireland, where the depth hardly exceeds 500 fathoms, and soundings are so easily made that they would be classed in hydrographic work as "off-shore soundings." Other portions of the sea-bed, again, deepen gradually from the shores outward, and it would be difficult to say where off-shore soundings end and *deep-sea soundings* begin.

The precise definition is of little importance, however, at the present time; but it may be said that in the early attempts to determine depths of the ocean out of sight of land a depth of 1000 fathoms (or 6000 feet) was considered a deep-sea sounding. It is believed that there is no record of any successful effort having been made to determine depths greater than 1000 fathoms previous to that of Capt. James Ross in the year 1840. Up to that time navigators had been engrossed in geographical explorations, and had contented themselves with regarding the ocean as practically unfathomable beyond a very narrow belt along the shores of continents. Capt. James Ross of the English navy was the first explorer who dispelled this idea by a successful effort to sound in what was evidently very deep water. In the year 1840, while off the western coast of Africa, he prepared several miles of sounding-line upon a reel, and having attached a weight of 540 pounds to the end of the line, this weight was allowed to descend to the bottom of the sea. A sudden cessation of the descending motion indicated that the bottom was reached, and it was found that the length of line run out was 2677 fathoms. In a subsequent attempt during the same voyage 4000 fathoms of line were run out without finding bottom, and the line finally broke. The first sounding was doubtless as nearly correct as most of the soundings since made at the same depth by other explorers.

Another attempt made in 1843 by officers of the English navy, in the Southern Ocean, proved a failure, no bottom having been reached with 4000 fathoms of line out. In 1847 another sounding was made by Capt. Stanley, midway between the coasts of Africa and South America, bottom having been reported at 2600 fathoms, but the result was doubtful.

These are the only recorded soundings made by the English navy before the problem was taken up by the American navy. In 1843, Lieut.-Commander (now Admiral) Davis, who was then attached to the U. S. Coast Survey, made several successful soundings off Block Island, in water a little less than 2000 fathoms' depth. A cup for bringing up specimens of the bottom was attached to the lead, and for the first time a portion of the deep-sea mud was brought to light from these depths. Deep-sea explorations became from that time invested with a special interest, from the discovery of the existence of animal life or the remains of minute animals in every specimen of the bottom brought to the surface.

During a period of ten years subsequent to the explorations of Commander Davis, deep-sea soundings were continued off the Atlantic coast by officers of the U. S. navy under the direction of Prof. Bache, superintendent of the U. S. Coast Survey, in a series of sections run perpendicular to the coast, made with a view of tracing the form of the bottom along the course of the Gulf Stream. The temperature of the waters of the Gulf Stream, taken beneath the surface at various depths, indicated, by successive bands of cool and warm water, the probable existence of submarine ranges of mountains having courses coincident with these bands, and the sections determined confirmed this idea wherever the depths could be determined. During the progress of these explorations the U. S. navy department, through the efforts of Lieut. Maury, undertook an extensive series of deep-sea soundings in various parts of the Atlantic, but as the observations were scattered and not confined to systematic lines, and were, moreover, made by a method which had in it great elements of uncertainty, the results, so far as the extension of exact knowledge in regard to the form of the ocean-bed was concerned, were very meagre. The explorations, however, served to prepare for this kind of service officers who subsequently did important work. Among these was Lieut. Berryman, who afterwards ran the first line of soundings across the Northern Atlantic Ocean. The invention of the apparatus for detaching the heavy lead at the bottom, thus enabling a small line to be used for bringing up specimens of the bottom, was also one of the fruits of these explorations. Brooke's lead, or detaching apparatus, became, both in the American and in foreign explorations, the most important feature of sounding-instruments.

The first lines of sounding which were carried across the Atlantic were run by Lieut. Berryman of the U. S. navy, for the purpose of ascertaining the practicability of laying a submarine cable. Upon the favorable report of his soundings it was determined definitely to undertake this work. Lieut. Berryman was followed in this field of exploration by Lieut. Dayman of the royal navy, whose results were confirmatory of those of Lieut. Berryman.

The depths obtained by both these officers appeared, however, to have large probable errors, and the small number of observations made for so long a line rendered it impossible to construct a profile of the bottom of positive accuracy. The actual laying of the telegraph cables furnished the only convincing and satisfactory evidence of the existence of the conditions favorable to such an enterprise.

After the laying of the Atlantic cable the English admiralty took up the question of deep-sea explorations in a thorough manner, and the field seems to have been abandoned by the American navy altogether.

Under the English admiralty the Mediterranean Sea has been explored; several new lines have been run across the North Atlantic; the banks off the coast of Ireland have been mapped out; lines have been run and submarine telegraphs established eastward from the Red Sea to China; and more recently a line of soundings has been carried from the Cape of Good Hope through the midst of the Southern Atlantic northward to the English Channel.

All these results, however, constitute only a beginning of the work of deep-sea explorations. The deepest parts of the ocean have probably not been sounded, and there are not yet sufficient results to determine with any degree of certainty the features of any considerable portion of the bottom of the sea. The general features, as thus far determined, seem to be as follows: The North Atlantic is a comparatively shallow basin, having, however, a deep valley or depression on the W. from Baffin's Bay southward. Near Cape Sable, and within thirty miles of it, the depth is nearly 3000 fathoms. How far this deep valley continues towards the tropics is not known. On the E. side a deep valley is also found extending from the latitude of the

British Channel to the tropics. Between these two great depressions the North Atlantic presents depths considerably less, and irregularities have been detected which indicate that the configuration of the bottom presents features corresponding to those of the surfaces of continents. The South Atlantic basin has not been explored.

In the Indian Ocean, along the lines of the telegraph across the Persian Gulf and Bay of Bengal, the depths increase gradually from the shores to a little over 2000 fathoms along both lines—one from the Malay Peninsula to Hindostan, and the other from Hindostan to the Red Sea.

In the vicinity of the equator, in the South Atlantic Ocean, Capt. Shortland found a plateau extending about 3000 miles in a N. and S. direction, on which are found the islands of St. Paul, Ascension, and the other well-known islands of this region. The depth on this plateau is about 1500 fathoms. Its extent in an E. and W. direction is not known. The Southern and Pacific oceans have not been explored.

In no instance yet recorded has a depth been reached exceeding 3000 fathoms, but this is to be considered as owing to the failure of attempts made in greater depths, and is not to be taken as evidence that no greater depths exist. It is presumed, on the contrary, by those who have given attention to the subject, that vastly greater depths are of frequent occurrence in many parts of the sea.

Methods of Sounding.—In ordinary depths the process of sounding is to attach a "lead" to the end of a small line, drop the lead into the sea, and allow it to sink to the bottom, the line being drawn down after the lead. If there is no current in the water nor drifting of the vessel or boat, and if the instant when the lead strikes the bottom can be distinctly noted, the length of line paid out will indicate the depth. As the depth increases, however, the friction of the line in the water becomes a strong resistance, requiring a very heavy lead to impart any considerable velocity to the descending plummet and line. This circumstance doubtless prevented the earlier attempts to sound from being successful.

Capt. Ross, in his first deep-sea sounding, employed a quarter of a ton weight as a sinker. A new difficulty, however, presented itself—namely, the difficulty of noting the instant when the weight struck bottom. In water nearly 3000 fathoms deep, whatever be the amount of the sinking weight, the downward motion became very slow, and it was only by noting the rate of descent by a watch that the instant the weight struck bottom was noted. It became customary afterwards, in all deep soundings, to note the time of running out of each successive 100 fathoms of line, and when the rate of descent became irregular or indeterminate it was taken for granted that the bottom was reached.

This practice introduced a delusive test of reaching bottom, which rendered useless many subsequent laborious and earnest efforts. It was not until Davis introduced the practice of bringing up specimens of the bottom, and Brooke invented his detaching apparatus, that any element of certainty attended deep-sea explorations.

There still remained two great difficulties to contend with—the drifting of the vessel from which soundings were taken, and the currents of the sea. Both of these occurrences rendered the measurements inaccurate, and in extreme cases, such as the rapid flow of the Gulf Stream along the coast of America, this method proved a failure. Many attempts have been made to sound the Gulf Stream N. of Cape Hatteras, but thus far without success.

Lieut. Walsh and Commander Wainwright used small wires for sounding-lines, but without advantage. At a certain depth the wire ran out of its own weight, and it was difficult to determine when the weight struck bottom. In the Gulf Stream the current carried away the line so rapidly that it was found impracticable to reach bottom.

The uncertainties and errors of these methods led to the invention of a recording apparatus, which was attached to the plummet in such a manner that the register, with the cup or tube for bringing up specimens of the bottom, was recovered, while the weight was detached and left at the bottom. The registers employed were generally revolving helices, which turned during the descent, the revolutions being recorded on wheel-work. Pressure-gauges were also tried, but owing to various causes of failure these devices have been generally abandoned. The revolving helices were found to require a constant velocity for perfect results, and the slowness of the motion at great depths caused an error in the recording. Pressure-gauges failed, mainly on account of the change of temperature and the very great pressure to which they were subjected.

The method still most commonly employed is that instituted by Capt. Ross, with the addition of Brooke's detaching apparatus. This method, however, has not thus far proved available for the deepest parts of the ocean. Among the devices which have been suggested for this difficult problem may be mentioned that of the late Mr. Sidney E. Morse, in which no line was to be employed. A pressure-gauge was to be carried to the bottom by weights; the weights becoming detached, the gauge and part of the apparatus with which it was connected were brought back to the surface by the buoyancy of hollow spheres of glass.

Another process, suggested by the writer of this article, may be termed the electric method. It consists in coiling a fine insulated wire within a hollow tube attached to the weight, the wire being paid out from the tube as the weight descends. There being no motion of the line in the water, friction is thus avoided, and the plummet will descend with a sensibly uniform velocity (or at least with a velocity which will vary according to a known law). By connecting the wire with a battery on board the vessel, and making the shock of the weight on the bottom "make" the galvanic circuit, the *time* of descent can be exactly determined. Knowing the *rate of descent* and the *time*, the depth can easily be ascertained. This device seems to be better calculated for reaching the depths which have not heretofore been reached than any other. It would not be necessary or advisable to attempt to recover the wire, but it would probably be less expensive to take a new wire at each cast. The time of making a deep sounding would thus be greatly shortened.

For further researches in determining depths of the ocean there is needed an apparatus which can be more frequently applied, so as to multiply soundings, and one which will attain the greatest depths with certainty of results.

William P. Trowbridge.

Deep Water, a township of Henry co., Mo. P. 2055.

Deer [etymologically related to the Gr. θήρ; Ger. *Thier*, a "beast"], the name given to ruminating quadrupeds with deciduous horns or antlers, which form the essential character of the Linnæan genus *Cervus*, to which all these animals belong. Deer are distinguished from other ruminants by the absence of a gall-bladder. The species of deer may be divided into two groups, of which one includes those with antlers more or less flattened; the other those with rounded antlers. The elk or moose (*Cervus alces*) is the most characteristic species of the first group, and forms the type of the genus *Alces* of modern systems. It sometimes exceeds the horse in bulk; has a short body, with a still shorter neck. In the lower jaw it has eight cutting teeth, none in the upper. The muzzle is long, broad, and overhangs the mouth like a square lapel; it is very muscular, and of service to the animal in gathering its food. The antlers of the elk appear first in the form of pointed stems; these are followed by a stem bearing a few short branches. At five years he puts up antlers in the form of a triangular plate, supported on a stem and notched along the outer margin. Subsequently this plate becomes more expanded, and the points between the notches are developed into long branches or *snags*, of which a single antler sometimes has as many as fourteen; and the pair will then weigh about fifty pounds.

The European fallow-deer (*Dama vulgaris*), called by the ancients *Platyceros*, is a species of deer belonging to the flat-horned group. The male is known as a *buck*, the female as a *doe*, and the young as a *fawn*.

The red-deer (*Cervus elaphus*) and the roebuck (*Capreolus capræa*) are European species, of which the stem of the antler shows a rounded form in section. The *hart* and *hind* are the male and female of the red-deer. The antlers are shed soon after pairing, and at this period the hart retires to the most unfrequented part of the grove. New antlers begin to grow very soon after the old ones are shed, and are completed in August. The skin which protects the vascular periosteum during the growth of the antlers now dries, and is rubbed off against any resisting object.

The roebuck (*Capreolus capræa*) is the smallest species of European deer; the male is monogamous, and the female brings forth two fawns. This deer is found in Asia and wild parts of Europe, such as the Scottish mountains. The common American deer (*Cariacus Virginianus*), called by the name of roebuck, jumping deer, etc., is about the size of the European fallow-deer, and resembles it in temper and character. Color, brown in summer, and gray-brown in winter; the fawns are spotted with white. Its food varies with the season; in winter, buds of shrubs; in spring and summer, grass, grain, berries, and the like. This species is now rare in New England. In the Alleghany Mountains, from Northern New York to Georgia, it is still common. In Texas, Florida, and Mexico it is abundant.

The mule-deer (*Cervus macrotis*) is between the common deer and the American elk in size. Its horns are round and twice forked; its ears long, giving its name from their resemblance to those of the mule. It is confined mostly to the eastern slope of the Rocky Mountains, from lat. 54° to 30°. The black-tailed deer (*Cervus Richardsonii*), some-

what larger than the common deer, but smaller than the mule-deer, is found in the Pacific States and Rocky Mountain region. The long-tailed deer (*Cervus leucurus*), so called on account of its long tail, which sometimes measures seventeen inches, is common on the Columbia River. The American elk or wapiti (*Cervus Canadensis*) is a large species resembling the European red-deer. It has tall branching horns, sometimes six feet high, which are shed in February or March. The animal is common in the North-western States. Its flesh is coarse, though the skins are much prized. Many other species of deer exist in South America, Africa, and especially in Asia and its islands. (See REINDEER, CARIBOO, and ELK.)

Mule Deer.

REVISED BY C. W. GREENE.

Deer Creek, a post-township of Tazewell co., Ill. Pop. 763.

Deer Creek, a post-township of Carroll co., Ind. P. 3458.

Deer Creek, a township of Cass co., Ind. Pop. 1271.

Deer Creek, a township of Miami co., Ind. P. 1173.

Deer Creek, a township of Webster co., Ia. P. 266.

Deer Creek, a township of Allen co., Kan. P. 614.

Deer Creek, a township of Bates co., Mo. P. 1057.

Deer Creek, a township of Madison co., O. P. 823.

Deer Creek, a post-township of Pickaway co., O. Pop. 1458.

Deer Creek, a township of Mercer co., Pa. P. 579.

Deer Creek, a township of Outagamie co., Wis. Pop. 134.

Deer'field, a township of Fulton co., Ill. Pop. 907.

Deerfield, a post-township of Lake co., Ill. P. 1525.

Deerfield, a post-township of Chickasaw co., Ia. P. 599.

Deerfield, a township and post-village of Franklin co., Mass., on the Connecticut River R. R., 33 miles N. of Springfield. The township contains the important manufacturing village of South Deerfield. This township was the scene of several contests with the Indians in colonial times. Among these may be mentioned the "Bloody Brook massacre" (1675), and the burning of the village by the French and Indians under De Rouville (1703). Deerfield has many points of interest to the tourist: the North and South Sugar Loaf Mountains, the latter rising 500 feet from the plain, and affording from its summit a most beautiful view of Mounts Holyoke, Tom, and Mettawampe, with the fertile Connecticut Valley; Arthur's Seat in the N. W.; the village of Old Deerfield, with its wide streets finely shaded with elms; and Deerfield Meadows, celebrated for its fine crops of tobacco. Old Deerfield has a beautiful soldiers' monument, and there is at South Deerfield a marble monument commemorative of the Bloody Brook disaster. Deerfield has a very fertile soil, an academy, two high schools, six churches, and is the birthplace of many distinguished men. It was the favorite summer residence of the late Prof. Agassiz. Pop. 3632.

Deerfield, a township of Lapeer co., Mich. Pop. 419.

Deerfield, a township and post-village of Lenawee co., Mich., on the Lake Shore and Michigan Southern R. R., 60 miles S. W. of Detroit. Pop. 1234.

Deerfield, a township of Livingston co., Mich. Pop. 1128.

Deerfield, a township and village of Mecosta co., Mich., on the Chicago and Michigan R. R., about 15 miles S. of Big Rapids. Pop. 564.

Deerfield, a township of Van Buren co., Mich. Pop. 677.

Deerfield, a township and post-village of Steele co., Minn. Pop. 438.

Deerfield, a township and post-village of Vernon co., Mo., on the Missouri Kansas and Texas R. R., 288 miles W. S. W. of St. Louis. Pop. 506.

Deerfield, a post-township of Rockingham co., N. H. It has manufactures of lumber, tubs, pails, doors, sash and blinds, boots and shoes, etc. Pop. 1768.

Deerfield, a township of Cumberland co., N. J. Pop. 1518.

Deerfield, a post-township of Oneida co., N. Y. Pop. 2045.

Deerfield, a township of Morgan co., O. Pop. 981.

Deerfield, a post-township of Portage co., O. Pop. 1025.

Deerfield, a township of Ross co., O. Pop. 1223.

Deerfield, a township of Warren co., O. Pop. 1965.

Deerfield, a post-village of Warren co., O. Pop. 274.

Deerfield, a township of Tioga co., Pa. Pop. 665.

Deerfield, a township of Warren co., Pa. Pop. 2324.

Deerfield, a post-township of Dane co., Wis. P. 1040.

Deerfield, a township of Waushara co., Wis. P. 234.

Deer Grass (*Rhexia*), a genus of plants of the order Melastomaceæ. Eight species are natives of the U. S. They have brilliant rosy-purple flowers.

Deer'ing, a post-township of Hillsborough co., N. H. It has an academy and manufactures of boots, shoes, and lumber. Pop. 722.

Deer Island, an island of Charlotte co., New Brunswick, at the entrance to the Bay of Fundy, inhabited by fishermen and farmers. Pop. about 1000.

Deer Island, in the harbor of Boston, Mass., containing the city almshouse, a house of industry, and other charitable institutions. Pop. 1001.

Deer Isle, a post-township of Hancock co., Me. It includes Great and Little Deer Isles and Ile au Haut, besides smaller islands, and has important fisheries. Lobsters are here canned for market. By steamer it is 130 miles from Portland. There are four churches. P. 3414.

Deer Lodge, a county in the W. of Montana. Area, 11,732 square miles. Is drained by the sources of Clarke's River. The surface is mountainous. Gold is found here. There is considerable timber upon the mountains, and many of the valleys are exceedingly fertile, though generally requiring irrigation. Grain, hay, and dairy products are raised. Capital, Deer Lodge City. Pop. 4367.

Deer Lodge City, capital of the above county, situated on Deer Lodge River, in Deer Lodge Valley, is 45 miles N. of the Deer Lodge Pass. It has two weekly newspapers, a graded school, a national bank, a hospital in charge of the Sisters of Mercy, a Catholic and a Presbyterian church, and contains the Territorial penitentiary. KERLEY SMITH, MCQUAID & CO., PROPS. "INDEPENDENT."

Deer'mouse, or **Jump'ing Mouse** (*Meriones*), a genus of rodents allied to the mouse and jerboa families, are natives of America. One species, the Labrador jumping mouse, is found far N. The Canada jumping mouse (*Meriones Canadensis*) is an active and beautiful animal, having long, slender hind legs and a very long tail. It can leap to the distance of four yards. It remains dormant during the winter.

Deer Park, a post-township of La Salle co., Ill. P. 894.

Deer Park, a township of Orange co., N. Y., 36 miles W. of Newburg. It is traversed by the Erie R. R., and contains the village of Port Jervis. Pop. 9387.

De Fac'to, a Latin legal phrase, signifies "in fact," "in reality," and is used to denote actual possession, however acquired. A person who usurps a throne to which he has no title is king *de facto*, but the legitimate claimant is king *de jure*, "of right." An officer *de facto* is one who performs the duties of an office with apparent rights and under claim and color of appointment to such office, but without being actually qualified by law to act as an officer.

Defamation. See Libel, by Prof. T. W. Dwight.

Default' [Fr. *défaut*, from *de*, intensive, and *faillir*, to "fail;" It. *diffalta*], in law, is, in a general sense, the omission of any act which a party ought to perform in order to entitle himself to a legal remedy. Such is, for example, non-appearance in court on a day assigned. If a plaintiff in an action make default, he is non-suited; if a defendant, judgment by default is passed against him. Judgment by default is not necessarily final.

Default'er, a person who fails to perform a public duty; an officeholder who embezzles public money, or fails to account for money entrusted to his keeping. His offence is called *defalcation*.

Defeas'ance [Norman Fr. *défesance*, from *de*, negative, and *faire*, to "do or perform"], in law, a collateral deed made at the same time with a deed of conveyance, containing conditions on the performance of which the estate thus created may be defeated; also a defeasance as to a bond or recognizance is a condition contained in or endorsed on the instrument, which when performed defeats it.

Defen'dant [Fr. *défendeur*], in law, the party against whom a claim is made in an action or suit. The rule is now held to be that in personal actions *ex contractu* the action is to be brought against the person who either expressly or implicitly made the contract; in personal actions *ex delicto*, against the person who either actually committed the injury or aided in committing it.

Defender of the Faith [Lat. *Fidei Defensor*], a title given Oct. 11, 1521, by Pope Leo X. to Henry VIII. of England, on the publication of his writings against Luther. When the king suppressed the monasteries and convents the pope recalled the title. It was, however, confirmed by Parliament in the thirty-fifth year of his reign, and has since been assumed by the sovereigns of England.

Def'erent [from the Lat. *defero*, to "carry away" (from *de*, "from," and *fero*, to "carry")], a term used in the Ptolemaic system of astronomy, according to which the planets move in small circular orbits, the centres of which are carried round in the circumference of other larger circles having the sun for their common centre. These principal circles are called the *deferents*, as carrying the orbits, those in which the planets move being called epicycles.

"Deferent nerves" are those which convey impressions from the brain to the periphery or to the muscles. They are otherwise called motor nerves. In point of fact, most nerves contain both deferent and afferent (or sensitive) filaments.

Deffand, du (Marie de Vichy-Chamroud), Marquise, a French literary lady, born in 1697. She was beautiful, witty, and accomplished, but was a skeptic and egotist. Her house in Paris was frequented by many eminent authors and statesmen. She corresponded with Voltaire, Horace Walpole, and D'Alembert, and wrote letters which are commended for style. Died Sept. 23, 1780.

Defiance, a county of Ohio, bordering on Indiana. Area, 414 square miles. It is intersected by the Maumee River, and partly drained by the Auglaize. The surface is nearly level; the soil is fertile. Lumber, dairy products, cattle, grain, tobacco, wool, and hay are staple productions. It is traversed by the Toledo Wabash and Western R. R. and the Wabash and Erie Canal. Capital, Defiance. Pop. 15,719.

Defiance, a post-village, capital of the above county, is on the Maumee River at the mouth of the Auglaize, and on the Toledo Wabash and Western R. R., 50 miles W. S. W. of Toledo. It has six churches, two weekly newspapers, and a national bank. Pop. 2750; of Defiance township, 3615.

Defi'cient Num'ber, in arithmetic, is one which exceeds the sum of its aliquot parts. Thus 8 is a deficient number, since the sum of its aliquot parts, 1, 2, 4, only amounts to 7.

Defilade [Fr. *défilade*, from the Lat. *de*, "away," and *filum*, a "line," referring to fortified lines]. Defilading, in fortification, is—1, so arranging the height of a work that the enemy cannot see into it; or, 2, so directing its faces that the enemy can neither enfilade them nor take them in reverse.

Defile [Fr. *défile*, etymologically related to Defilade (which see)], in military language, a narrow place or passage through which troops can pass only in file or in a column with a narrow front. Wherever free lateral movement is obstructed is a defile. If the defile cannot be avoided without making a long circuit, it is called a "pass." *To defile* is to march off by file.

Definite Proportionals, in chemistry. See Chemistry, by Prof. G. F. Barker, M. D.

Defini'tion [Lat. *definitio*, from *de*, intensive, and *finio, finitum*, to "mark limits" (from *finis*, an "end," a "limit")] is a proposition explanatory of the meaning of a word; a setting forth of a thing by its properties. In logic, definition signifies "an expression which explains any term so as to *separate* it from everything else, as a boundary separates fields." (See Logic.) A good definition must be—1st. Adequate—that is, neither so narrow as to explain a part instead of the whole, nor so extensive as to explain the whole instead of a part. 2d. It should be clearer (*i. e.* be composed of ideas less complex) than the thing defined. 3d. It should be expressed in just a sufficient number of proper words. Metaphorical words are indefinite, and should not be used. (See Fleming, "Vocabulary of Philosophy.")

Deflec'tion [Lat. *deflexio*, from *de*, "from" or "down," and *flecto, flexum*, to "bend"], in architecture, the change of form produced in a beam when its upper surface becomes depressed below its original level line, whether caused by an extraneous weight or merely by that of the unsupported portion of the beam itself. The laws which regulate the deflection of beams have been thus stated by Coulomb: 1. The deflection below the natural level is proportional to the weight; 2. The weight required to produce depression is proportional to the width of the bar, but in the ratio of the cube of the depth; 3. It is in the inverse ratio of the cube of the length.

Deflection of a projectile is its perpendicular distance at any point of its flight, measured horizontally at that point, from a vertical plane passing through the prolongation of the axis of the piece from which it is fired.

Deflection, in optics. See Diffraction.

De Foe (Daniel), an English writer, born in London in 1661, was a son of James Foe, a butcher and non-conformist. In 1685 he joined the rebellion of the duke of Monmouth, after whose defeat he became a tradesman. He produced in 1701 "The True-born Englishman," a satirical poem designed to vindicate King William III., and was very successful. In 1702 he wrote an ironical pamphlet entitled "The Shortest Way with Dissenters," for which the House of Commons punished him with the pillory, a fine, and imprisonment for two years. He advocated the principles of the Whigs and dissenters in several political works. In 1706 the ministers employed him as one of the staff of commissioners sent to Scotland to promote the union of the two countries. He published a "History of the Union" (1709). In 1713 he was again fined and imprisoned for one of his political writings. His most popular work is "The Adventures of Robinson Crusoe" (1719). He wrote, besides numerous other works, a "Journal of the Plague" (1722), "The Adventures of Roxana" (1724), and "Memoirs of a Cavalier," all of which produce a vivid impression of reality. He died April 24, 1731. He was a pithy and vigorous writer, distinguished for his versatility of mind and fertility of invention. (See W. Hazlitt, "Memoirs of De Foe," 1843; Sir Walter Scott, "Life of De Foe," prefixed to De Foe's works; William Lee, "Life of Daniel Defoe," 3 vols., 1869.)

De Forest (John William), an American author, born in Seymour, then part of Derby, Conn., Mar. 31, 1826. In his early life he spent two years in travelling in the Levant and four years in Europe. He is the author of "Oriental Sketches" and "European Acquaintances," light sketches of travels, and "Seacliff," "Miss Ravenel," "Overland," "Kate Beaumont," and "The Wetherel Affair," all novels. In the civil war he was three years in active service as captain of volunteers, was brevetted major, and commanded a Freedman's Bureau district three years more, and afterwards resided in New Haven.

Def'ter-Dar (literally, "bookkeeper"), the title given

by the Turks to the minister of finance, who sits in the divan and disposes of all the public money. The title is of Persian origin, and is conferred upon certain officials in that country.

De'ger (Ernst), a German historical painter of the Düsseldorf school, was born near Hildesheim in 1809. He became a professor of fine arts at Munich.

Deg'endorf, a town of Lower Bavaria, on the Danube, 28 miles N. W. of Passau. The town has a considerable trade in wood, etc. Pop. in 1871, 5452.

Dego'nia, a township of Jackson co., Ill. Pop. 470.

De Graff, a post-village of Miami township, Logan co., O. It is on the Cleveland Columbus Cincinnati and Indianapolis R. R., 9 miles S. W. of Bellefontaine. It has one weekly newspaper. Pop. 624.

Degree' [from the Lat. *de*, "intensive," and *gradus*, a "step" or "degree"], the 360th part of the circumference of a circle. (See below, Degree in Trigonometry.)

Degree in Algebra, the magnitude of the greatest sum that can be formed by adding together the exponents of the facients or variables which occur in any single term of an equation or expression. The terms *degree* and *order* are frequently used synonymously in algebra, but have distinct meanings when applied to differential equations.

Degree in Trigonometry is the angle subtended at the centre of any circle by an arc equal to the 360th part of its circumference; it is the 90th part of a right angle. A degree is subdivided into sixty minutes, and each minute into sixty seconds. The notation employed for an angle of six degrees fifty-two minutes and sixteen seconds is 6° 52′ 16″. The above division of the circle is of very remote origin. It is not certainly known what gave occasion to the adoption of the arbitrary number 360, but it probably had reference to the space described by the sun in one day in performing his annual revolution in the ecliptic, the number 360 being taken instead of 365, as being more convenient for arithmetical operations on account of its containing a great number of divisors. The Chinese divide the circle into 365¼ equal parts, so that the sun describes daily an arc of one Chinese degree. An attempt was made by the French philosophers, at the period of the Revolution, to introduce into works of science a division of the circle better adapted to our decimal arithmetic (the quadrant or right angle being divided into 100 degrees, the degrees into 100 minutes, etc.); but though the system was adopted by some writers of the first order of merit (as by Laplace in the "Mécanique Céleste"), and extensive tables were computed for the purposes of astronomical calculations, it never came into general use. A division of this sort was recommended long ago by some of the most eminent mathematicians. (See F. A. P. Barnard, "Metric System," 1872, pp. 84–86.)

Degree, as a Scholastic Distinction, is the grade or rank to which scholars are admitted, in recognition of their attainments, by a college or university. Collegiate degrees, *in course*, are given, or should be given, only upon examination. *Honorary* degrees are sometimes conferred without examination. The pope and the archbishop of Canterbury also confer scholastic degrees, especially the doctorate. (See Arts, Degrees in.)

Degree in Music, one of the small intervals of which the concords or harmonical intervals are composed; the difference of position or elevation of the notes on the lines and spaces. When notes are on the same line or space, they are on the same degree, even though one of the notes should be raised by a sharp or lowered by a flat.

Degrees of Latitude and Longitude. The distance from the equator to the poles, along a meridian, is called *latitude*, or width; the distance from an assumed prime meridian, along a parallel, in the direction of the earth's rotation, is called *longitude*, or length. These expressions have been handed down to us by the ancients, who used them because the world known to them was really more extensive, or long, from east to west, than wide, from north to south. The degrees of latitude are counted from the equator as zero, both north and south, making ninety degrees each way to the poles. It would be most desirable that all civilized nations should also agree on a prime meridian from which the degrees of longitude should be uniformly counted; but it is not so. The English count 180 degrees east and 180 degrees west from the meridian passing through their national observatory at Greenwich, near London; the French start from the meridian of their observatory at Paris; the Germans often take the meridian of Ferro, the most western of the Canary Islands, because it leaves all the lands of the Old World to the east, and those of the New World to the west; the Americans often use the meridian of the National Observatory at Washington. Therefore, when the longitude of a place is mentioned, the prime meridian from which it is reckoned must be indicated. The seafaring nations mostly use Greenwich longitude; the nations on the continent of Europe, Paris and Ferro.

The relative position of these prime meridians is such that, Paris being zero, Greenwich is 2° 20′ 22″ W., and Ferro is assumed to be 20° W. from the Paris meridian. Washington is 79° 23′ 28″ W. from Paris, and 77° 3′ 6″ from Greenwich. The latitude and longitude of a point being known, it is evident that its true position on the surface of the globe is fully determined.

The meridians being all great circles, the length of their degrees, or of the degrees of latitude, is about uniform; they only show slight elongation towards the poles, due to the polar compression. But the degrees of the parallels which mark the longitudes are rapidly decreasing with the circumference of the circles from the equator to the poles, as shown in the following table:

Length of Degrees of Longitude in Different Latitudes, in English Miles.

Degrees of latitude.	Length of degrees.	Circumf. of parallel.	Degrees of latitude.	Length of degrees.	Circumf. of parallel.
Equator	69.16	24,899	50°	45.55	16,037
5°	68.90	24,805	55	39.76	14,314
10	68.12	24,523	60	34.67	12,482
15	66.82	24,056	65	29.31	10,553
20	65.02	23,407	70	23.73	8,542
25	62.72	22,580	75	17.96	6,466
30	59.95	21,581	80	12.05	4,339
35	56.72	20,419	85	6 84	2,464
40	53.06	19,101	90	0.00	Pole.
45	48.99	17,636			

The length of a minute of a degree of the equator is called a *geographical* mile, of which, therefore, there are sixty in one degree. This is the same as the nautical mile, used by all mariners in computing distances at sea. One degree of the equator contains 69.16 English statute miles.

Finding the Difference of Longitude between Two Places.— As the earth revolves on its axis, each meridian is carried over 360 degrees in twenty-four hours, or 1440 minutes, and over one degree in four minutes, whatever be the length of the degree. The difference in longitude of two places can therefore be expressed by the difference in time of their meridians. That difference of four minutes for each degree is uniformly the same in all latitudes. A traveller going westward one degree of longitude with a good watch, will find it four minutes ahead of the time of the place; when travelling eastward, four minutes behind. When leaving New York, for example, and arriving at London, if we find the watch to be four hours and fifty-six minutes, or 296 minutes, behind the London—or, rather, the Greenwich—time, we conclude that the difference of longitude between the two places is $\frac{296}{4}$, or 74 degrees. Leaving New York for the Pacific coast, if we find that the timekeeper, which brings the true time of that place, marks 3h. 14m. P. M. when it is noon at San Francisco, we again conclude that the difference of longitude between the two places is 194 minutes of time, which, divided by 4, makes 48° 30′ W. of New York, and 122° 30′ W. from Greenwich.

Arnold Guyot.

De Grey, Earl. See Ripon, Marquis of.

De Haas (Maurice F. H.), born at Rotterdam, in the Netherlands, about 1830, was a pupil of Louis Meyer and other eminent artists. He gave much attention to marine painting, in which he early acquired distinction. In 1857 he was appointed artist to the Dutch navy. In 1859 he came to New York, where he has since occupied a high position as a painter. Most of his earlier pictures are from the British Channel and French coast, and are marked by vigorous and effective drawing and by fidelity to nature. His "Farragut passing the Forts" is his best-known American work.

De Ha'ven (Edwin J.), an American naval officer, born in Philadelphia in 1819. He conducted an expedition sent from New York in search of Sir John Franklin in 1850. Died in Philadelphia May 9, 1865.

De'i Grat'ia, a Latin formula, signifying "by the grace (or favor) of God," originally used by the clergy, but afterwards inserted in the ceremonial description of the title of a sovereign.

De'ists [from the Lat. *Deus*, "God"], a name assumed in France and Italy about the middle of the sixteenth century by those who acknowledged the existence of a God, but rejected the Bible. Among the earliest advocates of these opinions in England was Lord Herbert of Cherbury, whose work, "De Veritate," was published at Paris in 1624. Hobbes, Blount, Bolingbroke, Shaftesbury, Hume, Toland, and Anthony Collins are among the principal English deistical writers. As several of the early deists (including Bolingbroke) were men of more than doubtful

moral character, the word came to be used in an unfavorable sense, not implied in the etymology of the word (signifying simply a "believer in God"), and a sense which does not attach to the term *theist*, which originally meant the same. (See LECHLER, "Geschichte des Englischen Deismus," 1841.) In France deistical views were advocated by many of the prominent free-thinkers, and in Germany by a large number of rationalists. The term theist, which etymologically means the same, has now an entirely different meaning. (See FREE-THINKERS, by REV. O. B. FROTHINGHAM.)

Dejani'ra, or **Deianeira** [Gr. Δηϊάνειρα or Δηάνειρα], in Greek mythology, a daughter of Œneus, king of Ætolia, was the wife of Hercules. She preserved some blood of the centaur Nessus as a love-charm, and saturated with it a tunic of Hercules, who was poisoned by it.

De Jure, "of right." See DE FACTO.

De Kalb, a county in the N. E. of Alabama. Area, 750 square miles. It is drained by Wills Creek and Town Creek. It is partly occupied by Lookout Mountain and Sand Mountain, between which is a long and fertile valley. Grain, tobacco, cotton, and wool are raised. It is intersected by the Alabama and Chattanooga R. R. Bituminous coal is mined. Capital, Lebanon. Pop. 7126.

De Kalb, a county in N. W. Central Georgia. Area, 350 square miles. It is bounded on the N. by Chattahoochee River. The surface is undulating. A granite rock rises in this county about 2200 feet above the sea. Corn, cotton, wool, and tobacco are raised. It is intersected by the Georgia R. R. Capital, Decatur. Pop. 10,014.

De Kalb, a county in the N. of Illinois. Area, 648 square miles. It is drained by Kishwaukee and Indian creeks. The surface is undulating; the soil fertile. The greater part of it is prairie. Butter, cheese, cattle, grain, wool, and hay are largely raised. There are manufactures of carriages, wagons, etc. It is intersected by the Chicago and North-western and Chicago and Iowa R. Rs. Capital, Sycamore. Pop. 23,265.

De Kalb, a county of Indiana, bordering on Ohio. Area, 346 square miles. It is drained by the St. Joseph's River, a branch of the Maumee. The soil is fertile. Cattle, dairy products, lumber, wool, hay, and grain are the chief staples. It is intersected by the Fort Wayne Jackson and Saginaw R. R., and the Lake Shore and Michigan Southern R. R. Capital, Auburn. Pop. 17,167.

De Kalb, a county in the N. W. of Missouri. Area, 440 square miles. It is drained by several small affluents of the Platte, and by Blue Creek, an affluent of Grand River. The surface is diversified by prairies and forests; the soil is productive. Cattle, grain, tobacco, and wool are raised. Capital, Maysville. Pop. 9858.

De Kalb, a county of Middle Tennessee. Area, 300 square miles. It is intersected by Caney Fork, an affluent of the Cumberland River. The soil is fertile. Cattle, grain, tobacco, and wool are raised. Capital, Smithville. Pop. 11,425.

De Kalb, a township of Grant co., Ark. Pop. 529.

De Kalb, a township and village of De Kalb co., Ill., on the Chicago and North-western R. R., 58 miles W. of Chicago. It has a graded school, one weekly newspaper, and an artesian well. P. 2164. L. H. POST, ED. "NEWS."

De Kalb, a post-village, capital of Kemper co., Miss.

De Kalb, a post-village and township of St. Lawrence co., N. Y., on the Rome Watertown and Ogdensburg R. R., at the junction of branches from Potsdam and Ogdensburg. The town has five churches, extensive dairies, and manufactures of lime. Pop. 3116.

De Kalb, a township of Kershaw co., S. C. Pop. 2578.

De Kalb, a township of Scott co., Va. Pop. 1975.

De Kalb, a township of Gilmer co., West Va. Pop. 848.

De Kalb (JOHN), BARON, a German general, born in Bavaria June 29, 1721, served first in the French army. He came to the U. S. with La Fayette in 1777, and was appointed a major-general by Congress in the same year. He served under Washington in Pennsylvania and New Jersey until the spring of 1780, and then became the second in command in the army of Gen. Gates. He was mortally wounded at the battle of Camden, S. C., and died Aug. 19, 1780. (See KAPP, "Leben des Amerikan. Generals, Joh. Kalb," 1862.)

De Kay (JAMES E.), M. D., an eminent zoologist, born in New York in 1792, published, besides other works, "Sketches of Turkey," and 5 vols. 4to on the existing fauna in the "Report of the New York State Survey" (1842). Died Nov. 21, 1851.

Dekor'ra, a post-tp. of Columbia co., Wis. Pop. 1397.

De Koven (JAMES). See APPENDIX.

Del (*Artocarpus pubescens*), a tree of the same genus as the bread-fruit, is indigenous in the forests of Ceylon, and is valuable for its timber, which is used as a material for houses and for ships.

De la Beche (Sir HENRY THOMAS), F. R. S., an English geologist, born near London in 1796. Among his works are a "Geological Manual" (1832) and the "Geological Observer" (1851). Died April 13, 1855.

Delacroix (FERDINAND VICTOR EUGÈNE), an eminent French historical painter, born at Charenton, near Paris, April 26, 1799. He was a pupil of P. Guèrin, but did not adopt his classical style. In 1822 he produced a picture of "Dante and Virgil," which attracted much attention. His "Massacre of Scio" (1824) was generally admired. He soon became recognized as the chief of the romantic school, and displayed remarkable versatility of talent on a great variety of subjects. Among his best works are "Mephistopheles appearing to Faust" (1827), "The Death of Sardanapalus" (1827), "The Women of Algiers" (1834), "The Prisoner of Chillon" (1835), "Medea" (1838), "The Death of Marcus Aurelius" (1845), and "The Farewell of Romeo and Juliet" (1846). He was admitted into the Institute in 1857. He has a high reputation as a colorist, but he does not excel in correctness of drawing. Died at Paris Aug. 13, 1863. (THÉO. SILVESTRE, "Histoire des Artistes Vivants," Paris, 1856; "Catalogue raisonné de l'œuvre d'Eugène Delacroix," par M. A. MOREAU, Paris, 1873.)

Del'afield, a post-twp. of Waukesha co., Wis. P. 1364.

Delafield (RICHARD), an American officer, born Sept. 1, 1798, in New York City, graduated at West Point in 1818, chief of engineers April 22, 1864, with the rank of brigadier-general. He served on the northern boundary survey of the U. S. under the treaty of Ghent 1818; in building fortifications, improvement of rivers and harbors, constructing roads and canals, 1819–38 and 1846–64; as superintendent of the Military Academy 1838–45 and 1856–61; as member of boards of engineers 1845–64; as president of military commission to the Crimea and theatre of war in Europe 1854–56 (report thereon published by Congress 1860); on the staff of Gov. Morgan of New York to reorganize and equip State forces for service in the civil war 1861–63; in command of corps of engineers and in charge of engineer bureau, Washington, D. C., 1864–66; as inspector of Military Academy 1864–66; as member of lighthouse board and of commission for the improvement of Boston harbor 1864–70; and as regent of Smithsonian Institution 1865–70. Brevet major-general U. S. A. Mar. 13, 1865, for faithful, meritorious, and distinguished service in the engineer department; and retired from active service Aug. 8, 1866. Died Nov. 5, 1873.

GEORGE W. CULLUM, *U. S. Army*.

Delago'a Bay (*i. e.* "lagoon bay"), an inlet of the Indian Ocean, in South-eastern Africa, is 55 miles long and about 20 miles wide. It is about lat. 26° S. and lon. 33° E. The shores are flat, marshy, and unhealthy, but the bay is commodious and safe. It is visited by many whaling-ships. Several rivers, one of which is the Delagoa, enter this bay.

Delambre (JEAN BAPTIST JOSEPH), a French astronomer, born at Amiens Sept. 29, 1749, studied under Lalande. He produced "Tables of the Orbit of Uranus" in 1790, and in 1792 "Tables of Jupiter's Satellites." In the service of the government, Delambre and Méchain spent about seven years (1792–99) in the measurement of the arc of the meridian from Dunkirk to Barcelona. Delambre published the result of this operation in his "Base du Système Métrique Decimal" (1806–10). He was admitted into the Institute in 1795, became perpetual secretary of the Academy of Sciences in 1803, and professor of astronomy in the College of France in 1807. Among his numerous and able works are "Theoretical and Practical Astronomy" (1814), a "History of Ancient Astronomy" (1817), a "History of Mediæval Astronomy" (1819), and a "History of Modern Astronomy" (1821). Died Aug. 19, 1822. (See FOURIER, "Éloge de Delambre.")

De Lan'cey (JAMES), an American jurist, born in New York in 1703, was the son of a Huguenot from Normandy. He was educated at Cambridge, England, returned to New York in 1729, became a justice in the supreme court of the province, and in 1733 its chief-justice. He was one of the founders of King's (now Columbia) College, and was lieutenant-governor for several years. Died Aug. 2, 1760. He was a man of great talents, wealth, and learning, but is said to have been unprincipled and intriguing. Several members of the De Lancey family were prominent and bitter Tories during the Revolutionary war, but they were generally men of remarkable talents.

De Lancey (WILLIAM HEATHCOTE), D. D., LL.D., D. C. L. OXON., a Protestant Episcopalian bishop, born at

Mamaroneck, N. Y., Oct. 8, 1797, graduated at Yale in 1817, was ordained deacon in 1819, priest in 1822, was provost of the University of Pennsylvania (1825–30), and was consecrated bishop of Western New York in 1839. Died at Geneva, N. Y., April 5, 1865.

Dela'ney (Patrick), an Anglican theologian, born in Ireland in 1686, was educated at Dublin University. He published (1732–36) a work entitled "Revelation Examined with Candor," a treatise which is still highly valued. Some of his other works, among which is a "Life of David" (1740), exhibit learning and ingenuity, without great excellence in other respects. Died in 1768.

Delangle (Claude Alphonse), a French statesman, born at Varzy April 6, 1797, was advocate-general at the court of cassation from 1840 to 1846. In Dec., 1852, he became first president of the imperial court of justice, later was made a senator, was minister of the interior in 1858, minister of justice (1859 to 1863), and became in 1863 vice-president of the senate. Died in Paris Dec. 26, 1869.

Del'ano, a township of Humboldt co., Ia. Pop. 145.

Delano, a post-village of Wright co., Minn., on the St. Paul and Pacific R. R., 40 miles W. by N. of St. Paul. It has one weekly newspaper.

Delano (Columbus), an American lawyer, born in Shoreham, Vt., in 1809, removed in his early youth to Ohio. He practised law with distinction, and was chosen a member of Congress in 1844. Having joined the Republican party, he was again elected to Congress in 1864. He became commissioner of internal revenue in Mar., 1869, and secretary of the interior in the cabinet of General Grant in Oct., 1870.

Delan'ti, a village of Stockton township, Chautauqua co., N. Y., has three churches and some manufactures. Pop. 245.

Delaroche (Paul), a French historical painter, the chief of the modern eclectic school, was born in Paris July 17, 1797. He was a pupil of Baron Gros, and adopted a style by which he endeavored to unite the dignity of the classic with the picturesqueness of the romantic school. In 1824 he exhibited "Joan of Arc Interrogated in Prison." His reputation was increased by the "Death of Queen Elizabeth" (1827) and "The Children of Edward IV. in the Tower of London" (1831). He was admitted into the Institute in 1832, and married a daughter of Horace Vernet. Among his masterpieces are "Cromwell Gazing on the Corpse of Charles I." (1832), "Napoleon at Saint-Bernard" (1850), and "The Girondists in Prison" (1855). He adorned the semicircular saloon of the Palais des Beaux-Arts with an admirable composition, which represents the artists of all ages, and contains about seventy figures. Died Nov. 4, 1856.

De la Rue (Warren), Ph. D., F. R. S., an English physicist and inventor, born about 1815, was educated in Paris, and afterwards followed his father's employment as wholesale stationer and manufacturer of card-paper. He has invented processes for photographing the heavenly bodies, improvements in color-printing, in envelope-folding machines, in oil-refining, etc., and has published important reports of original observations in chemistry, astronomy, and physics.

Dela'tor (plu. **Delato'res**), [from the Lat. *defero, delatum*, to "carry off"], a Latin word, literally meaning "carrier," came to be applied to the carriers of evil reports, informers, or public spies. Under the Roman emperors the delatores were a class of men who gained their living by informing against their fellow-citizens. They constantly brought false charges forward to gratify the jealousy or avarice of the different emperors, and were generally paid according to the apparent consequence of the information they gave, although in some cases the law specified the sums which were to be given to informers. Thus, if a murder had been committed in a family, and any slaves ran away before inquest (*quæstio*) had been made, whoever apprehended such slaves received for each one so apprehended five pieces of gold from the estate of the deceased, or, if the estate could not pay it, the government gave the reward. At various times attempts were made to regulate the pay of public spies and informers, who at last became so numerous, and gave rise to so much trouble in society, that the emperors were obliged to expel and variously punish great numbers of them.

Delaunay (Charles Eugène), F. R. S. L., a French mathematician and astronomer, born April 9, 1816, was educated at the Polytechnic School, where he graduated in 1836 with the highest honors. He was subsequently appointed principal engineer of mines of the first class, and professor of mechanics in the Polytechnic School and in the Faculty of Sciences. He was also an officer of the Legion of Honor, a member of the Institute, and was the recipient of numerous native and foreign honors and distinctions. He became a member of the Academy in 1855, of the bureau of longitude in 1862, and director of the Parisian Observatory in 1870. He has written, among other works, "Traité de Mécanique Rationelle" (3d ed. 1862), "Théorie de la Lune" (1866), "Rapport sur le Progrès de l'Astronomie" (1867). He was drowned at Cherbourg Aug. 5, 1872.

Del'avan, a post-village of Tazewell co., Ill., on the Chicago and Alton R. R. and the Pekin branch of the Toledo Wabash and Western R. R., 157 miles S. W. of Chicago. It has two weekly newspapers, a library, two banks, two manufactories, a park, and a high school. Pop. of Delavan township, 1957. Ed. "Independent."

Delavan, a post-village of Faribault co., Minn., on the Southern Minnesota R. R., 162 miles W. of La Crosse. It has one weekly newspaper.

Delavan, a post-village of Walworth co., Wis., on Turtle Creek and the Western Union R. R., 58 miles S. W. of Milwaukee. It has a national bank, the State institution for the deaf and dumb, five churches, a foundry, a cheese-factory, one graded school, and one weekly newspaper. Pop. 1688; of Delavan township, 2509. Ed. "Republican."

Delavan (Edward C.), an American temperance reformer, born in Schenectady co., N. Y., in 1793, accumulated by industry and economy a large amount of property at Albany, N. Y. Here he erected the "Delavan House," which was for a long time a famous temperance hotel. He became a distinguished editor and speaker upon temperance, and expended a large amount of money in the cause. Died Jan. 15, 1871, after losing a large part of his property.

Delavigne (Jean François Casimir), a French dramatist, was born April 4, 1793, at Havre. After the Restoration he wrote a series of patriotic lyrics called "Messéniennes," which were received with favor. The dramas "The Sicilian Vespers" (1819), "The Comedians" (1820), and "The Pariah" (1821) increased his fame. In 1830 he wrote "La Parisienne" and other revolutionary songs. Delavigne occupies an intermediate position between the classical and romantic school. There are more piquancy and realistic sentences in his delineations of characters than in those of Voltaire, but less passion and fire of imagination than in those of Victor Hugo. He died Dec. 11, 1843.—His brother, Germain Delavigne (born 1790), wrote with Casimir the words to Halévy's opera of "Charles VI.," and in collaboration with Scribe "Le Vieux Garçon" and other vaudevilles. Died in 1868.

Del'aware [named in honor of Lord Delaware, second governor of Virginia], a river of the U. S., rises in New York, and is formed by the Coquago and the Popacton, which unite at Hancock on the boundary between New York and Pennsylvania. It flows south-eastward to Port Jervis on the Erie R. R., and reaches the northern extremity of New Jersey. Below this point it forms the boundary between Pennsylvania and New Jersey, and runs south-westward to the Delaware Water Gap, where the river passes through a picturesque gorge in the Kittatinny Mountain. Thence it flows southward to the northern extremity of Bucks county, and south-eastward to Trenton, where it meets tide-water. Below Bordentown it flows south-westward until it enters Delaware Bay, about 40 miles below Philadelphia. Its whole length is about 300 miles. It is navigable for steamboats to Trenton, and ships of the largest size can ascend to Philadelphia, where it is nearly one mile wide. It is connected with the Hudson River by the Morris Canal and the Delaware and Hudson Canal. Large numbers of shad are caught in the Delaware.

Delaware, one of the Middle States of the Atlantic coast, and one of the original thirteen which united in the war of Independence. It is situated between the parallels of 38° 28′ and 39° 50′ N. lat., and between the meridians of 75° and 75° 46′ W. lon. from Greenwich. It has a length of 96 miles from N. to S., and a breadth ranging from 9 to 12 miles in the N. to 36 or 37 miles on or near its S. line; and is bounded on the N. and N. W. by Pennsylvania, on the E. by Delaware River and bay and the Atlantic Ocean, on the S. and W. by Maryland. Its area is 2120 square miles, or 1,356,800 acres, being, with the exception of Rhode Island, the smallest State in the Union in territory.

Face of the Country.—The peninsula lying between the Chesapeake and Delaware bays and the Atlantic Ocean, of which Delaware forms the N. E. portion, is for the most part nearly level, and, except on the shores of the Delaware River and bay, very generally sandy. There are no mountains, though in the northern portion of the State, which is somewhat assimilated to the character of the Pennsylvania lands, there is some fine rolling country, with pleasant hills and dales; but below New Castle the only variation from an absolute level is a sandy and somewhat marshy ridge,

nowhere exceeding 60 or 70 feet in height, running southward near the western boundary of the State, and forming the backbone of the peninsula. From the marshes of this ridge most of the streams which drain the State take their rise. Of these the affluents of the Pocomoke, the Nanti-

Delaware Seal.

coke, the Choptank, the Chester, and the Elk rivers flow into Chesapeake Bay, while the Brandywine, White Clay Creek, Christiana Creek, Appoquinimink, Duck Creek, Murderkill, Mispillion River, Broadkill, Indian, and other rivers and creeks are tributaries of the Delaware River and bay, or discharge their waters into the Atlantic. There are no considerable indentations of the coast except below Cape Henlopen, where the surf has thrown up long spits of sand enclosing the shallow but landlocked sounds known as Rehoboth Bay, Indian River Bay, and the northern portion of St. Martin's Bay. Most of the larger streams are navigable for coasters and fishing-vessels of light draught for a short distance, but Christiana Creek is the only one navigable for merchant-ships. Rehoboth Bay admits vessels drawing six feet of water. Delaware Bay, which for more than half of its course along the eastern shore of the State is rather an estuary than a bay, is a fine body of water, with a deep though tortuous channel, having from 35 to 75 feet of water; but along the Delaware shore it is at most points much silted up and its banks are marshy and low. The only good harbors in the State are those of Wilmington on Christiana Creek, New Castle, and Lewes, just inside of the Breakwater.

Geology.—The northern portion of the State, including nearly one-half of New Castle county, belongs to the same group of cretaceous rocks with the West Jersey marls and greensand; from this point down to the banks of Murderkill the tertiary formations predominate; the southern portion is wholly alluvial. In the extreme southern part of the State is the Cypress Swamp, a morass 12 miles long and 6 miles wide, containing a dense growth of cypress and other evergreens and shrubs, and abounding in noxious reptiles. The soil for eight or ten miles inward from Delaware Bay is for the most part a rich clayey loam, but W. of this it is sandy, and unless constantly enriched yields but light crops. Of minerals, the most important are bog-iron ore, found in all the swamps, shell marl in the greensand region, and kaolin or porcelain clay, also found abundantly and of good quality in the northern part of the State. The *climate* is mild and favorable to agricultural pursuits. In the N. the air is pure and healthy; in the S. the presence of swamps causes the prevalence of intermittent and remittent fevers to some extent. The natural vegetation does not differ from that of the more level portions of the Middle States generally. Except in the swampy districts, there are no extensive forests, the land being generally under cultivation. In the swamps the trees are largely of a sub-tropical character. There are few wild animals in the State, though in the Cypress Swamp, as well as in other swamps, there is no lack of formidable reptiles. The shores of Delaware Bay are frequented in their season by immense flocks of ducks and teal, and at times by wild-geese. The other birds of the State are those common to the Middle States lying on or near the Atlantic.

Agricultural Products.—Delaware is eminently a fruit-growing State. Her peaches and apples and her small fruits are in demand in the markets of Philadelphia and New York, and, in connection with New Jersey and Maryland, almost completely supply the ever-increasing demand for these products. According to the census of 1870, 1,052,322 acres, or ten-thirteenths of her entire area, was in farms, and of this amount 698,115 acres were under cultivation, while 354,207 acres were either woodland or otherwise unimproved. The average size of her farms was 138 acres; the value of her farms was set down at $46,712,870, or an average of $45 per acre; the value of farming implements, $1,201,644; the value of all farm products, $8,171,667; of animals slaughtered, etc., $997,403; of home manufactures, $33,070; of forest products, $111,810; of market-garden products, $198,075 (evidently an under-estimate); of orchard products, $1,226,893 (this is also understated); of wages paid to farm hands, $1,696,571; wheat harvested, 895,477 bushels; rye, 10,222 bushels; Indian corn, 3,010,390 bushels; oats, 554,388; barley, 1799; buckwheat, 1349; flax, 878 pounds; wool, 58,316 pounds; hay, 41,890 tons; hops, 800 pounds; tobacco, 250 pounds; sorghum molasses, 65,908 gallons; common potatoes (*Solanum tuberosum*), 362,724 bushels; sweet potatoes (*Batatas edulis*), 85,309; peas and beans, 3123 bushels; beeswax, 800 pounds; honey, 33,151 pounds; domestic wine, 1552 gallons; cloverseed, 2228 bushels; flaxseed, 356 bushels; grass-seed, 60 bushels. Of some of these items we have later statistics in the careful estimates of the agricultural department; these gave for the crop of 1871 (two years later than that of the census), Indian corn, 3,575,000, an average of 22 bushels to the acre, and worth $2,145,000; wheat, 688,000 bushels, 11.5 bushels to the acre, and valued at $1,045,760; rye, 10,100 bushels, an average of but 5 bushels to the acre, worth $7575; oats, 398,000 bushels, an average yield of 20 bushels to the acre, worth $163,180; barley, 1700 bushels, 17 bushels to the acre, worth $1360; buckwheat, 1100 bushels, 12.5 bushels to the acre, worth $847; potatoes (common), 238,000 bushels, 120 bushels to the acre, worth $119,000; hay, 33,000 tons, 1.25 tons to the acre, worth $577,500. The estimated amount of live-stock in the State in Feb., 1872, was—horses, 20,000, valued at $1,516,400; mules, 4000, valued at $455,960; oxen and other cattle, 33,400, valued at $606,544; milch cows, 26,000, valued at $832,000; sheep, 25,300, valued at $101,200; hogs, 46,000, valued at $230,000. The peach crop of Delaware ranges from 3,300,000 to 3,800,000 baskets, or even more in favorable years, representing a value of $1,300,000 to $3,000,000; while the apples, pears, and small fruits are worth more than as much more. In 1872, 3,472,000 quarts of strawberries were shipped in twenty-five days, yielding nearly $250,000.

Manufacturing and Mining Industry.—According to the census of 1870, there were in the State 800 manufacturing establishments, having for motive-power 164 steam-engines of 4313 horse-power, and 234 water-wheels of 4220 horse-power, employing 9710 hands—viz. 7705 adult males, 1199 adult females, and 806 children; having a capital of $10,839,093; paying wages to the amount of $3,692,195; using raw materials valued at $10,206,397; and producing goods and wares annually worth $16,791,382. That the manufacturing industry of the State is greatly understated in this report (doubtless from the carelessness or incompetency of the census marshals) appears from the fact that a very careful census of the manufacturing establishments of the city of Wilmington alone, taken in Oct., 1872, gives capital invested in that city in manufactures, $12,275,000, and value of manufactured products for the year preceding, $20,125,000, or $3,334,000 more than the product of the whole State in 1870. Wilmington is unquestionably the largest manufacturing town or city in the State, but it does not monopolize more than three-fourths of the manufacturing of the State. The most important manufactures of the State are—the various departments of iron manufacture, which produce annually about $3,000,000; flour and flouring-mill products, about $2,500,000; morocco and other leather, tanned, curried, and enamelled, $2,500,000 ($2,000,000 worth of morocco alone is made in Wilmington); shipbuilding, iron and wood, $1,600,000; machinery, car-wheels, etc., $2,600,000; railroad and horse-railroad cars, $1,900,000; cotton goods, $1,600,000; paper, $1,400,000; powder and chemicals, $1,450,000; carriages and wagons, $1,500,000; tobacco, cigars, and snuff, $1,000,000; woollen goods, $800,000; boots, shoes, and findings, $650,000.

Railroads.—There are now completed in Delaware about 383 miles of railroad, belonging to thirteen different lines, the greater part of them leased to the Philadelphia Wilmington and Baltimore Railway, which by these leases controls most of the travel between New England, New York, and Philadelphia, and Norfolk and other Southern cities. A ship-canal is in progress between Bombay Hook and the Sassafras River, connecting the Chesapeake and Delaware bays.

Finances.—The State debt of Delaware Dec. 15, 1872, was $1,325,000. She had investments in dividend-paying stocks to the amount of $471,800, besides her school fund, which amounted to $452,410. The receipts of the State treasurer for the year ending Dec. 15, 1872, were $204,708.17, and the expenditures for the same time, $186,311.61. In Jan., 1873, the State had to her credit $171,286.88. In 1870 the assessed valuation of real and personal estate was

$64,787,223; the estimated true value was $97,180,833. In 1872 the valuation of the city of Wilmington alone was $43,000,000. The total taxation, State, county, and city, in 1870 was $418,092.

Commerce.—Until within the past two or three years the commerce of the State has been conducted almost entirely through Philadelphia and Baltimore, but recently Wilmington has begun to develop a commercial spirit, and now has a line of steamers plying to New York and numerous coasting-vessels running to various ports. The extensive interest in shipbuilding, especially of iron ships, of that city, has tended to increase her commercial activity. The commerce of the State consists mainly in the shipping to other States and cities of its agricultural and manufacturing products, and bringing in, in return, the raw materials and goods necessary for its own consumption. Its amount cannot be definitely ascertained.

Banks.—The State had in June, 1873, 11 national banks, with an aggregate capital of $1,528,185; 5 State banks, with an aggregate capital of $780,000; no savings banks, and two private banking-houses.

Insurance Companies.—There were on the 1st of July, 1873, 4 fire insurance companies, 3 of them at Wilmington and 1 at Dover, 1 a joint-stock company, with $100,000 capital, and 3 mutual companies, the whole reporting assets of $1,696,000. There is one mutual life insurance company at Wilmington, organized in 1867, with a capital of $100,000, and assets in April, 1873, of $153,431.

Population.—At the time of the Revolutionary war Delaware had probably not much more than 30,000 inhabitants. Her progress since the first decennial census is seen in the following table:

Census.	Whites.	Free Col'd	Slaves.	Males.	Females.	Total.	Density
1790	46,310	3,899	8,887	30,314	28,772	59,094	27.87
1800	49,852	8,268	6,153	32,243	32,070	64,273	30.31
1810	55,361	13,136	4,177	36,662	36,012	72,674	34.23
1820	55,282	12,958	4,509	36,939	35,810	72,749	34.31
1830	57,601	15,855	3,292	38,533	38,215	76,748	36.20
1840	58,561	16,919	2,605	39,256	38,829	78,085	36.83
1850	71,169	18,073	2,290	45,955	45,577	91,532	43.18
1860	90,589	19,829	1,798	56,689	55,527	112,216	52.93
1870	102,221	22,794	.....	62,628	62,387	125,015	58.97

According to the census of 1870, 115,879 of the inhabitants of Delaware were natives of the U. S., and 9136 were foreign born. Of the latter, 5907 were born in Ireland, 1421 in England, 1142 in Germany, 229 in Scotland, 112 in British America, 127 in France, and 208 in other countries. Of foreigners over ten years of age, 2469 could not read or write, and 20,631 natives above ten years of age were equally illiterate. Of these, 11,280 were whites and 9351 colored. Of the whites, 1878 (1035 males and 833 females) were between ten and fifteen years of age, 1370 (718 males and 652 females) were between fifteen and twenty-one years, and 8032 (3466 males and 4566 females) were twenty-one years of age and over. Of the colored illiterates, 1785 (925 males and 860 females) were from ten to fifteen years of age, 2065 (1054 males and 1011 females) were between fifteen and twenty-one years, and 7970 (3765 males and 4205 females) were over twenty-one years old.

Education.—Public school education in Delaware, except in the city of Wilmington, is not in so prosperous a condition as it should be. In 1871 there were 383 school districts and 421 public schools in the State, 19,018 scholars in attendance, and $144,509.08 was received and expended for public school purposes, $94,781.93 of it in New Castle co. All the schools for colored children are supported by voluntary contributions, except that an appropriation of $1000 was made by the Wilmington board of education to the Howard School of that city. In 1870, according to the ninth census, there were 326 public schools, with 388 teachers (107 male and 281 female) and 16,385 pupils (7694 male and 9141 female), and an income of $127,729 for their support, of which $120,429 was derived from taxation and $7300 from tuition and other sources. There were 9 academies, with 48 teachers (25 male and 23 female) and 722 pupils (463 male and 259 female), having a total income of $35,200, derived from tuition and other sources; there were also 14 private (day and boarding) schools, with 24 teachers (4 male and 20 female) and 482 scholars (223 male and 259 female), with a total income of $11,572, derived from tuition and other sources. There are in the State two colleges—Delaware College, at Newark, founded in 1867, a State institution, having 10 instructors and professors and 105 students, 93 of them (45 males and 48 females) in the preparatory department, and 12 (all male) in the collegiate department, and 6000 volumes in its libraries; and the Wesleyan Female College, at Wilmington, founded in 1839 and chartered in 1851, an institution under the direction of the Methodist Episcopal Church, having 12 professors and instructors (5 male and 7 female), 132 students (all female), and 3500 volumes in its libraries.

Libraries.—There were 252 public libraries in the State in 1870, containing 92,275 volumes, and 221 private libraries, containing 91,148 volumes. The State Library at Dover has, it is said, 30,000 volumes; the Wilmington Institute Library, 11,000 volumes, and the library of the Newcastle Library Company, 6254.

Newspapers and Periodicals.—There were, according to the census of 1870, 17 periodicals and newspapers issued in the State, having an aggregate circulation of 20,860, and issuing annually 1,607,840 copies. Of these, 1 was a daily paper, having a circulation of 1600 copies; 3 semi-weekly, with a circulation of 3660; 12 were weekly, having an aggregate circulation of 13,600; 1 was a monthly, with 2000 circulation. Of these, 2 were literary and miscellaneous, with 1500 circulation; 14 were political, with 17,360 circulation; 1 (monthly) religious, with 2000 circulation.

Churches.—In 1870 there were in the State, according to the census, 267 churches of all denominations, with 252 church edifices, 87,899 sittings, and church property valued at $1,823,950. Of these, there were Baptist churches, 8; church edifices, 7; sittings, 2950; church property, $131,000 (according to the "Baptist Year-Book" for 1873, there were in the State in 1872, 9 Baptist churches, 6 ordained ministers, 770 members, 104 Sunday school teachers, and 1206 Sunday school scholars). In 1870 there were 29 Protestant Episcopal parishes, 27 church edifices, 8975 sittings, and $246,850 of church property. (The "Episcopal Almanac" for 1873 gives the number of clergymen as 22, with 1 bishop and 1 episcopal diocese, 1641 communicants, 280 Sunday school teachers, 2412 Sunday school scholars, and $38,186 of benevolent contributions.) In 1870 there were 8 societies of Friends, with 8 meeting-houses, 3425 sittings, and $64,600 of meeting-house property; 1 Lutheran church, 1 church edifice, 300 sittings, and $5000 of church property; 173 Methodist churches, 166 church edifices, 51,924 sittings, and $781,000 of church property; in 1872 there were 53 travelling and 163 local preachers, 157 churches, 11,269 members, 954 probationers, and $141,013 of church property. In 1870 there was 1 New Jerusalem (Swedenborgian) church, 1 church edifice, 300 sittings, and $20,000 of church property. The same year there were 32 Presbyterian churches, 32 church edifices, 13,375 sittings, and $384,500 of church property. There were in 1870, 13 Roman Catholic churches, 8 church edifices, 6000 sittings, and $170,000 of church property; in 1873 the Roman Catholic diocese of Wilmington, comprising the State of Delaware and the Eastern Shores of Maryland and Virginia, had 1 bishop and 1 vicar-general, and in Delaware 11 churches, 10 clergymen, 4 parochial schools, with 1210 pupils, and 3 institutions. The adherent Catholic population is estimated (rather loosely) at about 15,000. There was 1 Unitarian church, 1 church edifice, 300 sittings, and $17,000 of church property; one Universalist society, with 1 church edifice, 350 sittings, and $4000 of church property.

Constitution, Courts, etc.—The constitution of Delaware has not been materially changed since 1833. It gives the elective franchise to every free white male citizen of the age of twenty-two years who has resided for one year in the State and the last month thereof in the county, and who has within two years paid a county tax assessed at least six months before the election; but every free white male citizen over twenty-one and under twenty-two years may vote without paying any tax. Idiots, insane persons, paupers, and felons are excluded from voting, and the legislature may impose forfeiture of the right of suffrage as punishment for crime. Under the operation of the fifteenth amendment of the Constitution of the U. S., colored men are allowed to vote, subject to the above restrictions. The governor is elected by the people for a term of four years; he must be thirty years of age and have resided in the State for six years next before the election. The secretary of state is appointed by the governor, and serves for four years. The State treasurer and auditor are elected by the legislature for two years. The attorney-general is appointed by the governor, and holds office for five years. The legislature consists of a senate of nine members (three from each county), chosen for four years, and a house of representatives of twenty-one members (seven from each county), chosen for two years. The sessions of the legislature are biennial. As New Castle county now contains double the population of the other counties, this mode of representation is manifestly unjust, and its influence is felt on many of the topics of legislation. The judicial power of the State is vested in a court of errors and appeals, superior court, court of chancery, orphans' court, court of oyer and terminer, court of general sessions of the peace and jail delivery, register's court, and justices of the peace.

These courts are presided over by five judges—viz. the chancellor of the State, who is president of the orphans' court of the respective counties, and who sits in that court with the associate judge of the county; the chief-justice and three associate judges, one for each county, who, sitting together, form the court of errors and appeals; and the chief-justice and two of his associates constitute the superior court and court of general sessions. The court of oyer and terminer, like the court of errors, comprises the whole bench, except the chancellor. Judges are appointed by the governor, and hold office during good behavior. Probate courts are held by registers of wills, with appeal to the superior court. The chancellor holds a court of chancery in each county of the State. The sheriff of each county is elected by the people every two years. The clerks of the courts and registers of wills are appointed by the governor for the term of five years. In some of her penal enactments Delaware is rather antiquated. She has maintained public whipping at the whipping-post as a punishment for larceny and other minor offences up to the present time (Oct., 1873). These offenders receive from twenty-five to sixty lashes on the bare back, and are also exposed in the pillory for an hour or more. The State is entitled to two Senators and one Representative in Congress.

Counties.—There are three counties in the State. Their population at each census was as follows:

Counties.	1790.	1800.	1810.	1820.	1830.	1840.	1850.	1860.	1870.	Remarks.
Kent	18,920	19,554	20,495	20,793	19,913	19,872	22,816	27,804	29,804	Central county.
New Castle	19,686	25,361	24,429	27,899	29,720	33,120	42,780	54,797	63,515	Northern county.
Sussex	20,488	19,358	27,750	24,057	27,115	25,093	25,936	29,615	31,696	Southern county.

Principal Towns.—Wilmington, situated on Christiana and Brandywine creeks, is the most populous and important city in the State. It is largely engaged in manufacturing. Its population in 1870 was 30,841, and is now (Oct., 1873) estimated at 37,000. Dover, the capital of the State and of Kent co., has a population of 1906 in the town, and of 6394 in the hundred or township in which it is situated. The other towns of 2000 inhabitants or more are New Castle and Smyrna. North Milford, Seaford, Lewes, Laurel, Delaware City, South Milford, and Georgetown are also thriving towns. The divisions of the counties, which in most of the States are called townships, are in this State denominated *hundreds*.

History.—Delaware takes its name from the bay and river, which were so called from the lord de la Warr, governor of Virginia, who entered the bay in 1610, though both bay and river had been explored by Hendrick Hudson in 1609. The first attempt at settlement was made by the Dutch, under De Vries, with thirty colonists, in 1630, in the vicinity of Lewes, Sussex co., but this colony was destroyed by the Indians in 1633. In 1637 a colony of Swedes and Finns, sent out by the Swedish West India Company, purchased the land from Cape Henlopen to Trenton Falls, erected a fort at the mouth of Christiana Creek, and called the country New Sweden. Soon after, they erected another fort on Tinicum Island, a few miles below Philadelphia. The Dutch colony at New Amsterdam (now New York) protested against this invasion of their territory, and built Fort Cassimir, now New Castle, 5 miles S. of Fort Christiana. In 1654 the Swedes captured this fort, but in 1655 the Dutch attacked and captured all the Swedish forts, and sent back to Europe those colonists who would not swear allegiance to Holland. In 1664, when New Netherlands was conquered by the English, the duke of York claimed these settlements on the Delaware as belonging to him. Lord Baltimore also claimed them as being within his grant, but without avail. In 1682, William Penn bought from the duke of York his claims, and, after some litigation with Lord Baltimore, established his right to the territory in 1685. The present State was called in the colonial records of Pennsylvania, "the territories, or the three lower counties on the Delaware." For twenty years they were considered a part of the colony of Pennsylvania, and sent eighteen delegates, six from each county, to the colonial assembly. In 1703 they obtained liberty to secede and establish a distinct legislature for themselves, but until the Revolution they were under the same governor as Pennsylvania, and the proprietary, on the ground of purchase, claimed all his rights. The colony suffered less from wars with Indians or foreign powers than most of the other colonies. In the French war, which terminated in 1763, she furnished her full quota of troops, who distinguished themselves for bravery and zeal; and in the Revolutionary war "the Blue Hen's chickens," as the Delaware soldiers were called from their flag, were second to none in efficiency. In 1776 the people of Delaware proclaimed themselves free and independent, and formed a constitution, Sept. 20, 1776. They came heartily into the old Confederation, and ratified the Constitution of the U. S. Dec. 7, 1787. In 1792 a second State constitution was adopted, which, with some amendments, is still the organic law of the State. The subsequent career of the State has been for the most part quiet, but prosperous. It has lacked in enterprise, in the advancement of education, and in the development of its resources, but up to the commencement of the late civil war the State had had no debt and had levied no general tax on its landed property. At the beginning of the civil war, though a majority of its citizens were in favor of maintaining the Union and sustaining the U. S. government, a large minority sympathized with the Southern Confederacy, as was to be expected, the State having been in all its past history a slaveholding State. Still, it contributed seven regiments of infantry, a battalion of cavalry, and two or three batteries of artillery, in all about 10,000 men, to the war. Yet its general position was for years one of steady but passive hostility to the general government and to the amendments to the Constitution of the U. S., which drew upon it in two or three instances the interference of the government, but never led to any active resistance. The governor and legislature protested against negro suffrage, and obstructed it as far as possible, but finally submitted to it as inevitable. Of late, wiser counsels seem to prevail, and there is reason to believe that the gallant little State will become distinguished, as of old, for her patriotism, loyalty, and fidelity to truth and right, and place herself in the front rank in education, enterprise, and social and moral progress.

Governors of the State.—In the period between the Declaration of Independence in 1776 and the adoption of the Constitution of the U. S. at the close of 1787, Delaware had for its chief magistrates, under the title of president, at least two distinguished citizens of Pennsylvania, who were chief magistrates also of that colony—viz. John Dickinson and Thomas McKean—thus maintaining, in effect, the previous custom of having the two colonies ruled by the same governor; but in 1789 the first of the governors of the State of Delaware was inaugurated, and the succession from that time has been as follows:

Joshua Clayton	1789–96	George Poindexter	1827–30
Gunning Bedford	1796–97	David Hazzard	1830–33
Daniel Rogers	1797–98	Caleb P. Bennett	1833–37
Richard Bassett	1798–1801	Cornelius P. Comegys	1837–40
James Sykes (acting)	1801–02	William B. Cooper	1840–44
David Hall	1802–05	Thomas Stockton	1844–46
Nathaniel Mitchell	1805–08	Joseph Maul (acting)	1846–46
George Truett	1808–11	William Temple	1846–46
Joseph Haslett	1811–14	William Thorp	1846–51
Daniel Rodney	1814–17	William H. Ross	1851–55
John Clarke	1817–20	Peter F. Causey	1855–59
Jacob Stout (acting)	1820–21	William Burton	1859–63
John Collins	1821–22	William Cannon	1863–65
Caleb Rodney (acting)	1822–23	Gove Saulsbury	1865–69
Joseph Haslett	1823–24	James Ponder	1869–71
Samuel Paynter	1824–27	James Ponder	1871–

Electoral and Popular Vote at Presidential Elections: 1. *Electoral Vote for President and Vice-President.*

Election.	Year.	Candidates Voted for.	No. of votes.
1st	1788	George Washington, scattering	3
2d	1792	George Washington and John Adams	3
3d	1796	John Adams and Thomas Pinckney	3
4th	1800	John Adams and Charles C. Pinckney	3
5th	1804	Charles C. Pinckney and Rufus King	3

L. P. Brockett.

Delaware, a county in the E. of Indiana. Area, 400 square miles. It is intersected by the White and Mississinewa rivers. The surface is nearly level; the soil is mostly fertile. Cattle, dairy products, wool, and grain are raised. Flour is the chief article of manufacture. It is traversed by the Fort Wayne Muncie and Cincinnati R. R. and another railroad called the Bee Line. Capital, Muncie. Pop. 19,030.

Delaware, a county in the E. N. E. of Iowa. Area, 576 square miles. It is intersected by the Makoqueta River. The surface is uneven; the soil productive. Cattle, dairy products, grain, hay, and wool are staples. The most numerous manufactories are of wagons, etc. The railroad which connects Dubuque with Sioux City passes through it. Capital, Delhi. Pop. 17,432.

Delaware, a county in the S. S. E. of New York. Area, 1580 square miles. It is bounded on the N. W. by the East Branch of the Susquehanna, and on the S. W. by the Delaware. It is drained by the Coquago and Popacton. The surface is hilly; the soil of the valleys is fertile. Cattle, grain, wool, hay, and potatoes are largely raised, but dairying is the principal industry. There are manufactures of lumber, leather, furniture, cooperage, harness, metallic wares, etc., but, though the water-power is very great, manufactures are not yet extensive. It is intersected by the New York and Oswego Midland R. R., and the Erie R. R. passes along the south-western border. Capital, Delhi. Pop. 42,972.

Delaware, a county in Central Ohio. Area, 478 square miles. It is intersected by the Scioto and Olentangy rivers. The surface is nearly level; the soil is fertile. Cattle, grain, wool, hay, potatoes, and dairy products are the staples. Among the manufactures are carriages, brick, and saddlery. It is traversed by the Cleveland Columbus and Cincinnati R. R. Capital, Delaware. Pop. 25,175.

Delaware, a county which forms the S. E. extremity of Pennsylvania. Area, 180 square miles. It is bounded on the S. E. by the Delaware River and on the W. by Brandywine Creek. The surface is mostly undulating or hilly; the soil is fertile, and is adapted to pasture. Many dairies are kept here, and grain, potatoes, and hay are raised. There are manufactures of flour, lumber, carriages, cotton and woollen goods, and many other articles. It is intersected by the Pennsylvania R. R., and by several railroads connecting Philadelphia with Baltimore and West Chester. Capital, Media. Pop. 39,403.

Delaware, a post-township of Yell co., Ark. P. 550.

Delaware, a township of Delaware co., Ind. P. 1210.

Delaware, a township of Hamilton co., Ind. P. 1434.

Delaware, a township and post-village of Ripley co., Ind., on the Ohio and Mississippi R. R., 47 miles W. of Cincinnati. Pop. 1559.

Delaware, a township and post-village of Delaware co., Ia., on the Davenport and St. Paul and the Dubuque and Sioux City R. Rs., 41 miles W. of Dubuque. P. 2727.

Delaware, a township of Polk co., Ia. Pop. 865, exclusive of the city of Des Moines.

Delaware, a twp. of Leavenworth co., Kan. Pop. 1641.

Delaware, a township of Wyandotte co., Kan. P. 926.

Delaware, a township of Sanilac co., Mich. P. 741.

Delaware, a township of Shannon co., Mo. P. 198.

Delaware, a township of Otoe co., Neb. Pop. 597.

Delaware, a township of Camden co., N. J. P. 1625.

Delaware, a township of Hunterdon co., N. J. P. 2959.

Delaware, a township of Sullivan co., N. Y. P. 1998.

Delaware, a township of Defiance co., O. Pop. 1160.

Delaware, a city, capital of Delaware co., O., on the Olentangy River and the Cleveland Columbus and Cincinnati R. R., 24 miles N. of Columbus. It is the seat of Ohio Wesleyan University and Ohio Wesleyan Female College. It has thirteen churches, good schools, three banks, a semi-monthly and three weekly newspapers, large railroad repair-shops, two foundries, two flouring and one oil mill, a woollen-factory, and manufactures of bagging, chairs, iron fences, carriages, lumber, beer, and other goods. It is handsomely situated and well built. There are valuable medicinal springs in Delaware and vicinity. Pop. 5641; of Delaware township, 6861. A. Thomson, Ed. "Gazette."

Delaware, a township of Hancock co., O. Pop. 1280.

Delaware, a township of Juniata co., Pa. Pop. 1079.

Delaware, a township of Mercer co., Pa. Pop. 1703.

Delaware, a twp. of Northumberland co., Pa. P. 1879.

Delaware, a post-township of Pike co., Pa. P. 758.

Delaware, or more correctly, **Delawarr** (Thomas **West**), Lord, the twelfth baron of that title, the second governor and first captain-general of Virginia, was a descendant by the female line of an old and noble family, which derived its name, according to some authorities, from an estate called La Warre (or Warwick) in Gloucestershire, England. He took his title in 1602. He was named captain-general of Virginia (which comprehended nearly all the present eastern coast of the U. S.) in a charter dated May 23, 1609. He visited the colony in 1610, and returned in the following year to England. He expended large sums of money in establishing the colony of Virginia. He died at sea, "not without suspicion of poison," June 7, 1618, while on his second voyage to America. He appears to have been a noble and philanthropic man.

Delaware Bay, a wide estuary between the mouth of the Delaware River and the Atlantic Ocean, separates the State of Delaware from the southern part of New Jersey. The entrance between Capes May and Henlopen is 13 miles wide; the greatest breadth of the bay is about 25 miles. A safe and capacious harbor has been formed in this bay by the construction of a Breakwater (which see, by Gen. J. G. Barnard, U. S. Army) near Lewes. This structure is in lat. 38° 59′ 07″ N., lon. 75° 6′ 9″ W. The western part of the bay is generally shallow, but it has a deep though not very direct channel for shipping.

Delaware City, a post-borough of New Castle co., Del., on the Delaware River, about 40 miles below Philadelphia. It is the eastern terminus of the Chesapeake and Delaware Canal. It has five churches and one national bank. Pop. 1059.

Del'aware In'dians, a tribe belonging to the Algonquin family, called in their own language Lenni-Lenape, lived originally on the banks of the Delaware and Schuylkill, but are now mostly found in the Indian Territory, in the valley of the Verdigris. They were, according to tradition, a bold and powerful race, but were overcome by the Iroquois, who compelled them in 1744 to leave their original settlement. Some of them removed to Ohio about 1780. They were friendly towards the U. S., and formed several treaties with them. They next crossed the Mississippi and settled in Kansas, where their number in 1869 was 1005. They were in 1870 for the most part removed to their new lands in the Indian Territory, and in part incorporated with the Cherokees. They have a few schools, and carry on farming and cattle-raising to some extent, but their chief occupation is hunting and fishing. They are generally good trappers, brave, and comparatively intelligent.

Delaware Water Gap, a summer resort of Monroe co., Pa., on the Delaware River where it passes through the Kittatinny Mountain, and on the Delaware Lackawanna and Western R. R., 108 miles N. of Philadelphia and 92 miles W. of New York. The river here flows through a narrow gorge between steep rocky banks, which rise nearly 1200 feet above the water.

De la Warr, Earls, and Viscounts Cantalupe (Great Britain, 1761), Barons de la Warr (1209), Barons West (1313), Barons de la Warr (England, 1570, by patent).—Charles Richard Sackville West, sixth earl, major-general, born Nov. 13, 1815, succeeded his father Feb. 23, 1869.

Del Cred'ere [from the It. *credere*, to "trust" or "credit"] **Commis'sion,** in mercantile law, signifies an additional premium charged by a factor or commission-merchant on the price of goods consigned to him when he guarantees the solvency of the purchaser who buys them on credit. Thus, if the percentage for effecting the sale is 2½, he might charge 2½ per cent. more for the guarantee.

De'le [imperative sing. of the Lat. *deleo*, to "blot out," to "destroy"], in printing, a direction inscribed on the margin of an article to remove something which has been put in type; it is usually thus expressed, ⅁.

Dele'gate [from the Lat. *de*, "away," and *lego, legatum*, to "send as an ambassador"], a person appointed and sent with powers to transact business for the party who sends him; a representative, a deputy. This term is applied in the U. S. to the members of political and constitutional conventions chosen by the people. The representatives sent to the first Continental Congress in 1774 were called *delegates*. Members of Congress from the Territories are still called delegates.

Delegates, Court of, formerly the highest ecclesiastical court of appeal in England. Its members were appointed by the king's commission to represent his royal person and to hear all appeals to him, by virtue of the statute 25 Henry VIII., c. 9. Appointments to this commission were made from the lords spiritual and temporal, and from the judges and doctors of civil law. This court was abolished by 2 and 3 Will. IV., c. 92, and its jurisdiction was transferred to the privy council.

Delega'tion [Lat. *delegatio*], the appointment of a delegate; also a number of delegates or persons deputed to act for a party or represent a constituency. In civil law, delegation is the act by which the debtor, with the assent of the creditor, substitutes another debtor in his place, and becomes himself discharged from the debt. There is necessary to the validity of such an act the concurrence of three parties—that of the original debtor, that of the substituted debtor, as well as that of the creditor who consents to the discharge and substitution. The substitute may himself owe the original debtor, but this is not an essential element in the case. The case sometimes assumes a more complicated form, and the substituted debtor is made liable to pay a fourth person pointed out by the creditor, instead of himself. (For a more full discussion of the whole subject, see Novation; also consult Domat on "Civil Law," title *Delegation*.)

Delegation [It. *delegazione*], the name of former provinces or divisions of Lombardy, Venetia, and the Papal States. An officer called a delegate presided over the government of each delegation. In the Papal States the delegate was always a prelate. If he was a cardinal, he was called a legate, and his province was a legation.

Delegation, in the Austro-Hungarian monarchy, the name of the deputies who are chosen by the Cisleithan and Transleithan parliaments for taking action on those questions which are counted among the common affairs of the empire. (See Austro-Hungarian Monarchy, by Prof. A. J. Schem.)

Delescluze (Louis Charles), a French politician, born Oct. 2, 1809, took part in 1830 in the republican movement, was, after the revolution of 1848, for a short time commissioner-general in the departments Du Nord and Pas de Calais, published then several ultra-radical papers in Paris, was in 1857 deported to Cayenne. During the reign of the Commune, of which he was the leading spirit, he was at the head of the war commission with almost unlimited powers. His fall, on the 28th of May, 1871, on the barricade in the Rue d'Angoulême, ended the resistance of the Commune to the troops of the government. He was accused unjustly of having issued the incendiary orders.

Delfi'co (Melchior), an Italian political economist, born in the Abruzzo Aug. 1, 1744. He became councillor of state at Naples in 1806. Among his works are an "Essay in Favor of Free Trade" and "Thoughts on the Uncertainty and Inutility of History" (1806). Died at Teramo June 21, 1835.

Delft, a town of the Netherlands, province of South Holland, is on the railway from Rotterdam to The Hague, 4 miles S. E. of the latter. It is well built of brick, and clean, and is intersected by a number of canals. It has a richly-adorned town-hall, and a Gothic church containing a magnificent monument to William prince of Orange, who was assassinated here in 1584. Delft was formerly noted for glazed earthenware, which throughout Holland came to have the name of delft-ware. The same kind of pottery, now mostly made in England, is still called *delf*. Here are manufactures of carpets, woollen cloths, soap, etc. Pop. in 1870, 22,909.

Delfts'haven, the port of the above place, is on the river Meuse, 2 miles S. W. of Rotterdam. It has a handsome church. The inhabitants are partly employed in shipbuilding, iron-foundries, and distilleries. Pop. in 1868, 7288.

Delf'zijl, a fortified seaport in the Netherlands, in the province of Groningen, on the Dollart, is the key of Groningen and Friesland. Pop. 5476.

Delga'da, or **Ponta Delgada,** a city of the Azores, is on the S. side of the island of St. Michael, and is the capital of that island and of St. Mary; lat. 37° 45′ N., lon. 25° 40′ W. It has considerable trade in fruit, grain, and orchil. The government is here constructing a breakwater and docks for shipping. Pop. 15,885.

Del'hi, a district of India, includes a small portion of the former province of Delhi. Area, 4057 square miles. The southern part is rocky and barren; the northern and north-western parts are watered by the Jumna, and are more fertile. Delhi is one of the administrative divisions of the North-west Provinces. Capital, Delhi. Pop. 1,328,650.

Delhi [Sanscrit, *Indraprastha*], a celebrated city of Hindostan, called by the Mohammedans **Shahjehanâbâd,** is situated on the Jumna, about 790 miles N. W. of Calcutta; lat. 28° 40′ N., lon. 77° 18′ E. It was formerly the capital of the Mogul empire, and was the largest city of Hindostan, having a population of 2,000,000. An extensive tract, covered with the ruins of palaces, pavilions, baths, and mausoleums, marks the dimensions of the ancient metropolis of the Mogul empire. The modern city, which was founded by Shah Jehan in 1631, has a circumference of seven miles, and is surrounded by walls of red sandstone thirty feet high. It has seven colossal arched gates, defended by round bulwarks. The streets are mostly narrow, but one of the main avenues is 120 feet wide. The palace of the Great Mogul, built by Shah Jehan, is the most magnificent in India. Its stupendous towers, surmounted by elegant pavilions, its marble domes and gilded minarets, present a very imposing appearance. Among the other remarkable edifices is the Jamma mosque, a splendid structure in the Byzantine style, built of white marble and red sandstone. Delhi has about forty mosques, many of which have lofty minarets and gilded domes. Here is Delhi College, which was founded in 1792, and has a separate department for each of these languages—Arabic, English, Persian, and Sanscrit. The goldsmiths of Delhi are famous for the beauty of their work. Many Cashmere shawls are here embroidered with silk and gold. The city, which has been frequently captured by hostile armies, was taken by the British general Lord Lake in 1803, and it has continued under British domination ever since that time. In May, 1857, Delhi was occupied by the mutinous Sepoys, who here murdered a number of English people. A British army commenced the siege of this place in June, and took it by assault, after a severe fight of seven days, in Sept., 1857. Pop. in 1870, 154,417.

Delhi, a township and post-village, capital of Delaware co., Ia., near the Maquoketa River, about 40 miles W. of Dubuque. It is on the Davenport and St. Paul R. R., and has several fine stone-quarries, two flouring-mills, a fine school building, several nurseries, etc. It has one weekly newspaper. Total pop. 1174; of village, 413.

J. B. Swinburne, Ed. "Monitor."

Delhi, a post-village of Richland co., La., on the North Louisiana and Texas R. R., 35 miles W. by N. of Vicksburg. It has one weekly newspaper. Pop. 186.

Delhi, a township and village of Ingham co., Mich., on the Michigan Central R. R., 33 miles N. of Jackson. Pop. 1259.

Delhi, a post-village, capital of Delaware co., N. Y., on the N. bank of the Delaware River (W. branch) and on a branch of the Midland R. R. It has a court-house, jail, county poor-house, an academy, four churches, a woollen mill, two national banks, and three weekly papers. Pop. 1223; of Delhi township, 2920.

Delhi, a post-township of Hamilton co., O. Pop. 2620.

Delille (Jacques), L'Abbé, a French didactic poet, born at Aigueperse, in Auvergne, June 22, 1738. He was educated at a college in Paris, and became professor of humanities at Amiens. His reputation was established by a translation of Virgil's "Georgics" (1769). In 1780 he published "Les Jardins." He translated into French verse Virgil's "Æneid" (1804) and Milton's "Paradise Lost"

(1805). His version of the "Æneid" is considered the best in the language. Among his works is a poem entitled "Imagination" (1806), which is highly commended. Died May 1, 1813. (See CAMPENON, "Éloge de Delille.")

Delir'ium [Lat. from *deliro*, to "be insane," which is said by some to be from *de*, "from," and *lira*, a "ridge," or "furrow;" thus an insane person was likened to one ploughing out of the proper line], a condition in which the ideas of a sick person are in a confused, wild, or wandering state. It differs from insanity in being a symptom of acute disease, like fever, while insanity is an evidence of chronic disease.

Delir'ium Tre'mens (*i. e.* "trembling delirium"), a morbid affection caused by the action of alcoholic drinks, and often afflicting hard drinkers after severe accidents or attacks of acute disease. Delirium, trembling and subsultus of the muscles and tendons, wakefulness, and rapid pulse, are characteristic symptoms. The patient sometimes suffers extremely from the most frightful apprehensions, and frequently thinks he sees grotesque and horrible objects. The tongue has a thick furry coat, the skin is generally cool and covered with sweat, and the patient gives forth a characteristic saccharine odor. The blood and fluids of the brain are loaded with alcohol, and often (especially in old patients) there are abundant degenerative changes in the brain, lungs, liver, etc. Death occurs in about one-sixth of the cases. The mortality appears to have been formerly much greater than at present. The treatment is various. Sleep may be induced by the use of chloral or bromide of potassium, and in long-continued cases opiates may be cautiously administered with the happiest results. Patients nearly always call for alcohol in some form, but this desire should not, as a general rule, be gratified. The strength should be kept up by beef-tea, milk, raw eggs, etc.

REVISED BY WILLARD PARKER.

Delisle (GUILLAUME), an eminent French geographer, born in Paris Feb. 28, 1675. He reformed the system of geography, and published in 1700 a map of the world and celestial and terrestrial globes. He wrote several memoirs on geography, and produced maps of ancient and modern countries. Died Jan. 25, 1726.—His brother, JOSEPH NICHOLAS DELISLE (born April 4, 1688), founded a school of astronomy at St. Petersburg, and wrote an account of the Russian search for a passage from the South Sea to the north of America. In Delisle's thermometer, used in Russia, the boiling-point of water is zero, and the freezing-point is 150°. Died Sept. 11, 1768.

De'litzsch, a town of Prussian Saxony, the capital of a circle, is on the river Lober, and on a railway, 15 miles N. of Leipsic. It has three churches, a castle, and manufactures of woollen hosiery and gloves. Pop. 8112.

Delitzsch (FRANZ), a German theologian, was born at Leipsic Feb. 23, 1813, of Jewish parents, and was educated at Leipsic. In 1846 he became professor of theology at Rostock, in 1850 at Erlangen, and in 1867 at Leipsic. He is a master of biblical exegesis and of the immense Jewish literature. He has published numerous devotional and theological works, among which are "The House of God" (1848), "History of Jewish Poetry" (1836), "Biblico-Prophetic Theology" (1845), "Biblical Psychology" (1855), "Christian Apologetics" (1869), "A Day in Capernaum" (1871), and many valuable commentaries.

De'lius (NIKOLAUS), a German scholar, well known as a writer on Shakspeare, was born at Bremen in 1813, and became in 1855 professor of Sanscrit and of the Romance and English literature at Bonn. He has published a critical edition of the works of Shakspeare (2d ed. 1863–64; supplement 1865), the "Mythus of William Shakspeare" (1851), "Shakspeare Lexicon" (1852), "The English Theatre in Shakspeare's Time" (1852), and works on Provençal and Prœcrit literature.

Del'la Crus'ca (*i. e.* "of the bran,"* so called because its chief aim or principal office was the boulting or purifying of the national language), the name of a celebrated academy founded at Florence in 1582 for the purpose of establishing a standard of the Italian tongue. This academy published a dictionary, which became a great authority in relation to classical purity of language. The Della Cruscan Academy was afterwards incorporated with the FLORENTINE ACADEMY (which see).

Del'la Cruscan School, a name derived from the celebrated academy Della Crusca of Florence (see preceding article), and applied to certain affected English writers residing at Florence in 1785. Gifford satirized their absurdities with scathing severity in his "Baviad" and "Mæviad," and "completely killed this school." Among the Della Cruscans were Bertie Greathead, Robert Merry, Mrs. Thrale Piozzi, and William Parsons.

Dellet (JAMES) was born in South Carolina, but settled at Claiborne, Ala. He was returned to the first legislature under the State government in 1819, and to Congress in 1837. He died in 1849.

Dell Prairie, a post-twp. of Adams co., Wis. P. 534.

Dell Rapids, a post-village of Minnehaha co., Dak., on the Big Sioux River. It has one weekly newspaper.

Del'mar, a post-village of Sussex co., Del., on the Maryland line, is the S. terminus of the Delaware R. R. and the N. terminus of the Eastern Shore R. R.

Delmar, a post-village of Bloomfield township, Clinton co., Ia., at the junction of the Davenport and St. Paul, the Iowa Midland, and the Sabula Ackley and Dakota R. Rs. It has one weekly newspaper.

Delmar, a township of Tioga co., Pa. Pop. 18.

Delmar (ALEXANDER), a political economist of Spanish extraction, was born in New York City Aug. 9, 1836. He was editor of the "Social Science Review" (1864–66), organized the U. S. bureau of statistics (1866), and was its director (1867–68). He has published, besides other works, "Gold Money and Paper Money" (1862), "Essays on Political Economy" (1865), the "International Almanac" (1866), "What is Free Trade?" (1868), "Letter on the Finances" (1868), and "The Suppressed Report" (1869).

Del Nor'te, a county which forms the N. W. extremity of California, is bounded on the W. by the Pacific Ocean. Area, 1500 square miles. It is partly drained by the Klamath River. The surface is mountainous, and is diversified by prairies and forests of redwood and spruce. Gold and copper are found here. Cattle, wheat, barley, and wool are raised. Capital, Crescent City. Pop. 2022.

Del Norte, a post-village of Saguache co., Col., on the Rio Grande, 144 miles S. of Pueblo.

De Lolme (JOHN LOUIS), a Swiss lawyer, born at Geneva in 1740. He emigrated in his youth to England, where he was reduced to indigence. In 1771 he published "The Constitution of England" (in French), which he translated into English (4th ed. 1784; new ed., with life, 1853). He returned to Switzerland in 1775. Died July 16, 1806.

Delo'na, a post-township of Sauk co., Wis. Pop. 536.

Delorme (PHILIBERT), a French architect, born at Lyons in 1515, studied at Rome. He planned the Tuileries, begun in 1564 for Catharine de Medici, and built the Château de Meudon. He wrote "Nouvelles Inventions pour bien bâtir" and a treatise on architecture. Died in 1577.

De'los [Gr. Δῆλος], also called **Orty'gia,** a small island in the Ægean Sea, belonging to the group of Cyclades, was celebrated in ancient times as the birthplace of Apollo and Diana. According to tradition, it was originally a floating island, and was rendered immovable by Jupiter, in order that it might be a place of refuge for Latona. It was the site of a famous temple and oracle of Apollo, and was the centre of a great periodical festival in honor of him. In 426 B. C., Delos was purified by the Athenians, who removed all the tombs, and enacted a law to prevent it from being polluted by births or deaths. It was reputed one of the holiest places in Hellas. On the formation of the confederacy in 477 B. C. for the purpose of resisting the Persian invaders, Delos was chosen as the common treasury of the Greek allies. After the fall of Corinth (146 B. C.), Delos, which had a good harbor, was the centre of an extensive commerce. Here was a town of the same name, which is now a mass of ruins. Shiploads of columns and other remains have been carried away to Venice and Constantinople. The island has an area of 32 square miles, and is at present not inhabited.

Del'phi [Gr. Δελφοί], an ancient town of Phocis, and one of the most celebrated places in the Hellenic world, on account of its oracle of Apollo. It was situated at the southern base of Mount Parnassus, in the narrow vale of the Pleistus, amidst sublime and beautiful scenery. It occupied the central area of a great natural theatre or semicircular recess, partly enclosed by stupendous rocky barriers. The original or proper name of the oracle was *Pytho*. The name Delphi does not occur in the poems of Homer, who mentions that Agamemnon consulted the oracle at Pytho. The Pythian games were celebrated here every four years, the first celebration occurring in 586 B. C. Delphi became an opulent city and independent state, deriving its riches and importance from its oracle, which was the most famous of all the oracles. In the eighth century B. C. its reputation extended not only throughout Hellas, but also among foreign nations. Crœsus, king of Lydia,

* Hallam calls attention to the fact that the Italian academies of that period were remarkable for "names humorously quaint." One (that of Viterbo) was called the academy of "the Obstinates," another (that of Sienna), of "the Blockheads."

gave rich presents to the Pythian Apollo. The oracles were uttered by a female called Pythia, who sat on a tripod placed over the mouth of a cavern. She is said to have breathed an intoxicating exhalation of vapor which issued from this cavern or chasm, and was supposed to inspire her with the gift of prophecy. The fountain of Castalia, issuing near the base of Parnassus, supplied holy water for the temple of Apollo, which was one of the largest and most beautiful in Greece, and had a front of Parian marble. In 480 B. C., Xerxes sent a detachment of his army to plunder this temple, which contained a large amount of treasure. As the Persians were climbing up the rugged path to the shrine, on a sudden thunder was heard to roll, the war-shout sounded from the temple of Athena, and two huge crags rolled down the mountain, crushing many to death. The surviving Persians were seized with a panic, and retreated without having effected their object. In 357 B. C. the Phocians seized the temple, and thus provoked the Sacred war, during which a portion of the treasures was expended in paying the troops of Phocis. Delphi was attacked in 279 B. C. by Brennus and an army of Gauls, who, it is said, were repulsed by the same supernatural agency as the Persians. The Delphic oracle was finally silenced by the emperor Theodosius. The site of Delphi is occupied by the modern town of Castri or Kastri. Pop. about 600.

Delphi, the capital of Carroll co., Ind., on the Wabash River and the Toledo Wabash and Western R. R. and the Indianapolis Delphi and Chicago R. R. It has six churches, a fine court-house, two weekly newspapers, two paper-mills, two planing-mills, excellent water-power, and one national bank. The Wabash and Erie Canal passes through it. Pop. 1614.

H. C. Craft, Ed. "Journal."

Del'phin Classics, an edition of the principal Roman classics prepared by thirty-nine of the best scholars of the time for the use of the dauphin of France (*in usum delphini*). Their work was superintended by Bossuet and Huet, preceptors to the dauphin, who was a son of Louis XIV.

Delphin'ium [so called from the resemblance of the nectary to the form of the dolphin], the name of a genus of poisonous herbs of the natural order Ranunculaceæ, commonly called larkspurs. The seeds of *Delphinium Staphisagria* and *Delphinium consolida* have powerful cathartic properties, and the alkaloid (*delphinia*) is recommended for paralysis and rheumatism. Both the annual and perennial kinds are favorite garden flowers; the double rocket larkspurs are especially rich and varied in color, and resemble hyacinths in their regular clusters. The genus *Delphinium* is closely allied to the aconites. Several species are natives of Europe, the U. S., and Mexico.

Delphi'nus [the Lat. term for dolphin], the name of one of the constellations of the northern hemisphere.

Delphi'nus, in zoology, a term limited to the species of Cetacea, having teeth simple and almost all conical in both jaws. They live in communities, and are the most carnivorous of the whole order. The Linnæan genus *Delphinus* is subdivided into *Delphinus* proper, *Phocæna*, the common porpoise, *Delphinapterus*, represented by the Beluga, and *Hyperoodon*, of which the bottle-nosed dolphin is the type. (See Dolphin.)

Del'phos, a post-village of Allen and Van Wert cos., O., on the Miami Extension Canal and on the Pittsburg Fort Wayne and Chicago R. R., 45 miles E. of Fort Wayne. It has a national and a savings bank, one newspaper, two building and loan associations, and good water-power, while fifteen smokestacks attest its industrial importance. Pop. 1667. D. H. Tolan, Ed. "Herald."

Del'ta [so named from their resemblance in form to the fourth letter (Δ) of the Greek alphabet], the triangular expanses of alluvial deposit formed at the mouths of certain rivers. They commence at the point where waters laden with mud first meet the sea, and from the constant mud-deposits gradually widen, until some, like the deltas of the Mississippi and the Nile, advance many miles beyond the coast-line. Deltas occur not only in the sea where fresh water meets the salt and is checked by the tides, but also in lakes, the accumulation projecting in the form of a tongue beyond the point at which the river enters the lake. The delta of the Ganges is the largest in the world. It is estimated that its head commences 220 miles from the sea, and its base-line measures about 200 miles.

Del'ta, a county of Michigan, in the S. part of the Upper Peninsula, is bounded on the S. by Lake Michigan. Area, 1100 square miles. The largest crop is of oats. It is intersected by the Escanawba and other small rivers, also by the Peninsular R. R. Capital, Escanawba. Pop. 2542.

Delta, a county in the N. E. of Texas, organized since the census of 1870. Area, about 350 square miles. It is very fertile and well timbered, and is a good region for grain, cotton, and stock-raising. Capital, Cooper.

Delta, a township of Clay co., Ala. Pop. 924.

Delta, a post-village, capital of Madison parish, La., on the Mississippi opposite Vicksburg, Miss., with which it is connected by ferry. It is the E. terminus of the North Louisiana and Texas R. R. It has one weekly newspaper.

Ed. "Madison Journal."

Delta, a township and post-village of Eaton co., Mich. Pop. 1154.

Delta, a post-village of Lee and Western townships, Oneida co., N. Y., has a tannery and a foundry. P. 270.

Delta, a post-village of Fulton co., O., on the Lake Shore and Michigan Southern R. R., 25 miles W. by S. from Toledo. It has one newspaper-office. Pop. 753.

Del'ton, a township of Delta co., Mich. Pop. 833.

Deluc (Jean André), F. R. S., a Swiss geologist and natural philosopher, born at Geneva Feb. 8, 1727. He invented a portable barometer, and published in 1772 "Researches on the Modifications of the Atmosphere." Soon after that date he removed to England, was chosen a fellow of the Royal Society, and became reader to the queen. He published in 1778 "Letters, Physical and Moral, on the History of the Earth and Man," in which he defended the cosmogony of the Bible, and ascribed the formation of the present continents to a great and violent revolution which occurred about 4500 years ago. He wrote several other works in French. He became a professor in Göttingen in 1798, but subsequently returned to England, and died at Windsor Nov. 8, 1817.

Del'uge [Lat. *diluvium*, from *di* (for *dis*), "apart," and *luo*, to "wash"], an inundation or overflow of land by water, a term especially applied to the flood in the time of Noah, an account of which is given in Genesis vi., vii., and viii. It is often estimated to have occurred B. C. 2516, but its date may have been much earlier. Traditions of the Flood occur in many countries. Among the more important of these is the Chaldæan account preserved in a fragment of Berosus, and somewhat resembling that given in the Bible. Mr. George Smith has published (1872), from the cuneiform inscriptions, a very remarkable account of the Flood, corresponding in many particulars with those of Moses and Berosus. Bunsen states that no trace of Noah's deluge is found in the Chinese traditions, but missionaries, both Protestant and Roman Catholic, assert that the Chinese have a story remarkably like that contained in the Bible. The Mahâbhârata of the Hindoos contains still another tradition of the same event. The ancient Mexicans and many other tribes of American Indians have similar accounts. The same is true of the ancient Phœnicians, Greeks, and many other nations, ancient and modern. The Egyptian monuments appear to have no account of a general flood.

It is now generally held by Christian scholars that the flood recorded in the Bible was local, and not universal. The language of the original account does not necessarily imply more than this.

Delusion. See Insanity, by W. A. Hammond, M. D.

Del'vino, a fortified town of European Turkey, in Albania, is situated on a hillside covered with olive and orange groves, 47 miles W. N. W. of Yánina. It has a trade in olive oil. Pop. about 10,000.

Dema'des [Gr. Δημάδης], an Athenian orator and demagogue, who was a violent opponent of Demosthenes. He was witty, eloquent, and profligate, and acquired great political influence. He fought against Philip of Macedon at Chærones, 338 B. C., but afterwards took a bribe from that king, and favored the interest of Philip and his son Alexander. He was put to death by order of Antipater (or Cassander) in 318 B. C.

Demand and Supply. See Political Economy.

Demarca'tion, or **Demarkation,** a line or boundary by which one object is separated or marked off from another; a limit ascertained and marked, or the act of ascertaining and marking a limit; the "dead line" between two armies. The "line of demarcation" is a name given especially to an imaginary N. and S. line drawn by Pope Alexander VI., 360 miles W. of the Azores, all newly-discovered lands to the eastward being granted by him to Portugal, and all westward to Spain (1494).

Demavend', a volcanic mountain of Persia, about 45 miles N. E. of Teherân, is the highest peak of the Elburs chain, which separates the low shores of the Caspian Sea from the high table-land of Persia. It has a conical form and a crater-shaped summit, which is covered with a large

deposit of sulphur. Its height is about 21,000 feet, as recently determined by the Russian survey. An Englishman (William T. Thompson) ascended to the top of Demavend in 1837. As it is a conspicuous object from the great trade-route between India and Western Asia, it is connected with the early Persian legends as Etna with those of the Greeks. It is classed among extinct volcanoes.

Dem'bea, or **Tzana,** a lake of Abyssinia, in lat. 12° N. and lon. 37° 15′ E., is 40 miles long, and has an average width of 25 miles. It occupies part of a fertile plain, and is 6108 feet above the level of the sea. A branch of the Blue Nile issues from this lake.

Dembin'ski (Henry), a Polish general, born in the palatinate of Cracow Jan. 16, 1791. He fought against Russia in the revolution of 1830, and made a masterly retreat from Lithuania in July, 1831. He afterwards passed many years in exile, and was appointed commander-in-chief of the Hungarian army by Kossuth in Feb., 1849. His success was hindered by the enmity of Görgei, who refused to serve under him. Dembinski soon resigned the command, and fled to Turkey. Died June 13, 1864.

Dement, a township of Ogle co., Ill. Pop. 1120.

Demen'tia [from the Lat. *de,* priv., and *mens,* "mind"], a form of insanity characterized by gradual extinction of all the mental powers. It is one of the most hopeless forms of mental disease.

Demera'ra, a small river of South America, in British Guiana, flows northward, and enters the Atlantic Ocean near lat. 6° 50′ N. and lon. 58° 20′ W.

Demerara is also the name of a county in British Guiana, intersected by the above river. Its inhabitants are Europeans, Indians, Hindoo and Chinese coolies, and negroes. Capital, Georgetown. Pop. about 80,000.

Demesne, de-mēn′, or **Demain,** in law, originally that portion of the lands belonging to a lord which was held in his own occupation or reserved for his immediate use. Hence it is sometimes used to denote those parts of a manor which the lord has in his own hands. In the present day it may be defined as the right which the owner in possession of lands in fee simple has in his estate.

Demeter. See Ceres.

Deme'trias [Gr. Δημητριάς], a city of Thessaly, at the head of the Pagasæan Gulf, founded about 290 B. C. by Demetrius Poliorcetes, became a favorite residence of the Macedonian kings. Its remains are still visible.

Deme'trius, an architect who is said to have completed, in conjunction with Pæonius the Ephesian, the temple of Diana at Ephesus. His period and country are not certainly known. Henry Drisler.

Deme'trius, probably of Alopece in Attica, a statuary who flourished, according to Sillig in his "Dictionary of Artists," about B. C. 440. He imitated nature so closely in his works that he reproduced imperfections as well as beauties, for which he is censured by Quintilian. Among his productions are a statue of Lysimache, priestess of Minerva, one of Minerva *Musica,* so called from the serpents of the Gorgon on it emitting a musical sound when struck, and an equestrian statue of Simon, the first writer on horsemanship. Henry Drisler.

Deme'trius, a silversmith of Ephesus, who made silver shrines for Diana. When Saint Paul was in Ephesus, gaining many, both Jews and Greeks, to the true faith, this man excited a tumult against him among his fellow-craftsmen. Henry Drisler.

Deme'trius [Russian, *Dmitrĭ*], czar of Russia, usually called the False Demetrius. He pretended to be a son of Ivan IV., who at his death in 1584 left two sons, Feodor and Demetrius. The latter probably died in 1591. The subject of this article raised an army of Poles in 1603, invaded Russia, and defeated Boris in battle. He began to reign in Moscow in 1605, but his partiality to the Poles offended the Russians, who revolted and killed him May 28, 1606. He was succeeded by Basil III., or Shuisky.

Deme'trius Phale'reus, an eminent Grecian orator and philosopher, born at Phalerum in Attica about 345 B. C. He was a disciple of Theophrastus the philosopher. He was appointed governor of Athens by Cassander in 317 B. C., and held that office ten years. His administration was so prosperous and popular that the Athenians erected to him, it is said, 360 statues. He escaped to Egypt when Athens was taken by Demetrius Poliorcetes in the year 306. He was the author of many historical and philosophical works, which, with the exception of fragments, are not extant. Died in Egypt about 284 B. C.

Demetrius Poliorce'tes [Gr. Δημήτριος Πολιορκητής (*i. e.* "Demetrius the besieger of cities")], a king of Macedon, born about 335 B. C., was a son of Antigonus, king of Asia. He was surnamed Poliorcetes, "besieger of cities," on account of his success as a general. He fought for his father against Ptolemy of Egypt in Syria. In 306 B. C. he captured Athens from Cassander, and defeated Ptolemy in a naval battle near Cyprus. He gave proof of superior military skill in a long siege of Rhodes, but he failed to take that city. After the death of Antigonus (299 B. C.) he formed an alliance with Seleucus. He usurped the throne of Macedon in 294, but was driven out by Pyrrhus and Lysimachus. Died about 283 B. C. (See Plutarch, "Life of Demetrius.")

Demetrius of Byzan'tium, a Peripatetic philosopher—probably the same, Westermann thinks, with the Demetrius who sought to dissuade Cato from suicide at Utica. Athenæus quotes a work of his by the title "περὶ ποιητῶν," and sometimes by that of "περὶ ποιημάτων," but they are no doubt the same work. Some fragments of this writer have been found in manuscripts discovered at Herculaneum. Henry Drisler.

Demetrius of Su'nium, a distinguished Cynic philosopher, enjoyed a high reputation for correctness of life and firmness of principle. He lived at Rome under the emperors from Caligula to Domitian, and was the friend of Thraseas Pætus and of Seneca. Living with the greatest strictness himself, he did not hesitate to censure even those in high position, for which freedom of speech he was banished. He is probably the same philosopher as the Demetrius of Corinth mentioned by Philostratus, according to Ritter, who gives a summary of his doctrines in his "History of Philosophy," vol. iv., p. 168, English translation. He left no writings. Henry Drisler.

Demetrius of Scep'sis, a Greek grammarian, flourished about 210 B. C. From Strabo and Athenæus we learn that he composed an extensive work in at least twenty-six books, full of historical and geographical information about the places mentioned in the catalogue of ships in the second book of the "Iliad" ("Τρωϊκὸς διάκοσμος"). The fragments are indicated in Müller's "Fragm. Hist. Græc.," vol. iv., p. 382. Henry Drisler.

Deme'trius So'ter [Gr. Δημήτριος Σωτήρ (*i. e.* "Demetrius the Preserver"), so called by the Babylonians because he freed them from their tyrants], a king of Syria, born about 185 B. C., was a son of Seleucus Philopator. He was a hostage at Rome when his father died in 175 B. C., and his uncle, Antiochus Epiphanes, obtained the throne. Having escaped from Rome in 161, he was proclaimed king by the Syrians. He waged war against the Maccabees. Syria was invaded by Alexander Balas, by whose army Demetrius was defeated and killed in 150 B. C. His son, Demetrius Nicator, eventually became king of Syria.

Demetrius the [Second] **False,** another pretender to the throne of Russia, began to urge his claim in 1607. He affirmed that he was Demetrius, the son of Ivan IV., and was supported by many partisans. He was killed by a Tartar chief in 1610.

Deme'trius Triclin'ius, a Greek scholiast who flourished in the fifteenth century. He is known for a recension of the text of Sophocles, which long served as a basis of subsequent revisions. He also composed scholia on Sophocles, first published by Turnebus in his edition, and two other works on the same poet, the one on the metres (περὶ μέτρων), the other on the figures (περὶ σχημάτων), which, however, are of no great value. He compiled scholia also on Hesiod, Pindar, and Aristophanes.

Henry Drisler.

Deme'trius Ze'nus, of Zacynthus, about 1530 A. D. translated the "Batrachomyomachia" into modern Greek in the so-called στίχοι πολιτικοί (popular verses). This is printed in Ilgen's edition of the "Homeric Hymns," pp. 123–139, with a Latin translation by M. Crusius. The best edition is that of Müllach, Berlin, 1837. He composed a poem in the same measure on Alexander the Great, printed at Venice, 1829. Henry Drisler.

Demetz (Frédéric Auguste), a French philanthropist and judge, born May 12, 1796. He visited the U. S. in 1836, for the purpose of examining the prisons. About 1840 he founded at Mettray, near Tours, an institution for the reformation of juvenile offenders, which was successful. His system has been adopted in England. Died Nov., 1873.

Dem'i, a prefix derived through the French from the Lat. *dimidium,* "half" (from *di,* "through," and *medium,* the "middle"), denoting a division into two parts; thus a demi-lune is a half moon; a demi-god is a half-divine being, etc.

Dem'i-Bast'ion, in fortification, a half bastion, which frequently terminates the branches of a crown-work or horn-work, and is occasionally used in other places.

Demi-god [Gr. ἡμίθεος; Lat. *semideus;* Fr. *demi-dieu;*

Ger. *Halbgott*], literally, "half-god," the name given to certain fabulous heroes of the Greek and Roman mythologies. They were sometimes deified heroes, and sometimes the offspring of a divinity and a mortal.

Demi-Lune [a Fr. term signifying "half-moon," so called because it is somewhat crescent-shaped], in fortification, is a work constructed to cover or defend the curtain or wall of a place and the shoulders of the adjoining bastions. It is composed of two faces, forming a salient angle towards the outside.

Demi-Monde [Fr.], the "half-world," a name applied originally to those classes in large cities who, with neither wealth, rank, nor culture, adopt a fashionable mode of living. Of late it designates that class of Parisian women who, while they are leaders of fashion, are excluded from the best society on account of their doubtful reputation.

Dem'ing (Henry C.), born at Middle Haddam, Conn., in 1815, graduated at Yale in 1836 and at Harvard Law School in 1838. He translated some of Eugene Sue's novels, but was better known as an able lawyer and Democratic politician of Hartford, Conn. He held many prominent State offices. In 1861 he became colonel of the Twelfth Connecticut Volunteers, serving in Louisiana, and was mayor of New Orleans (1862–63). He was a Republican member of Congress from Connecticut (1864–68). Died at Hartford, Conn., Oct. 9, 1872.

Demir-Hissar ("iron castle"), a town of European Turkey, province of Room-Elee, on the river Struma, 13 miles N. N. W. of Seres. It is defended by an old castle. Pop. about 8000.

Demiur'gus, or **Dem'iurge** [from the Gr. δημιουργός, "working for the people," from δῆμος, the "people," and ἔργον, "work"], a word originally applied to an artisan or workman, afterwards used by Plato, and especially by the Neo-Platonists and the Gnostics, to designate the Creator of the world, who was conceived by the Gnostics to be a being inferior to the Supreme Deity. The name was also given to the highest magistrate in some of the Grecian cities.

Demmin', a town of Prussia, in Pomerania, on the river Peene, about 75 miles W. N. W. of Stettin. It is very old, and was formerly fortified. It has manufactures of hats, woollen and linen fabrics, hosiery, etc. Pop. 9050.

Dem'mit, a county in the S. of Texas. Area, 1050 square miles. It is intersected by the Nueces. Wood and water are scarce, but the pasturage is fine. Pop. 109.

Democ'des [Gr. Δημοκήδης], an eminent Greek physician of Crotona, was born about 550 B. C. He was taken prisoner by the Persians, and carried to the court of Darius I., to whom he gave medical advice. The queen Atossa, whose favor Democedes had gained, persuaded Darius to send him to Greece with a small party of Persians on a secret mission. Democedes escaped from them and returned to Crotona.

Democh'ares [Gr. Δημοχάρης], an Athenian orator, a nephew of Demosthenes, was a leader of the anti-Macedonian party. He was banished about 295 B. C., but returned in 287 or 286, after which he rendered important service as minister of finance. Died after 280 B. C.

De'mocles (Δημοκλῆς), an Attic orator trained in the school of Theophrastus, was a contemporary and opponent of Demochares (which see). He is believed to have left written orations, since Dionysius of Halicarnassus attributes to him an oration previously ascribed to Dinarchus. Dionysius and Suidas call him Democlides.

Democ'racy [Gr. δημοκρατία, from δῆμος, "the people," and κρατέω, to "rule"]. A state in which the people at large possess the whole sovereignty is rightly denominated a democracy. At most, there are but three clearly distinguishable methods of government—the monarchical, the aristocratic, and the democratic; that is to say, the rule of one, of a number, or of the whole. The first two are of like nature, and might properly be treated as one; the last is altogether antagonistic to both of the others. The prefixes despotic, hereditary, and elective merely describe varieties of the first; an oligarchy is only a particular kind of the second; and such terms as republic and commonwealth import little that is distinctive as to political structure. Statesmen and philosophical writers apply them indiscriminately to states which differ greatly in the principles of their respective governments.

Of sovereignty in other forms there has been ample experience, but governments based exclusively upon the democratic principle, without any admixture of other elements, have not been known until a recent period on any considerable scale. Consequently, the true nature and tendency of that principle form an interesting theme.

A pure or simple democracy may conveniently regulate a prescribed portion of the civil authority within a subordinate district; and perhaps it is competent to the exercise of supreme power in an independent state of slight extent; opinions concur in denouncing it as impracticable in a large one. Deciding questions of policy by direct vote is a practice of this nature, but when performed by ballot it is subject to serious objections. If the entire elective body could meet at the same time and place, and in such a way as to admit of deliberate conference and consultation, the judgment of a majority might be esteemed valid. This, however, is not possible; nor can its place be supplied by discussion in partial assemblies, much less by the essays of a various press, each addressing its own narrow circle, and mainly unread beyond.

The representative form may therefore be regarded as the only practicable method of administering government on the democratic principle. Consistently with it political power may be denied to some members of the state, who are nevertheless entitled to protection and such privileges as are suitable to their condition. Age, sex, or ascertained unfitness may form grounds of exclusion; so in respect to a distinct race very inferior in numbers, as, for instance, the whites of Hayti. The right to exclude criminals after their guilt has been ascertained is indispensable to the preservation of social order—and, practically, it may be aimed against a class, as in the known instance of certain polygamists—but it should never operate otherwise than upon the offending individual as a consequence of his personal delinquency. Even in this case, pernicious opinions cannot properly be held to impair the citizen-right, though foreigners known to entertain them may be denied naturalisation or hospitality in any form. With this qualification, it may be broadly asserted that democracy, as a principle, entitles each citizen, in common with every other, to an equal interest in the state. A government based upon it can acknowledge no conflicting interests among the people to be favored or opposed. All its legitimate ends are accomplished when public safety and individual liberty are maintained. Restraining the turbulent and disorderly by a just administration of general laws, and perhaps making due provision for the impotent, it should leave all others in the quiet enjoyment of such social conditions as they may have created for themselves or derived from the ordinary incidents of life. In the main, it should be unfelt and unseen, or at least unperceived; the citizen should have no more vivid consciousness of the power which guards his civil rights than of the agencies whence flow his physical health or content of mind. Where the voice of the people is actually sovereign this must ever be the fact, for it is an irresistible deduction of reason that the supreme will never can intentionally enact a law which is not required, or, in other words, lay upon its own freedom any needless restraint. Hence the axiom, that in a democracy every positive regulation, not actually indispensable to the public and general welfare, which restrains, or even indirectly tends to restrain, individual liberty in any degree, however slight, so far violates the spirit of the constitution. It is an infraction of popular rights, and may justly be denounced as the offspring of unlawful force or of fraud. These agencies cannot be wholly expelled from any sphere; but it is the office of democracy to restrain their influence on official action within the narrowest limits. A contrast with its rivals will afford the best means of illustrating its tendency and usefulness.

The investiture of individuals with permanent political power by a title derived from personal descent is the primary element in monarchical and aristocratic states, as the absence of any such practice is the distinguishing feature of a democracy. An inequality of civil or political rights among those who were alike in all other respects could never have been deduced from the ancestry of individuals but for the assumed sacredness of office. At the outset the monarch could have been no more than the first officer of the state; the incipient aristocracy must have been composed of his subordinates; and it was not until offices became hereditary that the state was divided into two permanent classes, the rulers and the ruled. The existence of these two classes is the very essence of monarchy. Their interests are necessarily adverse—a circumstance enforcing upon the former a general activity in support of their preeminence. In states actually or approximately despotic standing armies and frequent wars are the forces for this purpose; where a nominal place is assigned to the democratic principle, permanent political parties might serve in lieu of the soldier to uphold the political machinery, but, in general, they only supplement him. The measure of governmental activity in monarchical states has varied from the grinding tyranny prefigured by Nimrod the man-hunter down to that modern crown which is a mere bauble, absolutely inert, save so far as it involves expense and a consequent burden upon labor. From the earliest times wars have been found necessary, not only to give employment to the state

officers—*i. e.* the king and his nobles—but also to color the pretence of their usefulness, and through military discipline to organize in their hands a power adequate to support their authority. Thus, in great monarchies the so-styled common people have always been oppressed by enormous establishments, military or naval, or both. These are easily justified to unreflecting observers on the score of necessity, for aggressive wars by monarchs in furtherance of ambitious designs being of constant recurrence, armed organization for defence seems a requisite. War, with its inherent rapine and cruelty, is not, indeed, due to the crimes of any one monarch; but the fact remains patent that it is an evil founded in the principle of monarchy, and inseparable from it. The active and enterprising spirits of every clime and age have found seductive occupation in these war-establishments, and through their agency large portions of society have always been withdrawn from useful employments to feed upon the labor of the rest. The desolation produced by foreign wars, and the internal oppression resulting in time of peace from war-establishments and their adjuncts, are both due to the vices of the ruling classes. In this self-evident proposition effectual reforms must long since have taken root but for the natural tendency to accuse our neighbors instead of correcting our own faults, and the difficulty of the latter task in any one of many neighboring independent states.

The annals of government are consequently little else than a recital of the devices by which from the beginning every civil society has been preyed upon by its own official corps. This is easily effected wherever monarchy or aristocracy prevails. Democracy, being based upon absolute equality, admits of no governing class, nor of any interest adverse to the people in those who conduct the public business. But by artifice and irregular methods the latter may become a class, may grasp powers incompatible with the nature of the government, and may involve their country in all the evils incident to hereditary rule. Persecution for moral non-conformity, so grateful to the ill-regulated mind, may be from time to time practised until resistance is provoked and a color afforded for war. To this condition the grandly patriotic spirit engendered by free institutions gives great force and breadth; the entire people at once rush to arms, and public debt is incurred at a pace twenty-fold more rapid than would be tolerated under the cautiously regulated corruption of monarchies. These are abuses, and are deviations from the democratic principle. Their prevention is the duty of every good citizen.

Unmixed democracy is the principle of government recognized in Switzerland and in various portions of the American continent. In the U. S. of America it nominally exists, and upon the grandest scale. They therefore present the best practical illustration of what it is in its present stage of development. Any shortcomings in practice there discernible may serve to indicate the advisable line of progress in endeavoring to perfect its machinery; and what many other nations seem inclined to imitate ought to be freed, if possible, from existing defects.

The founders of the American Union recognized not only the ineptitude of monarchy and aristocracy, but the necessity of repressing in the newly conceived system their most conspicuous abuses. Standing armies were denounced as dangerous to liberty; wars for the extension of territory were regarded as unjust, foreign alliances as inexpedient, and public debt as mischievous; but, strangely enough, no barriers whatever were instituted against any of these practices. On the contrary, powers to introduce and foster the most dangerous of them were expressly delegated, in the name of the people, to their public agents. The natural ill-effects were foreseen; but they were deemed susceptible of being kept within endurable bounds. Monarchy and aristocracy were indeed effectually repudiated for the time. Neither could long exist without hereditary distinctions, nor could these be upheld where commerce in land was free, and inheritances were equally partible by compulsion or from social habit; so primogeniture and the accustomed contrivances for rendering estates permanently inalienable were extirpated. This was effected by laws harmonizing so perfectly with the common instincts of humanity as to seem proof against repeal. In view of these things, and of the advances attained in civilization and power of thought, the most despondent do not anticipate that distinct ranks in society can ever be re-established. Americans therefore regard monarchy and aristocracy as utterly and irrevocably banished from their country, and consequently suppose that in the U. S., and for those countries which may reconstruct their political fabrics upon the American model, democracy has fulfilled its mission. Yet perhaps this great and just principle has not yet accomplished more than a modification of the social evils initiated, nurtured, and brought to maturity in the Old World by its opposites, monarchy and aristocracy.

In framing every government hitherto instituted amongst men, one of the aims was to enable the rulers—by which is meant the office-holders—to gratify their ambition or their avarice, or both, at the expense of the ruled—that is to say, the mass of the people. The former, as military or political leaders, have always laid the foundations, and have anticipated, at the least, employment in superintending the structure. Purity of motive may be admitted in many cases, so far as individual consciousness is concerned; but self-love is both inherent and blind. The founder, while conscious of no object but the public good, has always had an eye to his own gratification, and his work has invariably been in some respects accommodated to that end. This infirmity tainted the most ancient political structures, and has in some degree affected all their successors. Organizing places and public employments has ever received an attention not measured by necessity, or, in other words, by the interests of the people. We have seen, accordingly, that whilst ostracising monarchy the founders of the American Union invested it with most of the powers by which the few had oppressed the many in all previous times.

The State governments were framed in the same way. The powers of government in common use, originally designed by the office-holding aristocracy to create or uphold their own interests against the governed mass, were all sanctioned. Under the vicious and unjust systems previously existing they were no doubt indispensable; they were therefore assumed to be necessary, even in a representative democracy. Conceding all these functions to be thus inseparable from regular government in any of its forms was the error of that day. Assuming this, the manifest and undeniable tendency to abuse furnished no support to any useful argument. It only led to further error. It was thought to prove the necessity of devising various new artificial checks. And in compliance with this reasoning there was generated, in the councils of a simple and frugal people, a government which, though based upon a single principle, and that of the simplest nature, was without a parallel in the multitude of its offices, in the multifariousness of its forms, and in its general complexity. As the checks and balances of the mixed system existing in England had developed the best administration then known, it was thought that, monarchy and all hereditary distinctions being excluded, complexity would afford adequate preventives of official malversation. The same example induced a reliance upon the free action of political parties as a motive-power to keep the official counterchecks in healthy action. Obvious distinctions between the old and the new governments seem to have been overlooked. In the former permanently antagonistical interests were legalized, and so commingled in the political constitution as to induce and necessitate continual conflict as a duty. Each of the three estates was there obliged to maintain a constant contention with the others, in order to protect its own peculiar and rightful privileges; whilst in the U. S. there were to be no classes, no separate estates, and no peculiar privileges. Everything was reduced to the dead level of absolute equality; there was nothing fundamental that needed a check or requiring to be balanced; peace and tranquillity were the spirit and nature of the government adopted. The practicability of a government amongst frail mortals with objects and leading to results so grandly beneficent was, however, an untried experiment. Those who inaugurated it did well; their achievements were creditable, even though perfection may not have been attained. Progress in modes of enforcing the principle instituted was, doubtless, the patriotic expectation of those who, while dreading the powers created, found themselves unable, from want of apposite precedents or experience, to construct at that time a more perfect system. Oppression by a permanently privileged class had theretofore been the grievance of nations. Such a contradiction in terms, and apparently in fact, as oppression of the people by themselves was not anticipated; to their virtue and intelligence it was therefore committed to carry the experiment to its full fruition, with an admonitory warning that perpetual vigilance was the price of liberty. The extent to which popular vigilance could be kept in beneficial action was then a problem; in some respects it is still so.

In a great and prosperous state the private interests of business or pleasure afford engrossing employments. Minds fully occupied with such subjects cannot be at the same time employed on large conceptions of governmental policy and in devising plans for their execution. This is more especially true in respect to that portion of the citizens who are most favored by fortune or have enjoyed the highest advantages of education and culture. It is eminently true of those in affluence. An active attention to great political interests by the latter is a rare phenomenon. The wealthy who are unsatisfied and still thirsting for

more are equally regardless of governmental action, unless led to seek aid for their private enterprises through official favoritism. The necessary, and of course quite excusable, pre-occupation of the citizens in their private affairs, not lack of judgment or intelligence, will be found, on a careful scrutiny, to be the great impediment to wise and just administration in representative democracies. There is much injustice on both sides in the mutual criminations which disfigured the early debates of parties in America on this topic. It was never a fact that one party distrusted the popular judgment, or that the other relied upon it. All the leaders well knew that, as the political system was arranged, the people could never act directly on public affairs, and those leaders failed to devise an effectual method of securing in permanence the choice of desirable legislators. It is a delusion to suppose that in a representative democracy popular attention can be kept riveted on public affairs by the contentions of party. In mixed governments this may be possible. There antagonistical parties are supposed to be founded on conflicting ideas or principles expressed in intelligible maxims, and the original faith of each party, together with the social and political condition in which it originated, is consequently perpetuated in the same lines from generation to generation. It may thus acquire a fixed place in the mind and heart, and may become an active moral sentiment. In a representative democracy there is no legitimate basis for just and honorable antagonisms of this permanent character. During the brief period of unsettled opinion whilst the constitution is being constructed and put into operation there may be aliment for such parties, but fundamental differences of political sentiment must soon disappear. The citizens then find themselves blended together as one class, and occupying without distinction the same unalterable plane of absolute equality. Honest and intelligent political contention in the true sense of the expression must then cease. Thenceforth democrats are the only legitimate party; if any other can be supposed to exist, its members are foes to the constitution. It was only prior to and during the first decade of their constitutional union, if ever, that a monarchical party existed in the American States. During that brief period pure and honorable minds might have hoped for the re-establishment of ancient principles. When that hope perished a great change commenced. As in the nature of things was inevitable, the so-called political parties have ever since been gradually losing their hold upon distinctive opinions, and tending to a unity of views and purposes in which principles have little part. With such a unity parties can be nothing more than bands of rival leaders, keeping on foot, and employed as their respective forces, bodies of traders in the business or occupation of manipulating the masses, the ballots, or the returns. A government carried on by such agencies must at last attain a worse perfection than any which could exist under monarchical forms. According to these, the king and his nobles, as ruling officers, have a permanent interest in the state descendible to their heirs. For the protection of that inheritance and for the benefit of their posterity they will take some care of the state. In a representative democracy the office-holders of the hour are the rulers of the hour; their term is brief, and if corrupt they will, like the similarly situated pashas of Turkey, make haste to grow rich, for their positions are soon to be surrendered to others.

It is not through parties contending for control of the government that the benefits of democracy can be realized. The principle itself must be placed beyond the power of such parties. Permanent barriers, like those devised against monarchy, must be introduced, which shall absolutely restrain governmental agents—that is to say, the office-holders—from any action not indispensably necessary to the common weal. Public offices and employments must be thus rendered undesirable to the indolent and the avaricious. If this can be effected under any form, it is possible in a representative democracy. The other principles are directly opposed to it, and wholly incompatible with it. Its practicability in the former depends upon the question whether a persistently active and capable supervision of the ruling office-holder can be established among those who neither hold nor expect office—that is to say, among the burden-bearing multitude who support the official corps. The last requisite is thus pointedly defined for the purpose of excluding from reliance in their assumed office as "sentinels on the watch-tower of liberty" the organized class of office-seekers, constituting, in partisan phraseology, the opposition. In effect, and quite consciously too during advanced stages of political degradation, these will actually become allies of the party in power. Their function is to perpetuate among the people a delusive reliance upon that pretended but unreal conflict concerning principles which traders in politics always affect. Through the ordinary revolutions of the political lottery such contestants divide between themselves, and alternately enjoy, all that through the forms of law can be wrung from the multitude. They have been known to concert in perfect harmony before elections the means of accomplishing a prearranged result.

Democracy, regarded as a principle, plainly indicates the means of instituting this needful supervision. On public emergencies the heroic virtues do indeed exhibit themselves in acts of great disinterestedness, but there is very little of this spirit displayed whilst nations are in their normal condition. In an exceedingly small or greatly impoverished country the vices natural to rulers may, indeed, be without opportunities; but in a great and prosperous state there is no possible safeguard against robbery by those who control the machinery of government, if the machinery be, in itself, adequate to effect that object when pushed to its utmost capacity. Those who enact the laws and administer them will always promote their private interests at the public cost if vested with sufficient power. Such is human nature, no matter what form or name the government may adopt. Democracy accepts this as an indisputable truth, and, distrusting all rulers, it gives to none of them any power that can safely be withheld. The policy of instituting checks upon power unavoidably granted, though not to be absolutely repudiated, is of little value. Appointing one set of official persons to watch another is a bootless contrivance. The remedy really aggravates the disease; it fosters the primary evil of government—a multiplication of public agents. The watcher and the watched soon learn to co-operate for joint benefit in the work of deluding the mass, whom it is the interest of both to circumvent. The judiciary may form an exception. The ancient practice of assigning reasons for the judgment pronounced still exists, and the duty is regarded as unavoidable. This, with the institution of review on appeal, does afford a protection of some strength. Besides, for the honor of our common nature let it be said, as it is true, that the habitual study of justice tends to create a sincere love of it.

The inherent vice of all governments is a tendency amongst the official rulers to devour the people's substance, and the only remedy is in a strict application of the democratic principle. All powers which can be dispensed with should be withheld from the government, and numerous vicious methods now in the highest favor should be suppressed. Permitting revenue or the means of defraying public expenditures to be drawn from duties, imposts, excises, loans, or any source whatever other than immediate taxation, enables those who control the administration to conceal their waste of the people's wealth, and protects them from any effective supervision. Compelling them to procure all revenue from the last-named source would obviate both of these evils.

This assertion may require proof. It has been shown that the whole electoral body cannot directly govern. Even were the electors composed only of the most learned and enlightened of the non-office-holders, they could afford neither the time nor leisure to govern directly by their own act, or to watch the machinery of government in its varied details, and by that sort of guardianship prevent abuse. They could not even study, in this extended sphere, the character and capacity of their representatives. To hope for any of these things were idle and visionary. There is just one thing tending to secure good government, and one only that the mass can do. Each citizen can for himself—and if suitably spurred to the duty he will—give attention to preventing exactions from his own private purse, made directly before his eyes by government officials. From this tendency of the human mind a supervisory spirit among the tax-paying electors may be evoked. In great emergencies patriotic zeal may be relied upon, but the needs of every-day life can be supplied in no other way than by thus appealing to the common and constantly active impulses of mere individual self-interest. The difficulty of inducing the citizen to pay taxes directly must be admitted. The very quality of mind which is relied upon for thus utilizing public expenditure, and consequent taxation, creates an aversion to this duty. The evil art of the politician who calls himself a statesman consists in perceiving and acting upon the absurd preference for being robbed extensively through the secret and unfelt instrumentality of duties, excises, and the like, rather than paying directly moderate exactions in the form of taxes. This weakness of the citizen forms the strength of those evil counsellors who misgovern the state. It must be corrected, or intolerable evils will ensue. In the action of Congress, of the State legislatures, and of the municipalities official extravagance has been fostered to a shocking extent by allowing these unfelt methods of raising revenue, borrowing money for long terms on the public credit being the most promi-

nent. Unless the numerous governments intertwined in the American system can be checked in this career, the system itself must ere long perish. This cannot be accomplished otherwise than by absolutely forbidding all methods of obtaining revenue or funds for outlay other than immediate taxation. The use of those other methods is the root of every avoidable governmental abuse that exists in the U. S., or that, in the nature of things, can exist in any country blessed with a democratic constitution. If taxes form the only allowed sources of expenditure, frugality will ensue, and under the shadow of frugality serious mischiefs can scarcely prevail. Though labor may ultimately sustain it, simple taxation must always be paid, in the first instance, by those who possess property. A policy which would draw directly at the moment of need, and from the pockets of this class, through the immediate agency of the tax-gatherer, the whole supply for public expenditure, would keep its members, from a regard to their own private interests, under the pressure of a constant and potent stimulus to restrain injudicious enterprises in war or peace. Such a policy would induce effective attention to the election of inexpensive legislators. It would form a double goad, prompting the constituent to vigilance on this one point in the choice of his representative, and coercing the latter to frugality. A more extensive sphere than this will never be acted on by any beneficial vigilance of the elector: the unalterable constitution of human nature forbids it.

Perhaps the class referred to will never consent to place themselves under this incitement to diligence. If so, the great North American republic should not be adopted as a model by revolutionists, for ere long, in closing its career as a democracy, it may extinguish the last hope of good government, and confirm views expressed by a philosophical historian two thousand years ago. "From the despotism," says he, "in which it naturally begins, every human society passes through a succession of governments, each more liberal than its immediate predecessor, but each in its turn decaying from internal abuses, until at last, having reached the loosest or most liberal form attainable, a refuge from intolerable evils is found by completing the circuit and returning to that arbitrary rule under which it commenced. Thus it has ever been and ever will be with human governments." This prediction may not be verified if the Americans will expunge from their fundamental law the powers which are foreign to its nature and fatal to its usefulness. The changes needed are not organic except in form; they involve no departure from any principles adopted or sanctioned by the fathers; they only remove the seeds of decay inadvertently sown by copying administrative rules from monarchical precedents. The most important of these changes has been stated; some further illustration may be proper.

The creation of public debt diminishes present drafts upon the people, as duties, excises, and the like expedients conceal them. Both, consequently, facilitate wars and needless public works. War delights inconsiderate youth by its excitements and grasping age by its tender of the most desirable investments. Thus, the greatest of evils is hailed as a blessing, and profligate expenditure for purposes civil and military made easy. If, on the contrary, every governmental outlay were immediately defrayed by the taxpayers, very different results would ensue. The most wary and influential of the citizens, instead of being tempted to foster expense, would find in the shadow of the approaching tax-gatherer a potent stimulus to labor for its prevention. The consequent diminution of government jobs would relieve from public employ the multitudes whom corrupt officials now drive to the polls as cattle to the shambles. Free trade would follow as an inevitable consequence, and the enormous patronage of the custom-house would cease, together with a multitude of connected abuses and oppressions. The rapine and favoritism displayed in taxing all others for the means to confer a bounty upon manufacturers would likewise disappear.. The prevalent weakness before adverted to is exhibited in advocating a tariff reduced to the revenue standard. Obtaining revenue in this secret or unfelt method, independently of its keeping up a costly and vicious establishment, is in itself a positive evil. A sensibly felt pressure, in the form of taxation, is an indispensable provocative to that vigilance among the tax-paying electors which cannot be dispensed with. Indeed the only political evil to be apprehended from the extensive reforms suggested in this article is that the expenses of government might become so reduced that taxation to defray them would cease to be felt, and consequently cease to spur the elector to care in the choice of his representatives.

Government should possess no authority to coin its own bullion or metals, or to issue any currency of commerce or paper for circulation as money. No revenue or income should be derived from the public domain, nor should any gifts be made therefrom, unless in limited portions and for the encouragement of actual settlers.

By means of general laws admitting of no favoritism or partiality all requisite facilities, through corporate forms or otherwise, should be afforded to individuals for conducting every description of lawful business. This should include banking, insurance, establishing roads, canals, docks, fairs, or markets, and furnishing supplies of every description, and like objects. Under this head there is the greatest room for progress in effectively applying the democratic principle, so as to prevent any needless action by the government, or the employment of its officers in any affairs that experience might show could be safely committed to individuals as a business. Regulation by general laws being sufficient for all useful ends in that connection, no power should exist to create, repeal, or alter any private corporation. Monopolies and fraudulent or extortionate rivalries in trade should be alike prohibited, as well as all power of enacting private laws. A general structural law for each kind of civil division, say counties, towns, cities, and villages, should be adopted, subject to alteration only by amendments likewise general in their application. This would at once reduce the volume of statute law, simplify its form, conduce to its intelligibility, diminish litigation, and restrain corrupt practices. Under a system of which this affords a specimen, laws might become few, simple, and easily understood. We should not behold in one single State of the Union a legislative body sitting for four months of each year, surrounded by a hired lobby, and engaged in confounding the courts and the people with two thousand pages of additional legislation, most of it hurriedly passed during the last week of the session in such confusion and disorder that the clerks, if disposed, can make alterations in bills after their passage and before their formal engrossment or authentication as laws.

The power to declare and wage war cannot be withheld, but it should be as much restricted as possible. Perhaps withholding power to borrow money is alone sufficient for this purpose. Some ingenuity might be required in framing inhibitions of other devices for the creation of public debt, but absolute prevention is not impossible, and is imperatively necessary. The power to borrow money, if it exist at all, cannot be limited or duly guarded. In a great and populous state, separated by a wide ocean from any powerful rival or enemy, armies, navies, forts, arsenals, military schools, and standing armies or navies of any description, however slight, might safely be dispensed with. Until a period quite recent, agriculture, manufactures, and commerce were degrading employments; no occupation was honorable except that of a soldier. This distinction might ere long be precisely reversed, and military service, as the adopted pursuit of a lifetime, be entirely unknown. Even before the telegraphic current had traversed the ocean the diplomatic corps was useless; it should be abolished. These alterations, besides reducing the cost of government, would leave unemployed a large amount of public property which might be judiciously applied to the reduction of existing debts. Dispensing with all preparation for public defence, and trusting for the safety of the state in every emergency to the means which might then be brought together, would not be hazardous. The history of our race affords abundant proof that in populous countries the spirit which rejoices in any opportunity to make war has always exceeded the necessity for its employment. Loyalty might imagine a danger to government from lack of power to suppress rebellion, but the policy suggested would render formidable rebellions impossible. Besides, wars are becoming disfavored even in monarchical states. The light of sound morality is penetrating even the dark jungle of hereditary domination, and creating a general repugnance to this mischief.

Little progress has been made in practically applying the democratic principle since its adoption. Few of the steps hitherto taken or as yet proposed by parties with that professed object are of a beneficial tendency. It might excusably have been imagined, though quite false in fact, that in the great exemplar of Americans, the aristocratic *quasi* republic of Great Britain, election by ballot would be a boon to the miserable mine-laborer or cottier. In free, fertile, and prosperous America it was wholly needless; its acceptance was a reproach to the poorer citizen and a scandalous acknowledgment of timidity in the rich. It opened the door to frauds innumerable. Its inutility to the dependent poor has been demonstrated. The governing faction of a city that employs in public works one-tenth of its electoral body has sent its workman to the poll in charge of a whipper-in, who, when near the ballot-box, furnished him with the favored ticket, and thence until its delivery to the official receiver watched the hand in which it had been placed. After the ballot there came, by degrees, direct election to a very great multitude of offices. This

folly has reached its climax. In New York, the greatest of the States, not one of the best-informed, most active-minded, and experienced citizens has within a quarter of a century exercised an intelligent choice in selecting the numerous ballots required at an annual election. The thing is absolutely impossible, unless submitting to the dictation of a caucus composed of politicians by trade can be deemed an intelligent act of the will and judgment. Knowledge as to the capacity or fitness of the nominees for the various stations to be filled could not exist in any instance, and consequently there could not be an enlightened choice. No people can ever sustain the burden of directly choosing numerous administrative officers. The popular voice should not be called into action except in selecting a very moderate number of officers, say the chief executive and the legislature. The fallacy of presidential electors should of course be abolished. The existing embarrassments under this head are about to be carried to the last measure of complication which perverse ingenuity is supposed to be capable of devising. The conception called cumulative voting is susceptible of being embodied in forms of innumerable variety. It demands a measure of skill, intelligence, care, and attention in the ordinary citizen which Newton or La Place could scarcely have commanded and brought into efficient action under the pressure of such disturbing influences as are necessarily attendant upon a popular election of the horde annually chosen. Indeed, the pursuits of the gambler would afford the best apprenticeship for the elector under such a system. In respect to all three of these devices, the ballot, the direct choice of administrative officers, and cumulative voting, candid and thoughtful minds can hardly differ. The tendency of each and all of them is undeniably to establish on a permanent basis the trade of politics.

The unsound conceptions which gave rise to the ballot are precisely paralleled in the recent laws limiting the hours of labor on public works. That law indicates among Americans a preparedness for servile dependence. A freeman should submit to no law on such a subject; his own voluntary contract should alone control.

Ancestral memories amongst Americans have consecrated religious liberty, and it has hitherto been maintained; but reformatory progress threatens to extinguish it by a political recognition of dogmas in Christian theology. The citizens who are not Christians, and at least one-fifth of those who are, would thus be rendered non-conformists, and might be made liable to disabilities, if not to pains and penalties, for their disloyalty to the orthodox constitution. The advocates of this measure may not be very powerful as yet, but among them are persons of high position and wide influence. This same pernicious conception may ultimately prevail in another form. The revolting sons of the early colonists were without adequate means of educating the young. Many of the race born in the city of New York during the present century attained full age without learning to read. A State school system was deemed judicious, and doubtless was so. Medicine is properly applied by charity or bounty to remove disease. This system, wherever applied, had, in its early stages, a beneficial effect. It dispelled that low grade of ignorance which was the only evil under this head demanding strong measures. But in process of time the trading politician seized upon State education, and rendered it, to a considerable extent, another foster-parent of the jobbery and electioneering abuses incident to a loose administration. It is in some places enormously expensive, a means of official patronage, and a football to be tossed to and fro in factious contentions. It seems a favorite design of many to render the education of children under State regulations compulsory upon their parents, notwithstanding that those regulations should require the use of particular religious books, and the consequent inculcation of theological opinions which may be disbelieved by the latter and not sought by the former. This would be a plain infraction of religious liberty. Religion can exist only as a conviction deeply seated in the individual mind, and it is believed to be essential in forming good citizens; yet from the variety of its forms non-interference with it by government is a fixed democratic dogma. Theoretically, there seems an inconsistency in these propositions, but practically they are found to harmonize. Religious convictions bring into full action the voluntary principle, and divine worship is nowhere more amply provided for than in the U. S. The differences of opinion constituting what is called sectarianism, apart from which religion is unknown, form the precise objection to governmental interference with religious worship hitherto relied upon. The education of youth in a method which should studiously exclude religious, or what, as has been seen, is the same thing, sectarian ideas, would be pernicious, as tending necessarily to form bad citizens. This would seem to show conclusively that in the present advanced state of American social life education of the young, like religious worship for the mature, should be left to the voluntary principle. To perfect the policy which from the first for bade governments to interfere with the latter, they should now be commanded to withdraw from control of the former. Religious thought or observance and charitable ministration, of which gratuitous teaching forms a part, embody a circle of duties too pure for the mere statesman's touch. His assumed aid to either if it do not begin in actual obstruction is sure to end there.

There is room for the introduction of many real reforms. Short terms and frequent elections are no doubt necessary as to the chief executive and the legislative bodies. Due responsibility to the real sovereignty—*i. e.* the people—cannot otherwise be maintained; but as to all other officers removals should be for cause only—that is to say, fault or incapacity. Rotation in respect to public agents of any kind is a mistake in doctrine. Faithful service and proved capacity are singular grounds of disqualification. It must be admitted, however, that no absolute right of the citizen is invaded by introducing certain limits to eligibility; and expediency may require it in respect to one office. Indeed, it can hardly be doubted that a long quarantine should be required between exercising military command and aspiring to the chief magistracy.

To guard against fraud, registry laws are expedient in densely-peopled districts. A considerable period should elapse between the registry and the vote, without allowing exceptions on account of intermediate changes in residence. The more fixed and permanent the elector's habits, the better his duties will be performed. No public interest is subserved by a multitudinous or floating constituency; it is enough if the electoral body be sufficiently large to secure efficient supervision in the choice of representatives. It would be expedient to exclude from the elective franchise all officers and employés receiving pay from the public. Vast benefits would result from this measure, and also from denouncing severe penalties against compelling this class to contribute towards the expense of elections.

The Federal government was designed as an organ of limited powers, yet it has exhibited ample capacity to crush or modify at will not only State institutions, but the States themselves. Practically considered, the latter exist merely by sufferance, holding, as it respects the essentials of political power, no higher relation to the central authority than towns or counties do to the States in which they are situated. As bulwarks of liberty or constitutional rights they are nearly if not entirely powerless. But while thus superannuated and rendered ineffectual for the high purposes of the founders, they exercise a power which tends to serious mischiefs. Through their conflicting legislation, enforced by independent judiciaries, they may ultimately derange the laws concerning trade, contracts, and some other subjects of general concern. By the identity of their language, moral ideas, and social habits, and by their essential proximity effected through railroads and telegraphs, Americans have become commercially and socially one nation. Conflicting laws and a jarring jurisprudence amongst them should be prevented, if prevention be practicable. A court of ultimate appeal, as well from the State as from the Federal tribunals, composed of judges selected by the States, and neither subject to official interference nor possessing coercive machinery of its own, might preserve this desirable unity of jurisprudence throughout the whole country, and might also defend the autonomy of the States. Of course there should be no power to forbid, defeat, or trammel appeals to its justice by increasing its numbers or by any device whatever. The want of such an institution has been keenly felt by the confederate cantons of Switzerland. A precedent may be found in that modern tribunal at Lübeck which reviewed the judicial action of four perfectly independent republics. Probably the Amphictyonic Council of ancient times had its origin in similar objects.

The course of reform suggested would eventually mature the democratic system by securing to all citizens the utmost measure of freedom, affording material progress every aid to its most perfect development which an equal and impartial government can bestow, and terminating official misrule. Its aim is to break the sceptre of the trading politician, and thus, at last, to establish liberty on the only reliable basis—a popular censorship on democratic principles, perpetually stimulated to its duty by the simple operation of intelligent self-interest. CHARLES O'CONOR.

Dem'ocrat, a township of Carroll co., Ind. Pop. 1122.

Democ'rătes (Δημοκράτης), a supposed Pythagorean philosopher, under whose name a collection of moral sayings called the "Golden Maxims" (γνῶμαι χρυσαί) has come down to our time. These are written in the Ionic dialect, and are remarkable for their simple and correct character. The author is otherwise unknown, and the age of the col-

lection is not determined. They are printed along with the collection of DEMOPHILUS (which see).

HENRY DRISLER.

Democrătes, an Attic orator of the time of Demosthenes, was an opponent of the Macedonian party. He is mentioned in the Decrees in the oration of Demosthenes, "De Corona," as serving with Demosthenes on two embassies—the one to Philip to receive the oaths, the other to the Thebans to enlist them on the side of Athens against Philip. HENRY DRISLER.

Democ'ritus [Gr. Δημόκριτος], a celebrated and profound Greek philosopher, born at Abdera, in Thrace, about 460, or, some say, 469 B. C. He is supposed to have been a disciple of Leucippus, and to have received lessons from some Chaldæan magi. He inherited, it is said, from his father, a fortune of one hundred talents. In early life he travelled in pursuit of knowledge in Egypt, Greece, Persia, and India, and continued his travels until he had spent nearly all his patrimony. Having returned to Abdera, he declined political honors and employment, preferring to pass his life in study and retirement. He had a high reputation for virtue as well as learning. He appears to have been versed in geometry, physics, natural history, and ethics, on which subjects he wrote numerous works, but none of them are now extant. According to the later biographers he was called the "laughing philosopher," from his habit of laughing at the follies of mankind. He was a man of noble, pure, and diligent life. It appears that he admitted the existence of law in nature, but not that of design. He died 357 B. C. His system of philosophy is known as the atomic system. He taught that matter is eternal, and that the universe is composed of empty space and indivisible atoms which are infinite in number. To these atoms he attributes a primary motion, which brings them into contact and forms innumerable combinations, the result of which is seen in the multifarious productions and phenomena of nature. He imagined that the soul or thought is produced by the motion of round fiery atoms. Many of his ideas and theories were adopted by Epicurus, and explained by Lucretius in his poem "De Rerum Naturâ." Of his works only the smallest fragments have been preserved. (See G. H. LEWES, "Biographical History of Philosophy;" RITTER, "History of Philosophy.")

Democritus (Δημόκριτος), a statuary of Sicyon (whence his name appears also in the Doric form Damocritus), flourished B. C. 380. Pliny says that he made statues of several philosophers, and Pausanias assigns to him statues of victors in the games. HENRY DRISLER.

Demod'ŏcus (Δημόδοκος), the celebrated bard of the Phæacians, who is represented in the "Odyssey" as singing at the banquet of Alcinous the battles and the fate of the Greeks who went to Troy, with the conquest and destruction of that city, and also the loves of Mars and Venus. Later writers, who regarded him as an historical personage, represent him as an old and blind musician and poet of Corcyra, who composed a poem on the destruction of Troy (Ἰλίου ἄλωσις), and another on the loves of Mars and Venus. HENRY DRISLER.

Demogor'gon [from the Gr. δαίμων, a "divinity," and γοργός, "terrible"], a dreadful and mysterious being alluded to by some of the later classical writers, and by Boccaccio, Ariosto, Spenser, Milton, Shelley, and others. In Shelley's "Prometheus Unbound" he is the conqueror of Jupiter. The ancients dreaded the very mention of his name.

Demoiselle [a French word signifying "young lady"], the name of a genus of birds (*Anthropoidea*) belonging to the family Gruidæ, remarkable for their grace and symmetry of form. (See CRANE.) None of them occur in North America.

De'mon, or **Dæ'mon** [Gr. δαίμων or δαιμόνιον; Lat. *dæmon*], a term of Greek origin, used in classical writers primarily for the Supreme Divinity, sometimes as a synonym for θεός, a "god;" and later more especially as a tutelary or guardian divinity which was supposed to attend upon men. Thus, Socrates is commonly said to have been attended by a beneficent dæmon. It may well be doubted, however, whether such an idea is justified by the language of Xenophon (see "Memorabilia," I., 2 *et seq.*) or Plato ("Apol. Socr."). Socrates appears to have meant simply that a divine influence or intimation of some kind within him, a sign or voice (σημεῖον, φωνή, in Plato), controlled his actions. (See SOCRATES.) According to Plato, "Every dæmon is a middle being between God and man." "Intercourse between gods and men is carried on by dæmons." He further says, "The poets speak excellently when they say that when good men die . . . they become dæmons." These ideas were greatly amplified by the Neo-Platonists, who divided the dæmons into good and bad. The dread of evil dæmons became so great that in time the word came to be almost always used in a bad sense. In the Greek New Testament evil spirits are often called dæmons (δαιμόνια, commonly translated "devils"), and Beelzebub is spoken of as the prince of dæmons (ὁ ἄρχων τῶν δαιμονίων).

Demon (Δήμων), an Attic orator, was a nephew of Demosthenes, and belonged to the party opposed to the Macedonians. After the death of Alexander, Demon proposed a decree, which was passed, for recalling Demosthenes from exile. HENRY DRISLER.

Demon (Δήμων), a Greek writer, author of an "Atthis," or "History of Attica," flourished about 280 B. C. His writings were regarded as of no great authority. He is also the author, according to Schneidewin and Müller, of a work on proverbs (περὶ παροιμιῶν). Of both these works some fragments still exist. Those of the proverbs have been inserted in the "Parœmiographi Græci" of Schneidewin and Leutsch, and all the extant remains have been collected by Siebelis, "Phanodemi, Demonis, etc. Ἀτθίδων Fragm.," Leipsic, 1802, and by Müller, "Hist. Græc. Fragm.," vol. i., pp. 378–383. HENRY DRISLER.

Demo'nax [Δημώναξ], a celebrated Cynic philosopher who lived and taught at Athens in the second century A. D. His claim to distinction, however, is not so much that of a teacher of philosophy as of a model Cynic, and in this character he is depicted in Lucian's treatise called after his name. Though a native of Cyprus, he passed most of his life in Athens, where he was greatly honored while living, and when dead he was buried by the public with great magnificence. An outline of his doctrines will be found in RITTER'S "History of Philosophy" (English translation), vol. iv., p. 169, and several of his apothegms are given in ORELLI'S "Opuscula Græc. vet. Sententiosa," vol. ii., pp. 144 *seq.* HENRY DRISLER.

Demo'niac [Gr. δαιμονιζόμενος; Lat. *dæmoniacus*], a person possessed of or controlled by evil spirits. The New Testament abounds in narratives of demoniacal possession, and various opinions are entertained in regard to the character of this affliction.

Demonol'ogy [from the Gr. δαίμων, a "dæmon," and λόγος, a "treatise"], a treatise upon evil spirits; also the doctrine or science treating of the nature or character of evil spirits. Many works have been written on this subject. One of the most popular is Sir Walter Scott's "Letters on Demonology and Witchcraft."

Demonstra'tion [Lat. *demonstratio*, from *de*, intensive, and *monstro*, *monstratum*, to "show"], in mathematics, is an indubitable proof of a proposition. The term was used by old writers to signify any manner of showing either the connection of a conclusion with its premisses or that of a phenomenon with its asserted cause; but it now signifies in philosophical language only that process by which a result is shown to be a necessary consequence of the premisses from which it is asserted to follow. In common language it signifies an exhibition or display.

DEMONSTRATION, in military operations, is a movement or manœuvre, the chief object of which is to deceive the enemy, and to induce him to divide his force or divert his attention from the real point of attack.

Demoph'ilus [Δημόφιλος], a philosopher of the new Pythagorean school, whose age is not certainly known. He was the author of a work entitled βίου θεραπεία, from which there is still extant a collection of moral precepts entitled γνωμικὰ ὁμοιώματα, which are edited, along with the "Golden Maxims" of Democrates, by SCHIER, Leipsic, 1754, and which are printed also in ORELLI'S "Opuscula Græc. vet. Sententiosa," vol. i., p. 1 *seq.*

HENRY DRISLER.

Demoph'oön, or **Dem'ophon** [Δημοφόων, or Δημοφῶν], in Grecian mythology, a king of Athens, son of Theseus and Phædra, who is said to have accompanied the Greeks on their expedition against Troy, whence he rescued his grandmother Æthra. When Diomed, on his return from Troy with his Argives, ran in by night to the coast of Attica, and began to plunder it, Demophon attacked him and carried off the Palladium. Demophon is said also to have assisted the Heraclidæ against Eurystheus, who was slain in the battle that took place, and to have received Orestes when, after his mother's murder, he sought refuge at Athens. HENRY DRISLER.

Demop'olis, a township and post-village, capital of Marengo co., Ala., on the Tombigbee River just below the mouth of the Black Warrior, and on the Alabama Central R. R., 50 miles W. of Selma. It has four white and two colored churches and one weekly newspaper, a cotton and woollen factory and a private bank; also an active trade in cotton, which is shipped here. Pop. including the township, 4245; of village, 1539.

M. C. BURKE, ED. "BIGBEE NEWS."

De Mor'gan (Augustus), an English mathematician, born in the isle of Madura, near Java, in June, 1806, was educated at Cambridge. He was for many years professor of mathematics in University College, London. He wrote numerous works, among which are "Elements of Algebra" (1835), an "Essay on Probabilities" (1838), and "Formal Logic, or the Calculus of Inference, Necessary and Probable" (1847), and contributed largely to the "Penny Cyclopædia." Died Mar. 18, 1871.

De'mos [Gr. δῆμος, the "people"], the name given to the smaller divisions of the Attic tribes, somewhat similar to the townships into which counties are divided. When Clisthenes broke up the four old Attic tribes into ten new ones, Herodotus states that he subdivided these into 100 demes, but as there is no other authority for such statement, and the number of demes was actually 173 or 174, different explanations have been attempted of the passage in Herodotus. The demes were local divisions, in the registers of which the citizens had to enrol their names for political and other purposes. These demes were named sometimes after places, sometimes after persons, and those of the same tribe were not always adjacent, but might be in quite different parts of Attica. They had each its own presiding officer (δήμαρχος), treasurer, and other officers, and its own assembly, in which the business of the deme was transacted. Lists of the names of the demes under their proper tribes are given by K. F. Hermann, "Griech. Alterth.," Anhang iv., by Leake, in his "Demes of Attica," and by Müller, "Hist. Græc. Fragm.," vol. ii., pp. 357–359.

Revised by Henry Drisler.

Demos'thenes [Gr. Δημοσθένης], the most eminent orator of antiquity, and probably the greatest of whom history gives any account, was born in Attica, in the demos of Pæania, near Athens, about 382, or, according to some authorities, in 385 B. C. His father (also named Demosthenes) was a cutler and maker of furniture. He died when his son was seven years of age, leaving fifteen talents (more than $15,000) to be divided between the young Demosthenes and his sister. The guardians converted a large part of this money to their own use. Demosthenes studied rhetoric with Isæus, and philosophy, according to some authorities, with Plato. Cicero states that he was instructed in oratory by Isocrates, but the fact is not established. Demosthenes, when about eighteen years old, prosecuted his guardians, pleading his own cause, but though the case was decided in his favor, he received only a part of his dues. Before this time it is said that he had resolved to devote his whole attention to oratory, from witnessing the forensic triumphs of Callistratus. But his health was feeble, his manners ungraceful, his breath short, and voice stammering and indistinct. In order to remedy these defects we are told that he adopted the practice of speaking with pebbles in his mouth; that he was wont to declaim upon the sea-shore, so as to be able to be heard in the tumult of popular assemblies; and that he often practised before a mirror, so as to observe and rectify any awkwardness of gesture. Nevertheless, his first appearance before a popular assembly was, according to Plutarch, a failure, exciting only the laughter of the multitude. But encouraged by Satyrus, an actor, who gave him useful instruction, he devoted himself with the utmost diligence to his task. We are told that he shaved one side of his head, that it might be absolutely impossible for him to go into society. He made the writings of Thucydides his model for style, and it is said that he transcribed the writings of that historian no less than eight times. In 355 B. C. he delivered his oration against Leptines, with complete success. Soon after this he entered upon his great though unsuccessful life-work, the defence of Grecian liberty against the designs of Philip of Macedon. Between the years 352 and 340 B. C. he pronounced eleven or perhaps twelve orations against Philip. Four of these are especially denominated "Philippics." He took part in 338 B. C. in the disastrous battle of Chæronea. It having been proposed by Ctesiphon that the Athenian state should bestow upon Demosthenes a golden crown as reward for his services, there followed a contest of several years with his rival Æschines, which was triumphantly closed in 330 B. C. by the delivery of Demosthenes' celebrated oration "On the Crown," which is generally regarded as his finest effort. Demosthenes was afterwards accused of having received a bribe from the Macedonians, and though, in the opinion of the best historians, the accusation was entirely unjust, he was sentenced to pay a heavy fine, and left the country. He returned after the death of Alexander, but having been condemned to death by Antipater, he took poison and died in 322 B. C. Sixty extant orations and many fragments are ascribed to Demosthenes, but several of these are regarded as spurious.

Demosthenes appears to have been extremely averse to extemporaneous speaking, although we are told that his unpremeditated speeches were superior to his more elaborate efforts. The success of his oratory was due in a very great degree to the steadfastness with which he kept the attention of his hearers riveted on the one great object in view. Nothing superfluous, nothing which did not contribute to that object, was admitted into his discourse. "He uses language," says Fénelon, "as a modest man uses his dress—simply to cover him. We think not of his words; we think only of the things which he says. He lightens, he thunders, he is a torrent which sweeps everything before it. We can neither criticise nor admire, because we have not the command of our own faculties." "His style," observes Hume, "is rapid harmony exactly adjusted to the sense; it is vehement reasoning without any appearance of art; it is disdain, anger, boldness, freedom, involved in a continued stream of argument; and of all human productions his orations present the models which approach the nearest to perfection." "Such was the first of orators," says Lord Brougham: "at the head of all the mighty masters of speech, the adoration of ages has consecrated his place, and the loss of the noble instrument [the Greek language] with which he forged and launched his thunders is sure to maintain it unapproachable for ever." (See Grote, "History of Greece," vol. xi., ch. lxxxvii.; Thirlwall, "History of Greece;" Brougham, "Dissertation on the Eloquence of the Ancients;" Schäfer, "Demosthenes und seine Zeit," 3 vols., 1856–58.) One of the best editions of his works is that of W. Dindorf, with copious notes and the Greek scholia, Oxford, 1846–51, 9 vols. 8vo.

Revised by J. Thomas.

Demos'thenes, an Athenian general who acted a prominent part in the Peloponnesian war. He and Eurymedon jointly commanded an army sent in 413 B. C. to reinforce Nicias at Syracuse. After the Athenians had been defeated he surrendered, and was put to death by the victors in 413 B. C.

Demot'ica (anc. *Didymotichos*), a town of European Turkey, in Room-Elee, on the river Maritza, 25 miles S. of Adrianople. It is defended by a citadel or castle, and has several Greek churches; also manufactures of silk and woollen goods and pottery. Here Charles XII. of Sweden lived as a prisoner about 1712. Pop. about 8000.

Demotic Characters. See Enchorial Writing.

Demp'ster (John), D. D., an eminent Methodist preacher, born at Florida, N. Y., Jan. 2, 1794, was the son of the Rev. James Dempster, a Scottish Presbyterian, who had been a Wesleyan preacher. The younger Dempster entered the itinerant ministry in 1816, and became a master of pulpit oratory. From 1836 to 1841 he was a missionary in Buenos Ayres. From 1845 to 1863 he was a professor in the biblical institutes at Newbury, Vt., Concord, N. H., and Evanston, Ill. The success of these schools was largely owing to his energetic labors. Died at Chicago Nov. 28, 1863. (See Stevens, "History of the Methodist Episcopal Church," vol. iii.)

Dempster (Thomas), a learned Scottish writer, born at Muiresk Aug. 23, 1579. He studied at Cambridge, went to France to finish his education, and became regent of a college in Paris. He had a quarrelsome temper, which involved him in violent brawls. He was afterwards professor at Pisa and Bologna. He wrote "Historia Gentis Scotorum," reprinted in 1829. Died at Bologna Sept. 6, 1625.

Demul'cent [Lat. *demulcens*, present participle of *demulceo*, to "soothe," to "soften"], a name applied to medicines of a mucilaginous or oily consistency, such as starch, gum, etc., which are given for the purpose of soothing irritation of the mucous membrane and promoting the increase of the secretions. They are also used as poultices, etc.

Demur'rage, in mercantile law, is an allowance made to the master or owners of a ship by the merchant or freighter when he detains the ship in port beyond the time specified in the charter-party. It is usually stipulated in the charter-party or agreement that if delay occurs in loading or unloading the vessel, the merchant who charters and freights her shall pay a certain sum per diem for the extra time. The rule is, that during the loading and unloading the merchant runs all the risk of interruptions, even from necessary and accidental causes. But no demurrage can be claimed for the delay caused by the detention of a ship by a public enemy, or for delay caused by the fault of the master, owners, or crew. The word *demurrage* is also employed to mean the delay itself.

Demur'rer, in law, is a suspension of action in a cause until the determination of some point by the court. In a pleading in equity, as well as at law, it raises a question as to the sufficiency in law of the case as stated by the opposite party. There may also be a demurrer to evidence, on

the ground that the testimony offered by a party in a cause is insufficient to maintain or overthrow the issue.

Denain, a town of France, department of Nord, on the Scheldt, and on a railway, 5 miles W. of Valenciennes. It is in an extensive coal-field, and has iron-works and manufactures of beet-root sugar. Pop. 11,022.

Dena'rius [a Lat. term, from *deni*, "ten"], a Roman silver coin, originally equal to ten asses, was first coined 269 B. C. Its weight varied at different periods, and its value was afterwards equivalent to sixteen asses, or about 8*d.* of English money.

Den'bigh, a county of North Wales, bounded on the N. by the Irish Sea and on the W. by the river Conway. Area, 603 square miles. The surface is mostly rugged and mountainous, but fertile and beautiful valleys occur. Coal, copper, iron, lead, limestone, and slate are found in this county. The chief towns are Denbigh, Wrexham, Abergele, Llangollen, and Ruthin. Pop. in 1871, 104,266.

Denbigh, a town of Wales, the capital of the above county, is in the Vale of Clwyd, 22 miles W. of Chester. It stands on the sides and at the base of a steep limestone hill, crowned by the imposing ruins of a castle built in 1284, and has many handsome antique houses. Pop. in 1871, 6322.

Denbigh, a township of Warwick co., Va. Pop. 391.

Denbigh, Earls of (1622), Viscounts and Barons Fielding (1620), Barons St. Liz (England, 1664), earls of Desmond (1622), Viscounts Callan and Barons Fielding (Ireland, 1619).—Rudolph William Basil Fielding, eighth earl, M. A., born April 9, 1823, succeeded his father June 25, 1865.

Den'derah (anc. *Tentyra*, probably taken from *Tei n Athor*, "abode of Athor"), a town of Upper Egypt, near the left bank of the Nile, in lat. 26° 13′ N., lon. 32° 40′ E., and opposite Keneh. Here are the ruins of a celebrated temple, one of the most imposing and best-preserved of the ancient monuments of Egypt. It is 220 feet long, and has a portico supported by twenty-four columns. The columns and walls are covered with carved figures and hieroglyphics. On the ceiling of the portico of this temple is one of the famous zodiacs discovered by the French in 1799. On the exterior wall are figures of Cleopatra and her son, probably meant for portraits.

Dendermon'de, or **Termon'de,** a fortified town of Belgium, in East Flanders, is at the confluence of the Dender and the Scheldt, and on the railway from Mechlin to Ostend, 16 miles E. of Ghent. It has a town-house, and a very old church called Notre Dame; also manufactures of lace, cotton yarn, and woollen goods. Pop. 8300.

Den'drite [perhaps a corruption of *dendrolite*, from the Gr. δένδρον, a "tree," and λίθος, a "stone"], the name of a peculiar mineral, containing internally, or having its surface covered with, filamentary forms resembling moss, ferns, trees, etc. Moss agate and Mocha stone are examples.

Dendro'bium [from δένδρον, a "tree," and βιόω, to "live," so called because they live on trees], a genus of epiphytic orchids, mostly natives of the tropical parts of Asia and Australia. They have flowers of great beauty and fragrance, sometimes also remarkable for grotesqueness of form.

Den'drolites [from the Gr. δένδρον, a "tree," and λίθος, a "stone"], the name given to petrifactions found in secondary and coal formations. They consist of plants and fragments of trees, having, generally, nothing in common with those now growing in the same regions. They are mostly cycads, tree-ferns, conifers, etc.

Den'drophis [from the Gr. δένδρον, a "tree," and ὄφις, a "serpent"], a genus of serpents belonging to the Colubridæ. They are distinguished for their brilliant colors and very slender forms, live among branches of trees, feed upon insects, and have large and prominent eyes. They are natives of the warm parts of Asia, America, etc., none being found in Europe.

Dengue,* dĕng'gā, a disease known by the names of dunga, dandy, breakbone fever, etc., an epidemic, seldom fatal, which has prevailed at different times in the southern parts of the U. S. and in the East and West Indies. Its symptoms are headache, fever, pain and swelling of the smaller joints, an eruption of the skin, and gouty pains which often cause lameness for a considerable time. It appears to be of a rheumatic character.

Revised by Willard Parker.

Den'ham (Col. Dixon), an English traveller, born in London Jan. 1, 1786. He accompanied Clapperton and Oudney on an expedition to Timbuctoo in 1821. They proceeded to Kooka on Lake Tchad in 1823, and there Denham parted from his companions. He afterwards visited Mandara, and returned to England in June, 1825. He published a narrative of his journey. Having been appointed vice-governor of Sierra Leone, he died there May 9, 1828.

Denham (Sir John), an English poet, born in Dublin in 1615. He graduated at Trinity College, Cambridge, in 1634, and studied law. He wrote "Sophy" (1641), a tragedy, and a poem entitled "Cooper's Hill" (1643). He was a royalist in the civil war, and fled to France in 1648, but returned in 1652. Died in Mar., 1668. "Denham," says Dr. Johnson, "is deservedly considered as one of the fathers of English poetry."

Deni'na (Giacommaria Carlo), an Italian historian, born at Revello, in Piedmont, Feb. 28, 1731. He published "The Vicissitudes of Literature" ("Vicende della Letteratura," 1760). His principal work is a "History of the Revolutions of Italy" ("Istoria delle Rivoluzioni d'Italia," 3 vols., 1769–70). Having been invited by Frederick the Great, he removed to Berlin in 1782. In 1804 he was appointed by Napoleon imperial librarian at Paris. Among his works is a "History of Western Italy" (1809). Died in Paris Dec. 5, 1813. (See Carlo G. Reina, "Vita di C. Denina," 1820.)

Deni'o (Hiram), an American jurist, born in Rome, N. Y., May 21, 1799, began the practice of law in 1821, was circuit judge (1834–38), judge of the court of appeals (1853–66), and author of several important legal works. Died at Utica, N. Y., Nov. 5, 1871.

Denis (James Ferdinand), a French traveller, born Aug. 13, 1798, has published multitudinous books, the fruits of journeys in South America, Spain, and the East.

Denis, Saint [Lat. *Dionysius*], the patron saint of France and first bishop of Paris. According to Gregory of Tours (540–594 A. D.), he was one of seven missionaries sent from Rome about 250 A. D. to preach the gospel to the Gauls, and after he had converted great multitudes suffered martyrdom in 272, or, as some say, 290 A. D. His festival is on Oct. 9.

Den'ison, a township of Lawrence co., Ill. Pop. 1668.

Denison, a post-village, capital of Crawford co., Ia., on Boyer River and on a branch of the Chicago and Northwestern R. R., 64 miles N. N. E. of Council Bluffs. It has one weekly newspaper. Pop. of Denison township, 633; of village, 326.

Denison (Rev. Charles Wheeler), born in New London co., Conn., in 1809, has been a large contributor to periodical literature, and has published a volume of poems, several works of fiction, etc. He was an early abolitionist and a temperance writer, and was editorially connected with the "Emancipator" and the "Olive Branch," both in their time widely-known journals. He has resided in England, and was for a time an editor in London. He has been a U. S. consul in British Guiana, and wrote a popular life of Gen. U. S. Grant.

Denison (John Evelyn), Lord Ossington, an English statesman, born in 1800, was elected a member of Parliament in 1823, and acted with the Liberal party. He was chosen Speaker of the House of Commons in 1857, in 1859, in 1866, and in 1868, and became Viscount Ossington in 1872. Died Mar. 8, 1873.

Denison (Mary Andrews), wife of Rev. C. W. Denison, was born in 1826 in Cambridge, Mass. She is the author of numerous works, chiefly tales of a domestic character and designed for the young. These books have been quite successful.

Denison City, a post-village of Grayson co., Tex., at the junction of the Missouri Kansas and Texas and the Houston and Texas Central R. Rs., 150 miles S. of Parsons City, Kan. It has a national bank, one daily and two weekly newspapers.

Denison University, formerly Granville College, at Granville, Licking co., O., was established and located at Granville by a vote of the Ohio Baptist Education Society May, 1831. It was at first intended for a manual-labor school, and hence located on a 200-acre farm, a mile and a half W. of the town. As a manual-labor school it was, like most others of the time, a failure—as a school of instruction, a success. It was incorporated by the Ohio legislature Feb. 3, 1832, under the name of the "Granville Literary and Theological Institution." The name was changed in 1845 to "Granville College," and this again under the general law of Ohio was changed, June, 1856, to the name it now bears. Instruction was commenced in Dec., 1831, the principal and sole teacher being Prof. John Pratt, who brought to the position the reputation of an enthusiastic and accomplished teacher, and fully sustained it.

* *Dengue* is the Spanish for "dandy" or "fop," and is applied to this disease on account of the remarkable stiffness of the patient's motions.

The number of students the first quarter was thirty-seven. It was the day of small things, the beginning of greater. In thoroughness of instruction, from the beginning till now, no institution W. of the Alleghanies has been its superior. It had alternations of prosperity and decline. The great want was a living endowment. It was removed from the farm, and in Sept., 1856, instruction was commenced on the new site. Since that date it has been advancing in every element of prosperity, and now stands in the foremost rank of Western colleges.

The buildings are situated on a hill N. of the town, less than half a mile from the public square. The site contains twenty-four acres, nearly half of it, in the rear, being covered with a grove of old forest trees. The buildings are three, containing dormitories and study-rooms for 178 students, besides a fine chapel, natural history room, two society halls and libraries, college library (with over 11,000 volumes), lecture-rooms, recitation-rooms, etc.

The university is a proper college, furnishing the regular four years' course in classical, scientific, and philosophical studies, similar to the best American colleges; embracing also, under the same government, a preparatory department, classical, with a two years' course as a feeder to the regular course, and English, to fit for business, school-teaching, or the scientific course. The scientific embraces most of the studies of the regular college course, except the Latin and Greek languages, but in the mathematics and the natural sciences it is more extensive. Those who complete this course are entitled to a diploma and the degree of bachelor of sciences. For the last four years the whole number of full-course college students has been 49, 56, 58, and 67, and the entire number, including preparatory, etc., 175, 202, 191, and 190.

The board of instruction, as now constituted, consists of six professors (including the president), one principal of the preparatory department, and two tutors—nine in all; and all the nine fully employed in the business of instruction. There have been five presidents. The name and time of entering upon office of each are as follows: Rev. John Pratt, A. M., 1831; Rev. Jonathan Going, D. D., 1837; Rev. Silas Bailey, D. D., 1847; Rev. Jeremiah Hall, D. D., 1853; Rev. Samson Talbot, D. D., 1863. Dr. Going died in Nov., 1844, after which there was a vacancy of over two years. Dr. Talbot died June 29th of this year (1873); his successor is not yet appointed. The fixed property of the university, in ground, buildings, etc., is estimated at $80,000, and the productive endowment is $190,000, making a total of $270,000.

Denison, though one among some forty universities and colleges in Ohio, anticipates a prosperous future.

J. Stevens.

Den'izen [etymology doubtful], in English law, an alien who has received from the sovereign letters patent to make him an English subject. He may take lands by purchase and devise, but cannot inherit nor enjoy offices of trust or receive a grant of land from the Crown.

Deniz'li, or **Degnizli,** a town of Asia Minor, in Anatolia, 53 miles S. E. of Alashehr. It is surrounded by mountains or hills, and has a castle and several mosques. Leather is made here. It is stated that 12,000 of its inhabitants were killed by an earthquake in 1715. Pop. about 20,000.

Den'man (Thomas), first Lord Denman, an English judge, born in London Feb. 23, 1779. He was called to the bar in 1806, and elected to Parliament in 1818. In politics he was a liberal. He became attorney-general in 1830, and chief-justice of the king's bench in 1832. In 1834 he was raised to the peerage. Died Sept. 22, 1854.

Den'mark, a kingdom of Northern Europe, consists of the peninsula of Jutland and several adjacent islands of the Baltic Sea—viz. Seeland, Fünen, Falster, Laaland, Samsöe, Bornholm, Langeland, and Möen. Area, 14,753 square miles. Pop. in 1870, 1,784,741. Besides Denmark proper, the Danish monarchy possesses Greenland, Iceland, the Färöe Islands, and the West India islands of Santa Cruz, St. Thomas, and St. John. Area of the colonies, 87,258 square miles. Pop. in 1870, 127,401. Jutland is bounded on the N. by the Skager-Rack, on the E. by the Cattegat, and on the W. by the North Sea. Its surface is low and level, and was formerly covered by forests of beech, birch, oak, etc. The coasts are indented with numerous bays or *fiords*, and extensive marshes occur in various parts of the peninsula and the islands. Denmark has no considerable river. Seeland is separated from Sweden by the Sound, and from the island of Fünen by a channel called the Great Belt.

Climate, Soil, etc.—The climate is humid, and is modified by the proximity of the sea, so that the winter is milder than that of Northern Germany. The mean annual temperature is about 46° F. The weather is changeable, and the transition from winter to summer is more sudden than in some other countries. In spring and summer the W. wind prevails. The soil is generally productive, and alluvial or sandy. The marshy districts produce good pasture. Denmark is said to be pre-eminently an agricultural country. The staple productions are barley, oats, wheat, rye, buckwheat, potatoes, beans, peas, and flax. The Danish farmers derive a large part of their revenue from cattle, horses, and the products of the dairy. The chief articles of export are cereal grains, butter, horses, hides, and fish. The fiords abound in salmon, cod, herring, and other fish. Denmark is very deficient in mines and mineral resources, and, in consequence of the lack of coal, metals, and water-power, has comparatively few important manufactures. The peasants and people of the rural districts weave at their homes linen and woollen stuffs for the use of their families. There are in the kingdom numerous iron-foundries, sugar-refineries, paper-mills, and distilleries.

Commerce, Revenue, etc.—The commerce of Denmark is carried on mainly with Great Britain, Germany, and Sweden. The Danish official returns do not give the value of exports or imports, but only the weight of the same. The exports from Denmark to Great Britain in 1870 were valued at £3,053,425. The total exports for the year 1870–71 weighed 10,360,000 quintals, and the imports for the same year amounted to 19,770,000 quintals. (A quintal = about 112 pounds.) The revenue for 1870–71 was 23,419,623 rigsdalers, and the expenditure was 21,904,003 rigsdalers. In Mar., 1871, the public debt was 117,058,367 rigsdalers. The movement of shipping for the year 1870–71 was as follows: inland passages, 46,061 vessels, of 615,892 tons; outward passages, 36,755 vessels, of 1,092,742 tons. The merchant navy on Mar. 31, 1871 (exclusive of vessels of less than four tons), consisted of 2735 vessels, of 181,494 tons; this number includes 87 steamers, of 11,970 tons. The aggregate length of railroads which were in operation on Jan. 1, 1871, was 763.5 kilometers; the aggregate length of telegraph-lines was 1962.30 kilometers; the length of telegraph-wires 5096.67 kilometers. (See later statistics in "Almanach de Gotha" for 1873.)

Religion and Education.—The established religion is Lutheran, to which 99 per cent. of the population belong, and the king must be a member of the Lutheran Church. Other sects are tolerated. This kingdom has a good system of education, which is generally diffused among the people. All children between the ages of seven and fourteen are compelled to attend school. All the educational institutions are managed by a royal college or board, consisting of three assessors and a president. Education is given gratuitously in the public schools to children whose parents are too poor to pay for it. Of higher schools, Denmark has a good university at Copenhagen, several academies, twenty-two gymnasia, and seven seminaries.

Government.—The government is a hereditary constitutional monarchy. The present constitution is embodied in the charter of June 5, 1849, according to which the executive power belongs to the king, and the legislative power is vested in the king and diet (*Rigsdag*) jointly. The Rigsdag is composed of two houses, called the Landsthing and the Folkething. The latter, which is the lower house, consists of about one hundred members, elected by universal suffrage for a term of three years. Capital, Copenhagen. Military service begins with the age of twenty-two, and lasts for the line and the reserve ("first call") eight years; the "second call" is liable to military service to the age of thirty-eight. The first call comprises 37,000 men; the second call, 15,600; total strength of the army on the war-footing, 52,600 men. The war navy consists of twenty-nine steamers (among which are seven iron-clads), bearing 287 guns.

History.—Denmark is one of the three Scandinavian kingdoms. (See Scandinavia.) On the decline of the Roman empire the Scandinavians, under the name of Northmen or Normans, became a formidable and aggressive race, much addicted to piracy and maritime enterprises. The Danes invaded England with success in the ninth century, and completed the conquest of it about 1016, in the reign of Canute or Knud, who was perhaps the most powerful monarch of his time. He reigned over Denmark as well as England, and is said to have introduced Christianity into his dominions. Margaret, queen of Denmark and Norway, conquered Sweden in 1388, and procured the adoption of the "Union of Calmar" (1397), by which the three Scandinavian kingdoms were united, and her nephew Eric was appointed her heir. At her death (1411) each kingdom chose its separate ruler. In 1448 the Danes elected Christian I., count of Oldenburg, who was the founder of the royal family that has continued to reign to the present time. The monarchy was elective until 1660, when the clergy and people, impelled by enmity to the nobility, or-

dained that the power of the king should be hereditary and absolute. As an ally of Napoleon, Denmark was involved in a war against England and Russia, and suffered great disasters. The British fleet bombarded Copenhagen in Sept., 1807. Denmark was compelled to cede Norway to Sweden in 1814. Christian VIII., by the "Open Letter" of 1846, declared his intention to extend the law of succession of Denmark proper to the duchies of Sleswick-Holstein, the inhabitants of which are mostly Germans, in order to secure in this way the indivisibility of the Danish monarchy. When Frederic VII. in 1848 proclaimed the incorporation of Sleswick with Denmark, a three years' war ensued, which was ended by the intervention of Austria and Prussia (Jan., 1851). In the mean while the non-German great powers and Sweden had agreed (June, 1850) to declare the indivisibility of Denmark, and Austria soon after (Aug., 1850) acceded to this declaration. On June 5, 1851, Prince Christian of Sleswick-Holstein was designated in the "protocol of Warsaw" as heir to the throne, and on May 8, 1852, he was recognized as such by the great powers and Sweden. In 1849, Denmark had obtained an extremely liberal constitution, which secured the most entire civil liberty and universal right of suffrage. The duchies, however, had no part in this constitution. A second constitution (1855), which divided the council of the kingdom into two chambers (Landsthing and Folkething), subjected the duchies to a Danish majority. In Nov., 1858, the king abolished the joint constitution of the Danish state for Holstein and Lauenburg, and restored absolute monarchy in these countries. By a proclamation of Mar., 1863, Denmark treated the duchies of Holstein and Lauenburg as tributary appendages, while, on the other hand, a new fundamental law was prepared for Denmark and Sleswick. War with Germany broke out soon after, and was terminated by the peace of Vienna (Oct., 1864), and Denmark was compelled to renounce all claim on Sleswick-Holstein. (See SLESWICK-HOLSTEIN.) On Nov. 2, 1867, Denmark sold the West India islands of St. Thomas and St. John to the U. S., but the treaty did not receive the sanction of the U. S., and was therefore not carried into effect. (See ALLEN, "Haandbog i Fædrelandets Historie," 6th ed. 1863; DAHLMANN, "Geschichte von Dänemark," 3 vols., 1840–43.) A. J. SCHEM.

Den'mark, a post-township of Lee co., Ia. Pop. 1011.

Denmark, a post-township of Oxford co., Me. It has four churches, and manufactures of furniture, etc. Pop. 1069.

Denmark, a post-township of Tuscola co., Mich. Pop. 816.

Denmark, a township of Washington co., Minn. Pop. 824.

Denmark, a post-township of Lewis co., N. Y., on the Utica and Black River R. R. It has seven cheese-factories, and manufactures of various kinds. Pop. 2109.

Denmark, a post-township of Ashtabula co., O. Pop. 544.

Den'ner (BALTHASAR), a German portrait-painter, born at Hamburg in 1685. His works are remarkable for minuteness of finish. Died in 1747.

Dennery (ADOLPHE PHILIPPE), a French dramatist, born in Paris June 17, 1811, of Jewish parents. He first essayed art, then journalism, and then produced numerous dramas, comic operas, and vaudevilles, among them "The Market of London" and "The Bohemians of Paris."

Den'newitz, a village of Prussia, province of Brandenburg, 42 miles S. S. W. of Berlin. Here the Prussians defeated a large French army commanded by Marshal Ney on Sept. 6, 1813, after a very obstinate fight. The French lost about 15,000, killed, wounded, and prisoners.

Den'nie (JOSEPH), an American author and critic, born at Boston Aug. 30, 1768. He studied law, which, however, he did not practise. Having removed to Philadelphia in 1799, he founded the "Portfolio," a literary magazine, which he edited with ability from 1801 till 1812. Among his writings is "The Lay Preacher," which first appeared in the "Farmer's Museum." Died Jan. 7, 1812.

Den'ning, a post-township of Ulster co., N. Y. It has manufactures of lumber. Pop. 1044.

Den'nis, a township of Somerset co., Me. Pop. 37.

Dennis, a township of Wicomico co., Md. Pop. 683.

Dennis, a post-township of Barnstable co., Mass., on the Cape Cod R. R. The township extends across Cape Cod, has extensive fisheries, produces large crops of cranberries, and has manufactures of salt. There are four churches, five post-offices, fifteen schools, a free library, and many small but beautiful lakes. Pop. 3269.

Dennis, a township of Cape May co., N. J. Pop. 1640.

Dennis (JOHN), an English dramatist and writer of satires and pamphlets, was born in London in 1657. He produced dramas called "Liberty Asserted" and "A Plot and No Plot." His temper was quarrelsome, and he provoked the enmity of many persons by his libels. He was lampooned by Swift, and satirized by Pope in the "Dunciad." Died Jan. 6, 1733.

Den'nison, a post-village of Tuscarawas co., O. Pop. 828.

Dennison, a township of Luzerne co., Pa. Pop. 972.

Dennison (WILLIAM), a statesman, born in Cincinnati, O., Nov. 23, 1815, graduated at Miami University in 1835, became a lawyer, a railroad and bank president, and a leading Republican politician, was governor of Ohio (1860–62), and was postmaster-general (1864–66).

Den'nysville, a post-township of Washington co., Me. It has manufactures of lumber, etc. Pop. 488.

Denomi'nator [a Lat. term, from *denomino*, *denominatum*, to "name" or "designate"], literally, "that which designates," in arithmetic, is the number placed below the line in fractions, giving its name to the fraction, and showing the number of parts into which the integer is divided.

Denon (DOMINIQUE VIVANT), BARON, a skilful French artist and author, born at Châlons-sur-Sâone Jan. 4, 1747. He became chargé d'affaires at Naples in 1782, and a member of the Royal Academy in 1787, after which he devoted himself to art, and gained distinction as an art-critic. He accompanied Bonaparte to Egypt in 1798, and in 1802 he published an admirably illustrated work entitled "Travels in Upper and Lower Egypt." He died April 27, 1825, leaving an unfinished "History of Art."

Dens (PETER), a Flemish Roman Catholic theologian, born near Antwerp in 1690. He published a systematic exposition and defence of the Roman Catholic doctrines in his "Theologia Moralis et Dogmatica," which has been extensively used as a text-book. Died Feb. 15, 1775.

Den'sity [Lat. *densitas*, from *densus*, "thick"], a term used in physics to denote the quantity of matter which a body contains in a given or determinate space; for example, a cubic foot. The quantity of matter in any body is called its *mass*, and is measured by the weight of the body, to which it is always proportional. Hence, the density of any body is great in proportion as its weight is great and its volume small; or the density of bodies is directly as their mass and inversely as their volume. It follows that if two bodies have the same volume, their densities are directly as their masses or weights; and if two bodies have the same mass or weight, their densities are respectively in the inverse ratio of their volumes. The term is often used as synonymous with *specific gravity*.

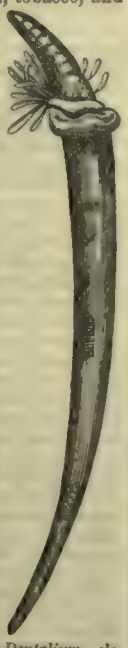
Density of the Earth is the ratio of the mass of the earth to that of the same bulk of water. The data of astronomy, in conjunction with the laws of gravitation, give the proportion of the mass of the earth to the masses of the sun and the principal planets; and thus the determination of the absolute mass of the earth will determine the absolute masses of the sun and planets; and then their density can be found. Experiments have been devised for determining the earth's density by observations upon the attraction of a mountain, and have been tried in the Schehallien experiment by Maskelyne, James, and others. The direction of gravity changes very nearly one second of angle for every 100 feet of horizontal distance. Suppose that two stations were taken on a mountain—one on the N. and the other on the S. side—and that their distance apart was 4000 feet. If the direction of gravity had not been influenced by the mountain, the inclination of the plumb-line at these two places would have been about forty seconds. Suppose, on applying the zenith sector, the inclination was found to be fifty-two seconds. The difference, or twelve seconds, could only be explained by the attraction of the mountain, which, combined with the natural direction of gravity, produced directions inclined to these natural directions. In the Schehallien experiment a calculation was made of what would have been the disturbing effect of the mountain if it had been as dense as the interior of the earth, showing that it would have been about twenty-seven seconds. The disturbance proved to be only twelve seconds, and therefore the density of the mountain to that of the earth was as 12 to 27. It follows from this that the mean specific gravity of the earth would be nearly five times that of water. The effect produced by the attraction of a mountain on the direction of a plumb-line was observed by Bouguer at Chimborazo in 1738. Col. James, by observations on Arthur's Seat near Edinburgh, has deduced a mean density of 5.316.

In 1826, Prof. Airy suggested the solving of the problem by pendulum experiments at the top and bottom of a deep mine. Suppose a spheroid concentric with the external

spheroid of the earth to pass through the lower station in the mine. The attraction of the shell included between these has the same effect at the upper station as if all its matter were collected at the earth's centre. At the lower station there is the attraction of the interior mass only; at the upper station that of the interior mass and the shell. By making the proportion of these theoretical attractions equal to the proportion observed by means of the pendulum, we have the elements for finding the proportion of the shell's attraction to the mass's attraction. The mean density is found from these data. The astronomer-royal having twice tried the experiment and failed, the attempt was renewed in 1854 at a colliery near South Shields, England, where the depth was reputed to be 1260 feet. A place was chosen for two stations in the same vertical. An invariable pendulum was mounted in each station, vibrating by means of a knife-edge upon plates of agate. Behind it was a clock, and before it a telescope so mounted that coincidences of the pendulum of the clock might be observed through a slit. The acceleration of the pendulum at the depth of 1260 feet was two and a quarter seconds a day. Taking into account the configuration and nature of the surrounding mass, Airy estimated the earth's density at 6.565.

Two leaden globes, 174 pounds in weight each, are supported six feet apart, by a horizontal frame capable of rotation. Above the centre is suspended horizontally, within a narrow glazed box, by a delicate wire forty inches long, a slender deal rod, carrying at its extremities two equal leaden balls one one-hundredth part as heavy as the globes. The rod being at rest, the globes are brought as near to the balls as the dimensions of the protecting box will allow, their separate attractions tending to turn the rod in the same direction. The amount of torsion produced is observed from a distance with a telescope. By rotation the disturbing force of the globes is then brought to act in the opposite direction, and the torsion is once more observed. Cavendish concluded that the force of mutual attraction between the globes and balls, the distance between their centres being 8.85 inches, was $\frac{1}{1000}$ of a grain; whence he deduced the total mass of the earth, and (its bulk being known) its mean specific gravity also, which he put at 5.480. The experiments of Reich give 5.438, and those of Baily, 5.660. The mean of all the results obtained is 5.639. It may, then, be assumed that the earth's mean density is not very far from 5.6 times that of water. Combining this result with what is known with respect to the dimensions of the earth, we find that its weight in tons is roughly expressed by 6,000,000,000,000,000,000,000. F. A. P. BARNARD.

Dent, a county in the S. E. of Missouri. Area, 700 square miles. It is partly drained by the Maramec River, which rises in it, and partly by the head-streams of the Current River. The surface is diversified by hills and valleys; the soil of the latter is fertile. Grain, tobacco, and wool are raised. Capital, Salem, or Dent Court-house. Pop. 6357.



Dent, a township of San Joaquin co., Cal. Pop. 1115.

Dent, a township of Iron co., Mo. Pop. 417.

Dent (DENNIS) was born in Maryland. He served in the Indian war in Florida as a major-general, and removed to Tuscaloosa, Ala., in whose legislature he served from 1838 to 1850. He died in 1860.

Dent (JOHN HERBERT), an American naval officer, born in Maryland in 1782. He commanded a vessel in the war against Tripoli in 1804, and gained the rank of captain in 1811. Died July 31, 1823.

Denta'lium [from the Lat. *dens*, a "tooth," alluding to the shape of the shell], a genus of gasteropodous marine carnivorous mollusks, called tooth-shells, from their curved, tubular shape. The shells are open at each end. There are many living and fossil species, of which the *Dentalium elephantinum*, or elephant's tooth, is the best known.

Dentalium elephantinum.

Denta'tus (MANIUS CURIUS), a Roman plebeian consul noted for his martial exploits, frugality, and integrity, is said to have been born with teeth; hence the surname. He defeated the Samnites in 290 B. C., and gained a decisive victory over Pyrrhus near Beneventum in 275. He was consul for the third time in 274, and censor in 272 B. C. During his censorship he constructed an aqueduct which conveyed water from the Anio to Rome. Died in 265 B. C.

Den'tex [perhaps derived from the Lat. *dens*, on account of their numerous teeth], a genus of acanthopterous fishes belonging to the Sparidæ, resembling the perch in form, with a deep compressed body, scaly cheeks, a single dorsal fin, and numerous small teeth, with four large canine teeth curved inward in each jaw. The *Dentex vulgaris*, sometimes called the four-toothed sparus, is found in great numbers in the Mediterranean, and sometimes on the southern coasts of Great Britain. It is of large size, often three feet long, and is an important article of commerce.

Den'tifrice [Lat. *dentifricium*, from *dens*, a "tooth," and *frico*, to "rub"], the name given to powders and washes of various kinds used for cleaning the teeth. Among the substances employed are charcoal, chalk, common salt, myrrh, catechu, cinchona, phosphate of soda, and cream of tartar.

Den'tils [from the Lat. *dens* (gen. *dentis*), a "tooth"], in architecture, square blocks or projections in the bed-mouldings of the cornices of the Corinthian, Ionic, and composite orders. The term is also applied to ornaments in cornices of rooms which are founded on the same style of decoration.

Dentin, or **Dentine.** See TEETH.

Dentiros'tres [from the Lat. *dens* (gen. *dentis*), a "tooth," and *rostrum*, a "beak"], a tribe of birds of the order Insessores, characterized by a notch or toothlike process on each side of the margin of the upper mandible. These birds have rapacious habits, and prey on smaller birds as well as insects. The butcher-bird is an example of this tribe.

Dent'istry [from *dentist* (from the Lat. *dens, dentis*, a "tooth"), and *ry*, a suffix denoting "art," "profession," etc.]. In every age and country, even among the rudest and most barbarous nations, the teeth as useful and beautiful organs have attracted attention, and been regarded as of great importance in giving beauty and symmetry to the face. Lord Chesterfield says that "fine and clean teeth are among the first recommendations to be met with in the common intercourse of society." Lavater, the learned physiognomist, remarks that "the countenance is the theatre on which the soul exhibits itself," and adds, "as are the teeth of man, so is his taste." "White, clean, and well-arranged teeth, visible as soon as the mouth opens, but not projecting nor always entirely seen, I have never met with," says he, "except in good, acute, honest, candid, and faithful men;" that "short, broad teeth, standing close to each other, show tranquil, firm strength; and that melancholy persons seldom have well-arranged, clean, and white teeth."

By the ancients, white and well-formed teeth were considered as characteristics of beauty. Jacob, in blessing Judah, says, "His teeth shall be white with milk." Joseph Murphy, in his "Natural History of the Human Teeth," states that the Brahmans are extremely delicate in every point relating to their teeth. Every morning when they rise they rub them for upwards of an hour with a twig from a racemiferous fig tree, at the same time addressing their prayers to the sun, and calling down the blessings of Heaven on themselves and their families. As this practice is prescribed in their most ancient books of law and divinity, we imagine it coeval with the date of their religion and government. These people also separated their teeth with a file as soon as the second set was perfectly formed, which was doubtless done for the purpose of ensuring cleanliness and preventing decay.

The inhabitants of many Oriental countries stain their teeth. Many women in Sumatra have their teeth filed to points, removing the enamel from the surface that they may be more easily dyed black. The Abyssinians and other African nations file their teeth to points, and thus increase the savageness of their aspect. Whether this custom was followed as a matter of ornament or fashion, it doubtless had its origin in the fact that teeth with sufficient space between their edges to prevent the accumulation of food were much less liable to be affected by caries.

In the time of Herodotus the art of dentistry appears to have been practised in Egypt, as was also the treatment of diseases of the eye and the ear. In the ancient tombs of this people artificial teeth of ivory or wood were found by Belzoni and others, some of which were fastened on gold plates; it is stated that the teeth of mummies have been found filled with gold, and others with a white cement.

To what extent the Greeks or Egyptians practised dental surgery as a specialty before the Christian era, there is but little upon record that gives us any definite knowledge. The essays or books upon the subject, if there were any, are lost. The only writings of ancient times extant, where dentistry is spoken of as an art, are those of Galen, who wrote in the second century after Christ; and from then until Ambrose Paré wrote his celebrated work on surgery there was but little to improve the practice or satisfy the

student in dental surgery. During the sixteenth century, from 1550 to 1580, there were published six essays or dissertations upon the anatomy, treatment, and preservation of the teeth. The seventeenth century was more favored; from 1614 to 1690 there were forty dissertations on toothache, teething, diseases of the teeth, etc. During the eighteenth century, from 1702 to 1799, there were one hundred and thirty such volumes and essays, many of them works of merit, and the result of the labors of such as Hunter, Jourdain, Lécluze, Blake, etc.

In the present century, from 1800 to 1830, sixty-eight volumes were added to the literature of dental surgery. Among the more prominent authors of these were Bell, Baumé, Duval, Rousseau, Delabarre, Laforgue, Fox, Maury, Murphy, Parmly, Fitch, and Gardette. The last three were American practitioners as well as writers. From 1830 to 1873 there have been contributed near forty volumes. Among the more prominent authors of these are Robinson and Tomes of London; Goddard, Harris, Taft, Arthur, Garretson, Richardson, and J. W. White of the U. S.

During the eighteenth century dental surgery became a subject of more critical inquiry and thorough investigation. Men of education and talent devoted themselves to it exclusively, and from that period it has progressed rapidly in importance. But not until within the last few years has it been enabled to claim a recognition from its sister professions of medicine and surgery. Until the latter part of the eighteenth century any advance in dentistry was confined to Europe. Dr. Harris, in his work on the "Principles and Practice of Dental Surgery," gives the following account of its introduction into the U. S. He says: "It was during our Revolutionary struggle for independence that the first knowledge of dental surgery was introduced into this country, and the first dentist in the U. S. of whom we have any account was a man by the name of Le Mair, who accompanied the French army which came over to our aid during that period. Soon after the arrival of Le Mair a dentist by the name of Whitlock came over from England, and from him and Le Mair dental surgery may be said to have had its origin in the U. S. With regard to the professional ability of these gentlemen little is known, but it is probable that it was limited, and that their practice consisted chiefly in the carving of artificial teeth from blocks of ivory and extracting and cleaning natural teeth.

"Mr. John Greenwood, however, I believe, was the first native American dentist, and he commenced practice in New York about the year 1788, and is said to have been the only dentist in that city in the year 1790. It was in this year he constructed an entire denture for General Washington, and in 1795 another, which for neatness of execution was unsurpassed by any of the European artificial teeth at that period. They were carved from ivory, and secured in the mouth with spiral springs."

About the year 1792, Dr. Spence, who had received some instructions from Le Mair, commenced practice in Philadelphia; soon afterwards he was joined by Dr. Gardette, who came from France, where he had previously received instruction. He soon acquired a reputation which he enjoyed through life. Dr. Hudson of Dublin soon followed Gardette to Philadelphia, and from his previous education and skill became the most prominent dentist in this country.

In the year 1800, Dr. H. H. Hayden commenced the practice of dental surgery in Baltimore; in 1807 he was joined by Dr. Koecker of London, who, after practising a few years in Baltimore, removed to Philadelphia. From this time until 1820 the ranks received accessions from Europe, with many in this country—some few with previous education, but others entirely deficient in theoretical or practical knowledge—so that the number of dental practitioners in the U. S. was now little more than one hundred. The next decade had increased them to three hundred, and in ten years more they had been quadrupled; while the next twenty years gave us at least five thousand in 1860, and in 1873 the dentists in the U. S. numbered ten thousand, while those in other countries combined do not exceed five thousand.

With this great increase in the number of dental practitioners the progress of dentistry as a science has been very marked. From the more simple and comparatively not difficult operations of cleansing, extracting, and filling small and superficial cavities, it has extended to a thorough and scientific treatment of the mouth, with the view not only of saving teeth but slightly decayed, but all teeth, and also of anticipating decay by such operations as shall make it possible for the patient to keep the mouth thoroughly cleansed, and the teeth free from the deleterious effects of the fermentation of portions of food or other substances in the mouth. Cleanliness is indispensable to sound teeth, and the most fruitful source of decay is admitted to be the presence of decomposing portions of food lodged between them and in the interstices of the crown. In view of these facts all dentists urge the importance of children acquiring the habit of brushing their teeth daily.

In the successful treatment of teeth where the nerve or pulp is exposed, much credit is due to Dr. Spooner of Montreal, who in 1838 first recommended the use of arsenic for the purpose of destroying the vitality of the nerve. This substance has been used since in combination with sulphate of morphine and tannin, with creosote sufficient to form a thick paste; and though many teeth were saved for years by the use of this escharotic, yet for some time the course was unscientific and far from satisfactory; for when the vitality of the pulp was destroyed and the tooth filled without removing the devitalized tissue, it invariably resulted in a fistulous opening being established in the gum opposite the apex of the root or fang, through which was a constant discharge of pus. The difficulty is invariably removed by opening into the tooth, cleansing out the fang, and injecting creasote until its presence is recognized at the fistulous opening in the gum.

The last ten years have been replete with various expedients by capping to preserve the vitality of the pulp, even though exposed; and the efforts have been crowned with such a degree of success that there is reason to hope the day is not distant when such teeth will be saved, and their vitality and lifelike appearance also preserved. The preparations which have been used for capping are lead, tin, asbestos, gutta-percha, Hill's stopping (made of gutta-percha and felspar pulverized), clarified quill, and oxychloride; the latter, made of oxide of zinc and dilute deliquescent chloride of zinc, is the most in favor for the purpose, and offers much the larger proportion of successful results.

The various materials used for filling or stopping teeth are gold, tin, amalgam, chloride of zinc (or oxychloride, as it is more frequently called), Hill's stopping, and gutta-percha. The requirements for a filling are ability to withstand the mechanical influences of mastication; resistance to chemical agents; non-susceptibility to thermal changes; qualities to admit of ease of introduction into a cavity and consolidation; harmony in color; and the absence of properties injurious to the structure of the tooth or to the system at large. Of such materials, the very best as a permanent filling is gold; after this amalgam and tin, the other agents being employed chiefly for temporary purposes.

Of the instruments used in filling teeth, the variety is numberless, so far as excavators and ordinary pluggers are concerned; the last few years have given us a number for condensing the gold, representing the mallet in modified forms. The small mallet was used some forty years since for a time to a limited extent; the last decade has again brought it generally into favor. It is made either of steel, ivory, vulcanized rubber, lead, or hard wood. In addition to these, there are much in use two automatic mallets, besides Bonwill's electric mallet. The last year has also given to the profession several drills for the preparation of cavities and the finishing of fillings; three of them have the motive-power of a foot-lathe, while one has that of a galvanic battery. All are arranged with a mandrel, into which fit burr and chisel drills of various sizes.

The "rubber dam" given to the profession by Dr. Barnum, as also the steel clamps for holding it in place around the neck of the tooth intended to be protected, is one of the most valuable acquisitions given to the dental practitioner.

The want of matrices in the construction of a temporary wall for the conversion of approximal cavities into simple holes had long been felt. A matrix invented by Dr. Louis Jack, and given to the profession, has attained a most deserved popularity. In addition to these, the small corundum wheel invented by Dr. Arthur (rapidly taking the place of the file in both separating teeth and finishing fillings) is considered a not less important acquisition in dentistry.

The great progress made in the dental profession has been contributed to and stimulated not a little by the organization of colleges, formation of societies, and publication of journals. An important event in the history of dental surgery in this country was the establishment of the "American Journal and Library of Dental Science" in Baltimore in 1839. The scattered members of the profession, who had long toiled in comparative obscurity, almost unknown to each other and the world, found through this journal an appropriate medium through which to communicate with each other. Several other important journals devoted to the interests of dentistry have since been established in the U. S. and Canada.

The formation of the "American Society of Dental Surgeons" soon followed the establishment of the above journal; and at its second annual meeting an arrangement was made with the publishers by which it became both the property and organ of the association. Two years afterwards another society of dentists like that of Baltimore was organized at Richmond, Va., and in Aug., 1844, a third was formed at Cincinnati, O., styled the "Mississippi Val-

ley Association of Dental Surgeons." In Aug., 1850, the National Convention of Dentists was formed, and its first annual meeting was held in Philadelphia. Just previous to this the Pennsylvania Association of Dental Surgeons was organized, and some years subsequent, in 1863, the Odontographic Society of Philadelphia. In addition to these, there are throughout the country fifty-five other State and county societies, the latter holding meetings generally monthly. In 1839 the legislature of Maryland chartered the "Baltimore College of Dental Surgery." It was the first dental college in the country. It held its thirty-third annual commencement this year (1873), and in the graduating class receiving the honors of the institution was one lady, she being its first female graduate. Its alumni number over 700.

The "Ohio College of Dental Surgery" was chartered in 1845. It is located in Cincinnati. Its alumni number about 250. It has for the last fifteen years admitted ladies equally with gentlemen, and several have taken their degree. The "Pennsylvania College of Dental Surgery" was chartered in 1856; it is located in Philadelphia. It held its seventeenth annual commencement in 1873. Its alumni numbered 488, of which 443 were regular graduates, 10 honorary, and 35 received the degree after a satisfactory examination, they having been in practice some years previous to the establishment of dental colleges. Among the graduates was one lady, now practising in Berlin; she received the degree in 1869. The "Philadelphia Dental College" was chartered in 1863; its alumni number 260. The "New York College of Dentistry" was chartered in 1865, and established in New York City. Its alumni number 68. The "Missouri Dental College," chartered in 1866, is in St. Louis, Mo.; its alumni number about 50. The "New Orleans Dental College," in New Orleans, La., was chartered in 1867; its alumni number about 30. The "Boston Dental College" and the "Dental School of Harvard University" were both chartered in 1868. They held their fifth annual commencement in 1873. The alumni of the latter number about 35.

A growing desire on the part of the liberal and educated men in the profession that their specialty should be raised above a mere mechanical trade has created an interest in the education of dental students, and a corresponding desire for a more extended and liberal curriculum in the colleges, many of the best men in the profession believing that a thorough medical education, preparatory to studying the specialty of dentistry, would make more efficient and useful practitioners; so that a patient with an oral disease of any complexity, trusting himself to the average dentist, would not meet with disaster because of the absence of surgical knowledge and skill; in fact, that dentistry should be practised as a specialty of medicine; that the practitioner should understand that the welfare of the teeth is intimately connected with that of the general system; and that a knowledge of the diseases whose effects may reach these organs is essential to the scientific dentist. His knowledge of anatomy should not be confined to the structure of the tooth, to the pulp which fills its internal cavity, to the position of the nerves which communicate its complaints to the brain, nor to the manner in which it is held fast in its socket; but his education should embrace a thorough acquaintance with the anatomical and sympathetic relations of the organs of the mouth with all parts of the system.

From what was originally called dentistry there have very naturally and almost without an effort been evolved two widely different occupations. They may properly be termed operative dentistry, or dental surgery, and mechanical dentistry; and as competition necessitates and stimulates proficiency, more distinctly marked must this division become. The artisan who works in his laboratory making casts, swedging plates, grinding and filing down teeth, and finally soldering them to the plate, and finishing the whole as neatly as a piece of jewelry-work, cannot keep his hands in a condition to successfully perform the delicate manipulative operations required in treating the natural teeth. Delicacy of touch is indispensable in a skilled operator, and one who does not possess it proportionally fails just where it is most essential his operations should be perfect.

Mechanical dentistry has again been relieved of a portion of the labors originally performed by the dentist—that of carving or moulding the teeth used. The early dentists carved from ivory the teeth and plate in one piece, and if a partial set was inserted, the teeth were fastened to the adjoining natural ones by means of ligatures; if a full set was required, springs were used. Ivory and natural teeth were objectionable from their liability to be acted upon by the fluids of the mouth. Absorbing as they do these secretions, they soon become offensive, and often rapidly decay. Porcelain teeth, well named incorruptible, perfectly resist the destructive action of these fluids; and as they are made nearly perfect in color and shape, they are not easily detected. Though of French origin, they owe the perfection to which they have been brought to the energy and ingenuity of the American manufacturer.

Mr. Charles W. Peale of Philadelphia has the reputation of making in 1807 the first manufactured in the U. S. He made a set for his son, Rembrandt Peale, in 1808, and gave instruction in his methods to Mr. Barabino, a dentist then practising in Philadelphia. The first regular manufacturers were Greenwood, Woffendale, and Parkhurst, who were engaged in the business in 1825. The manufacture of mineral teeth for the supply of dentists was first undertaken by Samuel W. Stockton in Philadelphia about the year 1835, and to him, together with Neal and Acock, is due the credit of establishing this branch of business in the U. S. The present perfection in moulding and enamelling the teeth was not attained for some years afterwards, nor was the color so life-like or the shades so varied. For many years the coloring was put on in the shape of paint. The teeth were moulded and partially burned, when they were subjected to the process of painting, and again placed in the furnace. Much of the improvement made between 1840 and 1849 in the transparency of the tooth, the granulated appearance of the gum enamel, and the almost unlimited variety of shades, was due to the persistent and untiring experiments of Dr. Elias Wildman of Philadelphia. The use of the purple of Cassius, or oxide of gold, now so generally used in gum-color, was brought to its present state of perfection through his untiring efforts.

An artificial tooth must possess certain qualities apart from size, shape, and color—a front surface which must closely resemble the enamel or external covering of the natural tooth, and a body having the toughness which allows the vigorous use of the hammer in riveting without fracture, and the use of the blowpipe in soldering without liability to crack. If the tooth were one homogeneous mass, the requisite amount of vitrifaction necessary to imitate the enamel would render it brittle; but a proper amount of translucency must be preserved, or there will be the opaque, clay-colored tooth, which proclaims its artificial character to the most casual glance; so that a nice calculation is necessary not to sacrifice beauty to strength. There must also be the distinctly-marked clear cutting edge of enamel projecting beyond the body of the tooth, and contrasting, as in Nature's work, with the yellow or brown base, and yet this depth of color in the body and translucency of the point must be so nicely blended that the line of union cannot be determined. These and many other valuable results have been secured by patience of research and skill in application.

The principal materials entering into the composition of mineral teeth are felspar, silex (flint), and kaolin (clay), with various fluxes, so known in chemistry, more familiarly characterized as *glasses*, used to determine the point of fusion desired, of different parts of the tooth. The general tone or tint of these materials is white or dusky yellow, so that coloring forms a prime adjunct in the process.

The chief coloring substances are titanium for yellow, platina sponge for gray, oxide of cobalt for bright blue, and oxide of gold for red. These, with others in varying combinations, are used to color the body, point, and outside enamels. There are more than forty shades of color in the bodies used, and an equal number in the point and outside enamels. Thus, starting with the lightest shade of body known as "A," forty different grades may be produced by using a different point-enamel, and on each of these a different effect by the use of various outside enamels, so that with a single body of any one color one may produce 64,000 varieties or gradations of color; and as there are thirty-nine other bodies, a smart calculator can determine the many changes of which they are capable. Some idea may be formed of the need of variety by the fact that out of innumerable trials in the way of combinations, 130 standard shades are made, duly arranged, and classified by numbers, forming a gradual but quite perceptible progression from the most delicate blue-white to the dark tobacco-stain. For the production of these colors one is not to think of a dyer's vat, but to remember that their bath is a glowing muffle at incandescent heat.

Many teeth, good in themselves, have an artificial appearance in the mouth, simply because the dentist, though an excellent mechanic, has lacked the perception to discover the shade made necessary by the complexion, hair, and eyes of the wearer.

One establishment in Philadelphia turns out 400,000 teeth per month, about half what are made in Europe and America. In Europe a substance resembling Wedgwood ware is of late much used for artificial teeth, and its toughness and durability are admirable.

In fitting artificial teeth it is very important to take a good impression of the shape of the mouth. Various sub-

stances have been used for the purpose, such as wax (either pure or mixed with paraffin, gutta-percha, or other materials); gutta-percha alone or combined; plaster of Paris alone. These substances have each their merits, and the choice for any particular case is to be determined by experience. The two materials principally employed in making the plate upon which the teeth are fastened are gold and vulcanized rubber. The principal advantage of the latter material is its cheapness, which is more than counterbalanced by its clumsiness, fragility, and its irritating effect on the mouth. C. NEWLIN PIERCE.

Dentition. See TEETH.

Den'ton, a county in the N. of Texas. Area, 900 square miles. It is intersected by several branches of Trinity River, one of which is called Denton Fork. The surface is diversified by prairies and extensive forests; the soil is fertile. Wheat, corn, cotton, cattle, swine, tobacco, and wool are raised. Capital, Denton. Pop. 7251.

Denton, a township and post-village, capital of Caroline co., Md., on the E. bank of the Choptank River, 65 miles E. of Annapolis. It has two weekly newspapers, one iron-foundry, one academy, five churches, and two churches for the colored people. The river on which it is situated is famous for shad and herring. Total pop. 475.
WM. HENRY LEGG, ED. "JOURNAL."

Denton, a post-village, capital of Denton co., Tex., on the Texas Pacific R. R., 45 miles S. W. of Sherman. It has one weekly newspaper. Pop. 361.
C. W. GEERS, ED. "MONITOR."

Denuda'tion [from the Lat. *denudo, denudatum,* to "lay bare"], in geology, is defined by Lyell as "the removal of solid matter by water in motion, whether of rivers or of the waves and currents of the sea, and the consequent laying bare of some inferior rock. This operation has exerted an influence on the structure of the earth's crust as universal and important as sedimentary deposition itself; for denudation is the necessary antecedent of the production of all new strata of mechanical origin. The formation of every new deposit by the transport of sediment and pebbles necessarily implies that there has been somewhere else a grinding down of rock into rounded fragments, sand, or mud equal in quantity to the new strata." Denudation may be divided into *subaërial,* which is effected by the action of wind, rain, and rivers, and *submarine,* which is caused by tides and currents of the sea. In many instances deep and wide channels or valleys have been excavated in rocky strata by the long-continued action of rivers; and these are called *valleys of denudation.* As the strata exposed on the sides of these valleys correspond to each other, both in composition and order of position, it is evident that they were originally continuous. "The larger part of the valleys of the world," says Dana, "are formed entirely by running water. . . . Many examples are on record of gorges hundreds of feet deep cut out of the solid rock by two or three centuries only of work."

Den'ver, a handsome city of Colorado, the capital of the Territory and of Arapahoe co., is beautifully situated on the South Platte River, 15 miles E. of the base of the Rocky Mountains and 5375 feet above the level of the sea; lat. 39° 47′ N., lon. 105° W. It is the western terminus of the Kansas Pacific R. R., and the northern terminus of the Denver and Rio Grande R. R. The Denver Pacific R. R., 106 miles long, extends from Denver northward to Cheyenne. Denver is the commercial centre and most populous city of Colorado. It commands a magnificent view of mountain-scenery and of several peaks covered with eternal snow. The climate is peculiarly serene, healthy, and delightful. The city occupies a series of plateaus rising as they recede from the river by gentle ascents. It contains a U. S. branch mint, three seminaries, and three national and four private banks. Exchange drawn in 1872, $21,000,000. Eight weekly, one semi-weekly, two monthly, and three daily newspapers are published here. The Colorado Central R. R. connects this place with Golden City, 17 miles distant. The Denver and Boulder Valley Railway, 44 miles long, was completed in Sept., 1873, to Boulder City. The Denver South Park and Pacific is a new narrow-gauge railway; making altogether six railroads diverging from Denver. The value of the goods sold here in 1872 was estimated at $18,000,000. Denver was first settled in 1858. There are eighteen churches, numerous manufactories, water and gas-works, and street railways. P. 4759.
WILLIAM N. BYERS, ED. "ROCKY MOUNTAIN NEWS."

Denver, a township of Richland co., Ill. Pop. 952.

Denver, a post-township of Newaygo co., Mich. Pop. 777.

Denver (JAMES W.), an American general, born at Winchester, Va., in 1818. He removed to California, was elected a member of Congress in 1854, and was governor of Kansas from Dec., 1857, to the autumn of 1858. He became a brigadier-general of Union volunteers in 1861.

Den'verton, a post-township of Solano co., Cal. P. 470.

De'odand [Lat. *deodandum,* from *Deo* (dative of *Deus,* "God"), and *dandum,* future passive participle from *do,* to "give;" literally, that which is "to be given or dedicated to God"], in English law, a name applied to any personal chattel which had caused the death of a human being, and for that reason was applied to pious uses, or, as the term implies, given to God. It was, in fact, forfeited to the king, and distributed in alms by his high almoner. The law of deodand is now abolished in England, and is unknown in American law.

Deodar. See CEDAR.

Deo'datus, or **Deus'dedit,** SAINT, pope, succeeded Boniface IV. in 615, died Nov. 9, 618, and was succeeded by Boniface V. He is regarded as a worker of miracles.

Deodorizers. See DISINFECTION, by PROF. HENRY HARTSHORNE, M. D.

Deoxida'tion [Lat. *deoxidatio,* from *de,* priv., and *oxygen*], the chemical process by which oxygen is abstracted from a compound. This term when applied to metals is synonymous with *reduction.* A compound of a metal with oxygen may in many cases be reduced or deoxidized by heating it with carbon or in a stream of hydrogen gas.

Depart'ment [Fr. *département,* from *departir,* to "divide"], literally, a "division;" a portion; a distinct province; a territorial division; a principal division of executive government. In the U. S. each of the secretaries and other functionaries who form the cabinet is the head of a department. These are called the departments of agriculture, education, interior, justice, navy, post-office, state, treasury, and war. A department is not defined by the Constitution, but is recognized and mentioned several times in that instrument. It is a division of government business over which the head, by law, exercises exclusive control, subject only to the supervision and direction of the President. The attorney-general is the head of the department of justice, established in 1870. Portions of the duties of several departments are allotted to bureaus, but there are no separate bureaus in the department of state or that of the post-office. The term department is also applied to the three principal branches or co-ordinate powers of the republic. "Under the Federal Constitution," says Gillet, "the national government is composed of three distinct and independent departments—the *legislative,* the *judicial,* and the *executive.*" The whole territory of the U. S. is divided into military departments, each under a general officer.

DEPARTMENT, in geography, a primary division of France. In 1790 the old divisions called provinces were abolished, and the country was divided into eighty-three departments, most of which were designated by the names of French rivers or mountains. During the first empire the number increased to 130, including Belgium, portions of Italy, etc. At the beginning of the German war in 1870 the number of departments was eighty-nine. In 1871, France ceded to the German empire the whole of Bas-Rhin, a large part of Haut-Rhin, nearly all of Moselle, a small part of the department of Vosges, and a part of Meurthe. Each department is divided into arrondissements, and is governed by a prefect (*préfet*). The principal divisions of Bolivia, Peru, and some other South American republics are also called departments.

Departure, in navigation. See NAVIGATION, by LIEUT.-COM. A. H. MCCORMICK, U. S. N.

Depau'ville, a post-village of Clayton township, Jefferson co., N. Y., at the head of navigation of Chaumont River. Pop. 235.

De Pere, a township of Brown co., Wis., containing the villages of De Pere and West De Pere, situated on opposite sides of the Fox River. They are connected by a bridge 1500 feet in length, and contain, together, eight churches, three public and one private school, four smelting-furnaces, one large railroad car-shop and iron-works, a foundry, machine-shop, and hub- and spoke-factory, three flouring, two wooden-ware, three shingle, and four saw mills, five wagon-shops, besides various other industries. The Milwaukee and Northern Railway runs on the river bank through De Pere, and the Chicago and North-western dépôt is in West De Pere. The Goodrich line of steamers makes regular trips to Chicago, and the Buffalo line takes freight from the wharves to Buffalo and intermediate ports. It has one weekly newspaper. The water-power is made by the first dam on the Fox River of the Green Bay and Mississippi Canal Company. Pop. of township, 2800; of De Pere, 1372; of West De Pere, 875.
P. R. PROCTOR, ED. "NEWS."

De Peys'ter, a post-village and fertile township of St. Lawrence co., N. Y., named after Frederic (I.) de Peyster, bounded on the W. by Black Lake, and intersected by the Oswegatchie River. Pop. 1138.

De Peyster (J. Watts), born Mar. 9, 1821, is of the seventh generation residing or born in the first ward of the city of New York. The first of the name in America, Johannes, of Huguenot extraction, a person of property, came from Holland, was schepen in 1656, etc., alderman in 1666, etc., burgomaster in 1673, and then deputy-mayor in 1677, of New York, refusing the mayoralty because he could not speak English. He had an opportunity for displaying his patriotism and firmness (1673) in one of the most trying crises of the Dutch colony. His eldest son, Abraham (I.), was a man of very great ability and most genial nature. He was acting governor and president of the council in 1700; chief-justice, 1700–01; colonel commanding the colonial militia of the city and county of New York, and treasurer for many years of the colonies of New York and New Jersey. His eldest son, Abraham (II.), succeeded him as treasurer in 1721, and continued in office during his lifetime (1767). James (I.), his eldest son, was a merchant of great note and of much benevolence. In this generation, Arent Schuyler de Peyster, the grandson of Abraham (I.), ultimately colonel B. A., and commanding the Eighth or King's regiment of foot, exercised a vast command and influence in the N. W. with his head-quarters at Michilimacinac, but will be better known by his literary connection with the poet Burns—a private in the Dumfries Volunteers, of which de Peyster was colonel—who dedicated to his military superior his "Poem on Life." The nephew of the preceding, bearing the same name, was a fearless navigator, and has left a memorial in the de Peyster Islands, a group of seventeen in the South Pacific (Mulgrave Archipelago), discovered by him in 1819. The three sons of James (I.), Abraham (III.), Frederic (I.), James (II.), were officers in the British service. Abraham (III.) was second in command in the battle of King's Mountain (1780), and after displaying great valor, severely wounded at the conclusion of this contest, the most desperate and sanguinary at the South. In this battle British troops (and perhaps any troops in the field) were first armed with breech-loading rifles, the invention of Patrick Ferguson, major B. A., and colonel and acting brigadier in America, chief in command of the royal forces in this decisive collision. Frederic (I.) was also severely wounded in the Carolinas, and James (II.), captain-lieutenant in America, and subsequently lieutenant in the Royal Artillery, one of the handsomest men in the British army, was killed under the most extraordinary circumstances at the assault of the French lines of Menin, in Flanders (1793), having been previously buried alive by the explosion of a mine at the siege of Valenciennes, and brought back to light and life almost by a miracle. (See "Gentleman's Magazine," 1793.) Frederic (II.), third son of Frederic (I.), president of the New York Historical Society and prominent member of a number of literary and charitable institutions, is the author of a number of able pamphlets, denoting great knowledge, research, ability, and influence.—J. Watts de Peyster has published a number of military, historical, and ethnological, etc. works, of which the most prominent are biographies of the Swedish field-marshal Torstenson (seventeenth century); of Major-General Philip Kearny; of Coehorn, "prince of engineers;" of Carausius; of the History of the Third Corps of the Army of the Potomac; of the decisive conflicts of the great American civil war, and of the Last Campaign of the Army of the Potomac, etc. etc. etc. For the first work he was the recipient of three splendid medals, etc. from Oscar I., king of Sweden, and, for valuable services, of the only brevet major-generalship ever conferred, after debate, by a special law or concurrent resolution of his native, or of any other, State. His writings have won for him the endorsement of a number of our most distinguished generals as "the foremost military writer of the country." He was the first to urge in a series of reports, made in 1852–53, the advantages of a paid fire department for this city, in conjunction with steam as applied to the means of combating fire. His three sons, J. Watts de Peyster, Jr., Frederic, Jr., and Johnston L., were respectively brevetted colonel, major, and lieutenant-colonel U. S. volunteers, and all three colonels N. Y. volunteers, for gallant and meritorious services during the great American conflict.

Charles W. Greene.

De Peyster (J. Watts, Jr.), born Dec. 2, 1841, displayed in early age great decision of character, power of command, laborious research, and practical power of application. In Mar., 1862, he left the Law School of Columbia College, N. Y., joined his cousin, Maj.-Gen. Philip Kearny, as volunteer aid, and was greatly distinguished for gallantry and good conduct in the battle of Williamsburg. Promoted to a lieutenancy, and while commanding a company of New York volunteer cavalry, he won the respect and esteem of his colonel, a man of great culture and observation, who testified "that with experience (which he was rapidly acquiring) he would have been one of the best of cavalry officers." Again promoted major of the First New York Volunteer Artillery, he returned to the Peninsula, and, attached to the staff of Maj.-Gen. Peck, acquired the respect, the regard, and good-will, not only of his immediate commander, but of every general with whom he was brought in contact or with whom he served in the course of most varied duties. Prostrated by James River fever, after many months' struggle between life and death he hastened back to the field in the winter of 1863, and, although pronounced by medical examiners as unfit for active duty, he displayed a zeal, capacity, and energy in the campaign of Chancellorsville which elicited the most remarkable commendations from the commander-in-chief, the magnificent hero of the "battle above the clouds," Joseph Hooker, who recommended Maj. de Peyster for brevet as eminently deserving, having been no less remarked for his coolness and courage at Fredericksburg than at Williamsburg; likewise from his immediate superior, Gen. Albion P. Howe.

Maj., Brevet Col. de Peyster, continued to command a brigade of artillery until midsummer, 1863, when the consequences of his faithful service in such a deteriorated sanitary condition developed diseases which neither science nor time could alleviate; and although he survived until 13th April, 1873, this whole period was one long, hopeless struggle of unyielding constancy against the unrelaxing siege of death.

Charles W. Greene.

Depil'atory [Lat. *depilatorius*, from *de*, priv., and *pilus*, the "hair"], a name given to applications used to remove hair from any part of the body. A thin paste of powdered quicklime and water applied to any part until a burning sensation is produced, and then wiped off with a wet sponge, will generally remove hair.

Deploy' [Fr. *déployer*, to "unfold," to "spread"], a military term, signifies to open or extend troops from column into line; to spread out a body of troops so as to present a wider front. To reverse this movement is to *ploy*.

Deporta'tion [from the Lat. *de*, "from," and *porto*, *portatum*, to "carry"], a compulsory removal from one country to another; a banishment. The kings of ancient Assyria attempted to secure their conquests by the deportation of a large part of the native population, as in the case of the Jews, who were carried as captives to Babylon. In French law, deportation is a punishment equivalent to transportation in English. It is ranked as third in degree after capital punishment, the second being condemnation to the galleys or hard labor for life. Deportation has often been inflicted in France as a punishment for political offences since the revolution of 1789.

Depos'it [Fr. *dépôt;* from the Lat. *depono*, *depositum*, to "lay down"], any matter laid down; that which is thrown down from a liquid in which it has been suspended. In geology, a bed or stratum of rock formed of matter that has settled from suspension in water. Deposits are characterized, according to the conditions under which they were formed, as marine, lacustrine, or fluviatile.

Depos'it, a post-village situated partly in Broome and partly in Delaware co., N. Y., on the Erie R. R. where it crosses the Delaware River, 177 miles N. W. of New York. It has a national bank, a newspaper, an academy, stock-yards, a planing-mill, a flouring mill, etc. Pop. 1286, of which 496 are in Delaware county.

Ed. "Courier."

Deposi'tion [Lat. *depositio*, from *de*, "down," and *pono*, *positum*, to "put"], in law, the testimony of a witness set down in writing in answer to interrogatories legally exhibited. Depositions are taken either by a judge or a commissioner specially appointed for that purpose. The questions to which the depositions are answers are usually put by the parties to the suit or their legal representatives, under the control of the court by whose authority the commission to take the testimony issues. Such depositions form an established medium of proof in the English court of chancery. It is a rule in the law of evidence that a deposition cannot be read where the witness himself might be produced, because his oral testimony is the most satisfactory medium of proof.

Deposition, in geology, the process by which sedimentary deposits or strata are formed. The greater portions of the strata of sandstone, limestone, and slate are the result of deposition. During the process of deposition each separate layer was once the uppermost, and was in contact with water, as is proved by the numerous fossils of marine animals found in it. "By attending," says Lyell, "to the

nature of these remains, we are often enabled to determine whether the deposition was slow or rapid, and whether it took place in a deep or shallow sea."

Depot [Fr. *dépôt*, dā'po', from the Lat. *de*, "down," and *pono, positum*, to "put" or "place"], a storehouse or place for the reception of goods for safe keeping;* a military station, where supplies are kept, recruits received and trained, and the needs of soldiers provided for. The term is also applied to that portion of a battalion remaining when the rest are ordered upon foreign service. The combining of several battalions of depots forms a depot battalion. In America the name depot is popularly and somewhat incorrectly given to railroad stations.

Dep'ping (George Bernard), a *littérateur*, born at Münster May 11, 1784, removed in early life to Paris. He wrote "The Maritime Expeditions of the Normans in the Tenth Century" (1826), "History of Normandy" (1835), and other works. Died Sept. 5, 1853.

Depres'sion of Equa'tions, in algebra, the derivation from a given equation of another lower in degree, whose roots are related in a known way to those of the first. This reduction can always be effected by simple division when one or more of the roots are known; but without knowing the roots beforehand the equation may be depressed—1st, when some particular relation subsists between two (or more) of the roots; for example, if an equation contain equal roots, these may be found and the equation reduced by as many dimensions as there are equal roots; 2d, if two roots of an equation be equal in magnitude, but opposite in sign; and 3d, if the equation be a reciprocal one—that is to say, such that its form is not changed by changing x into $\frac{1}{x}$. (See Equation, by F. A. P. Barnard.

Dept'ford, a town and naval port of England, is on the Thames, 4 miles below London Bridge, and is separated from Greenwich by the Ravensbourne, which here enters the Thames. It is partly in Kent and partly in Surrey. It contains a large naval arsenal and dockyard. Here are extensive market-gardens. Pop. 45,973.

Deptford, a township of Gloucester co., N. J. Pop. 4663.

Dep'uty [Fr. *député*, from the Lat. *deputo*, to "judge," to "destine," to "appoint"], a person appointed to act for another as representative, lieutenant, viceroy, or agent; a delegate; a legislator chosen to represent his constituents. One of the legislative bodies of France under the monarchy (1814–48) was called the Chambre des Députés, and the term *député* is now applied to the members of the French National Assembly. In the kingdom of Italy the lower house is called Camera de' Deputati, "Chamber of Deputies." It consists of about 508 deputies, elected by the people who pay taxes.

De Quin'cey (Thomas), an English author, born in Manchester Aug. 15, 1785. He was a younger son of a wealthy merchant. He once ran away from school and went to London, where he passed nearly two months in extreme want and strange adventures. He entered the University of Oxford in 1803, and there contracted a habit of using opium. In 1808 he quitted the university, became a friend and associate of Coleridge, Southey, and Wordsworth, and began to reside at Grasmere in the Lake district. He married in 1816, devoted his time chiefly to literature, made good translations from Lessing and Jean Paul Richter, and contributed articles on biography, philosophy, and other subjects to "Blackwood's Magazine." When in the prime of life he reformed the habit of the excessive use of opium, and in 1821 he published "Confessions of an English Opium-Eater." He removed to Scotland in 1843, and passed the later years of his life near Edinburgh. He was one of the most brilliant magazine-writers of his time, and wrote on a great variety of subjects, but his works are mostly fragmentary. The first edition of his collected works was published by Ticknor & Fields, Boston (18 vols., 1851–58). He died in Edinburgh Dec. 8, 1859.

Der'a Ghazee' Khan, a town of Afghanistan, hard by the river Indus and 65 miles N. W. of Bhawlpoor. It is advantageously situated for trade, and has manufactures of silk and cotton goods and cutlery. Pop. estimated at 25,000.

Derah [Arab. *deraa*], the unit measure of length in Egypt. The subdivisions are the *kadam* = one-half of a derah, the *abdat* = one-sixth of a derah, and the *kerat* = one-twenty-fourth of a derah. Several derahs are in use—viz. the common derah of Egypt = 22.37 British inches; the derah Hendazeh, by which dry goods are sold = 25.5 British inches; the derah Istambouli (Constantinopolitan derah), used for European dry goods = 66.34 British inches; and the ancient derah of the Nile or of Memphis = 20.699 British inches. The first three values above are given on the authority of the "Report of the International Conference on Moneys, Weights, and Measures," Paris, 1867; and the last on that of Prof. Piazzi Smyth. This measure has some interest, in consequence of its connection with recent discussions concerning the Great Pyramid of Egypt, and the purpose of its construction.

Der'a Isma'eel' Khan, a town of Afghanistan, in Derajat, on the Indus, 17 miles N. N. W. of Bukkur. It has an active trade and manufactures of cotton cloth. Pop. about 8000.

Derayeh, El, a town of Arabia, in Nedjed, about 430 miles N. E. of Mecca, was formerly the capital of the Wahabees. It has a beautiful situation, with gardens and fertile fields in the environs. It was once a populous town, and contained about thirty mosques, but it was taken and partly destroyed by Ibrâhim Pasha in 1819. Pop. about 15,000.

Der'bend', a fortified maritime town of Russia, capital of Daghestan, is on the W. shore of the Caspian Sea; lat. 42° N., lon. 48° 15' E. It is situated at the foot of a mountain, and at the entrance of a defile called by the ancients *Albaniæ Pylæ*, and now the Pass of Derbend. It is enclosed by walls which are supposed to be 1000 years old or more, and are eight feet thick and twenty-six feet high. The harbor is poor, and accessible only to small boats. Derbend was taken from Persia by the Russians in 1795. Pop. in 1869, 15,739.

Der'by, an inland county of England, bounded on the N. by Yorkshire, has an area of 1030 square miles. It is drained by the rivers Trent and Derwent. This county is remarkable for the variety of its scenery, and is partly occupied by the Penine chain, formed of carboniferous limestone, which abounds in precipices, caverns, and rocking-stones. The Peak, the highest hill in Derbyshire, has an altitude of 2000 feet. This county is rich in minerals—viz. coal, copper, iron, lead, zinc, marble, fluor-spar, etc. Here are important manufactures of cotton, silk, and worsted goods, metallic wares, and porcelain. It is traversed by several canals and railways. Capital, Derby. Pop. in 1871, 380,538.

Derby, a manufacturing town of England, capital of the above county, is on the river Derwent, at the junction of the main branches of the Midland Railway, 119 miles N. N. W. of London and 35 miles N. N. E. of Birmingham. The private houses are mostly built of brick. Here is a free grammar school founded in 1162. Derby has manufactures of silk, cotton, lace, hosiery, porcelain of great beauty, jewelry, and ornaments of fluor-spar; also iron-foundries, rolling-mills, and tanneries. The staple manufacture is throwing silk, introduced early in the eighteenth century. Pop. in 1871, 49,793.

Derby, or **Derby Narrows,** a post-village of New Haven co., Conn., is at the confluence of the Naugatuck with the Housatonic River, and on the Naugatuck and the New Haven and Derby R. Rs., 10 miles W. of New Haven. A bridge over the river connects it with Birmingham. It has extensive and varied manufactures, and a savings bank. Pop. 3168; of township, including Derby Village, Ansonia, and Birmingham, 8020.

Derby, a post-township of Orleans co., Vt. It is the seat of an academy. It has five churches, manufactures of lumber, starch, and woollen goods, and a national bank, the latter at Derby Line, on the Canada frontier. North Derby is the junction of the Connecticut and Passumpsic Rivers R. R. with the Massawippi Valley R. R. and the Stanstead branch. The town lies on the E. side of Lake Memphremagog. Pop. 2039.

Derby (Edward Geoffrey **Smith-Stanley**), fourteenth earl of, an English statesman, was born in Lancashire Mar. 29, 1799. He was educated at Oxford, was elected to Parliament in 1820, and represented successively Preston, Windsor, and North Lancashire. In 1825 he married a daughter of Lord Skelmersdale. He supported the Reform bill, and became chief secretary for Ireland in 1830. In 1833 he entered the Whig ministry as secretary for the colonies, but he resigned office in 1834, and joined the conservative party. He was secretary for the colonies in the cabinet of Sir Robert Peel from 1841 to 1845. Having been created Baron Stanley in 1844, he then passed into the House of Lords. He resigned office in 1845, because he was opposed to the repeal of the Corn laws, and soon after this date began to be regarded as the leader of the conservatives and protectionist party. He stood in the foremost rank as a parliamentary debater. On the death of his

* The original idea of *depot* is that of a place where something is "put down" for a short time, to be taken up again. *Repository* (from *re*, "back," and *pono*, to "put") is a place where something is put back (out of the way), to be kept a long time.

father, in 1851, he succeeded him as earl of Derby. He was prime minister from Feb. to Dec., 1852, and was then succeeded by Lord Aberdeen. He was the leader of the opposition during the administration of Lord Palmerston, who resigned in Feb., 1858. Lord Derby then formed a new ministry, in which he was first lord of the treasury (premier). He introduced a bill for electoral reform, but the House adopted an amendment offered by Lord John Russell. Lord Derby therefore dissolved Parliament and appealed to the country, but the liberals obtained a majority in the new House of Commons which met in June, 1859, and Lord Derby then resigned office. He produced a translation of Homer's "Iliad" into blank verse (1865), which is highly commended. Russell and Gladstone, whose Reform bill had been rejected by the House of Commons, retired from power in June, 1866, and Lord Derby was then requested by the queen to form a new ministry. He failed in his effort to draw several Whig or liberal leaders into a coalition. His principal colleague was Disraeli, who prepared a new Reform bill, passed in 1867, extending the right of suffrage to great numbers of the middle class. He resigned in Feb., 1868, and was succeeded by Disraeli. Died Oct. 23, 1869.

Derby, Earls of (England, 1485), Barons Stanley (United Kingdom, 1832), and baronets (1627). The kings of Man were of this line from 1406 till 1505, when they took the title of lords of that island. The lordship of Man passed from the Derby family in 1735.—Edward Henry Smith-Stanley, fifteenth earl, P. C., D. C. L., was born at Knowsley Park July 21, 1826. He was formerly styled Lord Stanley. He was educated at Trinity College, Cambridge, where he graduated as first class in classics in 1848, and was elected to Parliament in the same year. He was one of the most liberal members of the conservative party. In Feb., 1858, he entered the cabinet as secretary for the colonies, and in the ensuing May he became commissioner for the affairs of India. He retired from office when the liberals came into power, in June, 1859. On the formation of a conservative ministry by his father in June, 1866, he was appointed secretary for foreign affairs. He presided over the conference of the European powers which was held in London in May, 1867. He resigned with his colleagues in Dec., 1868, and inherited the title of earl of Derby in Oct., 1869; became sec. of foreign affairs 1874.

Derby (Elias Hasket), a merchant, born at Salem, Mass., Aug. 16, 1739, was a distinguished ship-owner, and in the Revolutionary war engaged extensively and successfully in privateering upon British commerce. He afterwards established the American China and East India trade. Died at Salem, Mass., Sept. 8, 1799.—General Elias Hasket Derby, born at Salem Jan. 10, 1766, was also one of the founders of the India trade. He also began the manufacture of American broadcloth, and is believed to have been the first importer of merino sheep. Died Sept. 16, 1826.—Elias Hasket Derby, a son of the preceding, born Sept. 24, 1803, graduated at Harvard in 1824, became an eminent lawyer and railroad president, and is well known for his contributions to the "Atlantic Monthly," "Edinburgh Review," etc. He labored with zeal in the construction of iron-clad vessels during the civil war.

Derby (George H.), an American officer and humorist, born in 1823 in Norfolk co., Mass., graduated at West Point in 1846, and July 1, 1860, captain of topographical engineers. He served in the war with Mexico 1846–47, engaged at Vera Cruz and Cerro Gordo (severely wounded and brevet first lieutenant); on various surveys and explorations 1846–52; on improvement of San Diego harbor, Cal., 1853–54; on staff of commanding general and in charge of military roads department of the Pacific 1854–56; on coast survey 1856; and lighthouse engineer 1857–59. Under the *nom-de-plume* of "John Phœnix" he was author of "Phœnixiana, or Sketches and Burlesques," 1860, of "Squibob Papers," 1860, and of numerous humorous effusions. Died May 15, 1861, at New York City, aged thirty-eight. George W. Cullum, *U. S. Army.*

Derbyshire Spar, a name given to the fluoride of calcium or Fluor-Spar (which see).

Dercyl'lidas [Δερκυλλίδας], a Spartan commander sent to aid the Asiatic Greeks in their resistance to the Persian forces under Pharnabazus and Tissaphernes, B. C. 399. He captured a number of cities in Asia Minor, and built a wall to protect the Greeks of the Chersonesus against the Thracians. He was superseded by Agesilaus, B. C. 396.
Henry Drisler.

Derecske, a town of Hungary, in the county of Bihar, 12 miles S. of Debreczin. Near it are several small lakes, in one of which pearls are found. Pop. about 6000.

Derg, Lough ("Red Lake"), a small lake of Ireland between Donegal county and Tyrone. It encloses an isle called St. Patrick's Purgatory, which is visited annually by nearly 12,000 devotees, and is the most celebrated place of pilgrimage in Ireland.

Derin'da, a post-township of Jo Daviess co., Ill. P. 804.

Derived Func'tion, or **Derivative,** a term first used by Lagrange in his "Calcul des Fonctions" to indicate the coefficient of h in the development of a function $F(x+h)$ according to powers of h. It is itself a function of x, and is usually represented by the symbol $F'(x)$. In a similar manner the derived function of $F'(x)$ is termed the second derived function of $F(x)$, and is denoted by the symbol $F''(x)$. By allowing h to diminish indefinitely, the identity of the derived function and the differential coefficient $\frac{dF(x)}{dx}$ is at once seen. (See Differential Coefficient, by F. A. P. Barnard.

Der'matophytes [from the Gr. δερμα (gen. δέρματος), the "skin," and φύτον, a "plant"], a term applied to cryptogamic vegetable growths which inhabit the cuticle or epidermis, and give rise to certain skin-diseases, such as favus, ringworm, etc. It is held that the various forms of these plants are in many cases transmutable into each other. For example, the favus plant, the barber's-itch plant (*Achorion*), and the chlosma plant (*Microsporon*) are only forms of the yeast plant (*Torula* or *Cryptococcus cerevisiæ*).

Dermop'tera [from the Gr. δέρμα, "skin," and πτερόν, a "wing" or "fin"], an order of cartilaginous fishes characterized by the absence of pectoral and ventral fins. The rays of the vertical fins are soft and delicate, or imperceptible. The lancelet and lampreys are of this order.

Der'moskel'eton [from the Gr. δέρμα, "skin," and σκελετόν, a "skeleton"], a term applied to the crustaceous, testaceous, or osseous integument which covers many invertebrate animals, as the beetle and lobster; also some vertebrate animals, as the tortoise. It serves to protect the soft parts of the body, and affords points of attachment for the organs of locomotion.

Der'ne, Der'na, or **Bel'ed-al-Soor** (anc. *Darnis*), a seaport-town of Northern Africa, in Barca, is 1 mile from the Mediterranean; lat. 32° 46′ N., lon. 22° 41′ E. Its harbor is insecure. During the hostilities between the U. S. and Tripoli this town was taken in 1805 by the American forces under Gen. Eaton. Pop. about 6000.

Der'num, a township of Randolph co., Ark. Pop. 1764.

De Rosset (John Armand), M. D., of Wilmington, N. C., was one of the most remarkable men of the medical profession of the U. S. Born in 1767 in North Carolina, of Huguenot descent, he graduated in Princeton College, studied under Dr. Rush (receiving the highest mark of distinction), practised his profession sixty-nine years, and died in the ninety-second year of his age. When eighty years old he said, "I have prescribed for six generations in one family." His grandfather, father, himself and two sons have all practised medicine in Wilmington, N. C. Of him it has been said, "In every respect he was a model of the Christian and gentleman."
Paul F. Eve.

Der'rick [said to be the name of a celebrated hangman at Tyburn in the seventeenth century; hence, literally, a "hanger"], a mechanical invention used for lifting machinery, raising wrecks and other great weights, and transporting them from one place to another. A floating derrick or crane consists of an iron pontoon, divided into several watertight compartments, from the centre of which rises a tripod mast. Across the mast turns a boom of great strength: one arm of the boom is furnished with fourfold blocks, through which pass the chains intended to hoist the weight; the chains pass over the top of the mast to the opposite end of the boom, and thence descend to the side of the vessel, where they are connected with steam-engines in the pontoon. Water is admitted into the compartments of the pontoon as a counterpoise to the weight suspended.

Der'ry, a township of Pike co., Ill. Pop. 1327.

Derry, a township and post-village of Rockingham co., N. H. The village is on the Manchester and Lawrence R. R., 11 miles S. E. of Manchester. It is the seat of Pinkerton Academy and of Adams Female Seminary (East Derry). It has a national bank, and manufactures of lumber, boots and shoes, edge-tools, etc. Pop. of township, 1809.

Derry, a township and borough of Dauphin co., Pa., on the Philadelphia and Reading R. R., 13½ miles E. of Harrisburg. Pop. of township, 1824; of borough, 216.

Derry, a township of Mifflin co., Pa. Pop. 1901.

Derry, a township of Montour co., Pa. Pop. 888.

Derry, a township and village of Westmoreland co., Pa., on the Pennsylvania R. R., 46 miles E. S. E. of Pittsburg. Pop. 5170.

Derrynane, a township of Le Sueur co., Minn. P. 759.

De Russy (René Edward), an American officer, born in 1791 in New York City, graduated at West Point in 1812, colonel of engineers Mar. 3, 1863. In the war of 1812–15 with Great Britain he was engaged on the Canadian frontier in the repulse of the British flotilla at French Creek 1813, battle of Chrystler's Field 1813, attack on La Cote Mill 1814, battle of Plattsburg 1814, and after Gov. Provost's defeat was chief engineer of Gen. Macomb's division. He served in the construction of fortifications 1816–33; as superintendent of the Military Academy 1833–38; in building coast defences and improving harbors and rivers 1838–65; as member of various boards of engineers 1848–64; and in command of corps of engineers 1858–61. Brevet brigadier-general, Mar. 13, 1865, for long and faithful service. Died Nov. 23, 1865, at San Francisco, Cal., aged seventy-five. George W. Cullum, *U. S. Army.*

De Ruyter, a post-village of Madison co., N. Y., on the Auburn branch of the New York and Oswego Midland R. R., about 25 miles S. S. E. of Syracuse. It has one newspaper, is the seat of the De Ruyter Institute, and is in a good hop and dairy section. Pop. 605; of De Ruyter township, 2009. John R. Beden, Pub. "New Era."

Der'vish [from *darvêsh* or *darwêsh*, a Persian word signifying "poor;" also a "mendicant"], a name applied to the orders of Mohammedan monks in Persia, India, and Turkey. Some belong to communities, and reside partly in monasteries and partly outside; others wander solitarily through the land, living on alms and professing abstinence and holiness, but belonging to no particular sect. Their worship consists in prayers, mortifications, and religious dances. Dervishism is supposed to have taken its rise in Persian Soofeeism.

Der'wentwater, also called **Keswick Lake,** a beautiful lake of England, in Cumberland, is an expansion of the river Derwent. It extends southward from Keswick, is 3 or 4 miles long and 1½ miles wide. Its banks are rocky, abrupt, and picturesque. On this lake is a remarkable floating island, covered with vegetation and full of air-bubbles, which render it buoyant.

Derwentwater (James **Ratcliffe**), Earl of, an English Catholic and Jacobite, born in Northumberland June 28, 1689. He inherited the earldom from his father in 1705. In 1715 he raised a small body of his retainers to fight for the Pretender. He was one of the leaders of the army that was defeated at Preston (Nov. 13), and was taken prisoner. He was convicted of treason, and beheaded Feb. 24, 1716. His estates were given to Greenwich Hospital.

Derzha'vin, written also **Derzavin** or **Derjavine** (Gabriel Romanovitch), a celebrated Russian lyric poet, born at Kazan July 3, 1743. He entered the army in 1760, and was raised to the rank of colonel. Having gained the favor of the empress Catharine, he was appointed secretary of state in 1791. He became a senator in 1793, imperial treasurer in 1800, and minister of justice in 1802. In 1810 he published four volumes of poems, remarkable for originality, sublimity, and for purity of sentiment. His most popular poem is an "Ode to the Deity" ("Oda Bogu"), which has been translated into English, Chinese, and other languages. Died July 6, 1816.

Desaguade'ro (*i. e.* the "outlet"), a river of Bolivia, issues from Lake Titicaca, of which it is the only outlet. It flows southward about 190 miles and enters Lake Aullagas. It is the highest considerable river in America, for the elevation of its source is 12,846 feet, and that of its mouth is not much less.

Desaguadero, a vast table-land in Bolivia and Peru, between two ranges of the Andes. It extends from Potosí to the peak of Vilcañota, and is about 400 miles long. Area, estimated at 150,000 square miles. It contains the great lake Titicaca, 12,846 feet above the level of the sea, and Lake Aullagas, which has no outlet.

Desaix de Veygoux (Louis Charles Antoine), an able French general, born near Riom, in Auvergne, Aug. 17, 1768. He served with distinction in several campaigns of the army of the Rhine, and was rapidly promoted to the rank of general. In 1798 he took part in the expedition to Egypt. He gained a victory at Sidiman in October of that year, and completed the conquest of Upper Egypt in 1769. He afterwards governed that province with such moderation and justice that the natives called him "The Just Sultan." In May, 1800, he returned to France, and hastened to join the army in Italy. The French were about to retreat at Marengo, when Desaix arrived with a reserve, and converted defeat into a decisive victory, but he was killed in this action, June 14, 1800. (See J. Lavallée, "Eloge historique du Général Desaix;" Thiers, "History of the Consulate."

De Sanctis (Luigi), a leader of the Protestant movement in Italy, born Dec. 31, 1808, was for some years a priest and professor of theology in Rome, became a Protestant in 1847, established the Protestant periodical "Eco della Verità," and was in 1868 appointed professor of theology at the Waldensian Seminary in Florence. He wrote a number of treatises against the Roman Catholic Church which have been translated into several languages. Died Dec. 31, 1869.

Des Arc, a township of White co., Ark. Des Arc post-office is in Prairie co., and has one weekly newspaper. Pop. of township, 861.

Desaugiers (Marc Antoine Madeleine), a French song-writer, born at Frejus Nov. 17, 1772. He produced many popular songs and comedies or vaudevilles. He taught pianoforte-playing for some years in the U. S. Died Aug. 9, 1827.

Desault (Pierre Joseph), an eminent French surgeon, born Feb. 6, 1744, was a pupil of Antoine Petit. He was considered the most skilful French surgeon of his time, and had a very large practice. Died June 1, 1795. His doctrines were published in the "Surgical Works" of his scholar, Bichat. (See Petit, "Éloge de Desault," 1795.)

Descartes (René), [Lat. *Renatus Cartesius*], an illustrious French philosopher and mathematician, born at La Haye, in Touraine, Mar. 31, 1596. He was educated at the college of La Flèche, where he acquired great proficiency in mathematics and astronomy, and formed an intimate friendship with Mersenne. He left college in 1612, dissatisfied with the method and doctrines which were then in vogue. He resolved to efface from his mind all scholastic dogmas and the prejudices of his education, to reject the authority of books, and to admit only that which was confirmed by reason and experiment. He entered the Dutch army in 1616, and that of the duke of Bavaria in 1619, but he renounced the military profession in 1621. In pursuit of knowledge he travelled for several years in Italy, France, and other countries. He settled in Holland in 1629, in order to devote himself to the study of mathematics, astronomy, metaphysics, etc. He made important discoveries in algebra and geometry, which he announced in his "Discourse on the Method of Reasoning Well and of Investigating Scientific Truth," 1637 ("Discours sur la Méthode pour bien conduire sa Raison," etc.). This work comprises treatises on metaphysics, dioptrics, and geometry. He was the first who introduced exponents or applied the notation of indices to algebraic powers, and he gave a new and ingenious solution of equations of the fourth degree.

He published in 1641 "Meditationes de Prima Philosophia," which gave a wonderful impulse to philosophical inquiry. He founded the superstructure of all positive knowledge on the basis of self-consciousness, or the relation between consciousness and existence, which he expressed in this phrase: "Cogito, ergo sum"—"I think, therefore I exist." He worked a greater change in metaphysical thought than any modern philosopher. The innovations and paradoxes of the Cartesian philosophy excited much hostility among the theologians and the disciples of Aristotle. His book was condemned by the college of cardinals at Rome. Among his other works is "Principles of Philosophy" ("Principia Philosophiæ," 1644), in which he propounds his theory of the world—that the sun is the centre of a *vortex* of an ethereal fluid, whose whirling motion produces the revolution of the planets and other phenomena. The French court granted him a pension of 3000 livres in 1647. Having been invited to her court by Christina, queen of Sweden, he went to Stockholm in 1649, where he died next year from a cold he caught by standing in shoes and silk stockings on the cold marble floor, to teach philosophy early in the morning to the queen, still in bed. Complete editions of his works were published in 1690 and 1824. The "Meditations" have been translated into English by W. Molyneux (London, 1680) and by W. R. Walker ("Jour. Spec. Phil.," St. Louis, 1870). (See G. H. Lewes, "Biographical History of Philosophy;" Millet, "Descartes, sa Vie, etc.," 1869.)

Descartes' Rule of Signs, a theorem by means of which the maximum number of positive or negative roots of an equation can be ascertained by inspection. The theory reduces itself essentially to this: The number of positive roots of an equation cannot exceed the number of variations in the signs of its coefficients, considered in their proper order. As an illustration, take the cubic equation $F(x) = 3x^3 - 7x^2 + 11x + 4 = 0$. Inasmuch as there are but two variations of signs on passing from one extreme term to the other, through the intermediate ones, we conclude that the cubic cannot have more than two positive roots. To ascertain the maximum number of negative roots, it is merely necessary to apply the same theorem to the equation which is obtained from the original by chang-

ing x into $-x$. Thus the positive roots $F(-x) = -3x^3 - 7x^2 - 11x + 4 = 0$ are negative roots of the original cubic, and by Descartes' rule their number cannot exceed one. This rule is a particular case of Fourier's theorem.

Descent', in law, is the succession to landed estate after the owner's death, in cases where he has not made previous disposition of the estate. The rule of descent among the ancient Greeks was that the sons shared alike, and the daughters were dependent upon the bounty of their brothers. Among the Hebrews the eldest son had a double portion. With the ancient Romans sons and daughters shared alike. The former English law was very complicated, but has of late received important modifications. The law of primogeniture prevails as to males, while several females of equal degree claim as one heir.

The subject of descent is regulated by positive rules in the U. S., and but few of general application can be stated. The following may be referred to as either of common recognition or having some peculiarity worthy of notice:

1. Title by descent depends upon a rule of law. The person from whom the land descends is termed an ancestor; the one to whom it passes is called an heir, who has no volition in the matter. The estate is cast upon him, at the death of the ancestor, even against his consent.

2. The persons to whom land descends are specifically designated by positive rule, and may be grouped as follows: (1) Lineal descendants. These, if of equal degree, take equally undivided shares or are "tenants in common." If of unequal degree, those who are more remote take the share that would have belonged to their parent if living. Thus, if the ancestor had left a son A, and C, D, E, children of a deceased son B, the grandchildren taken together would have the share of B. Those who inherit on equal terms are said to take *per capita;* those who take the shares of deceased persons, as above illustrated, are said to take *per stirpes.* (2) Where there are no descendants, the next claimants would regularly be the parents (the father being frequently preferred to the mother), as they are removed but one degree from the intestate, while the nearest collateral relatives (brothers and sisters), reckoning according to the methods of the civil law (see Consanguinity), are two degrees. Still, if the estate descended to the intestate from maternal relatives, there are cogent reasons for preferring the brothers and sisters to the father, and the same reasons for preferring them to the mother where the land came from paternal relatives. Under these circumstances the law of some of the States gives the land to the father or mother for life only, as the case may be, and the estate itself to the brothers and sisters. (3) If there be no father or mother or descendants, the land will descend to the brothers and sisters equally, with the same distinctions as to taking *per capita* and *per stirpes* as noticed under subdivision (1). (4) The next claimants are either grandparents, or, if these be passed over, as may be the case, uncles and aunts and their descendants. In the instance of uncles, etc. the law of some of the States distinguishes between the case where the intestate acquired the estate by his own act and where he obtained it by inheritance. In the former instance the descent would take place to maternal and paternal uncles and aunts and their descendants, without discrimination; in the latter, the uncles, etc. belonging to that branch of the family from which the estate was derived would have the preference. More remote claimants need not here be noticed. (5) Distinctions sometimes are recognized between relatives of the whole blood and those of the half blood, so that the latter are excluded from inheriting. An illustration is found in the law of New York, under which, for example, a brother of the half blood on the maternal side (*frater uterinus*) cannot inherit land from a brother having a different father, which land such brother had inherited from his father, as the claimant is not in that case of the blood of the immediate ancestor from whom the estate was derived by the brother from whom inheritance is claimed. (*Wheeler* vs. *Clutterbuck*, 52 New York Reports 67, 1873.) (6) Posthumous children inherit as if they had been born during the life of the ancestor. They must be born alive, and of such a state of development that by the laws of physiology they are capable of living. (7) The English common law will prevail unless abrogated by statute. Thus, in New York, where the special cases referred to in the statute of descents do not occur, primogeniture still is recognized.

3. Illegitimate relatives cannot in general inherit, though in a number of the States they may under certain qualifications, particularly from the mother and maternal relatives.

4. The law of the State where the land is situate governs descent, without reference to the law prevailing where the owner resides.

5. In general, all interests in and rights to land are governed by the rules of descent. Thus, should the intestate have only a right of action, or be the owner of a future estate, or have simply a beneficial ownership, such as an estate held in trust, his rights and qualified estates of this nature will be transmitted under the same general rules as if he were legal owner in possession. This proposition is in some respects in marked contrast with the doctrines of the common law. This system required the ancestor to have been at some time seized or to have an estate of which seizin could be affirmed. (See Seizin.) Accordingly, if he had acquired only a right of action, this could not descend from him, nor could in general an estate of which he had acquired the ownership, subject to a life estate in another. Still, if he had once been seized, the unlawful deprivation of his seizin would not prevent the operation of the law of descent.

6. In a number of the States aliens cannot inherit. This is a rule of the English common law. In other States it has been abrogated.

(Accurate knowledge of the law of descents in any State can only be acquired by an examination of its statutes. See also Washburn "On Real Property," and Blackstone's and Kent's "Commentaries.") T. W. Dwight.

Deschambault, a post-village of Portneuf co., Quebec (Canada), on the N. side of the St. Lawrence River, 45 miles above Quebec. It has a convent of Sisters of Charity. Pop. about 500.

Deschamps (Émile), a French poet and dramatist, born at Bourges Feb. 20, 1791. He produced in 1818 two successful comedies, entitled "Selmours et Florian" and "Le Tour de Faveur." In 1828 he published a volume of poems called "French and Foreign Studies." He contributed to the journals some prose tales. Died April, 1871.

Deschanel (Martin), a French author, born at Paris Nov. 14, 1819, published in 1850 "Catholicisme et Socialisme," and articles for the republican press which caused his banishment. Returning in 1859, he became an editor of the "Journal des Débats." He printed "Les Courtesanes de la Grèce" (1851), "Histoire de la Conversation" (1858), "Physiologie des écrivains et des artistes" (1864), and "Études sur Aristophane" (1867).

Descrip'tive Geom'etry is a branch of practical mathematics, the object of which is to obtain representations on plane surfaces of accurately-defined bodies in space, for the investigation of their metrical as well as descriptive properties. It differs from ordinary perspective, inasmuch as by the latter method the actual dimensions of a body cannot be ascertained from its representation. In descriptive geometry points in space are represented by their orthographical projections on two planes at right angles to each other, called the planes of projection. It is usual to suppose one of the planes of projection to be horizontal, in which case the other is vertical; and the projections are called horizontal or vertical according as they are on the one or the other of these planes. Any curve in space will be represented by two curves in the horizontal and vertical planes, and a curved surface by the corresponding representations of certain points and curves on that surface. Thus, a plane would be completely defined by its intersections with the planes of projection. The intersections of a line or surface with the planes of projection are called its traces. Again, a sphere may be represented by the projections of its horizontal (or vertical) great circle; a cylindrical surface by its trace on one of the planes of projection, and the projection of any generator on the other; a cone by the projections of its vertex, and by one of its traces, etc. Although applicable to sculpture and all mechanical arts, it is especially useful to civil and military engineering. Among the best works on the subject are those of Monge, Hachette, Lacroix, and Leroy.

Des'eret, a name given by the Mormons to the Territory of Utah (which see). The Mormons claim that in the language of their sacred books this word means "honey-bee."

Des'ert [from the Lat. *deserta*, neut. plu. of *desertus*, passive part. from *desero, desertum*, to "forsake," "forsaken" places], a term generally used to designate a barren or uninhabited place, but applied more particularly to the vast sandy and stony plains of Africa and Asia. In every region of the globe plains are to be found which, though resembling each other in their grand outlines, exhibit, with the different latitudes in which they are placed, a corresponding variety of character. There are considerable tracts of desert land in Nevada, Arizona, and other parts of the U. S. Such are the "Bad Lands" E. of the Rocky Mountains; these are not plains, but are generally peculiarly broken and rocky surfaces. The principal desert of South America is the nearly rainless Atacama region. The most striking feature of North Africa is its immense deserts; of these the chief is the Sahara, or *The Desert*, so called by way of eminence.

The great deserts of Africa are separated from those of Asia only by the valley of the Nile and the Red Sea, the sandy zone extending throughout the breadth of the old continent from Western Africa to 120° E. longitude.

In many parts the dreary waste of loose and hardened sand is broken by low hills of naked sandstone or by tracts of arid clay, and occasionally it is enlivened by verdant isles or oases, which serve as resting-places for caravans. It has been computed to cover an area of 6,500,000 square miles, but the Asiatic portion of this tract includes many chains of mountains and fertile valleys. It is characterized by arid wastes of sand or clay, sometimes with saline incrustations on the surface. Except the Nile, the Euphrates, the Indus, and the Oxus, there are no large rivers in a region which embraces almost a fourth part of both Africa and Asia. This portion of Central Asia forms a series of elevated plains 6000 miles in length from E. to W. "Some of these plains," says Humboldt, "are covered with herbage; others produce only evergreen saliferous plants; but a great number glitter from afar with a saline efflorescence that crystallizes in the semblance of lichens, and covers the clayey soil with patches like new-fallen snow."

In the Old Testament four words are employed, all of which are sometimes, not uniformly, rendered in our English version "desert," but no one of them denotes a sandy waste. Desert, in the Hebrew sense, is simply untilled pasture-land, which may be covered with a luxuriant vegetation. In the New Testament, ἐρῆμος has the same sense, which of course is quite at variance with classic usage.

REVISED BY R. D. HITCHCOCK.

Deser'ter [for etymology see preceding article], a soldier or seaman who abandons the public service without permission. In England this crime was formerly punished by death, but is now left to the discretion of a court-martial. In time of war in the U. S. deserters from the army and navy may be sentenced to death, or otherwise punished as a court-martial may decide. For desertion in times of peace the punishment is much less severe.

Desfontaines (RENÉ LOUICHE), a French botanist, born in Feb., 1752. In 1798 he published "Flora Atlantica" (2 vols. 4to), which treats of the plants of Africa. He discovered the difference in the growth and structure of endogenous and exogenous plants. Died Nov. 16, 1833. (See A. P. DE CANDOLLE, "Notice Historique sur la Vie de M. Desfontaines," 1834.)

Desgenettes (NICOLAS RENÉ DUFRICHE), M. D., BARON, a French physician, born at Alençon May 23, 1762. He was chief physician of the army of Italy in 1795–96, and was physician to the grand army during the empire. He wrote several medical works. Died Feb. 3, 1837.

Deshā', a county in the S. E. of Arkansas. Area, 750 square miles. It is bounded on the E. by the Mississippi River, and intersected by the Arkansas and White rivers. The surface is an alluvial plain, partly liable to inundation; the soil is fertile. Cotton is the chief crop. Capital, Napoleon. Pop. 6125.

Deshoulières (ANTOINETTE DU LIGIER DE LA GARDE), a French poetess, was born in Paris about 1634. She was distinguished for wit and beauty, and was married in 1651 to an officer named Deshoulières. Among her works are "Les Moutons," an idyl, eclogues, odes, "Moral Reflections," and a tragedy called "Genseric." Died Feb. 17, 1694.

Des'iccant [Lat. *desiccans*, from *de*, intensive, and *siccans*, pres. part. of *sicco*, *siccatum*, to "dry"], in medicine, an application used to check the secretion of a membrane or ulcer.

Desicca'tion [Lat. *desiccatio*, from *de*, intensive, and *sicco*, *siccatum*, to "dry"] is a process of extracting moisture by chemical agency or by the use of air and heat. Chloride of calcium, quicklime, fused carbonate of potash, and oil of vitriol are used for this purpose.

Design' [Fr. *dessin*, from the Lat. *designo*, to "mark out"], a plan or scheme formed in the mind; an intention, purpose, or project. In the fine arts, the idea formed in the mind of an artist on any particular subject; a preliminary work, either in outline or color, in which the conception of the artist is indicated and partly expressed. The design ought to exhibit the whole composition and drawing of the work, though the last only in a general way. The design ought thus to be a correct, though not a complete, representation of the future work. A sketch differs from a design in that the former is usually applied to a first drawing of an object placed before an artist; the latter to a first drawing of an object or subject which he has imagined or modified by his faculty of invention. Unity of design, combined with variety of form and embellishment, is essential to a perfect work of art. In architecture, the term design is applied to a drawing mathematically correct, but in which the effects which will ultimately be produced by distance and by light and shade are altogether ignored. Design is also an important term in philosophy, and is used as synonymous with *final* cause.

Design, Schools of, are institutions where ornamental artistic or mechanical drawing is taught. The most perfect institutions of the kind are in Europe, but most of our large cities have similar schools. Massachusetts gives free instruction in these branches. One of the largest schools of design is in the Cooper Union building in New York. The "National Academy of Design" is a beautiful building in the Venetian style, at the corner of Fourth Avenue and Twenty-third street, New York. This academy was founded in 1828, and the present building (which cost $150,000) was completed in 1864. There is in it an annual exhibition (from April to July) of paintings by artists connected with the institution.

Desima, a Japanese island in the Bay of Nangasaki, contains the factories of the Dutch.

Desmidia'ceæ [from *Desmidium*, one of the genera], an order of the green Algæ, closely approaching the Diatomaceæ, but differing by the absence of siliceous frustules and also by their green endochrome. These plants consist of connected joints, and they are increased by the addition of two half-joints in the centre. It is said fecundation sometimes takes place by the conjugation of two plants by means of simple contact. The spores take a variety of forms, and from them the new plant is produced by the formation of a vertical partition in the centre, and the subsequent growth of two new half-joints. The Desmidiaceæ are abundantly found in limpid fresh water, causing a green scum, which under the microscope presents an astonishing variety of beautiful forms. The late Prof. J. W. Bailey of West Point made them a subject of special observation. The number of species is very great.

Des Moines, de-moin', a river of the U. S., and the largest that traverses the State of Iowa, rises in the S. W. part of Minnesota. It flows in a S. S. E. direction to the capital city of Des Moines, below which it runs nearly south-eastward until it enters the Mississippi River at the S. E. extremity of Iowa, about 4 miles below Keokuk. Length, estimated at 500 miles. It flows through fertile undulating prairies, and through a large field of bituminous coal.

Des Moines, a county in the S. E. of Iowa. Area, 408 square miles. It is bounded on the E. by the Mississippi River, and on the S. W. by the Skunk River. The surface is diversified by woodlands and fertile undulating prairies. Cattle, grain, wool, hay, and dairy products are extensively raised. Of manufactories those of wagons are most numerous. Coal and limestone are abundant here. It is intersected by the Burlington and Missouri River R. R. and the Burlington Cedar Rapids and Minnesota R. R. Capital, Burlington. Pop. 27,256.

Des Moines, a township of Boone co., Ia. Pop. 5241.

Des Moines, a township of Dallas co., Ia. Pop. 802.

Des Moines, a township of Jasper co., Ia. Pop. 2105.

Des Moines, a township of Jefferson co., Ia. Pop. 1280.

Des Moines, a township of Lee co., Ia. Pop. 1104.

Des Moines, township of Mahaska co., Ia. Pop. 1101.

Des Moines, township of Pocahontas co., Ia. Pop. 256.

Des Moines, the capital of Iowa and seat of justice for Polk co., is situated on the Des Moines River at the mouth of the Raccoon, on the Chicago Rock Island and Pacific R. R., 357 miles W. of Chicago, 174 miles W. of Davenport, and 138 miles E. of Omaha, on the Des Moines Valley R. R., connecting it with Keokuk and Fort Dodge, on the Des Moines and Indianola R. R., on the Des Moines and Winterset R. R., and on the Des Moines and Minnesota Narrow-gauge Railway. The State capital was removed in 1857 to this place, at that time called Fort Des Moines. A new State-house is now in the process of erection, the estimated cost of which is $3,000,000. The State library contains some 20,000 volumes. The State arsenal, a large building, contains, besides military equipments for the State, the tattered flags of all Iowa regiments engaged in the war of 1861–65, and numberless other trophies and valuables of interest. The city has twenty or more churches; a large number of public and private schools, a high school, and a well-appointed Baptist college; three national and three private banks; a U. S. court-house and post-office, built of marble and costing $250,000; and a large county court-house; and it has complete gasworks, a street railroad, the Holly system of waterworks, numerous handsome residences, and other public improvements necessary in first-class modern cities. Three daily, seven weekly, and three monthly papers are published here. Mines of excellent coal are extensively worked. There is

plenty of water, plenty of timber, and plenty of coal. Numbers of manufactories of various kinds are in operation. Des Moines has increased rapidly during the last decade, and is the largest city in the interior of the State. Pop. in 1860, 3965; in 1870, 12,035.

R. P. Clarkson, Ed. "Iowa State Register."

New State Capitol (Des Moines, Iowa).

Des Moines, a township of Van Buren co., Ia. P. 1078.

Des Moines, a township of Jackson co., Minn. P. 548.

Des Moines, a township of Clarke co., Mo. Pop. 1235.

De Soto, a township and post-village of Jackson co., Ill., on the Illinois Central R. R., 63 miles N. of Cairo. P. 1433.

De Soto, a post-village of Dallas co., Ia., on the Chicago Rock Island and Pacific R. R., 22 miles W. by S. of Des Moines.

De So'to, a parish in the N. W. of Louisiana. Area, 910 square miles. It is bounded on the S. W. by the Sabine River. The soil is fertile. Cotton and corn are raised. Capital, Mansfield. Pop. 14,962.

De Soto, a county in the N. W. of Mississippi. Area, 900 square miles. It is drained by the Coldwater Creek. The surface is nearly level; the soil is fertile. Cotton is the staple product, but corn, cattle, wool, and tobacco are raised. It is intersected by the Mississippi and Tennessee R. R. Capital, Hernando. Pop. 32,021.

De Soto, a post-village of Jefferson co., Mo., on the St. Louis and Iron Mountain R. R., 43 miles S. W. of St. Louis. It has one weekly newspaper.

De Soto, a post-village of Washington co., Neb., is on the Missouri River and the Omaha and North-western R. R., 26 miles N. N. W. of Omaha. It is on the site of a former Mormon settlement. Pop. of township, 288.

De Soto, a post-village of Vernon co., Wis., on the Mississippi River halfway between La Crosse and Prairie du Chien. It has one weekly newspaper.

De So'to (Hernando), a Spanish explorer, born in Estremadura in 1500. He explored in early youth the coasts of Guatemala and Yucatan. Having a high command under Pizarro, he contributed largely to the conquest of Peru. He conducted an expedition from Spain to Florida in 1539, and discovered the Mississippi River. He died in Louisiana June 5, 1542.

Des'sau, a town of Germany, capital of the duchy of Anhalt, is on the Mulde near its entrance into the Elbe, 80 miles by railway S. W. of Berlin. It is well built, and contains a fine ducal palace, a town-hall, a theatre, a college, and a normal school. Here are many paintings of the early German masters. It has manufactures of woollen cloth, hosiery, hats, tobacco, etc. Pop. in 1871, 17,464.

De Staël-Holstein (Anne). See Staël, de.

Dessalines (J. J.). See Hayti.

Dester'ro, or Nos'sa Senho'ra do Dester'ro (*i. e.* "Our Lady of Desterro"), a seaport of Brazil, capital of the province of Santa Catharina, is on the island of Santa Catharina, 460 miles S. W. of Rio Janeiro. It has a trade in feathers and artificial flowers; is defended by several forts, and has a good harbor; lat. 27° 36′ S., lon. 48° 40′ W. Pop. 8000.

Deter'minant. This term is used to express a certain symmetrical algebraic function of n^2 quantities of very frequent recurrence in the theory of equations, and still more in the higher geometry. A definition of the term, with a statement of a few of the elementary properties of determinants, and of some of their most simple applications, is all that can be attempted here.

If we take the product $a_1b_2c_3...u_n$ of n factors, and permute the subscript indices in every possible way, we shall have 1.2.3....n products. If now we give to each one of these several products a *plus* sign whenever the number of interchanges of indices necessary to produce it from the above product is *even*, and a *minus* sign when the number of interchanges is *odd*, and add the results, we have the *determinant* of the n^2 quantities a_1, b_1, c_1, ...u_1, a_2, b_2, c_2, ...u_2, a_3, b_3, etc. etc.

The determinant is usually written thus:

$$\begin{vmatrix} a_1\ b_1\ c_1 \dots u_1 \\ a_2\ b_2\ c_2 \dots u_2 \\ a_3\ b_3\ c_3 \dots u_3 \\ \dots\dots\dots\dots \\ a_n\ b_n\ c_n \dots u_n \end{vmatrix}$$

but it is also sometimes written $\Sigma\pm(a_1b_2c_3...u_n)$, where the

product written in the parenthesis is that of the letters along the diagonal of the matrix, beginning at the upper left corner.

The following equations and propositions will serve to illustrate the definition. Most of them may be verified by inspection, or by actual expansion according to the rule:

1. $\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = \Sigma\pm(a_1b_2) = a_1b_2 - a_2b_1.$

2. $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = \Sigma\pm(a_1b_2c_3).$

$$= a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & c_1 \\ b_3 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix}$$

$$- a_1b_2c_3 - a_1b_3c_2 + a_2b_3c_1 - a_2b_1c_3 + a_3b_1c_2 - a_3b_2c_1.$$

3. $\begin{vmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \\ a_4 & b_4 & c_4 & d_4 \end{vmatrix} = \Sigma\pm(a_1b_2c_3d_4).$

$$= a_1 \begin{vmatrix} b_2 & c_2 & d_2 \\ b_3 & c_3 & d_3 \\ b_4 & c_4 & d_4 \end{vmatrix} - a^2 \begin{vmatrix} b_1 & c_1 & d_1 \\ b_3 & c_3 & d_3 \\ b_4 & c_4 & d_4 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & c_1 & d_1 \\ b_2 & c_2 & d_2 \\ b_4 & c_4 & d_4 \end{vmatrix} - a_4 \begin{vmatrix} b_1 & c_1 & d_1 \\ b_2 & c_2 & d_2 \\ b_3 & c_2 & d_3 \end{vmatrix}$$

$$= a_1b_2c_3d_4 \quad a_1b_2c_4d_3 + a_1b_3c_4d_2 - a_1b_3c_2d_4 + a_1b_4c_2d_3 - a_1b_4c_3d_2$$
$$- a_2b_1c_3d_4 + a_2b_1c_4d_3 - a_2b_3c_4d_1 + a_2b_3c_1d_4 - a_2b_4c_1d_3 + a_2b_4c_3d_1$$
$$+ a_3b_1c_2d_4 - a_3b_1c_4d_2 + a_3b_2c_4d_1 - a_3b_2c_1d_4 + a_3b_4c_1d_2 - a_3b_4c_2d_1$$
$$- a_4b_1c_2d_3 + a_4b_1c_3d_2 - a_4b_2c_3d_1 + a_4b_2c_1d_3 - a_4b_3c_1d_2 + a_4b_3c_2d_1$$

4. The determinant is a linear function of each element.

5. A single interchange of two adjacent rows, or two adjacent columns, changes the sign of the determinant. Two such interchanges leave the determinant unaltered.

6. The value of a determinant is not affected by changing the rows into columns and the columns into rows.

7. The determinant is zero when two columns are equal, or when two rows are equal.

8. The product of two determinants is a determinant.

9. The differential co-efficient of a determinant with respect to any element is a determinant.

An idea of the use of determinants in the theory of equations and in geometry may be formed from the statement of a few propositions:

1. If $a_1x+b_1y+c_1z=d_1$, $a_2x+b_2y+c_2z=d_2$, and $a_3x+b_3y+c_3z=d_3$, then $x=\frac{\Sigma\pm(d_1b_2c_3)}{\Sigma\pm(a_1b_2c_3)}$, $y=\frac{\Sigma\pm(a_1d_2c_3)}{\Sigma\pm(a_1b_2c_3)}$, and $z=\frac{\Sigma\pm(a_1b_2d_3)}{\Sigma\pm(a_1b_2c_3)}$.

2. Similar values are obtained for n unknown quantities from n linear equations.

3. Three straight lines whose equations are of the form $ax+by+c=0$ intersect in one point if $\begin{vmatrix} a & b & c \\ a' & b' & c' \\ a'' & b'' & c'' \end{vmatrix} = 0.$

4. The area of a triangle, the rectangular co-ordinates of whose angles are $x_1\,y_1$, $x_2\,y_2$, $x_3\,y_3$, is one-half of $\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$.

5. These three points of No. 4 are in a straight line when the determinant is zero. Hence, the equation of a line passing through two given points is $\begin{vmatrix} x & y & 1 \\ x' & y' & 1 \\ x'' & y'' & 1 \end{vmatrix} = 0.$

6. The volume of a pyramid in terms of the rectangular co-ordinates of its four summits is one-sixth of the determinant $\begin{vmatrix} x_1 & y_1 & z_1 & 1 \\ x_2 & y_2 & z_2 & 1 \\ x_3 & y_3 & z_3 & 1 \\ x_4 & y_4 & z_4 & 1 \end{vmatrix}$.

7. The equation of a plane passing through three given points is $\begin{vmatrix} x & y & z & 1 \\ x' & y' & z' & 1 \\ x'' & y'' & z'' & 1 \\ x''' & y''' & z''' & 1 \end{vmatrix} = 0.$

There is in all parts of the mathematics, but especially in higher geometry, a frequent recurrence of symmetrical forms which may be written as determinants. Hence, great importance attaches to all propositions respecting them. There is an elementary explanation of determinants in the last three chapters of Todhunter's "Theory of Equations." Their properties and use in plane geometry are developed in full in Whitworth's "Trilinear Co-ordinates." In Salmon's "Higher Algebra" there is an introduction to the theory of linear transformations, a large department of mathematical science which has been created within the past few years. H. A. Newton.

Deter'minate Prob'lem, a problem in geometry which admits of a limited number of solutions, an indeterminate problem being one which admits of an indefinite number of solutions. Thus, the problem, "Given the base, perimeter, and area, to construct the triangle," is determinate, there being in general but four solutions. By omitting one of the three data, however, the problem becomes indeterminate. For instance, an infinite number of triangles having the same perimeter can be constructed on a given base. The problem, however, is not *perfectly* indeterminate, for the vertices of all such triangles are restricted to a certain locus—*i. e.* the ellipse whose foci are the extremities of the given base. In general, the omission of one of the conditions or data which render a problem determinate leads to a local problem.

Det'inue [an Old Fr. word, from *detenir*, to "detain," literally, that which is "detained"], in law, an action for the recovery of a personal chattel wrongfully detained, or its value, with damages and costs. The action is for the recovery of a specified article; the chattel therefore must be of such a character that it can be distinguished from others, as a horse. The plaintiff must have an absolute or special property in the article at the time he brings the action. The defendant must have had possession at some time, which should have been acquired in some lawful manner, as by contract or finding. The nature of the possession must also continue. As if a finder should sell the thing found before action, the proper remedy would be an action for conversion, though if he had not sold there might be a case of detinue.

Det'mold, a town of Germany, capital of the principality of Lippe-Detmold, on the Werra, 42 miles S. W. of Hanover. It has a fine castellated palace, a theatre, a public library, and a celebrated teachers' seminary; also manufactures of linen and woollen goods. Its people are remarkable for culture and taste. Near this town is the battlefield where Hermann destroyed the Roman army of Varus in 9 A. D. Pop. in 1871, 6469.

De Tocqueville (Alexis Charles Henri Clerel), a renowned French statesman and political economist, was born in Paris July 29, 1805. He studied law, and in 1827 became judge-auditor at the tribunal of Versailles. In 1831 he was commissioned to investigate the penitentiary systems of the U. S., which he visited in company with Gustave de Beaumont. In 1832, having returned from the U. S., he resigned his office, and in 1835 he gave to the public the first volume of his work "De la Démocratie en Amérique" ("On Democracy in America," 4 vols., 1835–40), which met with a brilliant success. About this time he married Mary Mottly, an English lady. De Tocqueville, though himself opposed to democracy, foretold its rapid growth in the world. In 1838 he was made a member of the Academy of Moral and Political Sciences, and in 1839 he was elected to the Chamber of Deputies. He became a member of the French Academy in 1841. In 1848, having been elected to the Constituent Assembly, he lent his support to the cause of order. In 1849 he was minister of foreign affairs from June 2 to Oct. 31. The coup-d'état of Dec. 2, 1851, drove him from the public service. He published in 1856 his "L'ancien Régime et la Révolution" ("The Old Régime and the Revolution"), a very excellent work. Died at Cannes April 15, 1859.

Detona'tion [from the Lat. *detono, detonatum*, to "thunder"], combustion with explosive rapidity, accompanied with sound and light, as in the case of gunpowder, percussion-caps, and fulminating-powder. When a mixture of oxygen and hydrogen is inflamed by the electric spark, it is said to *detonate*. Detonation is due either to the sudden liberation and expansion of large volumes of gases, or to the sudden contraction of gaseous matter and its reduction to a liquid or solid state.

Detri'tus [from the Lat. *de*, "down" or "off," and *tero, tritum*, to "rub"], literally, that which is rubbed or worn off, a geological term applied to material composed of small portions of a rock or a deposit which have been detached and removed to a distance by the action of any abrading power.

De Trobriand (Philip Regis), an officer of the U. S. army, born in Tours, France, June 4, 1816, and a French baron by inheritance; "Bachelier-ès-lettres" (University of Orleans), "Licencié-en-droit" (legal faculty of Poitiers). During the recent civil war he entered the service as colonel of the Fifty-fifth New York Volunteers, July, 1861; commanding brigade (Third corps) 1862–63; appointed brigadier-general volunteers Jan., 1864; commanded defences of New York May, 1864; commanded brigade (Second corps) July, 1864; brevet major-general volunteers commanding division (Second corps) April, 1865; appointed colonel Thirty-first Infantry U. S. A., July, 1866; brevet brigadier-general U. S. A., Mar., 1867; commanding the district of Dakota Aug., 1867; colonel Thirteenth Infantry U. S. A., and commanding the district of Montana, Mar., 1869; Camp Douglass 1870; Fort Steele 1871; now in command of the district of Green River. Author of "Les Gentilshommes de l'Ouest," Paris, 1841; "Quatre

ans de Campagnes à l'armée du Potomac," Paris et Bruxelles, 1867; editor and publisher of the "Revue du nouveau-monde," New York, 1849-50; editor of the "Courrier des États-Unis," New York, 1851-61.

Detroit', a post-township of Pike co., Ill. Pop. 1056.

Detroit, a post-village of Dickinson co., Kan., on the Kansas Pacific R. R., 19 miles S. W. of Junction City.

Detroit, a township and post-village of Somerset co., Me., on the Maine Central R. R., 30 miles W. of Bangor. It has three churches and manufactures of leather and lumber. Pop. 690.

Detroit [Fr. *Détroit*, "the strait"], the metropolis of Michigan, and capital of Wayne co., is situated on the W. bank of the Detroit River, 18 miles from Lake Erie and 7 miles from Lake St. Clair, in lat. 42° 19′ 53″ N., lon. 82° 58′ W. The Detroit River, forming the boundary-line between the U. S. and Canada, is of varying width, being half a mile broad opposite the city, and of great depth, forming the most perfect harbor on the whole chain of lakes.

Detroit is the centre of the Michigan system of railroads, being the terminus of the Michigan Central and its branches, also of the Lake Shore and Michigan Southern, the Detroit Eel River and Illinois, the Detroit Lansing and Lake Michigan, the Detroit and Milwaukee, the Detroit and Bay City, the Grand Trunk of Canada, the Great Western of Canada, and the Canada Southern, which crosses the river at Trenton, a few miles below, and has a branch running to the city. The site upon which the city is built rises from the edge of the river, the inclination being gradual, at the rate of about 58 feet per mile, affording the most perfect drainage, which has been taken advantage of by the building of a system of sewers over eighty miles in length, costing $1,264,890, and permeating every quarter of the city.

The city is abundantly supplied with water, there being 151 miles of pipe laid up to the close of 1872, at which period the aggregate cost of construction of the waterworks amounted to $1,338,047. It was found that the increase of population was so rapid as to give promise of presently exceeding the capacity of the works, and the legislature of 1873 authorized the loan of $1,000,000 for the purpose of extending them. Plans for this have been completed, and the work is in progress. The city has a perfectly disciplined paid fire department, with steam apparatus, etc., costing $243,479, and also a fire-alarm telegraph. The annual expense of the department is a little over $72,000. The city has a uniformed metropolitan police force, with a central and two sub-stations in communication with all quarters of the town by means of a police telegraph. The expenses of the force for 1872 were $92,000. There are 25 public school buildings, valued at $547,410, with 138 separate schools of all grades, 177 teachers, and an enrolment of 11,764 pupils. The annual expenses of the schools are $170,228. There are, besides, 3 seminaries, 27 Roman Catholic parish schools, 9 German Lutheran schools, and a large number of private institutions, including 3 commercial colleges. The assessed valuation of the real and personal property of the city in 1872 was $23,615,674; the cash valuation for the same year $78,718,913. Since then an additional ward has been added, and the valuation has risen to $86,743,947. There are two gas companies which supply the city, and the number of street lamps at the close of 1872 was 1137. There are eight handsome public drinking-fountains, but the principal work of art adorning the city is the Michigan Soldiers' and Sailors' Monument, designed by Randolph Rogers, and built of bronze and granite at a cost of $58,000. The structure is fifty-five feet high, surmounted with a colossal bronze allegorical statue of "Michigan." The chief public building is the city hall, situated on the Campus Martius and facing upon four streets, being in length 200 feet, in width 90. The style is Italian, with mansard roof, and a central tower 180 feet high. The walls are built of Amherst sandstone. The whole cost of the building, regarded as one of the finest in the West, was $600,000. The house of correction is also a very fine building, and has attained a national and European reputation. The value of it is fixed at upwards of $300,000, and it has a capacity for 450 prisoners. The county jail is a substantial structure. There are eight lines of street railway in operation, and two lines of transit railway and one of street railway in process of construction. The public library contains 22,136 volumes, the bar library 3280 volumes, the mechanics' library 4000, and the Young Men's library 12,000. There are 2 medical colleges, 4 public hospitals, 4 orphan asylums, 2 foundling and women's hospitals, 1 insane asylum, a house of shelter for magdalens, 1 industrial school, and 1 old ladies' home. There are 59 churches and 4 chapels. Some of these church edifices are noble specimens of architecture. The city contains 3 national, 5 savings, and 16 other banks. It is the seat of the U. S. circuit court for the sixth circuit, and the U. S. district court for the eastern district of Michigan, the Wayne county circuit court, the superior court, the recorder's and the probate court of Wayne county. The U. S. custom-house for the port of Detroit and the internal revenue office are located here, as are also the principal office of the U. S. lake survey, the department in charge of the lake lighthouses, and the head-quarters of the military department of the lakes. Fort Wayne, designed to be the most extensive American fortification on the northern frontier, is located just below the city, commanding both it and the river. Though in an incomplete state, it includes a series of batteries protected by earthworks, and is garrisoned by a force of infantry and artillery. There are eight cemeteries—two, Woodmere and Elmwood, being upon locations of great natural beauty, are also embellished by skilful landscape gardening and monuments of taste.

The manufacturing advantages of the city are great, and these have been taken advantage of by the establishment of many foundries, blast-furnaces, copper-smelting works, locomotive and car works, shipyards, drydocks, iron-bridge works, safe manufactories, furniture and other establishments using wood as the chief material, and the most extensive tobacco and cigar factories in America, producing each year goods worth many millions of dollars. There are a number of pork-packing establishments, and the shipping trade of the city in produce and manufactures is very large. There are 8 daily papers published in the city, 3 being in the German language, 3 tri-weeklies, 11 weeklies, and 4 monthlies.

The present site of the city was occupied by Indian villages at the period of the discovery of the country. In 1610 it was first visited by the French, and remained under their dominion until 1762. The first legitimate settlement was made in 1701, at which time a fort was erected called Ponchartrain, the first governor being the Sieur de la Motte Cadillac; and from time to time emigrants were sent here by the French government. In 1763 the British assumed possession, erecting fifteen years later a fort. In 1787 its government was assumed by the U. S., Gen. Arthur St. Clair being the first governor. In 1812 it was surrendered to the British, and was retaken in 1813. The history of Detroit is intimately connected with the history of the whole Northwest. Three different sovereigns have claimed its allegiance, and since the U. S. have held it thrice has its government been transferred. It has twice been besieged by Indians, once captured in war, and once totally consumed by fire. It has been the scene of one surrender, fifty pitched battles, and twelve bloody massacres. For the rest, the streets are broad and well paved, handsomely embellished with shade trees, and ornamented with beautiful private residences, while the business quarters are well built up with lofty, substantial, and beautiful structures. Pop. 79,577.

W. E. Quimby, Managing Ed. "Free Press."

Detroit, a post-village of Becker co., Minn., on Detroit Lake and the Northern Pacific R. R., 206 miles W. of Duluth. It has one weekly newspaper.

Detroit River issues from Lake St. Clair, flows nearly southward, forms part of the boundary between Michigan and Canada, and enters Lake Erie. It is about 24 miles long, and from half a mile to one mile wide. It is navigable for vessels of the largest size.

Dett'va, a town of Hungary, in the county of Sohl, 20 miles E. of Altsohl. Pop. in 1869, 10,035.

Deuca'lion [Gr. Δευκαλίων], a personage of the Greek mythology, was a son of Prometheus and the husband of Pyrrha, and was the father of Amphictyon and Hellen. According to tradition, he saved himself and his wife from a deluge by building a ship or ark, which, when the water subsided, rested on Mount Parnassus. They threw stones behind them, which were transformed into men and women.

Deu'el, a county in the E. of Dakota, is partly bounded on the E. by Big Stone Lake. The surface is elevated; part of the soil is fertile. This county contains a part of the Coteau des Prairies. Pop. 37.

De'us ex Mach'inâ [a Latin phrase, signifying a "god from a machine," alluding to the machinery of the theatrical stage], an expression borrowed from the classic stage. The poets of Greece often had recourse to the intervention of a god, who descended by stage machinery, and brought about a speedy dénouement of the plot. The proverb has also been applied to savants or philosophers who, unable to explain facts by known laws, have had recourse to the aid of a supernatural power.

Deuteron'omy [Lat. *Deuteronomium;* Septuagint Gr. Δευτερονόμιον, the "duplicate law," from δεύτερος, "second," and νόμος, "law"], the last book of the Pentateuch, consisting, in part, of a restatement of the law, as given in

Exodus, Leviticus, and Numbers, and containing also, besides special commands and admonitions not previously given, an account of the death of Moses. The authorship of this book has been traditionally assigned to Moses, but of course the part relating to his death is not supposed to have been written by himself, and indeed the last four chapters may have been added by another hand. Of late years much critical labor has been bestowed upon the book, and its Mosaic authorship has been both assailed and defended with great learning and ability. See PENTATEUCH.

Deutz (anc. *Tuitium*), a fortified town of Prussia, on the right bank of the Rhine, opposite COLOGNE (which see). It is the terminus of a railway extending to Minden. Pop. in 1871, 11,881.

Deut'zia [named in honor of Deutz, a botanist], a genus of shrubs belonging to the order Saxifragaceæ, and indigenous in Northern India, China, and Japan. *Deutzia scabra* has leaves very rough, with siliceous hairs, which are used in Japan for polishing wood, and which are most beautiful objects under the microscope. *Deutzia gracilis*, a hardy shrub with elegant white flowers, is much cultivated in American gardens.

Deux Ponts. See ZWEIBRÜCKEN.

Dev, or **Dew,** a Persian word, akin to the Sanscrit *dêva* (a "god"), but applied in the system of Zoroaster to a class of demons supposed to be servants of Ahriman. (See ZOROASTER, RELIGION OF.)

Dêva, dā'va, a Sanscrit word signifying "god," and forming a part of many names in Hindoo mythology, as Kamadêva ("the god of love"), Mahadêva (the "great god"), a name of SIVA (which see).

Devall's Bluff, a post-village, capital of Prairie co., Ark., on White River and the Memphis and Little Rock R. R., 48 miles E. of Little Rock. It has one weekly newspaper and two schools, and is situated in a cotton and corn-growing region.

JAMES H. BALDING, ED. WHITE RIVER "JOURNAL."

Devanagari. See SANSCRIT, by PORTER C. BLISS, A. M.

Devapraya'ga, a town of Northern Hindostan, in Gurwhal, in lat. 30° 8′ N., lon. 78° 39′ E., is at the junction of the Alakananda and Bhagirathi, which unite to form the Ganges. As the origin of that sacred river, it is considered a holy place by the Hindoos, and is visited by multitudes of pilgrims. There are two ancient temples here. The permanent population consists of about 1000 Brahmans.

Dev'asaw, a township of Grant co., Ark. Pop. 357.

Devel'op [Fr. *développer*], in algebra, to expand an expression by writing out in full the operations previously indicated by symbols. In geometry to develop a curve or a curved surface is to find an equivalent straight line or plane surface, by rolling the former on the latter. The equivalent straight line or plane surface thus formed is called the *development* of the curve or curved surface rolled.

Development. See EVOLUTION, by PROF. H. HARTSHORNE; also DARWINISM, by PROFS. YOUMANS and SEELYE.

Development of the Embryo. See EMBRYOLOGY, by PROF. J. C. DALTON, M. D.

Dev'ens (CHARLES, JR.), an American jurist, born in Charlestown, Mass., April 4, 1820, graduated at Harvard in 1838, and was admitted to the bar in 1841; member of the Massachusetts State senate 1848–49; U. S. marshal for the district of Massachusetts 1849–53. On the outbreak of the recent civil war he entered the service as major of the third battalion of Rifles Massachusetts volunteers, was appointed colonel Fifteenth Massachusetts Aug., 1861, and was promoted brigadier-general April 15, 1862; brevet major-general U. S. volunteers for gallant and meritorious conduct at the capture of Richmond, April 3, 1865; military governor East district of South Carolina Sept., 1865, to June, 1866, when he was mustered out of the service; wounded at Ball's Bluff, Fair Oaks, Chancellorsville, and Cold Harbor. Throughout the war Gen. Devens was conspicuous for gallantry and ability, from the early engagement at Ball's Bluff till the closing scenes at Appomattox Court-house. He was appointed associate justice of the superior court of Massachusetts in 1867, which position he retained until Oct., 1873, when he was appointed associate justice of the supreme court of Massachusetts, which office he now holds.

Dev'enter [Lat. *Daventria*], a fortified city of Holland, in the province of Overyssel, is on the river Yssel, about 60 miles E. by S. from Amsterdam. It is surrounded by walls or ramparts, and has a good harbor. It contains a large town-house, a court-house, five or more churches, and several hospitals. It is the seat of an old Catholic (Jansenist) bishopric. About 600,000 pounds of butter are annually exported from this place. It has manufactures of carpets, hosiery, etc., and iron-foundries. Pop. 18,218.

De Vere (MAXIMILIAN SCHELE), LL.D., a writer, born in Sweden Nov. 1, 1820, emigrated to the U. S., and became in 1844 professor of modern languages and belles-lettres in the University of Virginia. Among his works are "Outlines of Comparative Philology" (1853) and "Stray Leaves from the Book of Nature" (1856).

Devereaux, a township of Washington co., Me. P. 8.

De Vesci, VISCOUNTS (1776), Barons Knapton (1750, Ireland), and baronets (1698).—THOMAS VESEY, third viscount, born Sept. 21, 1803, elected a representative peer for Ireland in 1857, was M. P. for Queen's county 1835–37 and 1841–52, and succeeded his father Oct. 19, 1855.

Dêvî (Sanscrit, "goddess"). See PARVATI.

Deviation of Projectiles. See GUNNERY; GYROSCOPE, by GEN. J. G. BARNARD, U. S. Army.

Deviation of the Compass is the variation of a ship's compass from the true magnetic meridian, caused by the proximity of iron. In iron ships it depends upon the direction, with regard to the magnetic meridian, in which the ship was built. It is least when the ship has been built with her head to the south. Armor-plated ships should be plated with the head in the opposite direction to that in which they are built. Two methods are employed by which this variation is attempted to be neutralized: the first is by ascertaining the actual variation in every position of the ship with regard to the magnetic meridian, and working by a table of errors; the other is by introducing on board ship masses of iron and magnets to neutralize exactly the action of the ship's magnetism. The latter method is now very generally employed. It is important that the ship should not be hurried out immediately for a voyage, and that her compasses should be readjusted before sailing.

Deviation of the Plumb-Line has been especially observed near mountains, in which case it is evident that the attraction of the mountain has drawn the line out of the perpendicular. Maskelyne took advantage of this fact in his experiments to determine the density of the earth. (See DENSITY OF THE EARTH.) The same phenomenon has been observed on plains, and is probably caused either by great caves under ground, or by large masses of matter near the surface greatly surpassing in density the average of the earth near the point of observation.

De View, a post-township of Woodruff co., Ark. Pop. 1204.

De Vigny (ALFRED VICTOR), COMTE, a distinguished French author, was born at the castle Loches Mar. 27, 1799. In 1828 he published a collection of poems called "Poëmes antiques et modernes." He also produced (1826) "Cinq-Mars, or a Conspiracy under Louis XIII.," which was very favorably received; "Stella, or the Blue Devils," a narrative; and the tragedy of "Chatterton" (1835). Died Sept. 18, 1863.

Dev'il [Persian *dev* or *dew*, a "demon;" Ger. *Teufel;* Gr. διάβολος (*i. e.* "accuser" or "slanderer"); Lat. *diabolus;* Fr. *diable*], the name among Christians of any evil spirit, but especially of the chief of evil spirits, nearly corresponding in the latter sense to the Hebrew Satan and the Mohammedan Iblis or Shytân. It is proposed in this article to limit ourselves chiefly to a notice of the popular and prevailing notions entertained of the devil in Europe during the Middle Ages and later; referring the reader to the article SATAN for a consideration of those graver questions respecting the character of the great Enemy of mankind which may be said to belong more properly to theology. The Greek for devil appears to be derived from the character of Satan as presented in the book of Job—that of a fault-finder or slanderer. In the Middle Ages, and even later, the devil was supposed to possess in the highest perfection every kind of skill and knowledge—a skill and knowledge resembling that of man, indeed, but immeasurably surpassing it in degree. The devil was believed to possess transcendent skill in all the magic arts, and when a man of genius had accomplished some wonderful feat which seemed clearly above the unassisted powers of the human mind, it was commonly supposed (especially if he was not preeminently a religious man) that he had been either assisted by the devil, or that the latter had performed for him the entire work; in which case, of course, some promise (such as the final surrender of the soul of the assisted party) or reward had to be given as an equivalent for his services. This idea, once almost universal in Europe, furnished the basis of the legend respecting Dr. Faustus.

It would seem probable that the prevailing superstitions of the Middle Ages respecting the devil might have been considerably influenced by the notions entertained of the character of Loki, the god of evil in the Norse mythology. As Loki is said to have taken various forms—sometimes

of a woman and sometimes of one of the lower animals—in order more successfully to deceive, so the devil was supposed to assume at one time the appearance of a most beautiful woman to mislead and ruin the souls of men, at another time to take the form of a hunted animal to draw the too eager pursuer into danger and death; but all his wiles were of course lost upon those who looked to Heaven for help, and called upon the protecting saints.

J. THOMAS.

Devil's Dust. See SHODDY.

Devil-worshippers, or Yezidees, a sect of religionists, founded by one Yezeed, and living in Armenia, Koordistan, etc. They number more than 200,000. They treat the devil with great respect, because they believe he will be restored to heaven, where they wish him to be their friend. There are various other sects of devil-worshippers. One in Southern India pays especial reverence to a malignant being called Sattan.

Devi'zes, a parliamentary borough of England, in Wiltshire, on the Avon and Kennet Canal, 22 miles N. N. W. of Salisbury. It stands on an eminence near the northern limit of Salisbury Plain. It has two old churches, a large corn exchange, silk-throwing mills, and manufactures of snuff and malt. Here are ruins of a castle of the time of Henry I. Pop. in 1871, 6840.

Dev'on [Lat. *Devonia*], a county of England, is bounded on the N. by the Bristol Channel, and on the S. by the English Channel. Area, 2590 square miles. The surface is mostly hilly, and in some parts rocky. The highest point, called Yes Tor, has an altitude of 2050 feet. Granite, magnesian limestone, Devonian and Silurian rocks occur here; also copper and tin. It is drained by the rivers Exe, Dart, Tamar, and Torridge, the estuaries of which form good harbors. The climate of the S. coast is mild; the soil is generally fertile. This county produces good apples, and is famous for cider. The Red Devon breed of cattle is highly esteemed. The chief exports are butter, cheese, cattle, and sheep. The largest towns are Exeter (the capital), Plymouth, Devonport, Tiverton, Tavistock, and Dartmouth. Pop. in 1871, 600,814.

Devo'nian Age [named by Murchison from Devonshire, England, where rocks of this age abound], in geology, the time succeeding the Silurian and preceding the carboniferous age. The American Devonian rocks are assigned to five divisions or periods of time, known as the Oriskany (the oldest), the Corniferous, the Hamilton, the Chemung, and the Catskill periods. The Devonian strata of Europe are variously divided in different countries. The old red sandstone of Scotland and Herefordshire was for some time described by English geologists as the only group of rocks separating the Silurian system from the carboniferous. The discovery made by Murchison and Sedgwick, that the calcareous slates and limestones of Devonshire were contemporaneous with the old red sandstone and with the Eifel series, was a great step in advance, and tended to fix important positions in geological classification. Normandy presents Devonian rocks in a characteristic state. The system is also largely developed in Russia, as well as in Western New York, Pennsylvania, Ohio, Michigan, Indiana, etc. The Devonian rocks of the U. S. are rich in fossil shells of mollusks and in fishes. "In the Devonian age," says Dana, "the fishes are the dominant type." (See GEOLOGY, by PROF. J. W. DAWSON, LL.D., F. R. S.)

Dev'onport (before 1824 called PLYMOUTH DOCK), a maritime and fortified town of England, is in Devonshire, on the E. shore of the estuary of the Tamar (called the Hamoaze), 2 miles W. N. W. of Plymouth. It occupies high ground, and has ramparts defended by batteries. It derives its importance from the dockyard and naval arsenal, which is perhaps the largest in Great Britain. The national works occupy about 350 acres, and the dockyard comprises six building-slips for vessels of various rates. Here are also five docks, and manufactures of sails, ropes, anchors, soap, etc. Devonport has a residence for the port-admiral, a military hospital, and a large barrack. It returns two members to Parliament. Pop. of municipal borough in 1871, 50,094; of parliamentary borough, 64,684.

Dew [Sax. *deaw;* Ger. *Thau*], moisture deposited during the night on the surfaces of bodies exposed in the open air. Dew is produced by the condensation of watery vapor from the atmosphere. Its deposition is, however, unaccompanied by the appearance of any visible mist. Such mist appears when the condensation takes place within the body of the air itself, and is then called "fog" in the lower regions of the atmosphere, and "cloud" in the higher. Dew occurs only at the surfaces of contact with solids, the air above remaining clear. The deposit of dew is caused by the cooling of the bodies bedewed, and this takes place in consequence of the radiation of heat into open space, without any equivalent return. Experiments on vaporization have shown that when a liquid is exposed in a confined space to a constant temperature, vapor will be formed from it until the density reaches a certain determinate limit, invariable for the temperature, but greater as the temperature is higher, after which evaporation will cease. This maximum density is called the density of saturation, or the density due to the temperature. Air is said to be saturated with vapor when the density of the vapor in it is the density due to its temperature. Should the temperature of a body of air in this condition be in the slightest degree depressed, the air will be supersaturated, and some of the vapor will be condensed, forming a visible cloud. But if, the temperature remaining the same, a body colder than the air be immersed in it, condensation will occur on the surface of that body only, and the air itself will remain clear. If, as is usual in the atmosphere, the air contain vapor without being saturated, it may be brought by cooling to a temperature at which it will be saturated, and then any further cooling will produce precipitation, as in the case before supposed. Or if the temperature of air in this condition remain unchanged, a body colder than the air immersed in it may produce condensation, provided its temperature be as low as the point of saturation, or lower, but not otherwise. This point is called the dew-point. (See DEW-POINT.)

During the day the loss of heat by bodies on the earth, in consequence of radiation, is more than compensated by the amount received directly or indirectly from the sun. After sunset all such bodies begin to cool, but they cool with unequal rapidity, because of their different relations to heat. The atmosphere cools very slowly. Badly conducting solids cool rapidly. Good conductors, if in contact with the earth, cool much less rapidly, because the heat they lose by radiation is, to an extent proportioned to their conducting power, restored by conduction from the earth beneath. If of small mass, however, and insulated by bad conductors, their temperature falls much more rapidly. So soon as the cooling process has depressed the temperature of any object down to the point of saturation for the vapor present in the air, dew will begin to form upon it. Some bodies are bedewed very soon, others more tardily, and some occasionally escape altogether. Grass, which radiates well and conducts ill, is in the first class; wool and woollen stuffs, cotton, linen, silk, wood, earth, gravel, stone, and metals contract dew with less and less facility, nearly in this order. Polished metallic surfaces often remain untarnished by moisture throughout the night. In clear nights the difference of temperature shown by two thermometers, one lying on the grass and the other suspended in the open air a few feet above, is often 8° or 10° F., and is sometimes much greater. In one instance, Mr. Glaisher (*Phil. Trans.*, 1847) observed a difference as great as 28½° F., the lower thermometer lying on raw wool.

Clouds check the formation of dew by obstructing radiation, or restoring by counter-radiation some of the heat lost. When the sky is wholly overcast no dew is formed. Neither is any dew formed beneath an open shed or shelter, though the earth around may be so distinctly wet as to leave the form of the roof distinctly marked on the ground. Facts of this kind were long supposed to prove that the dew descends like rain—a belief of which the trace is still preserved in the expression "the falling of the dew." Even a very slight screen, as a sheet of paper or a cambric handkerchief, spread out above an object exposed in the open air, will protect it perfectly against moisture from dew. Wind also prevents the formation of dew, by continually changing the strata of air in contact with the colder solids. The nights most favorable to the deposit of dew are those in which the sky is quite clear and the air quite motionless. The profuseness of the deposit will depend, however, upon the hygrometric state of the atmosphere.

Very various and very absurd notions prevailed among the ancients in regard to the dew. By some it was supposed to descend from the stars, and to be possessed of wonderful virtues. The Roman ladies were accustomed to use it as a cosmetic, supposing it superior to all other applications for the improvement of the complexion. If the cosmetics of those days were no better than those in use at present, their opinion was doubtless correct, though the grounds of it were mistaken. The true theory of dew was first clearly set forth by William Charles Wells, a physician of London, in his famous "Essay on Dew," first published in 1814. This has been many times reprinted, and still continues to be the standard authority on the subject.

F. A. P. BARNARD.

Dew (THOMAS R.), an American writer, born in Virginia Dec. 5, 1802. He became professor of political economy and history in William and Mary College in 1827, and president of that institution in 1836. He published, besides

other works, an "Essay in Favor of Slavery" (1832), and a "Digest of the Laws, Customs, etc. of Ancient and Modern Nations" (1853). Died in Paris, France, Aug. 6, 1846.

Dewees' (William Potts), M. D., an American physician, born at Pottsgrove, Pa., May 5, 1768. He practised in Philadelphia, and became in 1834 professor of obstetrics in the University of Pennsylvania. He published, besides other works, an excellent "System of Midwifery" (1825). Died May 20, 1841.

Deweese, a twp. of Mecklenburg co., N. C. P. 1606.

De Wet'te (Dr. Wilhelm Martin Leberecht), an eminent German biblical critic, born at Ulla, near Weimar, Jan. 14, 1780. In 1810 he became professor of divinity at Berlin, and as a preacher and writer he soon won a wide fame. He was a moderate rationalist in his opinions. In 1821 he was called to the chair of divinity at Bâle, where he died June 16, 1849. Among his works are a "Commentary on the Psalms" (1811), "Jewish Archæology" (1814), "Christian Dogmatics" (1813–16), "Introduction to the Old and New Testaments" (1817–26), translated by Theodore Parker and Frederick Frothingham (1843–58), "Lessons on Morality" (1824). (See accounts of De Wette by Schenkel (1849), Hagenbach (1849), and Lücke (1850).)

Dew'ey, a township of La Porte co., Ind. Pop. 202.

Dewey (Charles Augustus), LL.D., was born at Williamstown, Mass., Mar. 13, 1793, and graduated at Williams College in 1811. He began the practice of law in his native town in 1814, and removed to Northampton about 1826. He became judge of the Massachusetts supreme court in 1837, and retained the office till he died, Aug. 22, 1866.

Dewey (Chester), D. D., LL.D., an American botanist and teacher, born at Sheffield, Mass., Oct. 25, 1781. He was for many years professor of natural philosophy at Williams College, became principal of the Collegiate Institute at Rochester, N. Y., in 1836, and in 1850 professor of chemistry in the University of Rochester. He wrote many excellent monographs on the Carices of North America, etc. for the "American Journal of Science" and other publications. Died Dec. 15, 1867.

Dewey (George), U. S. N., born Dec. 26, 1837, in Vermont, graduated at the Naval Academy in 1858, became a lieutenant in 1861, a lieutenant-commander in 1865, and a commander in 1872. He served on board the steamer Mississippi at the passage of Forts Jackson and St. Philip and capture of New Orleans, April 24, 1862, and is thus handsomely spoken of in the official report of his commanding officer, Commander Melanchthon Smith: "I have much pleasure in mentioning the efficient service rendered by Executive Officer George Dewey, who kept the vessel in her station during the engagement, a task exceedingly difficult from the darkness and the thick smoke that enveloped us from the fire of our vessel and the burning gunboats." He was on board the Mississippi when she was lost in attempting to pass the batteries at Port Hudson, Mar. 14, 1863, and gained the commendation of his commander a second time by his "coolness" on this trying occasion. Foxhall A. Parker, U. S. N.

Dewey (Orville), D. D., LL.D., an eminent Unitarian minister, born in Sheffield, Mass., Mar. 28, 1794. He graduated at Williams College in 1814, and preached in the pulpit of Dr. Channing as his assistant for nearly two years. He was pastor at New Bedford from 1823 to 1833, after which he preached about fourteen years in the city of New York. In 1858 he became minister of the New South church in Boston. He is an original thinker and an impressive pulpit-orator. He has produced, besides other works, "The Unitarian Belief" and "The Education of the Human Race." His lectures before the Lowell Institute, on "The Problem of Human Destiny," embrace a very able discussion of profoundly interesting questions.

De Wint (Peter), an English painter in water-color, born in 1783. He was the son of Harry De Wint, an American who went to England and married. He was a distinguished member of the Old Water-color Society, and was formed by the influences that produced Turner, D. Cox, Stanfield, and Prout. His subjects were usually of a very simple character, but treated in a large and masterly style. He died in 1849. Clarence Cook.

De Witt, a county in Central Illinois. Area, 450 square miles. It is drained by Salt Creek. The surface is nearly level, and is diversified by prairies and forests; the soil is fertile. Grain, cattle, wool, and dairy products are raised. The most numerous manufactories are those of wagons and carriages. Coal is found here. The county is intersected by the Illinois Central and the Gilman Clinton and Springfield R. Rs. Capital, Clinton. Pop. 14,768.

De Witt, a county in S. Central Texas. Area, 898 square miles. It is intersected by the Guadalupe River. The surface is one half prairie; the soil is generally fertile. Cattle, corn, cotton, wool, pork, and tobacco are raised. Capital, Clinton. Pop. 6443.

De Witt, a post-village, capital of Arkansas co., Ark., on the left bank of the Arkansas River, about 70 miles S. E. of Little Rock. It has one weekly newspaper.

De Witt, a township and post-village of De Witt co., Ill., on the Gilman Clinton and Springfield R. R., 53 miles N. E. of Springfield. Pop. 1061.

De Witt, a post-village in Clinton co., Ia., on the Davenport and St. Paul R. R. where it crosses the Chicago and North-western R. R., 25 miles N. of Davenport. It has one weekly newspaper, two banks, and some manufactures. Pop. 1749; of De Witt twp., 3186. Ed. "Observer."

De Witt, a post-township of Clinton co., Mich. P. 1306.

De Witt, a post-village of Grand River township, Carroll co., Mo. Pop. 317.

De Witt, a post-township of Onondaga co., N. Y. It contains several mineral springs and caves, and has a number of manufacturing villages and five churches. Pop. 3105.

De Witt (Cornelius), a Dutch naval officer and statesman, born at Dort June 23, 1623, was an elder brother of John, noticed below. He had a high command under De Ruyter in 1666, when he burned the English shipping in the Thames. He distinguished himself in the naval battle of Solebay in 1672. In the same year he was falsely accused of complicity in a plot to poison the prince of Orange. He was imprisoned, tried, and acquitted, but was murdered by a mob (Aug. 20, 1672) as he was coming out of prison.

De Witt (John), an eminent Dutch statesman and republican, born at Dort Sept. 25, 1625. He was a leader of the party which was hostile to the House of Orange, or wished to reduce the power of the prince of Orange, who was supported by the populace and clergy. De Witt, who opposed the war against England, was elected grand pensionary of Holland in 1653. He had the chief control of the government during the minority of William, prince of Orange (who was afterwards king of England). In 1654 he negotiated with Cromwell a treaty of peace, in which a secret article stipulated that no member of the Orange family should ever be stadtholder. He was re-elected grand pensionary for a term of five years in 1658, and again in 1663. In 1665, Charles II. of England declared war against the Dutch, whose fleet entered the Thames and burned some shipping at Chatham. De Witt conducted this war with ability, and it was terminated by a treaty of peace in July, 1667. He joined England and Sweden in a triple alliance against Louis XIV. of France, but the latter soon seduced Charles II. to become his ally, and he invaded Holland with a large army. De Witt being unable to repel the enemy, who captured several towns, was blamed for these misfortunes, and lost his popularity. William of Orange was chosen general-in-chief and stadtholder. De Witt went to a prison to visit his brother Cornelius, who had been tried and acquitted. They were both murdered by the populace at the prison Aug. 20, 1672. (See P. Simon, "J. de Witt en Zijn Tijd," 3 vols., 1832–35.)

De Witt (Thomas), D. D. See Appendix.

De Witt'ville, a post-village of Chautauqua township, Chautauqua co., N. Y. Pop. 262.

Dew-point, the temperature at which watery vapor in the air begins to be condensed. Its determination is of great importance to the meteorologist, as by comparing it with the actual temperature he can tell the relative humidity of the air. He knows that at the actual temperature the air would be saturated if it contained a certain quantity of moisture; and also that the actual quantity present is only such as would suffice to saturate air at the observed dew-point; the ratio of this last quantity to the former expresses the relation between the actual humidity of the air and the humidity of saturation at the observed temperature. The dew-point in the evening further shows the temperature near which the minimum during the night is likely to be. When the temperature has fallen to the dew-point, the vapor in the air will be condensed, and an amount of heat will be set free which will raise the temperature of the air. The temperature will again sink by radiation somewhat below the dew-point; dew will be formed, and the temperature again be raised. F. A. P. Barnard.

Dews'bury, a manufacturing town of England, in the West Riding of Yorkshire, on the river Calder, 8 miles S. S. W. of Leeds. It is on the Lancashire and Yorkshire Railway, and is connected with London by another railway. It has manufactures of blankets, carpets, and coarse woollen goods made from shoddy (*i. e.* refuse rags worked over). There are collieries and iron-works in the vicinity. Pop. in 1871, 24,773. It is 1 mile S. of Batley, which has extensive manufactures of woollens. P. of Batley, 20,868.

Dexippus. See Appendix.

Dex'ter, a post-village of Dallas co., Ia., on the Chicago Rock Island and Pacific R. R., 35 miles W. by S. of Des Moines. It has one weekly newspaper.

Dexter, a post-village of Penobscot co., Me., on a branch of the Maine Central R. R., 70 miles N. E. by N. from Augusta. It has manufactures of woollen goods, and also several mills. It has one weekly newspaper. Pop. of Dexter township, 2875.

R. O. Robbins, Prop. "Gazette."

Dexter, a township of Washtenaw co., Mich. Pop. 889.

Dexter, a post-village of Scio township, Washtenaw co., Mich., on the Huron River and the Michigan Central R. R., 47 miles W. of Detroit. It has one weekly newspaper, two flouring-mills, a woollen-mill, planing-mill, and car-works. Pop. 1161. A. McMillan, Ed. "Leader."

Dexter, a township of Mower co., Minn. Pop. 120.

Dexter (Franklin), LL.D., a son of Samuel Dexter, noticed below, was born at Charlestown, Mass., Nov. 5, 1793, and graduated at Harvard in 1812. He practised law in Boston with marked success. He was a member of the State legislature and senate, and in 1849 was appointed U. S. district attorney for Massachusetts. In 1830 he was opposed to Daniel Webster in the famous murder trial of the Knapps. Died Aug. 14, 1857.

Dexter (Henry), a successful sculptor, born in New York, was originally a blacksmith in Connecticut. Among his productions are "The Young Naturalist," "The First Lesson," and others, besides many excellent portrait-busts. Mr. Dexter resides at Cambridge, Mass.

Dexter (Henry Martyn), D. D., an eminent Congregational minister, was born at Plympton, Mass., Aug. 13, 1821, graduated at Yale in 1840, and at Andover in 1844, was pastor in Manchester, N. H. (1844–49), and of the present Berkeley street church, Boston (1849–67). From 1859 to 1865 he was one of the editors of the "Congregational Quarterly," and in 1867 became editor-in-chief of the "Congregationalist." He is the author of "Street Thoughts" (1859), "Twelve Discourses" (1860), and of several other works, the most important of which is his "Congregationalism," a work of high authority, which reached a second edition in 1871. He has made the Massachusetts "Pilgrims" his special study, and is now (1873) preparing an elaborate "History of the Plymouth Colony."

Dexter (Samuel), LL.D., an American jurist and statesman, born in Boston May 14, 1761. He was admitted to the bar in 1784, attached himself to the Federal party, and was elected a Senator of the U. S. in 1798. He was appointed secretary of war in 1800 by John Adams, and became secretary of the treasury early in 1801. When the executive power was transferred to Jefferson in 1801, Dexter retired from the public service and resumed the practice of law in Boston. He had no superior and few equals as an advocate before the Supreme Court in Washington. As a supporter of the war against England, he separated from the Federalist party in 1812. Died May 4, 1816.

Dexter (Timothy), an eccentric American merchant, born at Malden, Mass., Jan. 22, 1747. He rose from poverty to affluence, and assumed the title of "Lord Timothy Dexter," by which name he is generally known. Many traditions with regard to his life are current in New England. Died at Newburyport Oct. 22, 1806. (See his Life by S. L. Knapp, 1823.)

Dex'trine [from the Lat. *dexter*, the "right hand"], ($C_6H_{10}O_5$), **British Gum, Alsace Gum, Gom'meline,** or **Lei'ocome,** a gum-like substance produced from starch by the action of heat, dilute acids or alkalies, diastase, saliva, bile, blood serum, pancreatic juice, etc., and by the action of sunlight on starch paste. It is soluble in water, and its solution turns the plane of polarization of a luminous ray to the right; hence the name *dextrine*. It is prepared from starch (potato starch is preferred on account of its cheapness and purity) by several processes: (1) By heating it in sheet-iron trays to a temperature of 300° F., by which it is changed into semi-transparent, yellowish-brown lumps, which are converted into a pale yellow powder by grinding between millstones. It is sometimes roasted in iron or copper cylinders or coffee-drums. (2) By the action of nitric acid (Payen's process): 1000 parts of starch are mixed with 2 parts of nitric acid (specific gravity, 1.4), diluted with 300 parts of water, and the mixture is carefully dried, the temperature being finally raised to between 230° and 250° F. The transformation is completed in about an hour and a half. (3) By carefully boiling starch with dilute acids: the operation must be discontinued as soon as the starch has all disappeared, which is shown by the failure to obtain the blue coloration characteristic of starch on adding iodine solution to a portion of the liquid. For 100 parts of starch, 25 of sulphuric acid and 280 of water may be used: the mixture to be heated to about 194° F. When the reaction is complete, the acid is neutralized with chalk, the insoluble gypsum separated by filtration, and the solution concentrated to a syrup or to a semi-solid mass, which can be transferred to a hot-air chamber and completely dried. Thus prepared, it contains a little gypsum. This impurity is avoided by using 300 parts of starch, 1500 of water, and 8 of oxalic acid, heating over a water-bath till all the starch has disappeared, neutralizing with carbonate of lime, filtering after two days' standing, and evaporating. (4) By the action of the diastase of malt: 80 parts of water are heated with 1 part of ground malt to 167° F., and 125 parts of starch are added in small portions. As soon as the starch has all passed into dextrine the solution is boiled to arrest the action of the diastase, which would otherwise change the dextrine to glucose. The solution is filtered and concentrated.

Cellulose is changed by the action of strong sulphuric acid into a substance resembling dextrine, but which rotates the plane of polarization to the left. Commercial dextrine always contains some glucose (grape-sugar), and generally some unchanged starch. It may be purified from the latter by solution in cold water and filtration; from the former, by repeated precipitation from its solution by alcohol or by dialysis.

Dextrine occurs in old potatoes and in young wheat plants in very small quantity. In the sprouting of seeds and buds it is produced from starch; hence it occurs in malt and malt liquors. In the baking of bread it is formed from the starch of the flour, and often constitutes 10 per cent. of the loaf. The glazing on the crust is chiefly a coating of dextrine. Limpricht found four-tenths of 1 per cent. of dextrine in the flesh of a horse.

Dextrine is an uncrystallizable, translucent solid, resembling gum-arabic. It is soluble in water and in dilute alcohol, but insoluble in absolute alcohol. Its aqueous solution is clear and limpid when dilute, but adhesive, viscid, and gummy when concentrated; it rotates the plane of polarization to the right, while the natural gums rotate to the left. It is not colored blue by iodine. By boiling with dilute acids or caustic alkalies it is converted into glucose. It is precipitated from its solution by an excess of strong alcohol. It has the same percentage composition as starch and cellulose. Dextrine is extensively used as a substitute for gum-arabic and other gums in stiffening, sizing, and glazing calicoes, nets, crapes, laces, silks, papers, cards, etc., as mucilage on every office-table, and for the adhesive layer on the back of postage stamps and on self-sealing envelopes. (Interesting observations on the transformation of starch into dextrine are recorded in the annual volumes of Wagner's "Jahresbericht der Chemischen Technologie.")

C. F. Chandler.

Dextrog'yrate [from the Lat. *dexter*, the "right hand," and *gyro*, to "turn"], a term applied in optics to crystals which have the power to rotate a plane of polarization of a plane polarized ray towards the right. It is opposed to *lævogyrate*, which expresses the power to rotate the plane in like manner towards the left.

Dey, dā [etymology doubtful], a Turkish title of dignity given formerly to the governors of Algiers (before the French conquest), and still given to the chief ruler of Tripoli. Tunis was governed by a dey at one period, but this title in the latter country has long been supplanted by that of bey.

Dezfool', a town of Persia, in the province of Khoozistan, on the Dezfool River, here crossed by a fine bridge of twenty-two arches, 28 miles W. N. W. of Shooster. It is the chief mart of Khoozistan. Ancient ruins and mounds, evidently of Sassanian origin, are found in the vicinity. Pop. estimated at 15,000.

Dhar, a decayed town of Central Hindostan, in Malwa, the capital of a protected state of the same name, 32 miles W. S. W. of Indore. It has two large mosques of red stone, and other traces of former magnificence.

Dhawalaghi'ri, a lofty peak of the Himalaya Mountains, in Northern Hindostan, was formerly supposed to be the highest mountain of the earth. It is in Nepaul, in lat. 28° 42′ N., lon. 82° 32′ E. Its altitude is 26,826 feet.

Dhole, dōl (*Canis scylax*), a wild dog found in the Western Ghauts and other mountainous parts of India. It is of a light-bay color, with a sharp muzzle, large and pointed ears, and in size is somewhat less than a wolf. This species is remarkable for fierceness and courage, and for hostility to tigers and other feline races.

Dhol'ka, a town of British India, in the presidency of Bombay, 22 miles S. W. of Ahmedâbâd. It is in the midst of ruined palaces, mosques, mausoleums, and spacious tanks lined with masonry. It is enclosed by a mud wall. Pop. about 25,000.

Dhol'poor, a town of Hindostan, on the Chumbul, 34 miles S. of Agra, is the capital of a protected state. Here are some old freestone mosques and mausoleums.

Dhubboree', a decayed town of Hindostan, in Guzerat, 78 miles N. E. of Surat. It has a ruined rampart two miles in circuit, and numerous Brahmanical temples built of hewn stone and adorned with sculptures.

Dhun'chee, or **Dhanchi,** a plant of the natural order Leguminosæ, of the genus *Sesbania*, having an extended loment with many seeds. It is an annual plant, cultivated extensively in some parts of India for its fibre, which is used in the manufacture of paper, cordage, canvas, and cloth. The plant has a slender stem about eight feet high.

Dia [διά], a Greek preposition and particle signifying "through," "apart," implying "separation" and "distinction;" "across," "between," implying mutuality. (For examples or illustrations, see DIAGONAL, DIAMAGNETISM, and DIALOGUE.)

Diabe'tes [Gr. διαβήτης, from διά, "through," and βαίνω, to "go"], the name of two diseases characterized by the excessive excretion of urine; whence the name. *Diabetes insipidus* (now called POLYURIA, which see) is distinguished from the other much more dangerous disease by the fact that the urine consists chiefly of water. It is neither frequent nor formidable. But *Diabetes mellitus*, "sweet" or "honeyed diabetes" (*Mellituria*), is one of the most incurable and serious of diseases. The urine has its specific gravity greatly increased by the presence of diabetic sugar, a substance believed to be identical (in most cases) with liver-sugar, and very closely approaching grape-sugar in its composition and reactions. In some cases it appears to be muscle-sugar (*inosite*). The disease is further characterized by indigestion, intense thirst, wasting, prostration of mind and body, and in many cases by degenerative changes in the tissues. Its causes are obscure and its treatment not well understood. Some cases are greatly benefited by opium and the use of strictly nitrogenous food, like gluten bread and skim-milk. Temporary diabetes has been observed after the administration of woorari poison and other drugs.

REVISED BY WILLARD PARKER.

Diadel'phia [from δίς, "twice," and ἀδελφός, a "brother"], in botany, the seventeenth class of the Linnæan artificial system. It comprises plants of which the filaments are united in two sets or brotherhoods. These are called *diadelphous*. Many plants of the natural order Leguminosæ and a few other plants belong to this class.

Di'adem [Gr. διάδημα; Lat. *diadema*], the symbol of royalty among several Oriental nations, was originally a fillet wound round the forehead and temples. The diadem of the Egyptian goddesses and kings bore the symbol of the serpent. Among the Persians the diadem was bound round the tiara or turban, and was of a blue color. Diocletian was the first Roman emperor who wore a diadem. After his time it was adorned with a single or double row of pearls or precious stones. Diadem is sometimes used as synonymous with crown.

Diagno'sis [Gr. διάγνωσις, from διά, "apart," and γιγνώσκω, to "know"], the discovery of the nature and seat of disease, one of the most difficult and important branches of medicine and surgery. Diagnosis is based upon "physical signs and rational symptoms;" "signs" being appreciable by the senses, and "symptoms" arrived at by the educated judgment. Both, however, are popularly known as symptoms. Diagnosis is best learned at the bedside, under the guidance of good instructors. The stethoscope, thermometer, laryngoscope, etc. furnish important aid in this branch of medical practice. The term is often used by naturalists for the discrimination of species of animals, plants, or minerals.

Diagom'eter [from the Gr. διάγω, to "conduct," and μέτρον, a "measure"], an electric instrument for determining the conducting power of fixed oils, invented by M. Rousseau. It consists of a dry pile, by means of which a current is passed through the oil, and the strength of the current determined by a magnetized needle. It is used especially for the detection of the adulteration of olive oil, which is said to have the lowest conducting power of such oils.

Diag'onal [Lat. *diagonalis*; Gr. διαγώνιος, from διά, "through," and γωνία, an "angle"], a straight line drawn through a figure, joining two opposite angles. The term is chiefly used in geometry in speaking of four-sided figures, but it is also properly applied with reference to all polygons of which the number of sides is not less than four. Euclid uses the term *diameter* in the same sense, but modern geometers use diameter only when speaking of curved lines, and diagonal when speaking of angular figures.

Diag'oras [Διαγόρας], a Greek poet and philosopher, born in the island of Melos, lived about 425 B. C., and is said to have been a disciple of Democritus of Abdera. He was a citizen or resident of Athens. As he rejected or doubted the popular religion and polytheism, he was stigmatized as an atheist. He fled from Athens in 411 B. C., or, as some say, was banished for impiety. He appears to have been a witty and fearless man of good moral character. His works are not extant. (See REUTHEN, "De Atheismo Diagoræ," 1812.)

Di'al [from the Lat. *dialis*, belonging to the day; Lat. *solarium*], an instrument which shows the hour of the day by the shadow of a gnomon or style cast by the sun on a graduated arc; it is also called **Sun-Dial.** The invention is of great antiquity, the Greeks having, it is said, learned its use from the Chaldæans. In the construction of a dial the object is to find the sun's distance from the meridian by means of the shadow. When this is known, the hour also is known, provided we suppose the sun's apparent motion to be uniform, and that it moves in a circle parallel to the equator during the whole day. In point of fact, neither of these conditions is fulfilled, but the error arising from this is of small amount. Although dials have many different constructions, the general principles are the same. The style, gnomon, or axis of the dial is either a cylindrical rod or the edge of a thin plate of metal. It must be parallel to the earth's axis, and thus it may be considered, on account of the smallness of the earth's diameter compared with the distance of the sun, as coinciding with the axis of the diurnal rotation; consequently the plane which passes through the centre of the sun, and the style will coincide with the shadow, and will turn with the sun, as the sun turns round the style, by the effect of the diurnal motion. Dials are horizontal, vertical, or inclined, according to the position of the plane of the dial with respect to the horizon of the place. The essential principle of the dial is, that the rod shall point to the pole of the heavens. F. A. P. BARNARD.

Dial, a township of Laurens co., S. C. Pop. 2529.

Di'al, The, a literary journal, the organ of the so-called "New England Transcendentalists," was founded in 1840 under the editorship of Margaret Fuller, assisted by George Ripley and R. W. Emerson. After a time, Mr. Emerson became its sole editor. It was published only four years, but was noted for the unusual number of persons of genius who contributed to it.

Di'alect [Gr. διάλεκτος, from διά, "apart," implying "difference," and λέγω, to "speak;" Lat. *dialectus*], a provincial form or manner of speaking or writing a language. The four Greek dialects, Attic, Doric, Ionic, and Æolic, were the four written varieties of the language, each having a literature of its own. No cultivated modern tongue resembles the Greek in this respect, as in all one dialect has been adopted as the standard of literature and polite society. In almost all languages there are still dialectic variations, in so far as colloquial discourse is concerned. English is a notorious example.

Dialectic [Gr. διαλεκτική, from διαλέγομαι, "I converse"] is a technical expression much used both in the Greek and German philosophy, but of a somewhat vague signification. In the Greek philosophy it may be best explained by considering it in its relation to logic. Logic was the science of the forms of thinking, the science of conclusion and evidence; it taught the manner by which to arrive at truth. Dialectic treated of the truths arrived at; it was the science of expressing and setting forth ideas, the science of definition. With an idealistic thinker like Plato, with whom truth is an intuition and the idea an inspiration, dialectic, the science of definition, the art of defining, means the highest function of science—science itself. With a realistic thinker like Aristotle, with whom truth is the result of induction and deduction, and the idea an evidence, dialectic means only a part, and even an inferior one, of logic. Hence the multitude of contradictions which invests this word all around. In the German philosophy it may be best explained by considering it in its relation to the expression "dogmatical." Dogmatical is applied to a definition when it excludes absolutely the opposite; "dialectical," when it combines the opposites as correlatives. According to the dogmatical definition, everything is either good or bad; and if it is good, it is not bad; if it is bad, it is not good. According to the dialectical definition, anything which is essentially good may have some bad in it, and anything which is essentially bad may have some good in it. According as the object passes under different views, the different constituents of the idea shift place and importance in the definition; relativity is the character of the actual world, relativity must be the character of the world of thought. Both in the Greek and German philosophy the word *dialectic* is sometimes used to signify a mere word-fence. CLEMENS PETERSEN.

Di'alogue [Gr. διάλογος, from διά, "between," or

"among," and λόγος, a "discourse"], originally a discourse between two or more persons. In literature, a composition in the form of a conversation between two or more individuals. The dialogue was the form most generally adopted by the ancients for the conveyance of instruction, and was considered applicable to the gravest and most philosophical subjects. It was adopted by Plato, Cicero, and Lucian with great success. The philosophical dialogue has also been employed by several eminent modern writers, as Fénelon, Fontenelle, Macchiavelli, Berkeley, Lessing, and Herder. In the drama, dialogue is combined with action, and those dramas which are not written for the stage differ from the dialogue chiefly in having a plot and a dénouement, while the dialogue is more strictly didactic.

Dial'ysis [Gr. διάλυσις, a "separation;" from διά, "apart," and λύω, to "loose"], the separation of certain substances by means of liquid diffusion. The dialyzer is usually a hoop of wood, gutta-percha, or metal on a low broad glass bell jar, open above as well as below. A piece of wet parchment paper is stretched over the hoop and securely tied in place. The fluid to be dialyzed is poured into the hoop to the depth of half an inch, and the whole is floated on distilled water. Crystallizable bodies, as common salt, nitrate of potassa, etc., and bodies closely allied to them, such as hydrochloric acid and alcohol, pass rapidly through the membrane into the water; while bodies which do not crystallize, but are inclined to assume the gelatinous form, such as silicic acid, hydrated alumina, starch, gum, caramel, tannin, albumen, gelatine, and extractive matters, diffuse with extreme slowness. Such bodies are called *colloid*, from κόλλη, "glue." When a mixture of sugar and gum was placed in the dialyzer, three-quarters of the sugar passed through in twenty-four hours, without a trace of the gum. On treating silicate of soda (soluble glass), acidulated with hydrochloric acid, in the same way, seven-eighths of the silicio acid was left in the dialyzer at the end of five days, without a trace of hydrochloric acid or chloride of sodium. Urine dialyzed for twenty-four hours gave a liquid so free from mucous and gelatinous matter that on evaporating to dryness and extracting with alcohol a solution was obtained which gave pure urea in crystalline tufts.

The purification of soluble colloids is best effected by dialysis; they are thus completely freed from crystalloids. A solution of pure hydrated alumina is obtained by dialyzing its solution in the chloride or acetate. In a similar manner may be obtained, *in solution*, hydrated sesquioxide of iron and of chromium; Prussian blue from its solution in oxalatic acid; an aqueous solution of silicic acid from silicate of soda and hydrochloric acid; pure albumen from albumen and acetic acid; pure gummic acid from gum-arabic (gummate of calcium) and hydrochloric acid. Mr. Whitelaw was granted a patent for the application of dialysis to brine from salted and corned meats. The salt and nitre pass rapidly through the parchment paper, while the nutritious extractive matters dissolved out of the meats are retained, and may be used for soup. (For the application of dialysis to the purification of beet-molasses, see Endosmose.)

Dialysis is specially useful in examining animal fluids for poisons where the presence of the colloids interferes with the ordinary tests. Arsenious acid may be readily separated in twenty-four hours from the contents of a stomach in sufficient purity to be immediately recognized by the usual tests. Tartar emetic, morphine, strychnine, and, in fact, almost all soluble poisons, may be thus separated.

Decompositions are also effected by dialysis. Bisulphate of potassa is partially separated into neutral sulphate and hydrated sulphuric acid; alum is partially separated into sulphate of alumina and sulphate of potassa; sulphate of potassa and lime-water yield considerable hydrate of potassa and sulphate of lime. Separations and decompositions of this kind undoubtedly occur in plants and animals, and in the soil; and dialysis is probably one of the most common processes in nature. (See Watts's "Dictionary of Chemistry," under "Liquids, Diffusion of;" also the original papers of Prof. Graham, who minutely investigated this subject, in the "Philosophical Transactions" for 1850 and 1862, and in the "Journal Chem. Soc.," iii. 60, 257; iv. 83; xv. 216.) C. F. Chandler.

Diamagnetic. See Diamagnetism, by Prof. Alfred M. Mayer, Ph. D.

Diamagnetic Polarity. It is well known (see Electro-Magnetism) that if a bar of iron be placed in a helix or spool of copper wire, through which circulates a current of electricity, the bar will be magnetized; and if we look at the end of the bar round which the current passes in the same direction as the motion of the hands of a watch, this end will be a south magnetic pole. When a bar of bismuth replaces the bar of iron, we find that the end above spoken of is a north magnetic pole in the bismuth: that is, bismuth has its poles the reverse of iron when it is placed in the same conditions of magnetization. Weber held to the opinion of the reversed polarity of bismuth, but Faraday denied any such condition. Tyndall settled the question by a series of experiments of great delicacy made with an apparatus designed for that purpose by Weber, and proved conclusively the existence of reversed polarity, not only in bismuth, but also in other diamagnetic solids and liquids. (By the author of the following article.)

Diamag'netism [for etymology see below]. The line joining the two opposite poles of a horseshoe magnet is called the *axial* line, while a line bisecting at right angles this axial line is called the *equatorial* line of the magnet. The space included between the opposite polar surfaces of the magnet is called *the magnetic field*.

When small bars of iron, nickel, cobalt, manganese, etc. are suspended between the poles of a magnet, they place their lengths in the axial line. Substances taking the above position are called magnetic substances, or, as Faraday termed them, *paramagnetic* substances. The majority of bodies, however (*e. g.* bismuth, antimony, phosphorus, heavy glass, wood, water, blood, bread, hydrogen, and ammonia), when delicately suspended in the magnetic field, place their lengths equatorially, and to distinguish them from magnetic substances they were called *diamagnetic* (διά, "across," and μάγνης, the "magnet") by Faraday, who in Dec., 1845, gave the discovery of diamagnetism to the world in a paper read before the Royal Society of London.

The difference in the behavior of magnetic and diamagnetic substances in the magnetic field was thus concisely stated by Faraday: Magnetic substances tend to go from weaker to stronger places of magnetic action, while diamagnetic bodies tend to go from stronger to weaker places in the magnetic field.

Faraday found that not only solids, but also liquids and gases, possessed magnetic and diamagnetic properties. In experimenting with these bodies he enclosed them in glass tubes, whose magnetic behavior was determined before they were filled with the liquids or gases to be examined, and the previously determined action of the magnet on the empty tube was deducted from the resultant magnetic effect on both the tube and its contained liquid or gas. Or two tubes of exactly the same size and material were hung opposite each other from the ends of a short piece of light wood, which was then placed across the end of a longer wooden rod, and the latter was suspended by silk fibres or by a fine silver wire. The two tubes hung on opposite sides of the axial line of the magnet, and with their centres equidistant from it. By this ingenious arrangement it is evident that the actions exerted by the magnet on the glass tubes neutralized each other, and whatever motion he observed was due to the difference in the action of the magnet on the two substances they contained. By filling one of the tubes with water or air, and the other successively with different liquids and gases, he determined *the specific magnetism* of these substances relatively to water or air taken as unity. Further experiments on the action of the magnetic field on water and air enclosed in a vacuum gave the data for reducing all of his measures to what he would have found had all the substances been suspended *in vacuo* between the poles of the magnet. Plücker in Germany and E. Becquerel in France also made very refined measures of these actions.

In the following table are contained the results of Faraday's measures of the actions of attraction or repulsion of magnetism on various substances, determined by means of a delicate torsion balance. In the comparisons equal volumes of the substance were used, and the action on water taken as the unity of intensity. The sign + indicates that the substance is magnetic, while — shows that it is diamagnetic:

Table of Specific Magnetism.

Substances.	Powers.	Substances.	Powers.
Iron	+ 2,500,000	Absolute alcohol	— 0.815
Protochloride of iron (saturated solution)	+ 62.	Essence of citron	— 0.8288
		Camphor	— 0.855
		Camphine	— 0.859
Protoammoniuret of copper	+ 1.390	Linseed oil	— 0.886
		Olive oil	— 0.886
Perammoniuret of copper	+ 1.240	Wax	— 0.887
		Nitric acid	— 0.911
Oxygen	+ 0.181	Liquid ammonia	— 1.010
Air	+ 0.035	Bisulphide of carbon	— 1.031
Olefiant gas	+ 0.006	Nitrate of potassa (saturated solution)	— 1.036
Nitrogen	+ 0.003		
Carbonic acid	0.000	Sulphuric acid	— 1.081
Hydrogen	— 0.001	Sulphur	— 1.221
Ammonia (gas)	— 0.005	Chloride of arsenic	— 1.260
Cyanogen	— 0.009	Borate of lead	— 1.413
Glass	— 0.188	Bismuth	— 20.369
Zinc	— 0.772		
Ether	— 0.797		

The general law of these actions was discovered by Faraday, and Becquerel has formally stated them as follows: If we place in the neighborhood of a magnetic pole a fixed vessel filled with a fluid, the latter will experience no motion. Imagine any portion of the interior of the fluid mass isolated; it is solicited, according as it is magnetic or diamagnetic, by a force f, positive or negative; and as it is not displaced, the medium which surrounds it must necessarily exert on it an equal and contrary pressure equal to $-f$; this is to say, that the principle of Archimedes applies as well to these forces as to gravity. Replace now the mass of the fluid we supposed isolated from the same fluid surrounding it by another which is bounded by the same surface as the former, but of a different magnetic nature; it will receive from the magnet a different action f^1, positive or negative, and from the surrounding fluid the same action as above, f; the resultant action on the new substance will be f^1-f. Consequently, the action which the pole of a magnet exerts on any body whatever, plunged in a fluid medium, is equal to the difference of the actions which it exerts separately on this body and on the fluid in which it is suspended.

From these considerations the following consequences result: When the medium is magnetic, f is positive, and f^1-f is negative; consequently, any body whatsoever tends to become diamagnetic in a magnetic fluid or medium. Conversely, in a diamagnetic medium f is negative, and $-f$ is positive; and the substance may act as though it were magnetic, even when it really is not when tested in a vacuum, and will become more diamagnetic when it really is diamagnetic when suspended in a vacuum between the poles of the magnet.

Faraday beautifully illustrated the above principle by the following ingenious experiments: He filled glass tubes with solutions of sulphate of iron (a magnetic substance) of different degrees of strength, and suspended them between the poles of his magnet in similar solutions, also of different degrees of strength. When the solution in the tube was stronger, or contained *more* iron, than that in the solution in which it was suspended, it pointed *axially;* when it was weaker, or contained *less* iron, than that in the surrounding liquid, it pointed *equatorially;* and when the solution in the tube and outside of the tube were of the same degree of strength, the tube was indifferent.

In Sept., 1847, Bancalari of Italy discovered that when the flame of a candle was placed between the poles of an electro-magnet, it was deflected into the equatorial line the moment the iron of the magnet was magnetized, and the flame returned to its first position when the magnet was demagnetized. Faraday repeated these experiments with the powerful magnet of the Royal Institution, and greatly extended these observations by his discovery of the magnetic character of oxygen, olefiant gas, and nitrogen, when these gases were contained in tubes and placed in a vacuum in the magnetic field; and observed that hydrogen, cyanogen, and ammonia were diamagnetic when placed in similar conditions. Faraday made many important experiments on the effects of the change of temperature and pressure in modifying the magnetic conditions of gases, and found that the action in the magnetic field on these bodies diminished with an elevation of their temperature and a diminution of their density. Thus, hot air is shown to be diamagnetic when allowed to ascend through cold air between the poles of the magnet. This and other similar facts he showed by causing the currents of gas in their progress towards the magnetic field to pass over pieces of paper saturated with chlorhydric acid, while between, around, and above the poles were placed little tubes moistened with ammonia. When the gases entered one of these tubes the fact was known by the formation in it of white fumes of chloride of ammonium. He thus found that the heated air on reaching the magnetic field was repelled from the poles, while a descending current of cold air was attracted towards the poles.

The writer of this article has recently devised a superior method of observing these phenomena, by passing through the gases, as they ascend or descend or pass between the poles, a strong diverging beam from an electric or calcium light. The difference in refracting power of the hot or cold gas currents and the surrounding air causes shadows of the currents to be projected on a screen placed on the side of the magnet opposite the light; and thus can be seen at once all the parts of the phenomena; and he has thus been able to draw and even to photograph them. In these experiments the writer used the powerful electro-magnet of the Stevens Institute of Technology. With this magnet the experiments of Bancalari are very remarkable. On bringing the flame of a candle slowly upward between the poles of the magnet, the top of the flame is first depressed and spread out equatorially in the magnetic field; as we elevate the flame it spreads out yet more, and often takes the form of an oval-shaped vase flattened equatorially, with an interior depression extending down nearly to the base of the wick. A larger flame becomes compressed into a flattened elliptical dish, with two curved arms or handles projected upward.

After Faraday had discovered the magnetic properties of oxygen, he experimentally determined that one cubic metre of this gas equalled in magnetic effect fifty-four centigrammes of iron, and hence that the whole atmosphere acted as would a layer of iron which enveloped the earth and had a thickness of one-tenth of a millimetre. Parts of this gaseous magnetic shell are successively heated—and therefore weakened in magnetic intensity—by the sun in his apparent daily and yearly changes of position; and hence Faraday reasoned that here was certainly a true, and probably a sufficient, cause of the diurnal variation of the needle. (*Phil. Trans. R. S.*, Nov., 1850.)

Faraday, in the course of his experiments on bars of bismuth, met with the following anomalous actions. He found that some cast bars of bismuth pointed axially, others equatorially, while yet other bars took intermediate positions of rest. These extraordinary phenomena both he and Plücker of Germany endeavored to explain, and they both observed that there was some relation between the positions of crystals in the magnetic field and their crystalline forms. The phenomena received their full explanation at the hands of Tyndall, whose subtile examination and lucid explanation of these phenomena—though not popularly known—we think form his greatest claim to illustrious distinction as a man of science.

We can best make clear Tyndall's discoveries by quoting from his paper "On Diamagnetism and Magne-crystallic Action" (*L., E., and D. Phil. Mag.*, July, 1850) the following experiments, and then give in his own words the law which embraces their characteristic phenomena: "If we take a slice of apple about the same size as a penny, but somewhat thicker, and pierce it through with short bits of iron wire in a direction perpendicular to its flat surface, such a disk, suspended in the magnetic field, will, on the evolution of the magnetic force, recede from the poles and set its horizontal diameter strongly equatorial; *not* by repulsion, but by the attraction of the iron wires passing through it. If, instead of iron, we use bismuth wire, the disk, on exciting the magnet, will turn into the axial position; *not* by attraction, but by the repulsion of the bismuth wires passing through it.

"If we suppose the slice of apple to be replaced by a little cake made of a mixture of flour and iron filings, the bits of wire running through this will assert their predominance as before; for, though the whole is strongly magnetic, the superior energy of action along the wire will determine the position of the mass. If the bismuth wire, instead of piercing the apple, pierce a little cake made of flour and bismuth filings, the cake will stand between the poles as the apple stood; for though the whole is diamagnetic, the stronger action along the wire will be the ruling energy as regards position.

"Is it not possible to conceive an arrangement among the particles of a magnetic or diamagnetic crystal capable of producing a visible result similar to that here described? If, in a magnetic or diamagnetic mass, two directions exist, in one of which the contact of the particles is closer than in the other, may we not fairly conclude that the strongest exhibition of force will be in the former line, which therefore will signalize itself between the poles in a manner similar to the bismuth or iron wire? . . .

"If analogic proof be of any value, we have it here of the very strongest description. For example: bismuth is a brittle metal, and can readily be reduced to a fine powder in a mortar. Let a teaspoonful of the powdered metal be wetted with gum-water, kneaded into a paste, and made into a little roll, say an inch long and a quarter of an inch across. Hung between the excited poles, it will set itself like a little bar of bismuth—equatorial. Place the roll, protected by bits of pasteboard, within the jaws of a vice, squeeze it flat, and suspend the plate thus formed between the poles. On exciting the magnet the plate will turn, with the energy of a magnetic substance, into the axial position, though its length may be ten times its breadth.

"Pound a piece of carbonate of iron into fine powder, and form it into a roll in the manner described. Hung between the excited poles, it will stand as an ordinary magnetic substance—axial. Squeeze it in the vice and suspend it edgeways, its position will be immediately reversed. On the development of the magnetic force the plate thus formed will recoil from the poles *as if violently repelled*, and take up the equatorial position.

"We have here 'approach' and 'recession,' but the cause is evident. The line of closest contact is perpendicular in each case to the surface of the plate—a consequence of the pressure which the particles have undergone in this direc-

tion; and this perpendicular stands axial or equatorial according as the plate is magnetic or diamagnetic."

Prof. Tyndall thus sums up the law which rules all of these actions: "If the arrangement of the component particles of any body be such as to present different degrees of proximity in different directions, then the line of closest proximity, other circumstances being equal, will be that chosen by the respective forces for the exhibition of their greatest energy. If the mass be magnetic, this line will stand axial; if diamagnetic, equatorial."

The above law explains clearly the anomalous actions Faraday observed in his bars of bismuth. Bismuth is a crystallized body, and the lines of greatest proximity of its particles are in the direction of its cleavage planes. Therefore, this line of greatest condensation will always place itself equatorially in the magnetic field. In other words, the planes of cleavage will take an equatorial direction. But in casting bars of bismuth, these planes may, on the solidification of the bismuth, take various positions in reference to the length of the bars; hence the anomalous actions which are sometimes observed in these bars.

When the crystal cleaves equally easy in two planes, the lines of greatest compression will be parallel to both of these planes, and therefore the intersections of these planes will determine the position the crystal takes in the magnetic field. This is confirmed by experiment.

If there are three cleavage planes, perpendicular to each other, as in rock-salt, or if there are none, as in quartz, there will be no line of elective polarity, and the body will act as though it were not crystallized.

Finally, when three planes of cleavage are not perpendicular, there is generally one direction of greatest compression, which is found—for example, in calc-spar—parallel to the axis of crystallization; this line will place itself axially if the crystal is magnetic, and equatorially if it is diamagnetic. This deduction is confirmed by experiment.

ALFRED M. MAYER.

Diamanti'na (formerly **Tejuco**), a city of Brazil, in the province of Minas Geraes, is the chief town in a diamond and gold mining district, and is situated in a valley between high mountains, 220 miles N. N. E. of Ouro Preto. It is 5700 feet above the level of the sea. It is the seat of a bishop, and is a handsome and wealthy place. Diamantina became a city in 1831. Pop. about 12,000.

Diam'eter [from the Gr. *διά*, "through," and *μέτρον*, a "measure;" Fr. *diamètre*], a right line drawn through the centre of a circle, and terminated on both sides by the circumference. Diameter in architecture is the measure across the lower part of the shaft of a column, which is usually divided into sixty minutes, and forms a scale for the measurement of all the parts. In astronomy the apparent diameter of a celestial body is the angle which the latter subtends at the eye, and is measured by the micrometer. The distance of the body in question from the earth, when multiplied by the sine of this angle, gives the real diameter of the body. In elementary geometry, diameter is any right line through the centre of a figure. In conics a diameter always bisects a system of parallel chords. Newton showed that the centres of mean distances upon a system of parallel lines, of the n intersections of each with a curve of any order, always lie on a right line, which may be called a diameter. A diameter of any curve is simply the polar line with respect to the curve of an infinitely distant point. The rth diameter is the rth polar of an infinitely distant point, and consequently a curve of the $(n-r)^{\text{th}}$ order. The $(n-2)^{\text{th}}$ diameter is called the diametral conic, the $(n-3)^{\text{th}}$ the diametral cubic, etc. The same extension is applicable to surfaces. When the primitive surface is of the second order, there is but one diametral surface, and that is the diametral plane which bisects a system of parallel chords. Three diametral planes so situated with respect to each other that each bisects all chords parallel to the intersection of the other two, constitute a system of conjugate diametral planes, and intersect each other in conjugate diameters.

Di'amond [Fr. *diamant*; Ger. *Diamant* or *Demant*, a corruption of ADAMANT (which see)], the most valuable of precious stones and the hardest of known substances, consists of pure carbon. The primary form of the diamond is a regular octahedron, but it often occurs in cubes and rhomboidal dodecahedrons, and sometimes in twin crystals; the faces are frequently convex. The finest diamonds are transparent and colorless, but those which are of decided tints of pink, green, or blue are prized, while those which are slightly colored are held in least estimation. They are found in alluvial deposits, from which they are extracted by washing. The most celebrated mines are those of India. In 1728 diamonds were found in Brazil, and since that time the mines of Minas Geraes have produced most of the diamonds of commerce until quite recently. At present there is a considerable importation from Southern Africa, where they were first discovered in 1870. They have also been brought from Siberia, Borneo, and other countries. The largest known diamond is probably that mentioned by Tavernier as belonging to the Great Mogul. It was found in Golconda in 1550, and it is said to have weighed in its original state 900 carats. Among the crown-jewels of Russia is a diamond weighing 194 carats; it is of the size of a pigeon's egg, and was stolen from a Brahmanical idol by a French soldier. It was ultimately bought by Catharine of Russia for about $450,000 and an annuity of $20,000. One of the most perfect diamonds was brought from India by a gentleman named Pitt, who sold it to the regent-duke of Orleans for about $625,000. The celebrated Koh-i-noor (the "mountain of light") became the property of Queen Victoria on the annexation of the Punjâb by the East India Company in 1850. It is mentioned by Tavernier in 1665 as the property of the Mogul emperor, and, together with the Dûriya-i-noor ("sea of light"), formed part of the plunder seized by Nadir Shah at the taking of Delhi in 1739. It weighed originally 186$\frac{1}{16}$ carats, but it has been recut and reduced to 103$\frac{3}{4}$ carats, and it is greatly improved in appearance. The diamond was first proved to be combustible in 1694 by the Florentine academicians, who found that when exposed to the heat of the sun in the focus of a large lens it burnt away with a blue lambent flame. The products of its combustion were first examined by Lavoisier in 1772, who showed that when burnt in air or oxygen it produced carbonic acid. Subsequent experiments have demonstrated that nothing but carbonic acid is thus formed. Diamonds of inferior quality have extensive employment in the diamond-drill (see BLASTING, by GEN. J. G. FOSTER), and in machines for sawing stone, dressing mill-stones, etc. (See also PRECIOUS STONES, by PROF. H. B. CORNWALL, E. M.) Attempts have been made to produce true diamonds by the crystallization of carbon, but thus far without success.

REVISED BY C. W. GREENE.

Diamond, in printing, a very small type, less than pearl, and next larger than brilliant.

Diamond Beetle (*Curculio*), a coleopterous insect belonging to the weevil tribe, remarkable for the splendor of its colors. It is golden-green, with two black bands on the thorax; on the wing-covers are rows of depressed spots of a sparkling green color, with intervals of black.

Diamond Bluff, a post-township of Pierce co., Wis. Pop. 475.

Diamond City, a post-village, capital of Meagher co., Mon., about 32 miles E. by N. from Helena. Gold is found in the vicinity.

Diamond Creek, a township of Chase co., Kan. P. 469.

Diamond Harbor, in British India, the port of Calcutta for large ships, is in the river Hoogly, 34 miles below that city, with which it is connected by an excellent road. The adjacent country is so swampy and unhealthy that few Europeans reside here.

Diamond Hill, a township of Abbeville co., S. C. Pop. 1760.

Diamond Necklace, a celebrated necklace containing 500 diamonds, and valued at 1,800,000 livres (about $400,000), made in 1773–75 by order of Louis XV. for Madame du Barry, his mistress; but before it was finished the king died, and Du Barry was excluded from court. In the years 1783–84 the prince-cardinal de Rohan was persuaded by the so-called countess Jeanne de Lamotte-Valois, an unscrupulous adventurer, that the queen Marie Antoinette regarded him with interest, which would be increased if he would assist her in buying the diamond necklace by becoming her surety for the payment of its price to the makers of the ornament, MM. Boehmer and Bassanges. The next steps in the affair are involved in some mystery. The count Cagliostro was probably one of the participants in the plot. The queen was believed (unjustly, as it is thought) to have been also involved in it. Certain it is that the cardinal agreed to stand surety for the payment—that the necklace was delivered to him, was stolen from him, was broken up, and sold in pieces. The jewellers, not having received their pay, went to court and made complaint. Cagliostro, the cardinal, and others were thrown into the Bastile. The trial in 1785–86 proved the guilt of no one but the countess Lamotte, who, with her husband, was branded on each shoulder and sentenced to a life imprisonment, from which she shortly afterwards escaped to London, where she died Aug. 23, 1791, having fallen from a window as she was trying to hide from her creditors. There is little doubt that the pretended signatures of the queen upon the papers and agreements made respecting this affair were clever forgeries.

Diamond Spring, a post-township of El Dorado co., Cal. Pop. 1055.

Dian'a, an ancient Italian divinity worshipped by the Romans as the goddess of light. She was identified by the later Romans with the Artemis of the Greeks, who was often called Delia, from her native island, Delos. She was supposed to be the daughter of Jupiter and Latona, and the sister of Apollo, with whom she shared his attributes of destruction and healing. She was represented as a virgin armed with bow and arrows, and was regarded as the patroness of chastity. As the goddess of the moon she was often called Selene and Phœbe.

Diana, a post-township of Lewis co., N. Y. It has iron mines and furnaces and many rare minerals. Joseph Bonaparte once had a summer residence here. The township contains several manufacturing villages and four churches. Pop. 1778.

Diana, Temple of, at Ephesus, one of the Seven Wonders of the World, built at the common charge of all the Asiatic states. The chief architect was Chersiphron; and Pliny says that 220 years were employed in completing this temple, whose riches were immense. It was 425 feet long, 225 broad, and was supported by 127 columns of Parian marble (60 feet high, each weighing 150 tons), furnished by so many kings. It was set on fire on the night of Alexander's nativity by an obscure individual named Erostratus, who confessed on the rack that the sole motive which had prompted him to destroy so magnificent an edifice was the desire of transmitting his name to future ages (356 B. C.). The temple was rebuilt, and again burned by the Goths in their naval invasion (A. D. 256).

Diane de Poitiers, a beautiful French lady, born Sept. 3, 1499, was married at the age of thirteen to Louis de Brézé. After his death (1531) she became a favorite of the king's son, who in 1547 ascended the throne as Henry II., and created her duchess of Valentinois in 1548. She had great influence over the king, who permitted her to exercise royal power and control his foreign policy. She maintained her ascendency until the death of Henry in 1559. Died April 22, 1566.

Dianthus. See Pink.

Diapa'son [Gr. *διά*, "through," and *πασῶν* (genitive plural feminine of *πᾶς*, "all")], in music, a term by which the ancient Greeks designated the octave. In modern music, diapason is used to denote the range or compass of the voice or of an instrument. The French use the term as equivalent to pitch, and apply it also to the steel instrument commonly called "tuning-fork" in English, which is employed to give a certain pitch. Diapason is also the name given by organ-builders to certain stops of pipes in the organ of eight feet pitch. (See Organ.)

Di'aper [Fr. *diapre*, a corruption of d'Ypres, a town of Flanders, where it was first manufactured], a linen fabric woven in flowers or regular patterns, chiefly used for napkins, table-cloths, etc. Diaper is also made in Scotland, Ireland, and Germany.

Diaph'anous [Gr. *διαφανής*, "transparent," from *διά*, "through," and *φαίνω*, "to shine"], a term nearly synonymous with *translucent*, is applied to bodies which like porcelain, permit light to pass through their substance. The term transparent is applied when the distinct forms of objects can be seen through the body.

Diaphore'sis [Gr. *διαφόρησις*, from *διά*, "through," and *φέρω*, to "carry"], the excretion of sweat from the skin without perceptible moisture; insensible perspiration. Medicines promoting this excretion are called "diaphoretics," while those producing perceptible wetness of the skin are called "sudorifics." Of late, however, the terms "diaphoretic" and "diaphoresis" are frequently applied to both the sensible and insensible perspiration.

Diaphragm [Gr. *φρήν* or *διάφραγμα*, from *διά*, "apart," and *φράγνυμι* (*φράσσω*), to "fence," to "enclose"], or **Mid'riff** [from the Ang.-Sax. *mid*, "middle," and *hrif*, the "abdomen"], a thin musculo-aponeurotic septum which in mammals separates the abdominal cavity from the thorax. Its centre in man is occupied by the cordiform tendon or trifolium (trefoil), so called from its shape, which roughly resembles a clover-leaf (Lat. *trifolium*). The diaphragm is attached to the vertebral column by two muscular buttresses or pillars called, in the plural, *crura*. These crura bear the names "right" and "left crus" (Lat. *crus, cruris*, a "leg," so called from their shape and position). The diaphragm is traversed by the phrenic (internal respiratory) nerves, and is, like the other respiratory muscles, partly involuntary. In forcible inspiration it is drawn down like the piston of an air-pump. It is one of the principal agents in the various expulsive acts, and also in sneezing, coughing, and laughing. Hiccough (Lat. *singultus*) is a clonic spasm of the diaphragm.

The term diaphragm is frequently applied by mechanics and others to a thin layer of leather, metal, or other material stretched across a cavity, after the manner of the above muscle.

Diarbekîr' [Turkish, *Kara-Amid*], a town of Asiatic Turkey, capital of a pashalic of its own name, is situated on the right bank of the Tigris, near its source, and about 200 miles N. E. of Aleppo; lat. 37° 55′ N., lon. 39° 52′ E. It is enclosed by a high, strong stone wall flanked with towers. It is the seat of a Nestorian and a Jacobite patriarch, and of a Catholic and an Armenian bishop. It has numerous handsome mosques, bazaars, and khans. It was formerly a more populous city, and had extensive manufactures of silk and cotton, but these have declined. The manufacture of silk is still carried on here. Pop. 45,000.

Diarrhœ'a [Gr. *διάῤῥοια*, from *διά*, "through," and *ῥέω*, to "flow"], a disease characterized by frequent soft alvine discharges; acute or chronic intestinal catarrh. Many writers have drawn nice distinctions between the various assumed varieties of this disease, which indeed is very frequently a symptom rather than a distinct disease; but nearly every case is in reality due to inflammation or irritation of some part of the intestinal canal. Diarrhœa as a symptom of cholera, dysentery, typhoid fever, pulmonary consumption, and some forms of peritonitis, is treated of under these respective heads. When resulting from local or general disease of the alimentary canal, its symptoms and treatment vary greatly according to the age of the patient. In infants both its acute and chronic forms are very frequent and fatal. These cases often depend on improper food and clothing—less frequently upon disturbances caused by dentition than is generally supposed. These cases require, first, a careful attention to hygienic conditions. Flannels should be worn next to the skin. If a milk diet should disagree, as it often does, finely-cut raw beef or strong broth may be given to the child. Medication should generally be cautious, but active. Many children suffer or die from over-medication, and still more probably from lack of active treatment. If scybalous masses of fæcal matter exist in the bowels, they should be cleared out by cathartics, such as rhubarb, etc., with aromatics, or castor oil. The proper use of astringents, tonics, and opiates in infantile diarrhœa is a matter requiring much discrimination. Chronic diarrhœa in the adult is an obstinate and rather common disease. A certain proportion of the cases are improved by iron, quinia, salicine, and other tonics. Change of climate, visits to mild saline chalybeate springs, sea-bathing, etc. are useful in many instances. Balsam of copaiba relieves some patients with surprising readiness. Astringent remedies and opiates have much value as palliative, and sometimes as curative, agents. In the simple acute diarrhœa of temperate climates, adults previously well are in general promptly cured by these agents, judiciously administered.

Revised by Willard Parker.

Di'astase [Gr. *διάστασις*, "division," "separation," from *διά*, "apart," and *ἵστημι*, to "stand"], a name given to the constituent of malt (germinated barley) which changes starch to dextrine and glucose (grape-sugar). Diastase may be extracted from ground malt by treating it with tepid water (80° F.), heating the solution to 160° F. to coagulate the albumen, filtering, and precipitating the diastase by absolute alcohol. It is purified by redissolving in water and reprecipitating by alcohol. Malt does not yield more than 0.002 to 0.003 per cent. of diastase. Thus obtained, diastase is a white amorphous substance, soluble in water and in dilute alcohol. It has not been obtained sufficiently pure for analysis. It is supposed to be a nitrogenous body. Mulder believes it to be a group of bodies, not a single, well-defined compound. Its most characteristic property is its action upon starch. At a temperature of 158° F. it rapidly changes this substance to a mixture of dextrine and glucose. Payen and Persoz say 1 part of diastase will change 2000 parts of starch. It was at first supposed that the starch was first changed to dextrine, and the dextrine then changed to glucose. Musculus claimed to have proved that the two products resulted simultaneously from the starch, in the ratio of 1 equivalent of glucose to 2 of dextrine, and that diastase would not change dextrine to glucose. Payen proved that diastase does change dextrine to sugar, but that the process is interrupted by the presence of a certain percentage of glucose, to be resumed when this glucose has been destroyed by fermentation. Schultz and Märker confirm to a certain extent the observations of Musculus; they claim to have proved the simultaneous formation of both products, and propose the following expression for the reaction:

Starch.	Water.	Dextrine.	Glucose.

$$2C_6H_{10}O_5 + H_2O = C_6H_{10}O_5 + C_6H_{12}O_6.$$

Before Payen and Persoz discovered diastase, Saussure obtained a substance from malt which changed starch to

dextrine and glucose, for which he proposed the name *mucin*. This name having been previously applied to a substance obtained from animal mucus, Ritthausen changed it to *mucidin*. Mucidin is probably identical with diastase. Dubrunfaut has obtained a body from malt which he calls *maltin*. It is precipitated from malt extract by tannin. He describes it as "a diastase of a true platonic character." The action of diastase on starch is prevented by nitric, sulphuric, hydrochloric, phosphoric, oxalic, tartaric, or citric acids; also by caustic potassa, soda, or lime, sulphate or acetate of copper, corrosive sublimate, nitrate of silver, alum, copperas, and borax. It is retarded by formic acid, arsenious acid, magnesia, ammonia, and alkaline carbonates; slightly by acetic acid, hydrocyanic acid, strychnine, quinine, morphine, and their salts. Essential oils, creosote, alcohol, and ether do not interfere with its action. Starch is also changed to dextrine and glucose by dilute acids, putrid flesh, yeast, gastric juice, by animal membranes, and in fact by all albuminoids in a certain stage of decomposition. (See STARCH, DEXTRINE, GLUCOSE, FERMENTATION.)

It is probable therefore that diastase is not a definite compound, but a certain condition of albuminous matter. Diastase plays a very important part in the germination of seeds and the sprouting of buds in tubers and stems containing starch. It serves to render the starch and albumen soluble, and thus facilitates their circulation and assimilation. (See GERMINATION.) In the manufacture of beer and spirits the diastase changes the starch into dextrine and glucose, and thus makes fermentation possible. (See BEER, ALCOHOL, WHISKY.) (The investigations with regard to the nature and action of diastase are recorded in LIEBIG and KOPP'S "Jahresbericht," and WAGNER'S "Jahresbericht.")

C. F. CHANDLER.

Diath'esis [Gr. διάθεσις, from διά, "apart," and τίθημι, to "place;" Lat. *dispositio*], in medicine, a predisposition; a constitution of body tending towards some particular disease. Writers mention the strumous, cancerous, scorbutic, rheumatic, gouty, hæmorrhagic, and other diatheses. These tendencies exercise a most powerful influence upon life and health, and their detection and treatment are matters of great practical importance.

Diatoma'ceæ [named from *Diatoma*, one of the genera], an order of microscopic plants which are usually referred to the class Algæ. Owing chiefly to the curious movements which the Diatomaceæ exhibit, they have been by some few naturalists considered as animals, and by others as belonging to a class of organisms intermediate between the animal and vegetable kingdoms; but movements like those of the Diatomaceæ are by no means absent from the higher vegetable world, and are especially frequent among the Protophytes; while it is certain that the organisms we are considering are closely akin to the Desmidiaceæ, which are confessedly of vegetable nature. They also contain endochrome (chlorophyll), which, however, is, during life, of a brown color, owing to the presence of iron.

Each diatom consists essentially of a single cell, and the wall of each cell is a layer (frustule) of silex, interpenetrated by organic matter chemically identical with the cellulose of higher plants. Each frustule is curiously marked with lines or dots, often of the most beautiful characters when seen under a powerful microscope. The interior contains endochrome and often oil-globules. Many diatoms have a protoplasmic layer outside the frustule, and it is upon contractions of this layer that the motions above alluded to are supposed to depend. Many of the most interesting diatoms are strung together in filaments; others are agglutinated in masses. Their reproduction is not well understood, but it is certain that they increase by the conjugation of cells, and also by fission.

The Diatomaceæ are found fossil in vast deposits. Bergmehl, tripoli, flint, and rotten-stone consist principally of these fossils. Bog-iron ore consists chiefly of these plants, which in some of the species incorporate large proportions of iron into their frustules. Diatoms are found in guano and in fresh and salt water, in some cases attached by stalks to fixed objects, and in other cases floating in the water in such numbers as to color it with their characteristic brown tint. They are eaten by the minute animals which form so large a part of the food of the whale. They abound especially in polar regions, some species ranging from Spitzbergen in the N. to Mount Erebus in the farthest S. A stratum eighteen feet thick of their fossil frustules underlies the city of Richmond, Va. On the Columbia River there is a mass of these fossils 500 feet thick. Living specimens are extensively found in soils and in the mud of many salt-water inlets and harbors. The ice in both polar regions is often colored with them; they also occur alive in springs whose water is near the boiling-point. (See CARPENTER on "The Microscope," and the articles of Prof. BAILEY and others upon this subject in the "American Naturalist," vol. i. *et seq.*)

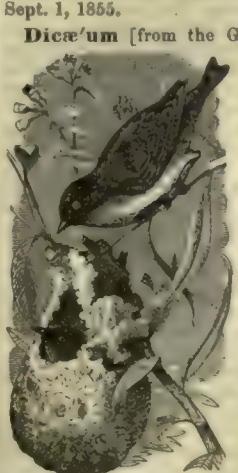
CHAS. W. GREENE.

Diaton'ic Scale of Col'ors, the spaces occupied by the seven primary colors in the solar spectrum, and supposed by Newton to be exactly proportional to the length of strings that sound the seven notes in the diatonic scale of music. It is now known, however, that this theory is not well founded, although there is an analogy between the pitch of sounds and the color of bodies.

Diaz (BARTOLOMEU), a Portuguese navigator, eminent for his learning, talents, and enterprise. He commanded an expedition sent in 1486 to explore the western coast of Africa. He sailed or was driven by the wind around the southern extremity of Africa, to the mouth of the Great Fish River. Returning homeward, he discovered the cape which he had previously doubled unawares, and called it Tormentoso, which was soon exchanged for the name of Cape of Good Hope (Cabo de Buena Esperanza). He was captain of one of the ships in the fleet of Cabral, which sailed for India in 1500, and he perished by shipwreck May 29 of that year.

Diaz de la Peña (NARCISSE-VIRGILE), a French painter, born at Bordeaux Aug. 20, 1809. He began as a landscape-painter, but later he occupied himself with subjects of pure fancy, filling a crowd of small canvases with nymphs and cupids, and with boys and girls dressed in costumes that might pass for Eastern, but in which no attempt at faithfulness to details is allowed to interfere with the effects of color, which is all the artist aims at, and which he is often successful in obtaining. At one time the pictures of Diaz fetched high prices, and when he first made a name it was by work that showed an original vein; but he has greatly deteriorated, and by flooding the market with pictures merely made to sell, he has nearly lost all reputation. He obtained a third-class medal in 1844, a second-class in 1846, and the first-class in 1848.—He has a son, M. EUGÈNE DIAZ, who has some local repute as a musical composer.

CLARENCE COOK.



Dib'din (CHARLES), an English musician and writer of songs, was born at Southampton in 1745. He composed over 1000 sea-songs, among them "Tom Bowling" and other favorites of the English tars. Died July 24, 1814.—His son, THOMAS DIBDIN, born in 1771, was an actor and author of innumerable melodramas, farces, etc., of which the best known is "The Cabinet." Died Sept. 16, 1842.

Dibdin (THOMAS FROGNALL), D. D., an English bibliographer, born in Calcutta in 1776, was a nephew of Charles, noticed above. He took orders as a priest in 1804. He published, besides other works, "Bibliomania" (1809); a new edition of Ames's "Typographical Antiquities of Great Britain" (4 vols., 1810–19); "Bibliographical Decameron, or Ten Days' Pleasant Discourse over Illuminated MSS." (1817); and "Reminiscences of a Literary Life" (2 vols., 1836). Died Nov. 18, 1847.

Dibrell (ANTHONY), a minister of the Methodist Episcopal Church South, born in Virginia Aug. 19, 1805. He was educated at the University of North Carolina, studied law, entered on the practice of his profession at Lynchburg, abandoned it for the ministry, and in 1830 joined the Virginia Conference, in which he became eminent for piety, talents, and zeal. Died in Norfolk, Va., of yellow fever, Sept. 1, 1855.

T. O. SUMMERS.

Dicæ'um [from the Gr. δίκαιος, "decent," "well-ordered," alluding to the habits of these birds], a genus of tenuirostral birds remarkable for their beauty, their rapid flight, and the sweetness of their long-continued though very soft notes. They are of small size, and inhabit the highest trees. They weave a purse-shaped nest from the down found about the seeds of many plants. The best known species are the Australian dicæum (*Dicæum hirundinaceum*) and the *Dicæum cruentatum* of India.

Australian Dicæum.

Di'cast [Gr. δικαστής, from δίκη, "justice"], a name for a body of Athenian citizens, consisting of 6000, who were chosen yearly by lot from the body of freemen for the purpose of assisting in the administration of justice. They were divided into ten sections, generally about 500 each, before which causes were tried. The leading points of law and evidence were previously ascertained

before a magistrate, and the conflicting issues were reduced to a formal statement called the anakrisis. This was carried for decision before a section of the dicasts, who were supreme judges of the law and the fact. They were kept in ignorance of the cause which was to come before them, and each dicast was sworn to vote according to the law and justice. The analogies of the system to jury trial are obvious, as are also the differences between the two systems.

The word *dicasterion* was used to denote the whole body of the dicasts and the place where their session was held.

Dice (plu. of **Die**), [Lat. *alea* and *tessera;* Gr. βολίς; Fr. *dé;* It., Sp., and Port. *dado;* Ger. *Würfel*], small cubes used in playing certain games of chance. They are made of bone, ivory, or close-grained wood, having their six sides marked with dots or pips from one up to six. These dots are so arranged that the numbers on two opposite sides taken together always count seven. The dice are shaken in a box called a dice-box, and then thrown on a board or table, and the number of dots on the upper faces decides the game. The invention of dice is very ancient, and is variously ascribed to the Greeks and Egyptians, and by Herodotus to the Lydians. Dice similar to those of our day have been found in Thebes. The Greeks gave the names of their gods and heroes to the different throws. The game of dice was popular among the Romans, and it is said that during the decline of the empire wealthy Romans not unfrequently staked their whole fortunes on a single throw. Gamblers resort to the practice of loading dice by adding lead to them on one side, so that the higher numbers are almost sure to turn up. When this trick is suspected, the thrower should turn down the mouth of the box abruptly, and this will prevent the dice from arranging themselves unjustly. Two cubes, supposed to be Etruscan dice, but marked with words instead of pips, have given ground for Taylor's theory that the Etruscan was a Turanian language, the words being assumed as numerals.

Dicen'tra [from the Gr. δίς, "twice," or "two," and κέντρον, a "spur," a term descriptive of the blossom of these plants], a genus of herbaceous perennials belonging to the order Fumariaceæ. They are found in moist, rich woodlands, and flower in spring. Among the species native in the U. S. are *Dicentra Cucullaria* (commonly called Dutchman's breeches), *Dicentra Canadensis* (squirrel corn), and *Dicentra eximia*. *Dicentra chrysantha*, found in California, has large golden-yellow flowers. *Dicentra spectabilis*, introduced from Japan about 1846, grows sometimes to the height of three feet, and produces long racemes of rosy blossoms of great beauty.

Dichlamyd'eous [from the Gr. δίς, "twice" or "two," and χλαμύς, a "short cloak"], a botanical term applied to flowers or plants having both calyx and corolla. In the system of Decandolle exogenous plants are divided into *dichlamydeous* and *monochlamydeous*.

Dichot'omous [from the Gr. δίχα, "double," and τέμνω, "to cut"], two-forked, a term in botany, is applied to branches or stems which bifurcate, and are repeatedly divided into pairs. The stems of some ferns, the fronds of some algæ, and the stems of several phænerogamous plants are dichotomously branched.

Dichot'omy [for etymology see Dichotomous], an artificial system for the arrangement of natural objects, based upon principles of binary distinction. In logic, the division of a class into two sub-classes, which are opposed to each other by contradiction. In anthropology, the recognition of two factors, and only two, in man—the physical and the spiritual—contrasted with trichotomy, which recognizes in man three factors—viz. body, soul, and spirit.

Di'chroism [from the Gr. δίς, "twice," and χρόα, "color"], the property possessed by some crystallized bodies of showing two different colors, according to the direction in which rays of light pass through them. The crystals of the double chloride of palladium and potassium appear deep red along the axis, and vivid green in a transverse direction.

Di'chroite [etymology same as for Dichroism], also called **I'olite,** a mineral so called from the different colors it exhibits, is a silicate of magnesia, iron, and alumina. It is found in prisms belonging to the trimetric system, and is sometimes used as a gem.

Dick (James T.), an artist born in New York City in 1834, was a son of A. L. Dick, an engraver of good reputation. The younger Dick gained several prizes at the age of fourteen, and was one of the founders of the Brooklyn Art School and of the Academy of Design. Died Jan. 19, 1868.

Dick (Thomas), LL.D., a Scottish author, born near Dundee Nov. 24, 1774, was educated for the ministry in connection with the Secession Church. He taught school for many years at Perth, and wrote numerous popular scientific and religious works, among which are "The Christian Philosopher" (1823), "The Philosophy of Religion" (1825), "The Philosophy of a Future State" (1828), "Celestial Scenery" (1838), and the "Sidereal Heavens" (1840). Died July 29, 1857.

Dick'ens (Charles), one of the greatest novelists that England has produced, was born at Landport, Portsmouth, on Feb. 7, 1812. His father was John Dickens, who held a position in the navy pay department, and who afterwards became parliamentary reporter for one of the London daily papers. After studying in a college near Rochester, young Dickens was placed in an attorney's office to learn the profession of the law. This pursuit proving uncongenial to his taste, he left it and obtained a position as reporter on the staff of the "Morning Chronicle." In this paper appeared the first efforts of his genius, his "Sketches of Life and Character," which in 1836 were collected and published in two volumes under the title "Sketches by Boz." The public gave these a favorable reception, and in 1837 they were followed by "The Posthumous Papers of the Pickwick Club," which first appeared as a serial in monthly parts. The work had an immediate and almost unparalleled success, and raised its author at once to the first rank among the popular writers of the day. In its peculiar vein of humor it has never been equalled in English literature. He was married in 1838 to the daughter of George Hogarth, a musical critic, and in the same year appeared "Oliver Twist," a novel in three volumes. This was followed by "The Life and Adventures of Nicholas Nickleby" (3 vols., 1839), "Master Humphrey's Clock" (1840–41), and "Barnaby Rudge" (1841). In 1841 he visited the U. S., and in the following year appeared his "American Notes for General Circulation," in which American life and character were somewhat severely satirized. The "Notes" were followed in 1843–44 by the "Life and Adventures of Martin Chuzzlewit" (3 vols.), a work which reflected still more on the faults and foibles of our countrymen.

In 1844, Mr. Dickens went to Italy, whence he returned in 1845, and towards the end of that year he assumed the chief editorship of the "Daily News," a Liberal journal then just established. He soon, however, resigned this position. In 1847–48 appeared his "Dombey & Son," which, in some of its passages at least, is not surpassed by any of his works either in power or pathos. It was followed in 1850 by "The Personal History of David Copperfield," which is regarded by many as the best of all his novels. Certainly in none other is the interest more intense or better sustained from the beginning to the end. It is commonly understood that in the story of "David Copperfield" the novelist has introduced many of the incidents or circumstances of his own life, without, however, following so closely the real history as in any way to compromise the characters of those with whom he associated. Among his other works may be mentioned "Bleak House" (1852), "Hard Times" (1854), "Little Dorrit" (1857), "A Tale of Two Cities" (1860), "Great Expectations" (1862), "Our Mutual Friend" (1864–65), and "The Mystery of Edwin Drood," left unfinished at his death. "Household Words," a weekly periodical originated by him in 1850, had a very extensive circulation. He afterwards in 1859 started another weekly journal entitled "All the Year Round." In 1867 he made a second visit to the U. S., and met everywhere with a cordial and even enthusiastic reception. He gave in the principal cities public readings from his own works, which were attended by crowded audiences. He returned to his native country in the spring of 1868, and died at Gad's Hill June 9, 1870. J. Thomas.

Dick'eyville, a post-township of Aroostook co., Me. It has a high school and some manufactures. Pop. 1851.

Dick'ins (John), a Methodist Episcopal preacher, born in London in 1746, studied at Eton, and came to America before the Revolutionary war. In 1774 he became a Methodist, and soon began to preach. He was one of the ablest preachers of his day, and contributed much to the foundation of Cokesbury College and the Methodist Book Concern. Died of yellow fever in 1798.

Dick'inson, a county in the N. W. of Iowa. Area, 430 square miles. It is drained by the Okoboji River, and contains several lakes, one of which is called Spirit Lake. The soil is mostly fertile, and grain is produced. Capital, Spirit Lake. Pop. 1389.

Dickinson, a county in E. Central Kansas. Area, 846 square miles. It is intersected by the Kansas River. The surface is partly occupied by extensive prairies; the soil is fertile. Cattle, grain, hay, butter, etc. are produced. It is traversed by the Kansas Pacific R. R. Capital, Abilene. Pop. 3043.

Dickinson, a post-township of Franklin co., N. Y. Pop. 1990.

Dickinson, a post-township of Cumberland co., Pa. Pop. 1617.

Dickinson (Anna Elizabeth), an American reformer and popular public speaker, was born of Quaker parents at Philadelphia Oct. 28, 1842. Her father died when she was but two years old, and her early years were spent in poverty. She was educated in the Friends' free schools. Her first public speech was delivered in Jan., 1860, at a meeting for the discussion of women's rights, and at once established her reputation. During the civil war she delivered many patriotic and political addresses, and since that time she has spoken much upon labor reform, woman's suffrage, etc. She published in 1868 "What Answer?" a novel.

Dickinson (Daniel Stevens), LL.D., an American Senator and lawyer, born in Goshen, Conn., Sept. 11, 1800. He was elected as a Democrat to the senate of New York in 1836, and became lieutenant-governor of that State in 1842. In 1844 he was chosen a Senator of the U. S. for six years. He was distinguished as a debater, and was the leader of the conservative ("Hunker") Democrats of New York. After he retired from the Senate he practised law at Binghamton, with a high reputation. In 1861 he was elected attorney-general of New York. During the civil war he zealously supported the cause of the Union by public speeches. He was appointed district attorney for the southern district of New York in the spring of 1865. Died April 12, 1866. (See his "Life," by his brother, 1867.)

Dickinson (Edward), LL.D., an American lawyer, was born at Amherst, Mass., Jan. 1, 1803, graduated at Yale with the highest honors in 1823, studied at the Law School of Northampton, Mass., and in 1826 became a lawyer of his native town, where he has since resided. He became treasurer of Amherst College in 1835, holding that position nearly forty years, greatly to the advantage of the college. In 1838, 1839, and 1873 he was chosen representative to the general court of Massachusetts, was State senator 1842–43, State councillor 1845–46, and a Whig member of Congress 1854–55, having declined other important public trusts. He was a prominent supporter of the railroad interests of his town and State, and was distinguished for integrity, public spirit, and professional success. Died June 16, 1874.

Dickinson (John), LL.D., an American statesman and lawyer, born in Maryland Nov. 13, 1732. He received his legal education in London, practised law with success in Philadelphia, and was a deputy to the first Colonial Congress in 1765. He was a member of the Continental Congress in 1774, and wrote for that body several important state papers, among which was a "Declaration to the Armies." He was an eloquent and ready debater. In 1776 he spoke against the Declaration of Independence, which he regarded as premature, and he was one of the few members of Congress who did not sign that declaration. He consequently became unpopular, and was defeated in the next election, but he served as a private soldier in the war of Independence. In 1779 he represented Delaware in Congress. He was president of Pennsylvania in 1782–85. He wrote numerous political essays, and had a high reputation for learning. In 1783 he founded and endowed Dickinson College at Carlisle, Pa. Died Feb. 14, 1808.

Dickinson (Rev. Jonathan), a Presbyterian theologian, born at Hatfield, Mass., April 22, 1688, graduated at Yale College in 1706. He preached at Elizabethtown, N. J., for more than thirty years, and was elected president of the College of New Jersey in 1746. He wrote several works on theology. Died Oct. 7, 1747.

Dickinson College, next to the University of Pennsylvania, is the oldest college in the State; the former was founded in 1753, the latter in 1783. As to its establishment and its location in Carlisle, the board of trustees in 1784 set forth the following: "The fitness of the situation, not only central to the State, but to the several States of the Union, the healthfulness and beauty of the country around, recommend the fitness of the situation. The great embarrassments learning lay under during the war pointed it out as a virtue peculiarly commendable to use our endeavors to revive the drooping sciences. Gratitude to God for the prosperous conclusion of the war laid us under obligation, our new relations to the other nations of the world, and especially the important interests of religion and virtue in this growing empire." In consequence of the valuable gifts to, and personal interest in, the college of Hon. John Dickinson, "president of Pennsylvania," the institution received his name. The first president was Charles Nisbet, D. D., a native of Scotland, and minister at Montrose. During the Revolutionary war his voice was in favor of the colonies. The college has had eleven presidents: Charles Nisbet, D. D., elected 1784; Robert Davidson, D. D., in 1804; Jeremiah Atwater, D. D., in 1809; John M. Mason, D. D., in 1821; William Neill, D. D., in 1824; Samuel B. How, in 1830; John P. Durbin, D. D., in 1833; Robert Emory, D. D., in 1845; Jesse T. Peck, D. D., in 1848; Charles Collins, D. D., in 1852; Herman M. Johnson, D. D., in 1860; Robert L. Dashiell, D. D., in 1868; James A. McAuley, D. D., in 1872.

The institution is denominational. Until 1833 it was under Presbyterian control, but the division of that Church into the old and new branches brought the college under grave embarrassments. The Old School kept the educational funds; the New School had a majority of the board of trustees, but, being without funds, transferred the college to the Methodist denomination, under whose care it now remains. At the breaking out of the late civil war it had many students from the Southern States; these left, others were called to the battle-field, and the college suffered in its finances until the year of the centenary of Methodism, when its endowment fund was increased $100,000.

The course of study retains the old classical course, but allows a divergence in the junior and senior years from the ancient languages in two directions—one in favor of the Hebrew language and literature, to accommodate those studying for the ministry; and the other in favor of natural science. The old prominence of the ancient classics has yielded much in favor of modern languages, literature, and the natural sciences.

The buildings are three in number. The libraries contain 26,000 volumes; the scientific apparatus is very extensive and valuable. S. D. Hillman.

Dickinson's Landing, a port of entry of Osnabruck township, Stormont co., Ontario (Canada), on the N. side of the St. Lawrence River, at the head of the Cornwall Canal, 96 miles from Kingston. It has a lighthouse. Pop. about 300.

Dick Johnson, a township of Clay co., Ind. P. 868.

Dick'son, a county in the N. of Tennessee. Area, 600 square miles. It is partly bounded on the N. E. by the Cumberland River, and drained by the Harpeth. The surface is undulating; the soil is productive. Tobacco, wool, cattle, and grain are staple products. It is intersected by the Nashville and North-western R. R. Capital, Charlotte. P. 9340.

Dickson, a township of Edwards co., Ill. Pop. 526.

Dickson, a township of Lewis co., Mo. Pop. 204.

Dickson, a borough of Luzerne co., Pa. Pop. 391.

Dickson (Samuel Henry), M. D., LL.D., was born of Scottish parentage at Charleston, S. C., Sept. 20, 1798, graduated at Yale in 1814, and received the degree of M. D. at the University of Pennsylvania in 1819. In 1824 he became professor of the institutes and practice of medicine at Charleston medical school (S. C.), was professor of practice in the University of New York (1847–50), and again in Charleston. In 1858 he was called to the chair of practice at Jefferson College, Philadelphia, which he filled with great ability. He was the author of several valuable works and numerous brochures upon medicine and other subjects. Died Mar. 31, 1872.

Dicotyled'onous [from the Gr. δί (for δίς), "twice" or "double," and κοτυληδών, a "cotyledon"] **Plants,** the name given to plants which have the embryo furnished with two, or more than two, Cotyledons (which see). More than two are of rare occurrence, but are found in the fir, larch, spruce, etc. of the Coniferæ. As a general rule, exogens are dicotyledonous, while endogens are almost always monocotyledonous. (See Exogenous Plants.)

Dicta'tor [Fr. *dictateur*, from the Lat. *dicto, dictatum*, to "say often," to "dictate"], the title of an extraordinary magistrate in the republic of ancient Rome, who was invested with nearly absolute power for a period of six months, and was irresponsible. Dictators were appointed when the republic was in danger, or when an important crisis demanded the prompt decision and vigorous action of a single executive chief. The first dictator, according to some authorities, was Titus Lartius, who was appointed 501 B. C.; the last, Marcus Junius Pera (216 B. C.). In general, no one could be made dictator who had not previously been consul. It is doubtful whether election by the curiæ was necessary to his appointment, but the nomination by the consul was indispensable. The dictator appointed a *magister equitum* ("master of the horsemen"), who in his absence acted as his deputy or lieutenant. The office of dictator was at first confined to patricians, and the first plebeian dictator was C. Marcius Rutilus, appointed in 356 B. C. The power of the dictators was subject to these limitations: they could not touch the treasury, they were not permitted to leave Italy, nor to ride through Rome on horseback without the consent of the people. The dictatorships of Sulla and Cæsar, both of whom transcended their limitations, were irregular and illegal, entirely different from the former dictatorships.

Dic'tionary [Modern Latin, *dictionarium*, from *dictio*, a "word," and *-arium*, a suffix, denoting a "place where things are kept;" Fr. *dictionnaire;* It. *dizionario;* Sp. *diccionario*], a book giving the words of a language in alphabetical order, and explaining their meaning. It is also a general term for works on science, literature, and art, giving information under separate classified heads, and in modern times under heads alphabetically arranged. The multiplication of books upon history, science, and literature has made it necessary to reduce the body of knowledge in specific branches of inquiry to the form of dictionaries, with the topics alphabetically arranged for convenience of reference. The earliest work of the kind is in the Chinese language, compiled about 1100 B. C. One of the first lexicographers among classic writers was M. T. Varro (128–116 B. C.), but the most celebrated dictionary of antiquity is the "Onomasticon" of Julius Pollux, completed early in the third century. In modern times the first Latin dictionary was published by Balbi of Genoa (1460). Sebastian Münster's "Chaldee Dictionary" appeared in 1527; Pagninus's "Lexicon of the Hebrew Language" (1529); Stephens's "Thesaurus" (1535); Erpenius's "Arabic Dictionary" (1613); Schindler's "Lexicon Pentaglottum" (1612); Castell's "Lexicon Heptaglotton" (1669); Moreri's "Dictionnaire" (1673); Bayle's "Historical and Critical Dictionary" and the "Dictionary of the French Academy" (1694); Dr. Johnson's "English Dictionary" (1755); Grose's "Dictionary of the Vulgar Tongue" (1785); Walker's "Dictionary" (1791); Webster's (1806); Webster's "American Dictionary" (1828); revised edition, unabridged (1864); Richardson's "Dictionary of the English Language" (1835–37; reissued with a supplement in 1856); Worcester's (1830–60); J. L. Grimm's "German Dictionary" ("Deutches Wörterbuch," begun in 1852; still unfinished). Among works of the kind may also be mentioned Wm. Smith's "Dictionary of Antiquities" (1842), "Dictionary of Biography" (1849), and his "Dictionary of Ancient Geography" (1857). His "Bible Dictionary" (1860–63) and his Latin Dictionaries (1855 and 1870) are valuable. Littré's "Dictionnaire de la Langue Française" (1863–73); the Greek-German Lexicon of Passow, translated into Greek-English by Liddell and Scott, and enlarged by Drisler; Yonge's English-Greek Lexicon, greatly enlarged by Drisler; Barretti's Italian Dictionary; Adler's German and English Dictionary (1848), and Sophocles' Dictionary of Byzantine Greek (1860), are among the best works of the kind. E. A. Andrews's Latin Dictionary, based upon that of Freund, and the lexicographic works of the late Prof. Anthon, are of much value. Quite recently much attention has been given in the U. S. to the compilation of dictionaries of the aboriginal languages of the country—a task upon which much valuable labor has been bestowed.

Dic'tyogens [from the Gr. δίκτυον, a "net" or "network"], a name proposed by Lindley for a sub-class of plants included by other botanists among endogenous plants. While they agree with endogens in the structure of the embryo, they are distinguished by having net-veined instead of parallel-veined leaves, and the growth of their stems appears to be partly exogenous and partly endogenous. The most important natural orders referred to this class are Dioscoreaceæ and Smilaceæ, and among the plants are the different species of yam and sarsaparilla.

Dicyn'odon [from the Gr. δί (for δίς), "twice" or "two," κύων, a "dog," and ὀδούς (gen. ὀδόντος), a "tooth"], literally, having two tusks or canine teeth, the name applied to a genus of fossil reptiles whose remains have been found in South Africa. Animals of this genus united in their structure the characteristics of different reptiles. The closed orbits and sharp, compressed jaws covered with a horny plate ally it closely to the tortoise, but it also has affinities with the lizard and crocodile. It takes its name from a pair of sharp-pointed tusks growing downward, one from each side of the upper jaw. The articulating surfaces of the vertebræ being hollow, it may be supposed these reptiles were good swimmers; and if they were inhabitants of the water, the construction of the bony passages of the nostrils proves that they must have come to the surface to breathe air.

Didac'tic [Gr. διδακτικός, from διδάσκω, to "teach"], a word signifying skilled in teaching, imparting instruction.

Didactic Poetry, a term applied to that poetry the chief object of which is to teach some art, science, or system of philosophy. Among the most remarkable examples of ancient didactic poems are the following: Lucretius's "De Rerum Naturâ" (designed to explain and defend the philosophy of Epicurus), which Macaulay pronounces "the finest didactic poem in any language;" Virgil's "Georgics" (a treatise on agriculture); and Horace's "De Arte Poeticâ" ("On the Poetic Art"). Many fine didactic poems have also been written in modern times. Among the principal of these are Vida's "Art of Poetry" ("De Arte Poeticâ"); Boileau's "Art of Poetry" ("L'Art poétique"); Pope's "Essay on Criticism" and "Essay on Man;" Darwin's "Botanic Garden;" and most of Cowper's longer poems.

Didelphys. See Opossum.

Diderot (Denis), a French philosopher, born at Langres Oct. 5, 1713, and educated by the Jesuits, was destined for the Church, and later for the law, but eagerly embraced the study of literature. His father, a prosperous cutler of stern character, withdrew from him all support upon his refusal to pursue his professional studies. Among his first writings were "Essai sur le Mérite et sur la Vertu" and "Lettre sur les Aveugles" (1749), which last established his reputation, but cost him a year's imprisonment. His earlier works were all written under the duress of poverty. His reputation is founded chiefly on the "Encyclopædia" ("Encyclopédie, ou Dictionnaire raisonnée des Sciences, des Arts et Métiers"), of which he and D'Alembert were joint editors. He wrote the articles on ancient philosophy, history, and on the arts and trades, and supervised other parts of the work. He expended many years on this arduous labor, for which he was qualified by great quickness of intellect and extent of information. Grimm expressed the opinion that he had perhaps the most encyclopedic head that ever existed. The first volume of this work was published in 1751. The government suspended the publication, because it advocated infidel doctrines, but it was finished in 1765. Catharine II. of Russia granted him a pension in 1765, and invited him to St. Petersburg, whither he went in 1773, but he soon returned to France. Among his works are novels entitled "The Nun" and "Jacques the Fatalist." He is considered as the chief of the skeptical philosophers called Encyclopedists. Died in Paris July 30, 1784. His complete works were published by Naigron (15 vols., 1798; new ed., 22 vols., 1821). (See Damiron, "Mémoire sur Diderot," 1852; Carlyle, "Essay on Diderot;" Rosenkranz, "Leben und Werke Diderots," 2 vols., 1866.)

Did'ius (Salvius Julianus), a Roman emperor, born at Milan in 133 A. D. He had a high command in the army, and was chosen consul with Pertinax, after whose death (193 A. D.) the prætorians offered the empire at public auction to the highest bidder. Didius, who was very rich, gave 6250 drachmas to each soldier, and was proclaimed emperor. After he had reigned nearly two months he was killed (June 1, 193) in his palace by his soldiers. He was succeeded by Severus.

Di'do ("the fugitive"), [Gr. Διδώ], whose real name was **Elissa** or **Elisa,** a daughter of the Tyrian king Matgen, after whose death she and her younger brother Pygmalion (Piimelium) were to reign conjointly. But Pygmalion, aided by democratic partisans, usurped the whole authority, and procured the assassination of her husband, Zicharbaal (the Sichæus of Virgil). She then fled with many Tyrians by sea, and founded Carthage about 870–860 B. C. Virgil has been charged with committing an anachronism in representing her as contemporary with Æneas. (See Virgil, "Æneid," i., ii., and iv.)

Didot (François), born at Paris in 1689, was the founder of a famous house of printers and type-founders in Paris. Died Nov. 1, 1757. The business was carried on by his sons, François Ambroise (born in 1730, died July 10, 1804), who made improvements in the printing-press and paper manufacture, and Pierre François. Of the sons of the former, Pierre (born 1760, died Dec. 31, 1853, leaving as his successor his son Jules) took charge of the printing-house in 1789, and published magnificent folio editions of Virgil, Horace, Racine, and other classic authors; and Firmin (born 1764, died April 24, 1836) took charge of the type-foundry, improved the art of stereotyping, and became known also as an author and translator. His business was inherited by his sons, Ambroise Firmin (born Dec. 20, 1790) and Hyacinthe Firmin (born Mar. 11, 1794).

Didron (Adolphe Napoléon), a French archæologist, born at Hautvillers (Marne) Mar. 13, 1806. He began in 1844 to publish "Annales Archéologiques," devoted to mediæval art and antiquities. His chief work is "Christian Iconography" (1843). Died Nov. 13, 1867.

Didym'ium [from the Gr. δίδυμος, a "twin"], a rare metal, so named from its resemblance to lanthanum, and the difficulty of separating the two. It is a dyad, its symbol D; atomic weight, 96. It forms a protoxide (D_2O), which is a powerful base, and forms with acids rose- or violet-colored salts. It was discovered in 1841 by Mosander.

Did'ymus [Gr. Δίδυμος], a grammarian of Alexandria in Egypt, was born about 62 B. C., and was surnamed

CHALCENTERUS. He was noted for his fecundity as a writer, and is said to have written nearly 4000 treatises, mostly frivolous, on various subjects. All of his works have perished.

Didymus (THE BLIND), one of the most learned men of his age, was born at Alexandria A. D. 308, became blind in his fifth year, and was at the head of the theological school in Alexandria from 390 to 395, the year in which he died. His most important extant works are a treatise upon the "Spirit" and a treatise upon the "Trinity."

Die (anc. *Dea Vocontiorum*), a walled town of France, department of Drôme, on the river Drôme, 26 miles E. S. E. of Valence. It has manufactures of silk and paper, and is the seat of a Catholic bishop. Pop. in 1866, 3762.

Die (plu. **Dies**), in coinage, the instrument by which impressions are stamped upon coins. The intended device is first engraved upon a plug of forged steel, which, when complete, is hardened, and is called a *matrix*. From this, by means of a powerful fly-press, an impression in *relief* is taken upon another piece of soft steel, which, when duly shaped and hardened, is called the *punch*. From this again indented impressions upon pieces of steel are taken, which, being shaped in the lathe and tempered, are the *dies*. A good pair of dies will sometimes yield from two to three hundred thousand impressions before they become too much worn for use.

Die-sinking has acquired increased importance on account of the great extension of the process of stamping metal. Many kinds of work formerly made by the hammer and punch are now shaped by a few blows between suitable dies. As examples of these we may mention the ornamental work of gas-fittings, buttons, common jewelry, ornamental trays, dishes, boxes, small parts of firearms, etc. For such purposes a pair of dies is required—one in relief, the other in intaglio—and the metal is pressed between them. The astonishing cheapness of many of the metallic wares is mainly due to the use of dies for doing by a single blow the work that formerly required long and tedious manipulation.

DIE, in architecture, is that part of a pedestal which lies between its base and its cornice.

DIE (plu. DICE). See DICE.

Die'bitsch, surnamed SABALKANSKI (HANS KARL FRIEDRICH ANTON), COUNT, a Russian general, born in Silesia May 13, 1785. He served at the battle of Austerlitz, 1805, and became a major-general in 1812. Having distinguished himself at the battles of Lützen, Dresden, and Leipsic, he was raised to the rank of lieutenant-general in 1813. He was appointed chief of the imperial staff about 1820. Having obtained command of an army in the war against the Turks, he took Varna in 1828, and became general-in-chief in 1829. He defeated the Turks and crossed the Balkan, hence his title SABALKANSKI ("Trans-Balkanian"). He was raised to the rank of field-marshal, and in Jan., 1831, took command of an army sent to subdue the Polish insurgents. After the indecisive battles of Praga and Ostrolenka, he died of cholera June 10, 1831. (See BELMONT, "Graf Diebitsch," 1830.)

Die'denhofen, a fortified town in Elsass-Lothringen, on the left bank of the Moselle, 14 miles below Metz. Pop. 7155.

Dief'fenbach (JOHANN FRIEDRICH), a skilful Prussian surgeon, born in Königsberg Feb. 1, 1794. He graduated in 1822, and began to practise in Berlin, where he gained a high reputation. He was a professor in the University of Berlin, and wrote, besides other works, "Die Operative Chirurgie" (12 vols., 1844–48). He made improvements in plastic surgery. Died Nov. 11, 1847.

Dielec'tric [from the Gr. διά, "between," and *electricity*], a non-conducting body which permits the force of electricity to act through it. For example, the interposition of thin glass plates does not prevent electric induction from taking place; hence glass is dielectric.

Die'men, van (ANTHONY), a Dutch naval officer, born at Kuilenburg in 1593. He served for many years in the East Indies, and became an admiral. He was appointed governor-general of the Dutch East Indies in 1636, and sent out in 1642 an exploring expedition under Abel Tasman, who discovered Van Diemen's Land. Died at Batavia April 19, 1645.

Die'penbeck, van, written also **Diepenbeke** (ABRAHAM), an eminent Dutch historical painter, born at Bois-le-Duc in 1607, was a pupil of Rubens. In 1641 he was chosen director of the Academy of Antwerp. He painted with facility on glass and tapestry, imitated Rubens with great freedom, and gained a high reputation by his skill in composition and coloring. Among his works is a series of fifty-eight designs called "The Temple of the Muses." Died in 1675.

Dieppe, a seaport-town of France, in the department of Seine-Inférieure, is on the English Channel at the mouth of the river Arques, and at the northern terminus of the Rouen and Dieppe Railway, 33 miles N. of Rouen, and 143 miles by rail N. W. of Paris; lat. 49° 55′ N., lon. 1° 5′ E. It stands between two high ranges of chalk-cliffs, and is defended by a wall and a castle built on a high cliff. Vessels of 500 tons can enter the harbor at high water, but at low tide the harbor is nearly dry. Dieppe has a town-hall, theatre, and public library; also manufactures of watches, lace, fine linen, paper, and ivory wares. It was formerly the principal port of France, and is now one of the most fashionable watering-places of that country. Dieppe is a favorite landing-place of English tourists visiting France. Pop. 19,946.

Di'es I'ræ, a Latin hymn written about the year 1250 by a Franciscan friar, Thomas da Celano, commencing—

> "Dies Iræ, dies illa,
> Solvet sæclum in favilla,
> Teste David cum Sibylla."
>
> Day of Wrath! O that dread day
> In ashes earth shall pass away,
> Attest the King's, the Sibyl's, lay.

The Western Church soon gave it a place in its offices as the "Sequence for the Dead," so called because in the Roman mass it is sung between the Epistle and the Gospel, following immediately after the Gradual Hymn, when that is sung. In an English form it has also been adopted into the hymn-books of the Church of England, and into the new Hymnal of the Protestant Episcopal Church of our country. It is chief among the "Seven great Hymns of the Mediæval Church," among which are "Jerusalem the Golden," "Come, Holy Ghost" (*Veni Sancte Spiritus*), etc. Of all these sacred lyrics none can compare in point of sublimity or touching pathos with the "Dies Iræ." For centuries it has been the favorite alike of Roman and Protestant Christendom. The most renowned of modern poets, composers, and divines have bent in admiration at its shrine, and multitudes have essayed in vain to transfer its force and beauty to their own language. (*Am. Ch. Rev.*)

The composition is evidently suggested by the words of Zephaniah, in the Vulgate: "*That Day, a Day of Wrath*, a day of trouble and distress, a day of wasteness and desolation, a day of darkness and gloominess, a day of clouds and thick darkness, a day of the trumpet and alarm against the fenced cities and against the high towers!" which the opening stanza, already quoted, coupled with the third stanza—

> "Tuba mirum spargens sonum,
> Per sepulcra regionum,
> Coget omnes ante thronum"—

forcibly renders, though, with poetical license, the *last* trumpet "*scattering* a wondrous sound" through "earth's sepulchres," and "*compelling* all before the throne" for judgment, is substituted for the battle-trumpet which "alarms" the "fenced cities." The translations and versions of this hymn in modern languages are numbered by scores, perhaps by hundreds; but the Latin verse of the Franciscan monk, simple and easy as it appears at the first glance, has in it a secret force which baffles the ingenuity and skill of translators. "After a close scrutiny, we must confess (says the "Amer. Church Review") that the version of Dr. Irons (the one adopted in 'Hymns Ancient and Modern,' 'The People's Hymnal,' and our new Hymnal) expresses most clearly the language and force of the original. The second best (which many rank as *the best*) has an historic interest attached to it; for it was the work of our own Christian soldier and statesman, Major-General John A. Dix, late governor of the State of New York, while in command of Fortress Monroe during the war with the South. As when, in the early days of the Christian Church, the Vandal legions encompassed his beloved city and diocese of Hippo, the holy Augustine found time and opportunity to compose his immortal 'City of God,' so, in the darkest days of a cruel war, the rhythms of Thomas da Celano found a fitting exponent in the person of one who was alike true to his country and faithful to his God." (*Amer. Church Review*, April, 1873.) The third best English translation is, according to the same authority, one by Dr. Abraham Coles, an American who has made thirteen excellent versions. The words of the "Dies Iræ" constitute the principal subject of the music of the famous "Requiem" of Mozart, to which, from the circumstances under which it was composed, a mysterious interest is attached.

J. G. BARNARD, *U. S. Army*.

Di'esis [Gr. δίεσις, a "gradation," from διά, "through," and ἵημι, to "send"], in music, an interval less than a comma. The harmonical diesis is the difference between the small and the great semitone, as from C to C sharp, and from C to D flat.

Dies'kau, von (Ludwig August), a German officer, born in 1701, entered the French service. He commanded a force which marched from Canada in 1755, and attacked Fort Edward in New York. Here he was wounded and taken prisoner by the British. Died near Paris Sept. 8, 1767.

Diest, a town of Belgium, in the province of South Brabant, on the river Demer, 17 miles N. E. of Louvain, is strongly fortified. It has manufactures of hosiery and woollen goods, and exports much good beer. It was taken by Marlborough in 1705. Pop. 7561.

Dies'terweg (Friedrich Adolph Wilhelm), an eminent German teacher and writer, born at Siegen Oct. 29, 1790. He taught in Berlin, and published numerous educational works. Died July 7, 1866.

Di'et [from the Gr. *διαιτα*, "manner of living," "maintenance;" Lat. *diæta*], a term signifying in its popular sense the food and drink which are taken to maintain life. Originally, however, the term included all the conditions of living, such as clothing, shelter, and exercise. (See Food, by Edward Smith, M. D., LL.B., F. R. S., London.)

Di'et [Lat. *diæta;* from the Gr. *διαιτάω*, to "govern"], the name of the assembly of the German states, which, originating at a very remote period, was reconstituted by the emperor Charles IV. in 1356. The sessions were made permanent at Ratisbon in 1663, and were removed to Frankfort by the Confederation of the Rhine in 1806.

Dietary, Military. See Subsistence of Armies.

Diet'erichs (Joachim Friedrich Christian), a German veterinary surgeon and writer, born at Stendal in 1792. He published, besides several professional works, a treatise "On the Education of Horses" (1825) and a "Manual of the Practical Knowledge of Horses" (1834).

Dieteri'ci (Karl Friedrich Wilhelm), a Prussian political economist, born in Berlin Aug. 23, 1790. He became professor of political economy at Berlin in 1834, director of the national bureau of statistics in 1844, and member of the Berlin Academy. He published, besides other works, "Public Welfare in the Prussian States" (1846) and "Manual of the Statistics of the Prussian State," continued by his son (1858–61). Died July 29, 1859.—His son, Friedrich Dieterici, has published an Arabic grammar and edited Arabic writings. He was born July 6, 1821, and became professor at Berlin in 1850.

Dietet'ics [from the Gr. *διαιτα*, "manner of living"], that branch of medicine which treats of food and drink. In a wider sense it may treat of the recovery or maintenance of health by means of correct habits with regard to eating, drinking, exercise, the wearing of proper clothes, etc. (See Hygiene, by Prof. Henry Hartshorne.)

Die'trich, or **Dietricy** (Christian Wilhelm Ernst), a German painter and engraver, born at Weimar Oct. 30, 1712. Among his works is an "Adoration of the Magi." Died April 24, 1774. (See monograph on his works, in German, by J. F. Linck, Berlin, 8vo, 1846.)

Dieu et mon Droit [Fr.], ("God and my right"), the motto of the royal arms of England. It was the parole given by Richard I. at the battle of Gisors in 1198, and was assumed by him and his successors, but it did not appear on the broad seal until the time of Henry VIII. Queen Anne substituted "Semper eadem" for the old motto, but the latter was restored by George I.

Diez (Friedrich Christian), Ph. D., a German philologist, was born at Giessen Mar. 15, 1794. He was appointed professor of modern literature at Bonn in 1830. He published "The Life and Works of the Troubadours" (1829), a "Grammar of the Romance Languages" (1842; entirely new ed., 3 vols., 1850–60), and an "Etymological Dictionary of the Romance Languages" (1853; 3d ed. 1869).

Dif'ference [Lat. *differentia*, from *dif* (for *dis*), "apart," and *fero*, to "bear"], in arithmetic and algebra, is the excess of one quantity over another, or the result of the operation of subtraction.

Difference, in logic, is that quality which distinguishes the species from its genus, and is said logically to be part of the essence of the object; *e. g.* to the genus "animal" add the difference "having the power of articulate speech," and we obtain the species "man"—a species distinguished from all other animals by that peculiarity.

Difference Engine, the name given to calculating-machines which operate by the method of differences. Such are the calculating-machines of Babbage and Scheutz. (See Calculating-Machines.)

Differences, Method of, in algebra, a method of finding any distant term of a series, or the sum of a definite number of terms, by means of the differences between the initial terms, the differences of their differences, and so on.

A *first order of differences* is found by taking each term of the series from the next term following. Thus, if the series be a, b, c, d, etc., the first order of differences is $b-a$, $c-b$, $d-c$, etc.; and the *first* of these $(b-a)$ may be indicated by d_1. The *second order of differences* will be found by taking each first difference from the next following first difference, and the *first* of the second differences may be indicated by d_2. In like manner are found d_3, d_4, etc. If the law of the series be expressed by a formula in which the indices of the powers of the variable are integral, or which is capable of being transformed into such an one, the differences of the order denoted by the highest power of the variable will be equal, and those of higher orders will be zero. Thus, if this highest power be the m^{th}, there will be m orders of differences. Then, putting T for the n^{th} term after the first, or the $(n+1)^{\text{th}}$ of the series,

$$T = a + nd_1 + \frac{n(n-1)}{1.2}d_2 + \frac{n(n-1)(n-2)}{1.2.3}d_3 \ldots\ldots + \frac{n(n-1)\ldots\ldots(n-m+1)}{1.2.3\ldots\ldots m}dm.$$

To find the sum of n terms of the given series, a, b, c, d, etc., prefix zero to this series, and form a new series, of which each succeeding term shall be the sum of all the terms of the given series up to the term of the same name; as 0, a, $a+b$, $a+b+c$, etc. It is evident that the terms a, b, c, d, etc. of the given series form the first order of differences of the new; the first order of differences of the given series, the second order of the new, and so on. The $(n+1)^{\text{th}}$ term of this new series will therefore be the sum of n terms of the given series; and representing this sum by S, we shall have,

$$S = na + \frac{n(n-1)}{1.2}d_1 + \frac{n(n-1)(n-2)}{1.2.3}d_2 \ldots\ldots + \frac{n(n-1)\ldots\ldots(n-m)}{1.2.3\ldots\ldots(m+1)}dm.$$

F. A. P. Barnard.

Differen'tial, a term belonging to mathematical analysis. When a variable quantity, as x, is taken in two states indefinitely near to each other, as x and $x+h$, the infinitely small difference, h, is called the differential of the variable, and is written in analysis, dx. If the given quantity is not x itself, but a function of x, say $F(x)$, then, when x becomes $x+h$, $F(x)$ becomes $F(x+h)$, and the differential is $F(x+h)-F(x)$, which may be written $F'(x,h)$. The analytic method which is founded on differentials is called the differential calculus. (See Calculus.)

Differential Calculus. See Calculus, by Gen. J. G. Barnard, U. S. Army.

Differen'tial Coeffic'ient, in the calculus, is the value of $F'(x,h)$ as defined in the last article, divided by $h=dx$, the differential of the variable. Putting u for $F(x)$, and u' for $F(x+h)$, then the differential of $F(x)$, which is $F(x+h) - F(x) = u'-u$, and is written du. Hence, $\frac{du}{dx} = \frac{F'(x,h)}{h}$ is the only quite general expression for the differential coefficient of a function. But if the function is purely algebraic, more explicit forms may be found. Thus, let $F(x) = x^m$. And in the expression for the differential of $F(x)$, viz. $du = F(x+h) - F(x) = (x+h)^m - x^m$, develop the first expression, and we shall have, $du = x^m + mx^{m-1}h + m \cdot \frac{m-1}{2} \cdot x^{m-2}h^2 + \ldots\ldots h^m - x^m$.

Substituting dx for h, and then dividing by the same, *i. e.* dx, there results,

$$\frac{du}{dx} = m \cdot x^{m-1} + m.\frac{m-1}{2}x^{m-2}dx + m.\frac{m-1}{2} \cdot \frac{m-2}{3}x^{m-3}dx^2 + \ldots\ldots dx^{m-1};$$

in which all the terms multiplied by the infinitely small factor dx and its powers are of no appreciable value compared with mx^{m-1}, the first term. Consequently, $\frac{du}{dx} = mx^{m-1}$, or the differential coefficient of any power of a single variable, is found by multiplying the given expression by the exponent of the power, and then diminishing this exponent by unity. The differential coefficient of an algebraic function consisting of more terms than one is the sum of the differential coefficients of the several terms. The differential coefficient of any algebraic function is identical with the *derivative* of that function. (See Derived Function.) F. A. P. Barnard.

Differen'tial Resol'vent, a certain linear differential equation of the $(n-1)^{\text{th}}$ order which is satisfied by each of the roots of an equation of the n^{th} degree, whose coefficients are functions of a single parameter.

Differen'tial Thermom'eter is a thermometer for indicating very slight variations of temperature. The instrument as here described was invented by Sir John Les-

lie. It consists of two glass bulbs connected by a narrow tube, which is usually bent in the form of a U. The bulbs are uppermost, and are filled with air, while the tube contains a column of mercury or sulphuric acid. The measurement is effected by the expansion of the air in one of the bulbs. This instrument is far more sensitive than mercurial and most other thermometers, owing to the greater expansive power of *gases*. It is estimated that a change not greater than the 6000th part of a degree Fahrenheit can be indicated by it. The differential thermometer has of late in a great measure been superseded for delicate measurements of temperature by the THERMOPILE (which see).

Differentia'tion is the operation in mathematics by which the differential of a function is determined. The allied operation, which leads to the determination of the derived function (or differential coefficient), is usually termed derivation. The partial differentiation of a function of two or more independent variables is the differentiation of that function, on the hypothesis that one only of these variables suffers change. "Finite differentiation" is the operation by which the difference of a function corresponding to a finite difference of the variable is determined. The term is also used to denote the process of development in plants and animals from simple to complex organizations.

Diffrac'tion [from the Lat. *dif* (for *dis*), "apart," and *frango, fractum*, to "break"], in optics, a deviation or deflection which the rays of light undergo in passing very near any opaque body. It had been observed by Grimaldi, but Newton first explained its cause. Let a beam of solar light, reflected horizontally, be admitted into a dark chamber through a small round hole, and received on a white screen. If the hole have a sensible diameter, the image of the sun on the screen will suffer no sensible alteration of color; but if we place in the axis of the beam, and at a distance of five or six feet from the hole through which it is admitted, a metallic plate having a very fine puncture, and intercepting all other light than that which passes through the puncture, the appearance on the wall will be surrounded with several concentric colored rings, covering a space far exceeding in extent that which the solar beam would have occupied if its rays had followed their rectilinear direction. By substituting a very narrow slit for the puncture in the plate, or several punctures or slits close to each other, very beautiful phenomena are produced. (See OPTICS.)

Diffusion of Gases. See GAS.

Digam'ma [Gr. *δίγαμμα*, "double gamma," from *δι*, for *δίς*, "double," and *γάμμα*, "gamma" (the third letter (Γ) in the Greek alphabet), so called from its shape (Ϝ)], an ancient aspirate or consonantal Greek letter, chiefly found in the Æolic dialect. It does not occur in extant literature, various substitutes having been employed for it, but its form and name have been preserved by the scholiasts. In many instances it disappeared altogether from the words where it was anciently employed; in others it became *β*, *φ*, *υ*, or *ο*, or took the form of a simple rough breathing. In Latin and in the Teutonic languages we find abundant traces of the Greek digamma. Thus, the old Æolic pronoun Fοι (the Attic οἱ) is the Latin *qui;* the Latin name for the city *Velia* is given in the Greek as Ὑέλη, Βέλεια, and Ἔλεια; the Greek οἶκος is the Latin *vicus;* οἶνος is *vinum;* and the digamma lost from the Greek ναῦς reappears in the Latin *navis*. The digamma is not found in the Homeric writings, but its influence is perceptible in the metre, as was first shown by Bentley. The Æolians called the digamma Fau (the Hebrew Vau), and it was used in Bœotian monumental inscriptions as late as 200 B. C. (See HEYNE, "Homer's Iliad" (1802), HERMANN'S "Review of Heyne" (1803), BOECKH, "On the Versification of Pindar" (1809), and the Greek grammars of BUTTMANN, KÜHNER, and VALPY.) Digamma is the name of one of the most important definite integrals, now of extensive use in mathematics.

Dig'by, a county in the W. of Nova Scotia, bordering on the Atlantic. The surface is hilly. Copper is found here. Capital, Digby. Pop. in 1871, 17,037.

Digby, a seaport-town, capital of the above county, is on the Bay of Fundy and on Digby Neck, about 110 miles W. of Halifax. It is the seat of an academy. Mackerel and herrings of good quality are exported from this place. Shipbuilding and the lumber-trade are largely carried on. Pop. about 1300.

Digby (GEORGE), earl of Bristol, an English royalist noted for his instability and inconsistency in politics, was born in Madrid in 1612. Having been exiled during the civil war, he went to France and became a Catholic. He returned home in 1660, and rashly impeached Lord Clarendon in 1663. He was the author of "Elvira," a comedy. Died Mar. 20, 1677.

Digby (Sir KENELM), F. R. S., a learned English author, a son of SIR EVERARD (born in 1581, and executed Jan. 30, 1606, for abetting the Gunpowder Plot), was born June 11, 1603. He was a gentleman of the bedchamber at the court of Charles I., and was a royalist in the civil war. In 1636 he was converted to the Catholic Church. He passed much time in France, and was an associate of Descartes. His wife was Venetia Anastasia Stanley, a well-known beauty. He wrote, besides other works, a "Treatise on the Nature of Bodies" (1644), "The Body and Soul of Man," "Chemical Secrets," a famous treatise on sympathetic cures, and "Private Memoirs of Sir Kenelm Digby" (1827). Died in London June 11, 1665.

Digby (KENELM HENRY), M. P., was born in Ireland in 1800, was educated at Cambridge, and, having become a Roman Catholic, devoted himself to scholastic theology and mediæval antiquities. He published "The Broad Stone of Honor" (1829), "Mores Catholici" (1840), "Compitum" (1851), and other works, which have many warm admirers, and are imbued by the nobler characteristics of Middle Age thought.

Digest, in legal terminology, is a condensation or systematic arrangement of laws, statutes, or decisions. The name is sometimes applied to the Pandects of Justinian.

Digester, Papin's [named from Denis Papin, a French savant, who invented it in 1681], an invention by which bodies may be subjected to the action of high-pressure steam or water raised above its ordinary boiling temperature to 400° F., and sometimes higher. The digester is a strong boiler made of copper or iron, with a tightly-adjusted cover furnished with a safety-valve. It has the power of dissolving even bones, and has been employed in France to a considerable extent in preparing soup from bones.

Diges'tion [Lat. *digestio*, from *di* (for *dis*), "apart," and *gero, gestum*, to "carry" (*digero*, the compound verb, often means to "distribute," to "dissolve"); Ger. *Verdauung*], a physiological process observable in all animals (with the exception of certain entozoa, which appear to have this work performed by proxy), and which constitutes one of the distinguishing marks of the animal kingdom. It is believed that vegetables absorb their nourishment without any process analogous to digestion; while it is regarded as certain that every animal requires to have its food undergo digestion—that is, a mechanical and chemical change, effected by the agency of the animal economy, preparatory to absorption and conversion into nutritive material. This process, in man and the higher animals, seems to commence before the food is swallowed. During mastication the saliva becomes mixed with the food, and immediately begins to convert the starchy parts into grape-sugar, a step preliminary to its absorption into the blood. This process is further carried on by the other secretions of the alimentary canal; and the sugar thus produced, together with that eaten in the form of sugar, is absorbed by the mucous membranes, and passes directly into the blood without change, except that cane-sugar and milk-sugar are changed (probably for the most part in the intestines) into grape-sugar before absorption.

The action of the stomach upon food is partly mechanical, partly solvent, and partly chemical. The chemical action is to some extent catalytic—*i. e.* not explicable by ordinary theories of chemical reaction. The gastric juice, the principal secretion of the stomach, contains two active elements—free acid (chiefly lactic acid) and pepsin. The most important part of their action is the solution of the nitrogenous parts of the food, and their conversion into albuminose (peptone). The albuminose is absorbed by the coats of the stomach, and passes directly into the portal circulation, while the sugar, much of the starch, and probably all of the fat, pass on to be subjected to the action of the pancreatic juice, the bile, and the intestinal fluids. The pancreatic juice has the power of digesting fats by converting them into a fine emulsion, which is absorbed to some extent by the veins, but principally by the lacteals. It also converts cane-sugar and starch into grape-sugar, which is rapidly absorbed by the intestinal veins. The pancreatic juice probably completes the digestion of such albuminous matters as have escaped digestion in the stomach, being assisted in this work by the intestinal secretion. The bile is believed to be auxiliary to the other secretions in the intestinal digestion, but its part in the process is by no means well ascertained.

C. W. GREENE.

Digges, an English family, several members of which attained note as scholars and writers.—LEONARD, born at Barham, was educated at Oxford, and died about 1573. He wrote "Tectonicon: Measuring of Land," etc. (1556), an arithmetic, and a military treatise entitled "Stratonicos," which was enlarged by his son THOMAS (died 1596), who edited his father's works and published "Celestial Orbs," "Pantometria," a geometrical work, etc.—SIR DUDLEY, son of

the last named (1583–1639), was the author of "Right and Privileges of the Subject" (1642) and the "Compleat Ambassador" (1655).—His son DUDLEY published "Unlawfulness of Subjects Taking up Arms against their Sovereign" (1643). Died in 1642.

Digh'ton, a township and post-village of Bristol co., Mass., on the Old Colony and Newport R. R., 6 miles S. of Taunton. It gives its name to the Dighton Rock, a stone bearing a rude inscription, which has been by some attributed to the Northmen. This rock is in the adjoining town of Berkley. Dighton has important fisheries, and manufactures of cotton, shoddy, paper, white lead, and iron. It has seven churches, and is extensively engaged in the raising of strawberries. Pop. 1817.

Dig'it [Fr. *doigt*, from the Lat. *digitus*, a "finger"], in arithmetic, one of the ten symbols, 0, 1, 2, 3, etc., by which all numbers are expressed. In astronomy the term is used in speaking of eclipses to denote the twelfth part of the diameter of the sun or moon. Thus the eclipse is said to be of ten digits if ten parts of twelve of the disk are concealed. It is also a measure of dimension equal to the breadth of a finger, and estimated at about three-fourths of an inch.

Digita'lis [from the Lat. *digitale*, the "finger of a glove;" Fr. *digitale;* Ger. *Fingerhut*], a genus of plants belonging to the order Scrophulariaceæ. With the exception of the common foxglove (*Digitalis purpurea*), which is a native of Great Britain, the species are mostly found in Southern Europe and different parts of Asia. *Digitalis purpurea* has narcotic and poisonous leaves and seeds, which are valued for their medicinal properties. The fresh leaves are cathartic and emetic, and when dried are administered in diseases of the heart, brain, and nervous system, in which they act as a powerful sedative. They contain a crystalline principle called digitalin. Several of the species are cultivated in gardens.

Dig'itate [Lat. *digitatus*, from *digitus*, a "finger"], a botanical term applied to compound leaves, the leaflets of which are all borne on the apex or tip of the petiole, as the clover and horse-chestnut. Such leaves are also called *palmate.*

Digitigra'da, or Dig'itigrades [from the Lat. *digitus*, a "finger," and *gradior*, to "walk"], a term applied to those carnivorous quadrupeds that walk on their toes. A group of Carnivora is so called in the system of Cuvier. Among the Digitigrada are included the cat, the dog, the hyæna, weasel, etc.

Digna'no, a town in Austria, province of Triest, in a fertile region. Pop. 6405.

Digne (anc. *Dinia*), a town of France, capital of the department of Basses-Alpes, on the river Bléone, 60 miles N. E. of Marseilles. It has a cathedral, a public library, and several tanneries; also a trade in almonds, prunes, grain, honey, wax, and hemp. It has given title to a bishop since 340 A. D. Pop. 7002.

Dig'nitary [from the Lat. *dignitas*, "dignity" or "worth"]. In the canon law, this term signified originally an ecclesiastic of higher rank than an ordinary priest. To this class exclusively belonged all bishops, deans, and archdeacons, but it now includes also prebendaries and canons. Any officer of high rank may be called a dignitary.

Digres'sion [Lat. *digressio*, a "stepping aside," from *di*, "apart," and *gradior, gressus*, to "go," to "step"], the act of deviating or wandering from the main subject or argument in writing or oral discourse; in astronomy, the apparent distance of the inferior planets, Mercury and Venus, from the sun. Mercury is never seen at a greater distance than about 28° from the sun; this is called its greatest digression.

Dihong', also called **Sanpoo',** a large river of Asia, rises on the N. side of the Himalayas, traverses part of Thibet, and bursts through that mountain-chain near lat. 28° 15′ N. It unites with another river to form the Brahmapootra.

Dijon (anc. *Dibio*), a handsome town of France, capital of the department of Côte-d'Or, is delightfully situated in a plain on the river Ouche, about 175 miles S. E. of Paris and 120 miles N. of Lyons, with both of which it is connected by a railway. Its environs are remarkably beautiful. Dijon was formerly the capital of Burgundy. It is well built, has spacious and clean streets, and is enclosed by ramparts. Among the principal public edifices are the palace of the princes of Condé; the cathedral, a Gothic structure founded in the thirteenth century; the noble Gothic church of Notre Dame; a theatre and town-hall. Dijon has a large public library, a botanic garden, and an *académie universitaire;* also manufactures of woollen cloth, blankets, hosiery, chemical products, and cotton fabrics. Its prosperity is largely derived from the trade in Burgundy wines. Pop. 39,193.

Dike [Dutch, *dyk;* Ger. *Deich;* Fr. *digue* or *levée*], an embankment or mound erected on the shore of the sea or of a river in order to prevent inundation. Such embankments raised along the Mississippi River are called levées. The coasts of Holland are protected against the encroachments of the sea by dikes constructed on a grand scale and in a systematic manner. A large part of that country is so low that it would be overflowed by the sea during high tides if it were not protected, partly by natural sandhills or dunes and partly by artificial dikes. The latter are also raised on the banks of the Rhine, Waal, and other rivers near their mouths. The dikes are broad at the base, and are usually of such magnitude that there is room on the top for a public road. The fabric is strengthened by willows, either growing or interwoven as wicker-work on the sides of the dike, which should present a very gradual slope towards the sea or river. The *Ammophila* and other creeping grasses are carefully cultivated on some of the dykes, and contribute much to their security. The base is often faced with masonry, and protected by vast heaps of stones (usually brought from Norway), and by rows of piles projecting six or seven feet above ground, connected by timber, and filled in with fascines weighted with stones. The most stupendous of these embankments are the dykes of the Helder and of West Kappel, at the W. extremity of the island of Walcheren. The term dike, as the equivalent of the Fr. *digue*, is also applicable to BREAKWATERS, JETTIES (which see), and also the stupendous *dams* of Holland constructed for engineering purposes, the most remarkable of which is the recent work by which the Y is isolated from the Zuyder Zee (see CANAL), and also that by which one of the outlets of the Maas has been obstructed. (See "Prof. Papers Corps of Engineers," No. 22.)

REVISED BY J. G. BARNARD, *U. S. Army.*

Dilapida'tion [Lat. *dilapidatio*, from *di* (for *dis*), "apart," and *lapis* (gen. *lapidis*), a "stone"], originally the falling apart of the stones in a building, is used in ecclesiastical law where an incumbent of a benefice suffers the parsonage-house or outhouses to fall down or decay for the want of necessary repairs, or commits any wilful waste of the inheritance of the Church.

Dilem'ma [Gr. δίλημμα, from δί (for δίς), "twice," "double," and the verbal noun λῆμμα, an "assumption," from λαμβάνω, to "take;" Lat. *dilemma*] is a syllogism with a conditional premiss, used to prove the absurdity or falsehood of some assertion. A conditional proposition is assumed, of which the antecedent is the assertion to be disproved, and the consequent is a disjunctive proposition setting forth the supposition on which the assertion can be true. If the supposition be denied, the assertion must also be denied. Thus, if A is B, either C is D or E is F; but C is not D, and E is not F; therefore A is not B. The dilemma was called the *syllogismus cornutus* ("horned syllogism"), the two members of the consequent being the "horns of the dilemma," on which the adversary is caught. Since there may be more than two horns to the dilemma (giving us a trilemma, tetralemma, or polylemma), Hamilton proposes the term hypothetica-disjunctive.

Dilettan'te [from the Lat. *diligo, dilectum*, to "love"], an Italian term naturalized in England, France, and Germany, was originally synonymous with an *amateur* or lover of the fine arts. It is sometimes applied to a person who pursues an art without serious purpose or for mere amusement, and is often used as a term of reproach for one whose knowledge is superficial and affected.

Dilettan'ti Soci'ety, The, was established in Great Britain in 1760 to encourage a taste for the fine arts. They sent an expedition to the East in 1764, and published in 1769 the first part of the "Ionian Antiquities," the third part of which appeared in 1840. Chandler's "Travels in Asia Minor" came out in 1775, and his "Travels in Greece" in 1776. The "Unedited Antiquities of Attica" appeared in 1817, and "Antique Sculpture" in 1835. The society consists of fifty members.

Diligence [a Fr. word signifying "diligence," "speed," "promptness"], a four-wheeled public vehicle used in Europe. The French diligence is very strongly built, and drawn by four or six horses at the rate of six miles an hour. The front, called the *coupé*, holds three persons, the second compartment (the *intérieur*) six, and the *rotonde*, entered from behind, also holds six. Diligences are also used in Germany, Italy, Spain, and Russia; the German diligence (Eilwagen and Postwagen) is attached to the post-office. Diligences are much less used than formerly, owing to the facilities of railway travel.

Dilke (CHARLES WENTWORTH), an English editor, born Dec. 8, 1789. He purchased in 1830 "The Athenæum,"

which he edited with ability and success until 1846. He was afterwards editor of the "Daily News," a liberal journal. Died in 1864.

Dilke (Sir Charles Wentworth), Bart., an English republican politician, is the grandson of the preceding, and son of Sir Charles Wentworth Dilke, M. P., editor of the "Athenæum," who was actively connected with the exhibitions of 1851 and 1862. He was born Sept. 4, 1843, educated at Cambridge, and called to the bar in 1866. He travelled through the U. S., and on his return published "Greater Britain, a Record of Travel in English-Speaking Countries during 1866–67" (1868), which speedily passed through several editions, and procured the author's election to Parliament for Chelsea. He is a recognized leader of the republicans in England. He is the proprietor and editor of the "Athenæum."

Dill, a plant of the order Umbelliferæ, having compound umbels, yellow involute petals, dorsally compressed lenticular fruit, and the border of the calyx minute and five-toothed. The common dill (*Anethum graveolens*), an annual or biennial plant, is a native of Southern Europe and Asia, and has long been cultivated for its stimulant and carminative seeds. It is also highly aromatic, and the leaves are used to flavor sauces, etc. Dill-seed is administered in the form of dill-water, obtained from oil of dill, a pale-yellow essential oil. The fruit of the *Anethum Sowa*, which grows in the East Indies, is used for flavoring and medicine.

Dil'lard's, a township of Etowah co., Ala. Pop. 962.

Dil'len [Lat. *Dillenius*], (Johann Jakob), M. D., a German botanist, born at Darmstadt in 1687. In 1721 he removed to London, where he edited Ray's "Synopsis of Plants" (1724). He obtained in 1728 the chair of botany founded by Sherard at Oxford. He published "Hortus Elthamensis" (1732) and a good "History of Mosses" (1741). Died April 2, 1747.

Dillenia'ceæ [from *Dillenia*, one of its genera, named after the above], a natural order of plants containing about 200 species, allied to the Ranunculaceæ and Magnoliaceæ. They are mostly trees or shrubs, and natives of tropical countries. They have thick, leathery leaves, without stipules, and generally alternate; flowers sometimes in racemes, sometimes solitary, with five persistent sepals and five deciduous petals; numerous stamens; fruit consisting of two to five carpels, and the seeds have an aril. They are generally astringent, and several species are valued as medicine, while others are excellent as timber. Many of the Dillenias are conspicuous for the beauty of their flower and foliage.

Dil'lingen, a town of Bavaria, in the circle of Suabia, on the Danube, 24 miles N. W. of Augsburg. It is enclosed by old walls, has a palace, three Catholic churches, a gymnasium, and a Catholic institution for deaf and dumb girls, with which is also connected, since 1869, an institution for cretins. The university, which was established in 1554, and was a chief seat of the Jesuits, was suppressed in 1809. The town has also manufactures of cutlery. Pop. 5220.

Dil'lingham (Paul) was born in Shutesbury, Mass., in 1800, removed with his father to Waterbury, Vt., in 1805, was admitted to the bar in 1824, was a member of Congress (1843–47), and was governor of Vermont (1865–67).

Dill'mann (Christian Friedrich August), a German theologian and Orientalist, born in 1823, became professor of exegetical theology at Tübingen in 1853, of Oriental languages at Kiel in 1854, of exegetical theology at Giessen in 1861, and at Berlin in 1869. He chiefly distinguished himself by his works on the Ethiopic language, among the most important of which are "Grammatik der Æthiopischen Sprache" (1857), "Chrestomathia Æthiopica" (1866), "Lexicon linguæ Æthiopicæ" (3 parts, 1862–65), an edition of the old Ethiopic version of the Bible (1855–73) and of the apocryphal book of Enoch (1851), and author of the able article on the Ethiopic Language in the present work.

Dil'lon, a post-village of Bolton township, Brome co., Quebec (Canada), has important copper-mines. Pop. about 400.

Dillon, a township of Klamath co., Cal. Pop. exclusive of Indians, 79.

Dillon, a post-township of Tazewell co., Ill. P. 1126.

Dillon (John B.), an American author, born in Brooke co., Va., about 1807. His parents removed to Ohio in his infancy. He became a printer in his youth, and contributed poetical articles to various journals. In 1834 he removed to Indiana, where he became well known as a lawyer, a writer, and a friend of education. He published "Historical Notes" (1842) and a "History of Indiana" (1859).

Dillon, Viscounts (Ireland, 1622).—Theobald Dominick Geoffrey Dillon Lee, fifteenth viscount, born April 5, 1811, succeeded his brother in 1865.

Dills'burg, a post-borough of York co., Pa. Pop. 281.

Dilman', a town of Persia, in the province of Azerbijan, 50 miles N. N. W. of Ooroomeeyah. It is about 4 miles E. of an old ruined town of the same name. It is surrounded by gardens and orchards. Pop. about 15,000.

Dilu'vial [from the Lat. *diluvium*, a "deluge"], a geological term applied to deposits that are the result of a flood, or accumulations of gravel and angular stones which have been produced by a sudden and extraordinary rush of water.

Dilu'vium, a Latin word signifying Deluge (which see). This term was applied by the older geologists to certain gravels and comparatively recent deposits which appear to be the result of a deluge, in order to distinguish them from the fine sand and mud which is washed down by rivers, and is called *alluvium*. The term diluvium is now chiefly used to designate the gravels of one geological period—namely, that of the boulder clay.

Di'ma, a large town of Abyssinia, in Amhara, 150 miles S. E. of Gondar. It has a large church and many stone houses.

Di'man (Rev. Jeremiah Lewis), D. D., was born at Bristol, R. I., May 1, 1831, graduated at Brown University, 1851, and at Andover Theological Seminary, 1856, spending in the mean time two years in study abroad. He was settled over the First Congregational church in Fall River, Mass., in 1856, and over the Harvard church in Brookline, Mass., in 1860. In 1864 he was elected professor of history and political economy in Brown University. He has published numerous addresses and articles in the leading reviews, and takes high rank as an accomplished scholar and orator.

Dime [from the Fr. *dime*, the "tenth part," a "tithe" (from the Lat. *decimus*, "tenth")], a silver coin of the U. S. equivalent to ten cents or one-tenth of a dollar. It was formerly written *disme*.

Dimen'sion [Lat. *dimensio*, from *di*, "apart," and *metior, mensus*, to "measure"], measure in a single line, extension. Dimensions, in the plural, signifies length, breadth, and thickness. In geometry, a line, whether straight or curved, has only one dimension—namely, length; a surface has two—length and breadth; and a solid has three dimensions—length, breadth, and thickness. In algebra, the term dimension is applied in nearly the same sense as *degree*, to express the number of literal factors that enter into a term.

Dim'ick (Justin), an American officer, born Aug. 5, 1800, in Connecticut, graduated at West Point in 1819; colonel First Artillery Oct. 26, 1861. He served chiefly at seaboard posts 1819–59; at the Military Academy 1822; on ordnance duty 1834–35; in Florida war 1836 (brevet major), where he killed two Seminole savages in personal encounter; in suppressing Canada border disturbances 1838–39; in military occupation of Texas 1845–46; in the war with Mexico 1846–48, engaged at Palo Alto, Resaca de la Palma, La Hoya, Contreras, and Churubusco (brevet lieutenant-colonel), Chapultepec (brevet colonel), and the city of Mexico; in the Florida hostilities 1849–50 and 1856–57; on the Western frontier 1859; in command of the artillery school for practice 1859–61; in charge of Fort Warren dépôt of prisoners 1861–64; and governor of "Soldiers' Home," near Washington, 1864–68. Brevet brigadier-general U. S. A. Mar. 13, 1865, for long, gallant, and faithful services to his country, and retired from active service Aug. 1, 1863. Died Oct. 13, 1871, at Philadelphia, Pa., aged 71. George W. Cullum, *U. S. Army*.

Dimid'iate [from the Lat. *dimidius*, "half," from *di*, "through," and *medium*, the "middle"], divided into halves. In botany, a leaf which has only one side developed, and a stamen which has only one lobe, are called *dimidiate*.

Diminuen'do [the It. gerund of *diminuire*, to "diminish"], the same as Decrescendo (which see).

Diminu'tion [Lat. *diminutio*, from *minuo, minutum*, to "lessen"], the act of making or becoming less; decrease; in architecture, the gradual decrease in the diameter of a column from the base to the upper end. In heraldry, the word diminutions is sometimes used for differences, marks of cadency, and brisures indifferently.

Dimin'utive [Lat. *diminutivus*, from *di*, intensive, and *minuo*, to "lessen;" Fr. *diminutif;* It. *diminutivo*], a term applied to a derivative word, formed by the addition of one or more syllables in such a way as to soften its meaning or diminish its original force. All languages are susceptible of diminutives, but the Italian surpasses all others, both ancient and modern, in this respect.

Dim'ity [from Damietta in Egypt, where it was formerly manufactured], a cotton fabric of thick texture, and generally figured or striped. It was formerly much used for bed-hangings and window-curtains. The figure or stripe is raised on one side and depressed on the other, so that the two faces present reversed patterns.

Dim'mick, a township of La Salle co., Ill. Pop. 1222.

Dim'ock, a post-township of Susquehanna co., Pa. Pop. 1124.

Dimor'phism [from the Gr. δίς, "twice" or "two," and μορφή, a "form"], the property of assuming two distinct crystalline forms. (See DIMORPHOUS.)

Dimor'phous, a term applied to a body which has the property of crystallizing in two distinct forms, as, for example, sulphur and some other solids. Sulphur, as found crystallized, naturally presents itself in crystals of the form of octahedra with a rhombic base, and thus belongs to the prismatic system; but when sulphur is heated to fusion, and then slowly cooled, prismatic crystals are obtained which belong to the oblique system. The latter form of sulphur is not permanent. Carbon affords another example of dimorphism.

Di'naburg, a strongly fortified town of Russia, is in the government of Vitebsk, on the river Düna, where it is crossed by the railway from Warsaw to St. Petersburg, about 120 miles S. E. of Riga. Another railway connects Dinaburg with Riga. It is an important military position, and has an active trade. Pop. in 1869, 29,613.

Dinagepoor', a district of British India, province of Bengal, has an area of 3820 square miles. The surface is nearly level. Rice is the staple product of the soil. Pop. in 1872, 1,501,924.

Dinagepoor, a city of India, the capital of the above district, 250 miles N. of Calcutta. It is meanly built. Pop. about 30,000.

Dinan, an old town of France, department of Côtes-du-Nord, on the river Rance, 30 miles N. W. of Rennes. It stands on a hill of granite about 250 feet above the river, is enclosed by walls and defended by a castle. It has a handsome cathedral, a public library, a college, and a town-hall. Here are manufactures of linen and cotton fabrics, sailcloth, hats, beet-root sugar, etc. The Rance is navigable from its mouth to Dinan. Pop. 8510.

Dinant' [Lat. *Dinantium*], a town of Belgium, province of Namur, is on the river Meuse, 15 miles S. of Namur. It is on the declivity of a rocky hill, and is surrounded by picturesque scenery. It has a Gothic cathedral, a town-house, and two hospitals; also manufactures of cutlery, paper, woollen goods, hats, and leather. Dinant was founded in the sixth century, was strongly fortified as early as the twelfth century, and has suffered much from sieges. Pop. 7208.

Dinapoor', a town and important military station of British India, province of Bengal, on the right bank of the Ganges, about 12 miles above Patna. Here are spacious barracks, and about 3200 houses, mostly of mud.

Dinar'ic Alps [Lat. *Alpes Dinaricæ*], the portion of the Alpine system which connects the Julian Alps with the western ranges of the Balkan, and occupies part of Croatia, Dalmatia, and Herzegovina. The highest summits are Mount Dinara and Mount Prolok, the former of which rises about 6000 feet above the sea. The rocks of this range are mostly limestone.

Dindigul', a town of India, in the British district of Madura and presidency of Madras, 259 miles S. W. of the city of Madras. Here is a fort on a naked steep rock which rises 280 feet. Pop. 9000.

Din'dorf (WILHELM), a German philologist, born at Leipsic Jan. 21, 1802. He became professor of history and literature in Leipsic in 1828, but resigned in 1833 in order to devote himself to the publication of a new edition of the "Thesaurus" of Stephanus, which his brother Ludwig Dindorf and Hase had begun in Paris. He also wrote commentaries on Æschylus, Sophocles, and Euripides, and prepared an edition of Demosthenes for the University of Oxford (1849).

Ding'elstedt, von (FRANZ), a German poet, born at Halsdorf, in Hesse, Jan. 30, 1814. He wrote popular political poems entitled "Songs of a Cosmopolitan Night-Watch" (1840). He was appointed librarian to the king at Stuttgart in 1843, intendant of the royal theatre of Munich in 1850, director of the court opera at Vienna in 1867, and director of the burg theatre of Vienna in 1871. Among his works are "The House of Barneveldt," a tragedy (1850), and a poem called "Night and Morning" (1851).

Ding'man, a township of Pike co., Pa. Pop. 519.

Din'go, an Australian dog, supposed to be a distinct species by some naturalists. It is sometimes found domesticated. The wild dingo is somewhat larger than a shepherd's dog, of a tawny color, with a large head, ears short and erect, and tail bushy. In its wild state it does not bark.

Dingo.

Dinich'thys [Gr. δεινός, "terrible," and ἰχθύς, "fish"], a remarkable placoderm fish found in the upper Devonian rocks of Ohio, and described by Prof. Newberry. It was allied to *Coccosteus*, but was very much larger; the head was three feet in length, the lower jaws two feet long and very massive, the central dorsal shield two feet in diameter, etc. One species was without proper teeth, but the jaws played on each other like huge shears.

Dink'elsbühl, a walled town of Bavaria, district of Middle Franconia, on the river Wernitz, 44 miles S. W. of Nuremberg, was formerly a free city of the empire. It has a Latin school, and manufactures of hosiery, coarse linen, paper, gloves, etc. Pop. in 1871, 5213.

Dinor'nis [from the Gr. δεινός, "terrible," and ὄρνις, a "bird"], an extinct genus of gigantic birds of the tribe Brevipennes, of which the bones have been found in the most recent deposits of New Zealand. In the traditions of that country these birds are known by the name of moa. They are said to have been much esteemed, both

Dinornis (restored).

for their flesh and gaudy plumage, and are described as fat and stupid birds, incapable of flying, but feeding on vegetable food, and living in forests. Their bones, which appear to confirm this description, are not properly fossil or mineralized, but retain a great part of their animal matter. It is perhaps not impossible that some of the smaller species of dinornis may still exist, but the larger ones are undoubtedly extinct. Some of the bones of these birds are at least twice the size of those of the ostrich. The framework of the leg is the most massive of any in the class of birds, and the bones are remarkable for their solidity, the toe-bones of *Dinornis elephantopes* almost rivalling those of the elephant. The bones of several species of dinornis have been described.

Dinosau'ria [Gr. δεινός, "terrible" or "wonderful," and σαῦρος, a "lizard"], the name of an order of extinct saurians found in the oolite, lias, and wealden. Their structure resembled the mammalian type more than others of their kind. They had four strong limbs, and the sacrum was composed of five amalgamated vertebræ. The *Megalosaurus*, *Iguanodon*, and *Hylæosaurus* are the principal genera of this order.

Dinothe'rium [Gr. δεινός, "terrible," and θερίον, a "beast"], an extinct animal, the remains of which have been found in the miocene formations of France and Germany. It had long tusks like the elephant and walrus; these projected from the end of the lower jaw, which was bent downward at a right angle to the body of the jaw. Besides the two tusks, it had five double-ridged grinders on each side of both jaws, and the nasal cavity was large. As no bones of the body or limbs have been found corresponding with those of the skull, the position of the dinotherium has not been determined. De Blainville supposed it to be a herbivorous cetacean, while Cuvier regarded it as allied to the tapir, and others to the dugong.

Dins'moor (Gen. Samuel) was born at Londonderry, N. H., July 1, 1766, and graduated at Dartmouth in 1789. He was for many years general of militia and judge of probate, was a member of Congress (1811–13), and governor of New Hampshire (1831–34). Died at Keene Mar. 15, 1835.

Dinsmoor (Samuel), LL.D., a son of the foregoing, was born at Keene, N. H., May 8, 1799, graduated at Dartmouth in 1814, and became a lawyer. He was governor of New Hampshire (1849–53). Died Feb. 24, 1869.

Dins'more, a post-township of Shelby co., O. Pop. 1700.

Dinwid'die, a county in the S. E. of Virginia. Area, 540 square miles. It is bounded on the N. by the Appomattox River, and on the S. W. by the Nottoway. The surface is undulating. Wool, grain, and tobacco are raised, and tobacco is manufactured here. The Southside R. R. and the railroad which connects Petersburg with Weldon pass through this county. Capital, Dinwiddie Court-house. Pop. 30,702.

Dinwiddie (Robert) was born in Scotland about 1690. He was appointed governor of Virginia in 1752, and filled that office until 1758, when he returned to England. Died in Clifton, England, Aug. 1, 1770.

Dinwiddie Court-house, a post-village, capital of Dinwiddie co., Va., is on Stony Creek, 35 miles S. by W. from Richmond.

Di'ocese [from the Gr. δί (for διά), "through," and οἰκέω, to "manage a household"), the name given to the district under the ecclesiastical jurisdiction of a bishop, was formerly used to designate the collection of churches under the care of an archbishop. Under Constantine the Great the Roman empire was divided into thirteen civil territories called dioceses, which were again subdivided into 120 provinces. These dioceses were governed either by prefects, proconsuls, or vicars, and the provinces by rectors. Before 400 B. C. the Church had a similar division, the dioceses being what are now termed patriarchates.

Diocle'tian [Lat. *Diocletianus*], or, more fully, **Caius Valerius Aurelius Diocletianus,** a Roman emperor, born of humble parentage in Dalmatia in 245 A. D. He served with distinction in the army under Aurelian and Probus. On the death of Numerianus, in 284, he was proclaimed emperor by the army at Chalcedon. In the year 286 he adopted Maximian as his colleague in the empire, which was disturbed by incursions of barbarians and menaced by the Persians. They suppressed revolts in Gaul, and in order to divide the labor of ruling so vast an empire chose Galerius and Constantius Chlorus as their assistants in 292 A. D., and gave them the title of cæsar. This was the beginning of the division of the empire into Eastern and Western. Diocletian reserved to himself Asia and Egypt; Maximian received power over Italy and Africa; Thrace and Illyricum were assigned to Galerius; and Gaul and Spain to Constantius Chlorus. The supremacy of Diocletian (whose court was at Nicomedia) was acknowledged by the other three. After this distribution of power the Roman armies gained successes in Egypt, Persia, and Britain. Diocletian protected or omitted to persecute the Christians until 303 A. D., when a persecution was commenced at the instigation of Galerius. Diocletian abdicated the throne in 305 A. D. in favor of Galerius, and retired to Salona, in Dalmatia, where he devoted his time to horticulture. Died in 313 A. D. He was a ruler of superior talents. (See Gibbon, "Decline and Fall of the Roman Empire;" Tillemont, "Histoire des Empereurs;" Vogel, "Der Kaiser Diocletian," 1857.)

Diocletian Era (called also the **Era of Martyrs,** on account of the persecution in Diocletian's reign) was used by Christian writers until the introduction of the Christian era in the sixth century, and is still employed by the Abyssinians and Copts. It dates from the day on which Diocletian was proclaimed emperor at Chalcedon, Aug. 29, 284 A. D.

Dioda'ti (John), a Calvinistic theologian, born of an Italian family at Geneva June 6, 1576. He was appointed professor of Hebrew at his native place in 1597, and became professor of theology there in 1609. In 1618 he represented the church of Geneva in the Synod of Dort, where his reputation was so high that he was one of the persons appointed to write the articles of faith. He produced Italian and French translations of the Bible, and wrote several treatises against the doctrines of the Roman Catholic Church. Died Oct. 3, 1649.

Di'odon [from the Gr. δί (for δίς), "double," and ὀδούς (gen. ὀδόντος), "tooth," because all the teeth of each jaw are united into one], the name of a genus of marine fishes of the order Plectognathes, without distinct teeth, but having the jaws covered with an ivory-like substance, which is formed by the blending of the teeth into one. Some of them have the power of filling their stomachs with air and assuming a globular form, whence they are called globe-fish; others are designated porcupine-fish from their numerous spines, which stand out like those of a hedge-hog. Most of the diodons of our Atlantic waters are called balloon-fish. They are of several species.

Diodo'rus Sic'ulus, a Greek historian, born at Agyrium in Sicily, flourished about 50–20 B. C. He travelled in Europe and Asia in order to collect materials for a universal history, and afterwards became a resident of Rome. He expended many years in the composition of his history, which is entitled "Historical Library" ("Βιβλιοθήκη ἱστορική"), in forty books. It is a history of the world from the earliest times to 60 B. C. As an historian he is deficient in critical judgment and other qualifications, but he has preserved important facts. Fifteen entire books of his work, and some fragments of the others, are extant. Among the best editions of his works are those by Bekker (4 vols., 1853–54) and by L. Dindorf (5 vols., 1867–68).

Diog'enes [Gr. Διογένης], a famous Cynic philosopher, born at Sinope in Asia Minor, flourished about 400–330 B. C. He was a pupil of Antisthenes at Athens. His habits were austere, eccentric, and frugal. He inured himself to extreme privations, and manifested or affected a contempt for the comforts of life, as well as for the customs of the world. According to tradition, he usually lodged in a cask or tub. He was a severe and caustic censor of the follies and vices of the Athenians, who allowed him a great latitude of comment and reproof. He was renowned for his witty and sarcastic sayings. He once received a visit from Alexander the Great, who inquired, "What can I do for you?" Diogenes replied, "Cease to stand between me and the sun." Having been captured by pirates, who offered him for sale in a slave-market of Crete, he was asked what he could do, and replied, "I can govern men; therefore sell me to some man who needs a master." He was purchased by Xeniades, a citizen of Corinth, who was a kind master, and soon liberated him and employed him as tutor of his children. Diogenes died about 323 B. C. (See Ritter, "History of Philosophy;" Grimaldi, "Vita di Diogene Cynico," 1777.)

Diogenes Laer'tius [Gr. Διογένης ὁ Λαέρτιος], a Greek compiler, born at Laertes in Cilicia. The period in which he lived is not known, nor is anything known of his personal history, except that he compiled "The Lives and Doctrines of the Ancient Philosophers." It contains interesting information and anecdotes, with extracts from lost works, but is destitute of critical merit, and is not well planned nor well digested. Among the best editions of it is that published by Hübner (Leipsic, 4 vols., 1828–33).

Diogenes of Apollonia, an ancient Greek philosopher, born in Crete, was a disciple of Anaximenes. He lived about 470 B. C., and taught philosophy at Athens.

He regarded air as the first principle of all things, and wrote a work on nature or cosmology, which is not extant.

Diomedea. See ALBATROSS.

Di'omede Islands, a group of three small islands in the middle of Behring's Strait, midway between Asia and America.

Diome'des, often anglicised **Di'omede** or **Di'omed** [Gr. Διομήδης], a brave Greek warrior and king of Argos, celebrated in the ancient legends as a son of Tydeus (hence he was called TYDIDES), and a favorite of Minerva. He fought with distinction at the siege of Troy, and, according to Homer, ventured to attack Mars, who defended the Trojans. Diomedes and Ulysses are said to have carried away the Palladium of Troy. Some writers relate that after the capture of Troy he settled in Italy.

Diomedes, a king of the Bistones in Thrace, is fabled to have fed his horses on human flesh. He was slain by Hercules.

Di'on [Gr. Δίων], an eminent statesman of Syracuse, born about 410 B. C., inherited an ample fortune from his father. He acquired great influence at the court of Dionysius the Elder, who had married Aristomache, a sister of Dion. He was a pupil and intimate friend of Plato, who taught at Syracuse. After the accession of Dionysius the Younger, Dion persuaded him to invite Plato to return to Syracuse. The virtue and austere morals of Dion rendered him obnoxious to the dissolute tyrant and his courtiers. He was banished, and took refuge at Athens, leaving at Syracuse his wife Arete, who was compelled to marry another man. In order to revenge himself and liberate his country, he raised a small body of troops in 357 B. C., and attacked Syracuse, which he occupied without much resistance. He expelled Dionysius, but was soon deprived of power by the intrigues of Heraclides. Dion was recalled by the people, but he was assassinated by Calippus about 354 B. C. (See "Life of Dion," by PLUTARCH, who compares him to Marcus Brutus; CORNELIUS NEPOS, "Dion.")

Dion, or **Dio,** surnamed CHRYSOSTOM ("golden-mouthed"), a Greek sophist or rhetorician, born at Prusa in Bithynia about 50 A. D. He received a liberal education, which was perfected by travel. He became a resident of Rome in 96 A. D., and gained the favor of Nerva and Trajan. The latter esteemed him so highly that he permitted him to ride in the imperial chariot. Dion died about 117 A. D., and left numerous orations, of which eighty are extant. They are remarkable for beauty of style and Attic purity of language. Best edition by Emperius, Brunsw., 1844.

Dionæ'a [a name of Venus], a genus of plants of the natural order Droseraceæ, having five petals, calyx 5-partite, from ten to twenty stamens, and one style, with five united stigmas. One species only is known, *Dionæa muscipula*, commonly called Venus's flytrap. It grows in moist sandy soil, and is indigenous only to the south-eastern part of North Carolina. The plant is perennial, with a rosette of root-leaves, from the midst of which a scape about six inches high arises, terminating in a corymb of white flowers. It derives its popular name from the singular irritability of its leaves. The elongated leaf-stalk is winged, and bears an orbicular leaf at its extremity, having the margin set round with long bristly hairs. On its upper surface are many small glands, and three slender irritable hairs on each side, so that an insect can hardly cross the leaf without touching one of them, when the two sides of the leaf instantly close together, the marginal bristles crossing each other, and thus preventing any possibility of escape. The leaf remains closed until the insect is dead, macerated in a juice secreted by the leaf, and the juice reabsorbed. That the plant feeds upon the captured insect can now hardly be doubted.

Dionæa: Venus's Flytrap.

Di'on Cas'sius, Dio Cassius, or, more fully, **Cassius Dion Cocceia'nus,** an eminent historian, born at Nicæa in Bithynia about 155 A. D., was descended from Dion Chrysostom. He became a Roman senator in the reign of Commodus, and was chosen consul in the year 229, through the influence of the emperor Alexander Severus. He wrote in Greek a "History of Rome" in eighty books, from the arrival of Æneas to 229 A. D. Only eighteen books (from 36 to 54) have been preserved entire. As a historian he is commended for accuracy in dates, diligence in research, and elegance of style. Among the best editions of Dion Cassius are those of Bekker (2 vols., 1849) and L. Dindorf (5 vols., 1863–65).

Dionys'ia [Gr. Διονύσια] were great annual festivals in honor of Dionysus (Bacchus), and are said to have been introduced into Greece from Egypt in 1415 B. C. They were of four kinds—the rural or lesser, the Lenæan, the Anthesterian, and the great Dionysia. They were chiefly celebrated at Athens. (See BOECKH, "Abhandlung Berliner Akademie," 1816–17, pp. 47–124.)

Dionys'ius Exig'uus, a learned monk, born in Scythia, was a friend of Cassiodorus. He lived at Rome, and wrote several works, among which is a collection of apostolical canons and decisions of councils. He fixed the year of the Incarnation as coincident with the year 753 of Rome. He was the first who computed the Christian era from the birth of Christ, instead of his death. His name Exiguus, "the little," refers to his small stature. Died about 556.

Dionys'ius of Halicarnas'sus [Gr. Διονύσιος ὁ Ἁλικαρνασσεύς], an eminent Greek historian and critic, born at Halicarnassus in Caria about 70 B. C. From his own writings we learn that he removed to Rome in 30 B. C., and passed more than twenty years in that capital in the study of Latin and in the composition of a history (in Greek) entitled "Roman Antiquities" ("Ῥωμαϊκὴ Ἀρχαιολογία"), in twenty books. Nine entire books, and fragments of the others, are extant. This work includes the period from the origin of Rome to 265 B. C. He is not considered a high authority as an historian, but he has a good reputation as a critic. Among his critical works are a "Treatise on Rhetoric" and "De Compositione Verborum." Died about 6 B. C. The best edition of his works is that of Reiske, 6 vols., Leips., 1774–77; text of Rom. Antiq. by Kiessling (4 vols., 1860–70.)

Dionysius, SAINT, a native of Alexandria, was a disciple of Origen. He became patriarch of Alexandria in 248 A. D., and was driven out of that city by severe persecution in 250. In 257 A. D. the persecution was renewed, and Dionysius was banished to Libya, but he was restored in the year 260. He wrote many letters and religious treatises, which are not extant. Died in 265 A. D.

Dionysius the Areop'agite is mentioned in the Acts of the Apostles (chap. xvii. 34) as one of the persons converted at Athens by the apostle Paul. He is supposed to have been a member of the court of the Areopagus when Paul appeared before that tribunal. According to an early tradition, he was the first bishop of Athens, and, according to a later tradition, suffered martyrdom there. In France he has been confounded with the Dionysius who went as missionary bishop to Paris about the middle of the third century. The spurious mystical writings which bear his name appear to have had their origin in Egypt during the fifth century. In the ninth century they were brought into Western Europe, and translated into Latin by Scotus Erigena.

Dionysius [Gr. Διονύσιος] **the Elder,** a celebrated tyrant of Syracuse, born about 430 B. C. He was in his youth an obscure private citizen, and became a general in the service of the republic of Syracuse when Sicily was invaded by the Carthaginians. In the year 405 he usurped the supreme power in Syracuse, which then ceased to be a republic. He suppressed several insurrections of his subjects, and in 397 B. C. commenced or renewed hostilities against the Carthaginians, who then held some towns in Sicily. His fleet was defeated by the Carthaginians, who besieged Syracuse, but their success was hindered by a pestilence, and Dionysius gained a decisive victory over them after they had lost great numbers by disease. He also captured several towns in Sicily, and made conquests on the Italian peninsula. He was an able ruler, displayed superior political talents, and was one of the most powerful princes of his time. At the request of Dion he invited Plato to his court, but the lectures of that philosopher offended the tyrant, who ordered the captain of a ship to take Plato away and sell him as a slave. He was ambitious of literary fame, and wrote poems and tragedies, some of which he sent to the Olympic games, but he failed to obtain a prize. It is stated that in the latter part of his life he was very suspicious, and took many precautions against the traitors and conspirators who (he imagined) intended to kill him. He died in 367 B. C., and was succeeded by his son Dionysius. (See GROTE, "History of

Greece," part ii., chaps. lxxxi.–lxxxiii.; THORKIL BADEN, "Res Gestæ Dionysii Syracusii recognitæ," 1795.)

Dionysius the Younger, tyrant of Syracuse, was a son of the preceding, whom he succeeded in 367 B. C. He was indolent, dissolute, and inferior to his father in political talents. He was persuaded by Dion to invite Plato to his court, but the eloquence and wisdom of that philosopher were unavailing to reform him. Dionysius banished Dion, who in 357 B. C. returned with a small army and expelled the tyrant. The latter fled to Locri, and became the despotic ruler of that city. He recovered power in Syracuse about the year 346, soon after which the oppressed Syracusans applied for aid to the Corinthians, who sent Timoleon with an army in 344 B. C. Dionysius was then deposed, and went as an exile to Corinth, where he is said to have taught school. (See GROTE, "History of Greece," part ii., chaps. lxxxiv., lxxxv.)

Diony'sus [Gr. Διόνυσος or Διώνυσος], the original Greek name of the god of wine. (See BACCHUS.)

Diophan'tine [from DIOPHANTUS (which see)] **Anal'ysis,** a branch of algebra not reducible to systematic rule, which treats of indeterminate problems, principally such as involve square or cube numbers, or the relations of the parts of right-angled triangles; and in which integral or commensurable values are found for the indeterminates by means of artifices suggested by the nature or conditions of the problems themselves. Success in this rather fascinating but not particularly useful branch of investigation depends very much upon the ingenuity of the investigator. An example of a Diophantine problem is the following: To find three numbers such that the sum of their squares shall be a square. The numbers are 2, 3, and 6, or any equimultiples of these.

Diophan'tus [Gr. Διόφαντος], a Greek mathematician who lived at Alexandria, probably between 200 and 400 A. D. He is the author of the most ancient extant treatise on algebra, and is the reputed inventor of algebra, according to Lagrange and others. He wrote an important work called "Arithmetica," in thirteen books, of which only six are extant.

Diop'sis [from the Gr. διά, "through" or "across," also "apart," and ὄψις, "vision"], the name of a genus of dipterous insects remarkable for having the eyes and antennæ at the end of long, horny stalks growing from the sides of the head. In some instances the distance of the eyes from the head is almost as great as the length of the wings.

Diop'trics [from the Gr. *διοπτρον*, "anything which one looks through," a "transparent substance" (from διά, "through," and the obsolete verb ὄπτω, to "see")], that branch of geometrical optics which treats of the refraction of light, or of the changes which take place in the direction of rays transmitted from one medium to another (as from air to water, etc.), or through media of varying density. It is applied chiefly in the construction of telescopes, microscopes, and other instruments requiring the use of refracting lenses. (See OPTICS and LENS.) (See LITTROW, "Dioptrik," 1830; PRECHTL, "Practische Dioptrik," 1828.)

Dioptric System, an arrangement of lenses for condensing light in lighthouses, devised by Fresnel about 1819, based on the discoveries of Buffon, Condorcet, Brewster, and others. (See LIGHTHOUSE ILLUMINATION, by COL. PETER C. HAINS.)

Diora'ma [from the Gr. δί (for διά), "through," and ὅραμα, "that which is seen" (from ὁράω, to "see")], a mode of scenic display invented by Daguerre and Bouton, and first exhibited in Paris in 1822. The painting is viewed through a large aperture or proscenium, beyond which it is placed at such a distance that the light is thrown upon it at a proper angle from the roof, which is glazed with ground glass, and cannot be seen by the spectator, who is in comparative darkness, receiving no other light than what is reflected from the painting itself. By means of shutters or curtains the light may be diminished or increased at pleasure; and some parts of the picture being transparent, light may be admitted through it—an artifice which secures the advantages of painting in transparency without its defects.

Dioscorea'ceæ [from *Dioscorea*, one of the genera], a natural order of plants, ranked by Lindley among the DICTYOGENS (which see), mostly natives of tropical countries. They are classed among endogenous plants by most botanists. They are twining shrubs with large tubers either above or under ground. The most important plants of the order are the species of *Dioscorea* or YAM (which see). The order comprises one British plant, the black bryony, and the *Dioscorea villosa*, which grows in many parts of the U. S.

Dioscor'ides Peda'nius [Διοσκουρίδης Πεδάνιος], a Greek botanist, born at Anazarba in Cilicia, lived between 50 and 200 A. D. He travelled in Asia Minor, Greece, and Italy to procure information about plants, and wrote a celebrated work on materia medica (in Greek), in which he describes or names more than 500 plants. This work was regarded as the highest authority for fifteen centuries or more, and was universally used by medical and botanical students. Best edition by Sprengel, 2 vols., Leips., 1829–30.

Dioscu'ri [Gr. Διόσκουροι], (*i. e.* "sons of Jupiter"), a name given to CASTOR AND POLLUX (which see).

Dios'ma [from the Gr. δίοσμος, "transmitting smell," or perhaps "having a strong smell" (from διά, "through," and ὀσμή, "smell")], a genus of plants of the natural order Rutaceæ and Linnæan class Pentandria. The buchu leaves are obtained from the *Dioema crenata* and other species.

Diospy'ros [probably the διόσπυρον of Theophrastus, a name signifying in Greek the "wheat" or "bread of Zeus"], a large genus of trees of the ebony family, comprising about one hundred species, mostly natives of the tropical parts of the Old World. They generally have hard wood, and many of them yield edible fruits.

The persimmon tree of the Atlantic States and Mississippi Valley (*Diospyros Virginiana*) is well known for its fruit, which becomes edible late in autumn, and for its wood, which is used by makers of lasts for shoes. It is represented in Texas, and Northern Mexico by the *Diospyros Texana* (persimmon, ebony, or japote).

The pishamin or date-plum (*Diospyros Lotus*) grows in Europe as far N. as London, and its fruit is made into preserves or eaten without cooking. Other species are prized for their fruit in China, Africa, and Japan. The CALAMANDER-WOOD (which see) and several other Diospyri of Asia are greatly valued for their timber. Among these is the true ebony (*Diospyros Ebenum*), which grows principally in Ceylon. (See EBONY.) Remains of many fossil species are found in the eocene of the U. S.

Dioszeg, a town of Hungary, in the county of Bihar, on the Er. It exports wine and tobacco. Pop. 5774.

Dip and Strike. In geology, the angle of inclination of a stratum to the horizon is called its *dip* or *pitch*. Strata presenting this inclination must cut the surface in a line, and this line, called the *outcrop* of the rocks, has a definite direction, which in geological language is called the *strike* (from the German *streichen*, to "reach," to "extend"). The strike of rocks is therefore the compass direction of the intersection of their plane of stratification with the plane of the horizon. When strata are moderately regular, the line of strike is a very useful fact to determine, as it enables the geologist to follow the same bed, and when concealed, suggests the place where he should seek for it. The dip must be at right angles to the strike, for that is the direction in which the plane of the bed dips down towards the interior of the earth. Beds dipping at a high angle are soon lost sight of, being covered up with other deposits of newer date. In the direction opposite to that of the dip beds of older date come up from below, or "crop out." The amount of inclination as required for practical purposes can be measured by a simple instrument, the clinometer.

Diphthe'ria [from the Gr. διφθέρα, the "skin" of an animal, in allusion to the false membrane described below], an acute disease, characterized by inflammation of the mucous membrane of the pharynx, attended by an exudation of lymph, often assuming the character of a false membrane, which may extend into the larynx and air-passages, into the œsophagus, and into the mouth, occasionally also appearing upon raw or mucous surfaces of other parts of the body; it is also attended by prostration and albuminuria, which may or may not be persistent. Diphtheria is not a new disease, but its nature having been investigated by Bretonneau (who gave it the name *diphtheritis*), it has of late received much attention, more especially from its present frequency and the terrible fatality which distinguishes it. Its duration and symptoms are variable, and the distinctive exudation is by no means of uniform appearance. In general, the mucous membrane is dark and congested, and the exudation growing from one or more centres if torn away leaves a bleeding and sensitive surface. The membrane itself frequently is the seat of a microscopic vegetable growth (*oïdium*), believed by some to be an essential part of the disease itself. The prognosis is always grave, no case being free from danger. The mildest attack may be followed by paralysis or by fatal prostration. No routine treatment can be laid down for this disease. In mild cases it is permissible to use detergent chlorinated washes for the mouth, and the general treatment may be mainly expectant, provided the pulse is firm. Sulphate of quinia has the happiest effects upon many cases. The inhalation of vaporized water is an excellent measure. The

treatment of the various sequelæ of diphtheria requires the careful use of tonics, such as strychnia and iron, with the best hygienic conditions.

REVISED BY WILLARD PARKER.

Diph'thong [Gr. δίφθογγος, from δί (for δίς), "double," and φθόγγος, "voice," "sound;" Lat. *diphthongus*] is the union of two vowels pronounced together in one syllable. A proper diphthong is one in which both vowels are sounded, as in *boil, out*. An improper diphthong is one in which only one vowel is sounded, as in *Cæsar, beat*.

Diplacan'thus [from the Gr. διπλός, "double," and ἄκανθα, a "thorn" or "spine"], the name of a genus of ganoid fishes found only in the old red sandstone. They have small scales on the body, a large head, wide mouth, and two dorsal fins with a strong spine in front.

Diplograp'sus [from the Gr. διπλός, "double," and γράφω, to "mark" or "write"], a genus of zoophytes existing in great numbers in the anthracite shales of the Silurian formation. They are marked with a double series of cells.

Diplo'ma [Gr. δίπλωμα, from διπλόω, to "double," or "fold;" Lat. *diploma*], a term formerly applied to every sort of royal charter or letter-patent. These were so called because under the Roman emperors charters were inscribed on two tablets of copper, joined together so as to fold in the form of a book. The charter by which a physician or surgeon is declared qualified to practise his profession is called a diploma. The term is also applied to the certificate of graduation given to every one who has taken a degree in a college or university.

Diplo'macy [from *diploma*, originally signifying "credentials" or "letters-patent" (see DIPLOMA)] is the art of conducting the official intercourse between foreign states, and is generally managed by ambassadors instructed in the policy to be pursued. The negotiation of treaties forms an important part of the duties of these envoys, but frequently they exercise a delicate and yet profound influence over the nation with which they are sent to deal. In receiving his instructions, much must sometimes be left to the discretion of the diplomatist. Very early in history heralds and ambassadors are found bearing messages from one power to another. Generally these messages were special. It is only in modern times that diplomatists are established permanently in foreign courts to watch the interests of their own governments. From the very necessities of the case, ambassadors have been held personally sacred, since, were it not so, it would be impossible for them to venture into unfriendly states. Even among barbarians their privileges were respected; and in our own times they are not subject to the municipal laws of the states in which they reside, but can be sent home for punishment if they offend those laws. When resident ambassadors first came to be employed they were looked on as spies, but as the usage became general its advantages were made manifest. It tends to bring nations nearer together, and to make them respect one another, when there are representatives of foreign states in each country; the community of nations is more vividly felt. Ambassadors become acquainted with the laws, institutions, and history of the land where they reside; they protect their countrymen who are there as travellers or residents; they foresee difficulties and are able to prevent them; they put their countries on their guard against the preparations for war of other states; and when they withdraw on account of war their absence causes the separation of the two countries to make more impression. Even the exchange of compliments, the opportunity of representing their country in expressions of friendship at public and festive gatherings, as well as by condolence and forms of sympathy,—these minor uses of resident ministers will not be despised by those who rightly estimate the effect of such things on national feeling.

The highest diplomatic office is that of ambassador. In the Roman Catholic states of Europe the legates and nuncios of the pope take rank with the highest class. The second grade includes ministers plenipotentiary, the internuncios of the pope, envoys ordinary and extraordinary, and all agents accredited directly to sovereigns. The third order are chargés-d'affaires, who are generally accredited to the department of foreign affairs. The appointment of diplomatic agents in the U. S. belongs to the President, but his choice must be confirmed by the Senate. The secretary of state superintends our diplomatic relations.

REVISED BY T. D. WOOLSEY.

Diplomat'ics [from the Gr. δίπλωμα, "something folded;" see DIPLOMA], originally the science of deciphering ancient writings. Previous to the fifth century writing was done extensively on papyrus. In that century parchment appears to have been generally used, and the oldest documents in our possession bearing the character of diplomas have no higher antiquity. The science of diplomatics teaches the different styles and forms adopted in ancient public documents, the titles, rank, etc. of public officers whose names are subscribed to them, etc. Its origin is attributed to a Jesuit of Antwerp named Papebroeck, who about 1675 applied himself to the exposition of old diplomas. Mabillon, however, whose work "De Re Diplomaticâ" came out in 1681, was the first who established it on a sure foundation. The principles laid down in this work were more fully developed in the "Nouveau Traité de Diplomatique," by Toussaint and Tassin (1765). Among other valuable works on this subject may be named De Vainer's "Dictionnaire Raisonnée de Diplomatique" (Paris, 1774) and Gatterer's "Abriss der Diplomatik" (Göttingen, 1798).

Diplop'terus [from the Gr. διπλός, "double," and πτερόν, a "wing" or fin"], a genus of ganoid fishes of the palæozoic age, having double dorsal and anal fins, heterocercal tails, scales perforated with small foramina, and a large and flattened head.

Dip of the Horizon, in navigation, is the difference between the altitude of a heavenly body, as observed from the deck of a ship, and the altitude of the same body observed from the level of the sea. If the height of the spectator above the surface of the sea be a feet, then the correction for dip $= 1.063\sqrt{a}$. Experiments, however, seem to show that refraction diminishes the amount of dip by about three-fortieths of itself; hence the common table of dip used in navigation may be computed from the formula $= \text{dip}\ \frac{37}{40} \times 1.063 \times \sqrt{a} = 984\sqrt{a}$.

Dip'per (*Cinclus*), a genus of birds of the ouzel family (Cinclidæ), found in Europe, Asia, and America. They feed chiefly on mollusks and on aquatic insects and their larvæ, which they seek in clear lakes and streams, frequently diving with great facility, and moving about under water by means of their wings. They resemble the wren in their manner of dipping the head, accompanied with an upward jerking of the tail. The dippers build very curious nests of interwoven moss, having the entrance in one side.

Dipping Needle. When a magnetic needle is hung within a stirrup so as to move freely in a vertical direction, and the whole system is suspended by a thread, it will adjust itself in the magnetic meridian, and its pole will dip towards the north pole of the earth. Such a needle is called a *dipping needle*, and its deviation from the horizontal line is its *inclination*. When the needle is carried nearer the magnetic pole, the inclination increases. Sir James Ross in 1832 saw the dipping needle stand within one minute of a degree of the vertical position near Baffin's Bay. Approaching the equator, it becomes less and less inclined, until a point is reached at which it is quite horizontal. This point will be in the *magnetic equator*, or line of no dip, which is near, but not coincident with, the equator of the earth. When tracing the lines of equal dip on a Mercator's map, we find that they coincide in a remarkable manner with the isothermals or lines of equal mean temperature, indicating a close connection of the distribution of heat with that of magnetism, and seemingly a common cause for both.

The inclination, like the declination, is subject to periodic and secular variations. The last is shown in the following table:

Inclinations observed in Paris.

Year.	Inclination.	Year.	Inclination.
1671	75° 00′	1820	68° 20′
1780	71 48	1825	68 00
1798	69 51	1831	67 40
1814	68 36	1853	66 28

It appears from the table that since the year 1671 the inclination has steadily diminished at the rate of about three to five minutes a year.

ARNOLD GUYOT.

Dipsa'ceæ [from *Dipsacus*, one of the genera], a natural order of herbaceous exogenous plants, mostly natives of the south of Europe. They are nearly allied to Compositæ, from which they differ by having the stamens distinct. Among the plants of this order is the *Dipsacus fullonum* (fullers' teazel). (See TEAZEL.)

Dip'sas [Gr. διψάς, the name of a venomous snake whose bite caused intense thirst, from δίψα, "thirst"], a genus of non-venomous serpents belonging to the Colubridæ. They are tree-snakes, greatly elongated in form, and having a broad, thick head. They are natives of the warmer parts of America and Asia. Some of them are of large size. Like many other modern scientific names, the designation of this genus is etymologically inappropriate.

Dipsoma'nia [from the Gr. δίψα, "thirst," and μανία, "frenzy"] is a term sometimes applied to DELIRIUM TRE-

MENS (which see), but of late more especially used to designate a morbid craving for alcoholic drinks, sometimes called methomania. Of late, this craving is looked upon as a disease, and it has been very successfully treated in "inebriate asylums" in various countries.

Dip'tera [Gr. δί (for δίς), "twice" or "two," and πτερόν, a "wing"], an order of insects having for their distinguishing characteristic two wings only, corresponding to the anterior pair, instead of four. In addition they have two short clubbed appendages, called "halters" or balancers, probably rudiments of the posterior pair in four-winged insects. They are marked also by having the mouth in the form of a sucker, constructed of from two to six lancet-shaped, elongated scales, enveloping a canal upon the upper surface of a fleshy proboscis. The larvæ or maggots of dipterans generally have a membranous head, and always have the stigmata, or breathing-pores, placed in the second and terminal segments of the body. In some species of these insects the eggs are hatched within the body of the parent—for instance, the blow-fly; in others, as the forest-fly, the larvæ are metamorphosed in the parent's body, and the young are excluded as pupæ.

Dipterocarpa'ceæ, or Diptera'ceæ [from *Dipterocarpus*, one of the genera], a natural order of exogenous trees, indigenous only in the East Indies. It comprises about fifty known species, mostly beautiful and majestic trees, some of which are valuable for timber. They have simple, alternate leaves, with large stipules, and 1-celled, 1-seeded fruits. They abound in balsamic resin and resinous products, among which are camphor, copal, and dammar. The sal, one of the best timber trees in India, belongs to this order. (See DIPTEROCARPUS.)

Dipterocar'pus [from the Gr. δίπτερος, "two-winged," and καρπός, "fruit"], a genus of plants of the order Dipteraceæ, comprises several species of the noblest trees of India. They bear clusters of large fragrant flowers, and abound in a resinous juice which is used medicinally and for burning in torches. The fruit is furnished with two membranes like wings. The *Dipterocarpus turbinatus*, or goorjun tree, often attains a height of 200 feet, and has no branches except near the summit. The wood is hard, close-grained, and durable. From the trunk exudes a fragrant oil which is valuable for varnish, for an ingredient of paint, and for medicine.

Dip'terus [from the Gr. δίπτερος, "having two wings" or "fins"], a genus of ganoid fishes, two species of which are found in the old red sandstone. They have a large and flattened head, and double anal and dorsal fins, opposite to each other.

Dip'tych [Lat. *diptychum*, from the Gr. δίς, "twice," and πτύξ (gen. πτυχός), "fold" or "tablet"], a register used by the ancients at an early period. It consisted of two tablets of ivory or wood, covered with wax. Diptychs were of two kinds, sacred and profane, the latter being the more ancient form. The profane diptychs contained the name and titles of the consul, and were distributed by him among his friends on entering his office. On one side of the sacred diptych were inscribed the names of living, and on the other those of deceased, ecclesiastics and benefactors of the clergy, which were read during service by the deacon. They were often decorated with scenes from biblical history. Diptychs are still used in the Eastern churches.

Dirræ. See EUMENIDES.

Direct'or [from the Lat. *dirigo, directum*, to "arrange" or "direct;" Fr. *directeur*], literally, "one who directs or manages," usually applied to one of a number of individuals whose duty it is to conduct the affairs of certain enterprises, such as banks, railways, insurance companies, etc. Directors are usually elected by the stockholders from their own number; they have the right of supplying casual vacancies, and may delegate their powers to committees of such number as they may judge expedient. The title is also usually given to the chief officer or superintendent of an astronomical or physical observatory.

Direc'tory [Fr. *Directoire*], in French history, the name given by the constitution of 1795 to the executive body of the French republic. It consisted of five persons called Directors (*Directeurs*), who were selected by the Council of Elders from a list of candidates presented by the Council of Five Hundred. Their names were Barras, Carnot, Laréveillère-Lépaux, Letourneur, and Rewbell. One of them retired every year, and was succeeded by another chosen in the same way. They came into power at a time when France was involved in war against nearly all Europe, and was distracted by domestic factions. The French armies gained many victories under this *régime*, but the home policy of the Directory was unpopular. The Directory was divided into two parties, and the majority, consisting of Barras, Laréveillère-Lépaux, and Rewbell, removed their adversaries by the *coup-d'état* of the 18th Fructidor (Sept. 4, 1797). In 1797 the directors were Barras, Ducos, Gohier, Moulins, and Sieyès. The Directory was abolished by the *coup-d'état* of the 18th Brumaire (Nov. 9, 1799), in which Bonaparte and Sieyès were the prominent actors. (See BARANTE, "Histoire du Directoire," 1855.)

Directory, a book containing the names of the inhabitants of a city arranged in alphabetical order, together with the numbers of the houses in which they reside. The first London directory, "A Collection of the Names of Merchants, etc.," came out in 1677. In the U. S. every town of importance has its own directory. In several States there are also published "State directories." In New York City the earliest published was in 1786—a small volume of 82 pages, printed by Shepherd Kollock, Wall street. The names of the individuals and firms include about 900, and occupy 33 pages, the remainder being filled with general statistics of the city, U. S. government, post-office regulations, etc. In his address the editor states that it was the "first directory ever attempted in this country." The New York Historical Society possesses a complete set from its first publication.

Direc'trix, plu. **Direc'trices** [the feminine of the Lat. *director*, a "guide"], a term in geometry applied to a line which serves for the description of a curve or surface. The directrix of a conic is a right line perpendicular to the axis, whose distance from any point on the curve bears a constant ratio to the distance of the same point from the focus. Quadric surfaces have also directrices possessing analogous properties. When a surface is conceived to be generated by the motion of a line, right or curved, which always rests on other fixed lines, the latter are sometimes called directrices, but more frequently directing lines or directors, the former being distinguished as the generator.

Dirge [a contraction of the first word of an ancient Latin funeral hymn, "*Dirige gressus meos*"—"Direct my steps;" the word *dirge* is written "dirige" in old books], a hymn of a mournful character sung at funerals, much used in the services of the Roman Catholic Church. "Dirge" is used also by poets to characterize sad verses on the dead.

Dir'schau, a town of Prussia, in the province of Prussia, on the river Vistula, and on the railway from Berlin to Dantzic, 20 miles S. S. E. of Dantzic. It has machine-works, tanneries, etc., an enormous railroad bridge 2843 feet in length, and a transit trade by the river. Pop. in 1871, 7761.

Dirt-Bed, a name given to deposits of dark-brown or black earthy lignite situated in the lower Purbeck series in Europe, near the top of the middle secondary or mesozoic rocks. Through the beds, which are from twelve to eighteen inches thick, are distributed stones from three to nine inches in diameter, also the silicified trunks of cycadaceous trees like *Zamia*. For many miles this black earth may be traced, containing fragments of fossil wood. The name "dirt-bed" is also given by geologists to the strata in the carboniferous rocks, etc. in which fossil roots of trees are found *in situ*.

Dis [contracted from the Lat. *dives*, "rich"], a name of Pluto, sometimes applied to the infernal regions. (See PLUTO.)

Dis, or Di, a Latin particle signifying "apart" or "off," usually implying separation, as in "dismiss," "disjoin." It is sometimes equivalent to "un," being negative or privative, as in "displease," "disorder." The Greek particle δίς or δί usually means "twice" or "double."

Disabil'ity, in law, signifies a state which renders a person incapable of enjoying certain legal benefits or disables him from doing a legal act. The disability is either absolute, as in the case of outlawry or attainder, or it is partial, as in the case of infancy and coverture. It may arise from the act of God, of the law, of the person himself, or of his ancestor. (See CAPACITY, by PROF. T. W. DWIGHT.)

Disband'ing is the breaking up of a military organization and the discharge of soldiers from military duty.

Disbar', a term applied in England to barristers, who, in accordance with authority reposed in the benchers of the four inns of court, subject to an appeal to the common-law judges, may be expelled from the bar.

Disc. See DISK.

Discharge, from military service, is sometimes honorably obtained by non-commissioned officers and privates with the consent of the commanding officer; sometimes on a surgeon's certificate of disability. Soldiers are also discharged with ignominy for great offences, being in some cases stripped of their decorations and drummed out of the regiment.

Disciples of Christ, or, as they generally call themselves, **Christians** or **Church of Christ,** a body of

Christians frequently called **Campbellites,** taking the latter name from Alexander Campbell (see CAMPBELL, ALEXANDER), one of their most distinguished elders, and from his father, Rev. Thomas Campbell, a Scotch-Irish "Seceder," who came to the U. S. in 1807, and with his son began to labor in Western Pennsylvania for the restoration of Christianity to apostolic practice. In 1811 they organized the Brush Run church in Washington co., Pa. In 1812 this church adopted Baptist views, and in 1813 they, with other sister congregations, joined a Baptist association. But as the principles and practice of the Campbells and their followers were distasteful to many Baptists, much agitation followed, and in 1827 the Baptist churches generally withdrew from fellowship with the reformers, who consequently organized themselves anew, professing to reject all creeds, and to receive the Bible alone as their authority in faith and practice. They, however, though rejecting the Trinitarian terminology, are, in fact, in essential agreement with other evangelical Christians in their opinions with regard to the person and work of Christ and the future resurrection and judgment. They celebrate the Lord's Supper weekly, hold that repentance and faith should precede baptism, though, from the importance they attach to the latter ordinance, they are often charged with holding to baptismal regeneration. On all other points they allow and encourage independence of individual opinion. Their church organization is congregational. Their officers are of three classes: (1) elders, called also bishops, pastors, and presbyters; (2) deacons; and (3) evangelists, who are itinerants supported by the free offerings of the congregations. This denomination is distinguished for its efforts in behalf of education. They hold that the laborer is worthy of his hire, and teach the duty of the Church to provide amply for its ministers' support. They sustain several religious quarterly and monthly reviews and many weekly periodicals in the U. S., and several in Great Britain and her colonies. Among their numerous institutions of learning are Bethany College, in West Va., Hiram College, Hiram, O., the Northwestern Christian University, Indianapolis, Ind., Eureka College, Ill., Kentucky University, Lexington, Ky., and Oskaloosa College, Oskaloosa, Ia., besides a large number of seminaries and schools of a high grade.

REVISED BY B. A. HINSDALE.

Dis'cipline [Lat. *disciplina*, from *discipulus*, a "scholar"], education, training; the treatment suited to a learner or disciple; subjection to rules and regulations. It sometimes signifies punishment or chastisement. The term is applied figuratively to a peculiar mode of life in accordance with the rules of some profession or society.

DISCIPLINE, in military and naval affairs, is a general name for the rules and regulations prescribed and enforced for the proper conduct and subordination of the soldiers, etc.

DISCIPLINE, ECCLESIASTICAL, is a term used to designate the means employed by churches to maintain correctness of life among their members, orderly government in church affairs, and to prevent the spread of heresy in their ranks. In the Middle Ages discipline was either penitential (that is, inflicted on those who confessed their sin; see PENANCE) or punitive, which was, in theory at least, frequently administered by the civil power.

Discipline, First Book of, an important document in the ecclesiastical history of Scotland. It was drawn up in 1560 by John Knox and four others. It lays down rules for the election of ministers and other officers, but deals more especially with ecclesiastical discipline. Though subscribed to by many of the nobles, it was never acknowledged by an act of Parliament. The "Second Book of Discipline" was drawn up by a committee of the General Assembly in 1578. Andrew Melville took a leading part in preparing it.

The "Discipline" of the Methodist Episcopal Church is a volume containing all the doctrines, administrations, and ritual forms of that denomination, and is revised every four years, so as to include changes made by the quadrennial or General Conference.

Disclaim'er, in law, a plea containing an express denial or renunciation of some claim alleged to have been made by the party pleading. This term is also applied to the act of one who renounces or refuses to accept a gift or devise made to him of land or other property, and generally to the waiver of any claim. In the law of landlord and tenant it means a denial by the tenant of the landlord's title, in such a way as to cause a forfeiture of the tenant's estate.

Discob'oli (plu. of **Discob'olus**), [Gr. δισκόβολος, from δίσκος, a "disk" or "quoit," and βάλλω, to "throw," also to "put" or "place," so called in allusion to the habit of the fish of placing its disk on some firm body], the name of a family of malacopterous fishes, having the ventral fins united to form a sucking disk on the under surface of the body, by which the animal is enabled to firmly attach itself to a rock or other fixed body in order to obtain food. To this family belongs the lumpsucker (*Cyclopterus lumpus*).

Discontin'uous Funct'ion, in mathematics, is a function which does not continuously increase or diminish when the independent variable increases uniformly. The function *tan.* x is discontinuous; for though the arc x increases uniformly from 0° to 360°, *tan.* x changes abruptly from $+\infty$ to $-\infty$ at $x = 90°$ and $x = 270°$.

Discord [Lat. *discordia*], want of concord; dissension, strife; a combination of sounds which have no harmonical relation. In music, a combination of notes more or less disagreeable to the ear. Discords are largely employed in musical compositions, being introduced by way of transition between successive concords, of which they serve, by contrast, to heighten the pleasing effect. They are, therefore, indispensable to the highest order of musical expression. The concord preceding a purposely introduced discord is called the *preparation*, and that which follows, the *resolution*.

Discount [from *dis*, "un" or "off," and *count*], an allowance or deduction made for cash or advanced payments. Thus, in mercantile transactions a bill purchased may amount to $250. The seller allows the purchaser a discount of 15 per cent. for prompt or advanced payment, making the amount paid $212.50; in other words, $250 − 15 per cent. = $212.50. Discount is a form of interest. To borrow $100 at 6 per cent. for four months, and paying $102 at the expiration of the time stated, is *interest*, but does not differ materially from taking $98 at once, under promise to pay $100 at the end of four months; this latter method is called *discounting*. The *rate* of discount is usually agreed upon by the parties directly interested.

Discourse [Lat. *discursus*], conversation, talk; the expression of ideas; a formal treatise or dissertation; in rhetoric, a series of sentences and arguments arranged according to the rules of art. In logic, this term is applied to the operation of the mind commonly called *reasoning*.

Discovery, in equity jurisprudence (see EQUITY), the act of disclosure by a defendant of facts to which he is required to answer by reason of a "bill of discovery" which has been filed against him. The court entertains such a bill to secure the due administration of justice. There must be an interest on the part of the plaintiff in the subject to which the discovery refers, and the information sought must appear to be material either to the prosecution of the suit or of some other suit or action then pending or which may be commenced. The defendant will not be compelled to make the discovery when disclosure would subject him to criminal proceedings or to a forfeiture. (The works on equity jurisprudence should be consulted for more full information: STORY, "On Equity;" ADAMS, on the same; SPENCE, "Equitable Jurisdiction," etc.) In a number of the American States, following the lead of the New York code of procedure, the bill for discovery is abolished. Either party to an action under that system may obtain an order from a judge to examine a party to an action before trial. The mode of examination is regulated by rule of court. This proceeding is a substitute for the former bill of discovery.

T. W. DWIGHT.

Discovery, of countries. See INTERNATIONAL LAW No. I., by PRES. T. D. WOOLSEY, S. T. D., LL.D.)

Discussion of a problem or formula in mathematics, is the process of assigning to the arbitrary quantities which enter into it every reasonable value, and especially limiting values and interpreting the results.

Disease [from the Fr. *dés*, negative, and *aise*, "ease;" Lat. *morbus;* Fr. *maladie;* Ger. *Krankheit*], a deviation from a state of health, consisting in most cases (if not in all) in some change, palpable or impalpable, of some one or more of the tissues, rendering such tissue (or the organ containing it) incapable of performing its proper part in the economy of the organism to which it belongs. In a less general sense, a particular form of ill-health is called a disease. Diseases are either *diathetic* (arising from the diathesis or predisposition of the patient) or *enthetic* (arising from without the patient). It is at present a favorite theory with many that enthetic diseases arise from minute organisms or disease-germs. (See GERM-THEORY.)

Diseases, Distribution of. See GEOGRAPHICAL DISTRIBUTION OF DISEASES.

Disfran'chisement, the act of depriving a person of any privilege, liberty, franchise, or immunity—such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "amotion," which refers to the removal of an officer of the corporation from office, without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of de-

priving a person of the right to vote, and in England to the act which deprives a borough of the right of returning a member to Parliament.

Dishon'or [from the Lat. *dis*, "un," and *honor*, "honor"], in mercantile language, signifies to refuse or neglect to pay (or to accept) a draft or a bill of exchange. The act of drawing or indorsing such a bill or draft involves the drawer and indorser in an obligation to pay it in case the drawee dishonors the same. In order that the person in whose favor it is drawn may have recourse against the drawer and indorser, it is necessary that notice of the dishonor shall be given to these parties without unreasonable delay.

Disinfec'tion [from the Lat. *dis*, "un," and *inficio*, *infectum*, to "stain," to "taint," to "poison"] is the destruction or removal of the causes of disease present in any locality or material. It may be applied therefore to the atmosphere, to sewage or other liquid or solid filth, to ships, houses, clothing, merchandise, etc. Cologne-water and other merely odorous substances, while they may disguise foulness of the air, do not really disinfect. The power of the substances commonly used for this purpose has been overrated; they seldom destroy the contagious or infectious materials which produce diseases, yet they often do good by removing the conditions which favor their increase and dissemination. Cheapest among disinfectants are dry earth, lime, charcoal, and tar; and they are all positively useful. Earth immediately destroys the odor of excrement covered by it, and prevents unwholesome emanations. The same is true also of lime. Charcoal is a very powerful absorbent of gases and purifier of liquid and semi-liquid substances. Common wood-tar has similar properties to a less degree, but its partial volatility enables it to act more favorably upon an impure atmosphere. Chlorine is probably equal to any other substance in destroying in the air morbific materials of organic origin. It is usually employed as it is given off from chloride of lime (bleaching-powder) or chloride of soda solution (Labarraque's liquid). Chloride of zinc, dissolved in water (Burnett's liquid), and proto- or sesquichloride of iron are serviceable for the disinfection of privies, sewers, etc. Solution of nitrate of lead (Ledoyen's liquid), by the affinity of lead for sulphur, decomposes sulphuretted hydrogen, the most common noxious ingredient in foul atmospheres. Protosulphate of iron is much used for the disinfection of sewage and of privies. Permanganate of potassa (Condy's liquid) as an oxidizing agent has analogous utility, but is more expensive. The crude permanganate will answer very well for this purpose. Sulphurous acid and nitrous or hyponitric acid, both gaseous, are available for the fumigation of unoccupied rooms; they are irrespirable. Iodine (solid) and bromine (liquid) have both been found practically similar, and perhaps equal, to chlorine for the disinfection of wards of hospitals. Carbolic acid (phenic acid or carbol) has of late years been the most popular of all disinfectants. It is obtained, along with cresylic acid, in the distillation of coal-tar. More than any other of the substances named, it is believed to have the power of destroying minute living vegetable and animal organisms in the air or elsewhere. Ozone is asserted by some experimenters to be a valuable disinfectant, but it has not yet been much employed for that purpose. Chloralum (chloride of aluminum) and bromochloralum have been recently introduced, and are under trial, with somewhat conflicting reports concerning their value.

The modes of action of the above-named disinfectant substances may be classified as follows: 1. By absorbing gases and preventing their emanation—dry earth, lime, charcoal. 2. Neutralizing sulphuretted hydrogen gas—nitrate of lead. 3. Decomposing sulphuretted hydrogen and dead organic matter—chlorine (by its affinity for hydrogen, setting oxygen free), iodine, bromine, permanganate of potassa. 4. Arresting decay and putrefaction (*i. e.* by antiseptic action) in vegetable and animal materials—sulphurous and hyponitric acid gases, chloride of zinc, protosulphate, protochloride, and sesquichloride of iron, wood-tar, coal-tar, carbolic acid (by its affinity for water, and by combining with and fixing albumen and similar principles). 5. Destroying minute organisms, vegetable or animal (disease-germs), in the atmosphere—carbolic acid; *perhaps* chlorine, iodine, and bromine.

Quantities of disinfectants for use may be thus stated. For privies or sewers, a pound of sulphate or chloride of iron or chloride of lime, diffused in a gallon of water, will answer for a very large amount of foul material. Burnett's liquid contains twenty-five grains of chloride of zinc in each fluiddrachm of water. A pint of this in a gallon of water will be strong enough for use. For water-closets or bed-pans, Labarraque's solution of chloride of soda, a fluid-ounce in a quart of water; or permanganate of potassa, ten grains to a quart of water; or carbolic acid, twenty grains to a pint. A 70-per-cent. solution of this last substance is often used also. Drinking-water is best purified by filtration through charcoal, but it may be improved, when containing an excess of organic matter, by a small amount of permanganate of potassa, enough to make it very slightly pink in color in a strong light. Articles of clothing may be disinfected by boiling them in a solution of the permanganate, an ounce to three gallons of water. Greatly contaminated garments or bedding, as from smallpox patients, should be burned. Occupied rooms may be disinfected by fresh chloride of lime, placed about in saucers in convenient places to give off chlorine.

Ledoyen's liquid is made by dissolving a pound of litharge in seven ounces of nitric acid and two gallons of water. Ridgewood's disinfectant consists principally of carbolic acid, lime, and fuller's earth. McDougall's (much used in England and India) contains the sulphites of magnesia and lime and carbolate of lime.

But the most effective, indeed the only certain, disinfectant agencies are *cold* and *heat*. Malaria (the local cause of ague and remittent fever) is disarmed of its noxious power by a single hard frost; and the same is true of the infection of yellow fever. Cholera disappears almost always in temperate climates with the approach of winter. The continuance, and even increase, of smallpox, typhus, and some other contagious diseases during cold weather is due to the closing up of houses to keep them warm, thus diminishing ventilation and concentrating the morbid poison. Yet no considerable use can be practically made of the disinfectant action of low temperature, on account of the difficulty of producing it at will on a sufficiently large scale.

Heat was known by the ancients to exert an influence antagonistic to infection. Fires were in early times burned in the streets of cities to dissipate the plague. Pliny wrote, "Est in ipsis ignibus medica vis"—"There is in fire itself a medicating power." Yet only latterly has this been clearly verified by science. Dr. Henry of Manchester, England, in 1824, performed a series of experiments, by which he proved that the contagious property of smallpox and of vaccine virus, and that of typhus and scarlet fever, are destroyed by a temperature of from 140° to 200° F., and that such a heat does not injure such fabrics as are commonly used for clothing. In 1851, Dr. von Busch of Berlin made a trial of this agent in a large lying-in hospital, in the wards of which puerperal fever had been very destructive. After all ordinary methods of fumigation and disinfection had failed to eradicate the disease, he had all the patients removed and the wards heated by stoves, for two days, up to the temperature of 150° F. The same class of patients being then reintroduced, not a single case of the fever followed. Dr. W. Ferguson, inspector-general of the British navy, and Dr. A. N. Bell of Brooklyn, N. Y., have reported equally satisfactory success in extirpating yellow fever from large vessels at sea or in port. Dr. Bell and Dr. E. Harris of New York also made use of superheated steam as a disinfectant, with good effect, in New York City during the cholera season of 1866. It is probably one of the most efficacious of all the means yet employed for this purpose.

HENRY HARTSHORNE.

Disintegra'tion [from the Lat. *dis*, negative, and *integer*, "entire"], the separation of the integrant particles of a body; the destruction of cohesion; in geology, the gradual wearing away of a rock by ordinary atmospheric action, etc.; the process by which a solid rock is reduced and comminuted to sand, gravel, or soil. Soil or arable land is formed and prepared by the disintegration of rocks. The action of the weather is helped by frequent alternations of temperature above and below the point at which water attains its greatest density—*i. e.* 39° F.

Disk, or Disc [from the Lat. *discus* (Gr. δίσκος), a "disk" or "quoit"], in astronomy, the face of the sun, moon, or a planet, such as it appears to us projected on the sky. The forms of the celestial bodies being nearly spherical, their projections are circular planes. The fixed stars, when viewed through a telescope, present *spurious disks*, in consequence of the diffraction of light.

DISK, or DISC, in botany, is a fleshy expansion of the receptacle of the flower; a part of the receptacle, or a growth from it enlarged under and around the pistil; also the central part of a head of flowers of the order Compositæ, as the *Coreopsis*.

Disloca'tion [from the Lat. *dis*, "apart," and *loco*, *locatum*, to "place"], otherwise called **Luxa'tion** [from the Lat. *luxo*, *luxatum*, to "loosen"], in surgery, is the displacement of a bone from its proper relation to another bone with which it is articulated. A "complicated" dislocation is the displacement of a bone, accompanied by a severe local lesion of the soft parts, or fracture of a bone.

"Congenital" dislocations are those which occur before birth. The restitution of a dislocated bone is called its "reduction." Reduction of recent luxations is usually a comparatively easy task to those who have the requisite knowledge and experience, but in old and long-neglected cases it is frequently a most formidable operation, and is liable to be followed by bad consequences to the patient.

REVISED BY WILLARD PARKER.

Dis'mal, a post-township of Sampson co., N. C. Pop. 746.

Dismal Swamp, a great morass in the counties of Nansemond and Norfolk in Virginia, and in Gates, Camden, and Pasquotank counties in North Carolina, is about 30 miles long and 10 miles wide. A large portion of it is covered with dense forests of juniper, cypress, white cedar, and gum trees, from which lumber is exported. Near the middle of the swamp is Lake Drummond, which has an area of about 6 square miles, and abounds with fish. A canal through the Dismal Swamp opens steam communication between Chesapeake Bay and Albemarle Sound. The Dismal Swamp is remarkable for its considerable elevation above the surrounding country. The water of this swamp, known as "juniper water," is of a dark reddish color, and is carried in large quantities to Norfolk and Hampton Roads for shipping purposes. It is highly prized for its excellent quality, and is not liable to become corrupt by keeping.

Dis'part [etymology uncertain], in gunnery, half the difference between the diameter of the base-ring at the breech of a gun and that of the swell of the muzzle.

Dispen'sary [from the Lat. *dispendo, dispensum,* to "distribute" (from *dis,* "apart," and *pendo,* to "weigh")], a charitable institution in which medical and surgical aid is gratuitously furnished to the poor. During the Middle Ages dispensaries were set up in the houses of the wealthy and in monasteries, and towards the end of the eighteenth century were established in their present form. They now are established in most or all large cities. The oldest in the U. S. was founded in 1795 in New York. The poor receive treatment and medicine in them free of charge.

Dispensa'tion [Lat. *dispensatio,* perhaps from *dis,* "apart," and *penso,* to "judge," frequentative of *pendo,* to "weigh"], in the Roman Catholic Church, is an exemption from some canon or other law. Bishops and priests grant dispensations in some cases, but the pope alone has the power of giving them in the more important ones. Papal dispensations were first granted in 1200 by Innocent III. After the English Reformation the dispensing power was assumed by the kings, but it was abolished by the Bill of Rights (1689). (See PARDON.)

Dispen'satory [for etymology see DISPENSARY], a book containing an account of the physical qualities and medicinal powers of different drugs, with their natural and commercial history, and their preparation and combinations. One of the most complete works of the kind is the "United States Dispensatory," by Wood and Bache (1833; 13th ed. 1870).

Disper'sion [Lat. *dispersio,* from *dis,* "apart," and *spargo, sparsum,* to "scatter"], in optics, is the angular separation of the constituent rays of light when decomposed by the prism. Owing to the unequal refrangibility of the rays of different colors, a beam of light admitted through a small aperture in the shutter of a darkened room, and refracted by passing through a prism, forms an elongated image or spectrum; the red rays, which are the least refracted, occupying one end of the spectrum, and the violet rays, which have the greatest refraction, the other end. The rays after refraction are no longer parallel, so that the index of refraction (the ratio of the sine of incidence to the sine of refraction) is different for each ray; and the difference of the indices for the extreme rays is called the dispersion of the light. It had been supposed by Sir Isaac Newton that the dispersion was proportioned to the refraction, but it was soon found that although the colors in spectra formed by prisms of different substances are always arranged in the same order, they do not occupy the same relative amount of space; a prism of flint-glass giving, in proportion, less red and more violet than a prism of crown-glass, and that substances for which the index of refraction of the middle ray of the spectrum is nearly the same, produce spectra of different lengths. F. A. P. BARNARD.

Disposi''tion [Lat. *dispositio,* from *dispono, dispositum,* to "dispose," to "put in order," to "arrange"], in architecture, one of the six essentials of the art. It is the arrangement of the whole design by means of the ichnography (plan), orthography (section and elevation), and scenography (perspective view), and differs from *distribution,* which signifies the particular arrangement of the internal parts of a building.

DISPOSITION, a musical term employed in organ-building, and referring to the combination and arrangement of the stops on the rows of keys and pedals, with the pitch of each stop or length of the lowest CC pipe.

Disra'eli (Rt. Hon. BENJAMIN), D. C. L., an eminent English statesman and novelist of Jewish extraction, was born in London Dec. 21, 1805. He published novels entitled "Vivian Grey" (1826), "The Young Duke" (1830), "Contarini Fleming" (1832), and "Henrietta Temple," some of which were successful. He began his political career as a radical, and offered himself as a candidate for Parliament in 1831, but was defeated. Having become a Tory, he was again repulsed by the electors of Taunton in 1835, but was elected a member of Parliament for Maidstone in 1837. His maiden speech was so pretentious, and uttered with gestures so extravagant, that he excited the laughter of the House, and closed abruptly, saying, "I shall sit down now, but the time will come when you will hear me." He married in 1839 the widow of Wyndham Lewis. Having gradually acquired skill as a debater, he became about 1842 the leader of the "Young England party" and an opponent of Sir Robert Peel, whom he denounced with unsparing invective because Peel advocated the repeal of the Corn laws. In 1844 he produced "Coningsby," a political novel, which was much admired. In 1846 he was returned to Parliament for Buckinghamshire, which he represented for many years. He succeeded Lord G. Bentinck, who died in 1848, as leader of the protectionist party in the House of Commons. He was chancellor of the exchequer in the conservative ministry of Lord Derby for nearly nine months in 1852.[1] About the end of that year he resumed the post of leader of the opposition in the House of Commons. Early in 1858 he was again appointed chancellor of the exchequer in the new conservative Derby-Disraeli ministry. In 1859 he introduced a bill for parliamentary reform, which was rejected by a majority of the House of Commons. He therefore resigned with his colleagues in June of that year. He opposed the electoral Reform bill of Russell and Gladstone, which was defeated in June, 1866. The liberal ministers then resigned, and the conservatives formed a new cabinet, in which Disraeli was chancellor of the exchequer. He also became the leader of the House of Commons, and the most prominent minister except the premier, Lord Derby. He was the principal author and manager of the Reform bill which became a law in Aug., 1867, and extended the right of suffrage to every householder in a borough. This bill enfranchised nearly a million of men, mostly workingmen, and was considered a dangerous innovation by the conservatives. Disraeli succeeded Lord Derby, who resigned the place of prime minister in Feb., 1868. He opposed the resolutions or bill which Mr. Gladstone introduced to disestablish the Irish (Episcopal) Church. After a long debate, Mr. Gladstone's resolutions were adopted by the House of Commons on the 1st of May, 1868, by a majority of 64. Disraeli, though defeated on this important question, resolved not to resign office, but to wait for the result of the general election which occurred in the next November. The liberal party having secured a large majority in the new Parliament, he and his colleagues resigned Dec. 2, 1868, and Mr. Gladstone then became prime minister. An early poetical work, entitled "A Revolutionary Epic," was republished in 1864. As Mr. Disraeli declined a seat in the House of Lords which was offered to him, his wife, in acknowledgment of her husband's official services, was raised to the peerage of the United Kingdom as Viscountess Beaconsfield, Nov. 28, 1868. Among the works published by Mr. Disraeli since his entrance on political life are (besides "Coningsby") "Sybil," "Tancred," "A Vindication of the English Constitution," "A Biography of Lord G. Bentinck," and "Lothair," a novel published in 1870. He was chosen lord rector of the University of Glasgow, 1873, and became prime minister again in 1874.

REVISED BY A. J. SCHEM.

Disraeli (ISAAC), D. C. L., an English *littérateur,* the father of the preceding, was born at Enfield in May, 1766. He studied in Amsterdam and Leyden, and spent some years in France. Inheriting a fortune from his father, a Hebrew merchant originally from Venice, and belonging to one of the Jewish families who escaped to Venice from the Inquisition in Spain in the fifteenth century, he devoted himself to the study of literary history. His principal works are "Curiosities of Literature" (1790), "Calamities of Authors" (1812), and "Amenities of Literature" (1841). Died Jan. 19, 1848.

Disrup'tion [from the Lat. *dis,* "apart," and *rumpo, ruptum,* to "break"], a term generally applied to the schism in the Church of Scotland which occurred in 1843. (See FREE CHURCH OF SCOTLAND, by DAVID INGLIS, LL.D.)

Dissen'ters [from the Lat. *dis,* "apart" (or "differ-

ently"), and *sentio*, to "think"], or **Non-Conformists,** the name given to English Protestants who differ in their views from the Church of England. After the act of Uniformity was passed (1662), about two thousand clergymen seceded, and were called Dissenters. All who refused to take the oaths of allegiance and supremacy, and the Eucharist according to the rites of the Established Church, were excluded by the Test act (1673) from government employment. By the Toleration act (1689), Dissenters obtained legal security in celebrating their worship, and the Corporation and Test Repeal act (1828) enabled them to accept public employment without taking the Eucharist. In 1836 they were first authorized to solemnize marriages in their own places of worship or at a registrar's office. The "General Body of Protestant Dissenting Ministers of the Three Denominations" is the official name of the union of the three boards of Presbyterian, Independent, and Baptist ministers resident in and about the cities of London and Westminster. This union was organized July 11, 1727, and has always taken a leading part in the struggle for the disestablishment of the Church of England. In some European countries Dissenters are called Dissidents. (See also Non-Conformists, by Rev. Beverly R. Betts.)

Dissei'zin [from *dis*, "un," and *seizin*], in law, a term signifying an unlawful ejection of one who is seized of a freehold in lands, so as to deprive him of the seizin and place it in another. The modern equivalent for this word is "adverse possession." There is also "disseizin by election," where a person chooses to consider himself disseized, though he is not so in fact, in order to avail himself of legal remedies applicable to a true disseizin. (See Seizin, by Prof. T. W. Dwight, LL.D.)

Dissep'iment [Lat. *dissepimentum*, from *dis*, "apart," and *sepio*, to "hedge," to "enclose"], a botanical term applied to the partitions that are formed in the ovary by the united sides of the cohering carpels. Sometimes dissepiments meet in the centre, and divide the ovary or fruit into cells; in other cases they are partial, and leave the ovary one-celled.

Dissidents. See Dissenters.

Dissocia'tion, or **Disassocia'tion** [*dis*, "apart," and *socius*, "a companion"], in chemistry, is applied to the investigation of the influence of heat and pressure on chemical action. The word was first introduced into chemical nomenclature by Henry St. Claire Deville, who presented a paper to the French Institute Nov. 23, 1857, "On the Dissociation or Spontaneous Decomposition of Bodies under the Influence of Heat." Deville says in this paper: "When heat acts upon any body it produces an expansion which we attribute to a force called the repulsive force of heat. By selecting a proper compound and heating it sufficiently, the distance between the molecules can be increased to such an extent that they will separate into their elementary condition. This is a spontaneous decomposition, not determined by any chemical action. I propose to call it the *dissociation* of compound bodies."

The decomposition of water by fused platinum in the celebrated experiment of Grove, performed in 1846, was attributed by Berzelius to the catalytic action of the metal; this phenomenon is now explained on the principle of dissociation. Deville repeated Graham's experiment on a large scale by pouring melted platinum into water, and obtained an explosive mixture of hydrogen and oxygen disproportionate to the theoretical quantity; from which he concluded that the molecules recombined on cooling in the water. He believes that at the temperature of melted silver, water is dissociated into its constituent elements.

The next step in the literature of the subject was the publication, Mar. 18, 1861, of a series of researches upon the influence exerted by certain porous vessels upon the composition of the gases that pass through them. Although outside of the line of his studies, yet under the advice of M. Jamin, Deville concluded to publish these researches. A porous porcelain tube was placed in the interior of a large glass tube, and each was provided with separate escape-tubes. On causing hydrogen to pass through the interior tube, and carbonic acid gas through the outer space, the two gases were found to exchange places, and an inflammable gas was given off at the end of the carbonic acid tube. It thus appeared that the hydrogen passed through the pores of the porcelain tube and was replaced by the carbonic acid. There was nothing new in this experiment, as the principle is described in Gmelin's "Chemistry" under the head of adhesion, and the subject was familiar to Priestley. Gmelin says if gas be evolved in an earthen retort or conducted through an earthen tube, a portion of it escapes through the tube, and is replaced by the external air or by nitrogen, or carbonic acid if the vessels be in a fire. He further describes an experiment made by Priestley when an earthen retort is placed under a bell-jar over mercury and heated by a burning glass. If the outer bell-jar contains hydrogen, and the retort atmospheric air and water, the hydrogen will be found to pass through the pores into the retort, and air and water will collect over the mercury under the bell-jar. This was the celebrated experiment of Dr. Priestley, made in the days of phlogiston, and is essentially the same as that described by Deville. Similar experiments were made by Pfaff in 1816, which are reported in Schweigger's "Journal," vol. xviii., page 80. But in the next paper published by Deville, Feb. 2, 1863, he carries the research further than it was done by any other philosopher, and brings it within the domain of dissociation.

The previous experiment of hydrogen and carbonic acid was repeated with steam. In a furnace fed with very compact coal, capable of producing a heat of 1100° to 1300° C., he placed two tubes; through the interior tube, made of porous clay, he forced a gentle current of steam, and through the annular space of the outer tube a stream of carbonic acid gas. A part of the vapor of water is decomposed spontaneously or dissociated in the tube of porous clay; the hydrogen is filtered through to the annular space (as in the previous experiment with carbonic acid and pure hydrogen), and the oxygen remains in the inner tube mixed with a considerable quantity of carbonic acid. Deville obtained in this way one centimètre cube of gas to one gramme of water. The separation of the oxygen is thus accomplished by physical agency. The free hydrogen at this high temperature reduces some of the carbonic acid to carbonic oxide, producing water. There is thus a loss of hydrogen in this experiment, so that the oxygen is always in excess of the quantity demanded by the formula of water. The carbonic acid also brings with it a small quantity of nitrogen of the air. The explosive gas obtained had the following composition:

	I.	II.
Oxygen	55.7	48.6
Hydrogen	24.3	13.1
Carbonic oxide	0.0	25.3
Nitrogen	20.0	13.0
	100.0	100.0

It will thus be seen that Deville was able to dissociate the oxygen and hydrogen of water, and to obtain these gases in a separate condition. His experiment indicates a method for the accomplishment of this desirable result in an economical manner. By employing the carbonic acid resulting from the fire used to generate the steam, we can conceive of a simple system of tubes that would enable us to dissociate water in a way that would yield hydrogen and oxygen for light and heat.

Deville published an account of another series of experiments Feb. 13, 1865. He conducted these upon a somewhat different plan. He had early observed that although compounds were dissociated at high temperatures, yet on cooling the elements recombined before they could be collected; it therefore became necessary for him to devise some plan to obviate this difficulty. He hit upon the following expedient: Through the centre of the system of tubes he arranged a tube for conducting a constant stream of cold water. While the outer vessel was raised to the highest temperature of the furnace, the inside was cold, and thus two surfaces were exposed to the gas—one for dissociating it, the other for condensing one of the constituents before it could recombine. In this way he succeeded in dissociating sulphurous acid at 1200° C. into sulphur and anhydrous sulphuric acid; hydrochloric acid into hydrogen and chlorine; carbonic oxide into carbon and carbonic acid: and carbonic acid into carbonic oxide. In discussing these experiments, Deville uses the phrase *tension of dissociation*, just as we have long employed the expression "tension of vapors," and he says this tension for hydrochloric acid at 1500° C. is very feeble.

In a subsequent article, Jan. 14, 1867, Deville gives a more full development of his theory of dissociation, and furnishes extended tables of the tension of dissociation for a large number of substances. He endeavors to show that it will be possible to accurately ascertain the exact point of dissociation for many bodies now only obscurely understood; and when this point is settled we shall have a new method for the decomposition of compound substances.

A Dutch physicist, Van der Kolk, published a long article in 1866, in which he tried to refute the arguments advanced by Deville in support of his theory, and also criticised many points in Deville's mathematical calculations; but as he repeated none of the experiments, and the errors in the tables were accidental, and corrected by Deville himself before the appearance of the criticism, the value of Van der Kolk's article is chiefly confined to the analysis he gives of the researches of Deville and the meaning to

be attached to the word *dissociation*. According to Van der Kolk, the new theory can be summed up as follows:

"1. From the heat of combustion of two gases and the specific heat of the compound the temperature of the flame can be calculated. The calculated temperature of the oxy-hydrogen flame is 6880° C. Deville believes, however, that the decomposition of water vapor takes place at 2500° C., and that the temperature of decomposition of all gases is below the calculated temperature of its flame.

"2. The temperature of decomposition changes according to pressure, and is in this particular analogous to the temperature of condensation of vapors.

"3. The temperature under one atmosphere for water vapor being taken $v = t$, the temperature of condensation in this case is equal to 100° C. Deville assumes that at $t°$ the vapor of water is partially decomposed into explosive gas; it is then in the condition of dissociation or state of partial decomposition.

"4. The degree of dissociation is expressed in numbers which, in analogy with the expansion of vapors, is called the tension of dissociation. There is a perfect analogy between condensation and chemical union."

Several recent writers have had recourse to Deville's theory of dissociation in explanation of the origin of rocks and the action of forces in primeval chemistry. Among these may be mentioned Fournet and the distinguished American geologist, Sterry Hunt.

Debray, in some researches on dissociation, shows that the law holds good with reference to solids formed by the direct union of a fixed and volatile body. His experiments were made upon Iceland spar heated in mercury vapor 350° C., sulphur 440° C., cadmium 860° C., zinc 1040° C.

Lamy has applied these results to the construction of a pyrometer for the measurement of high temperatures. The instrument consists of a porcelain tube glazed within and without, filled with pure carbonate of lime, closed at one end, and connected at the other with a manometer. By reading the volume of the gas in the pressure-gauge, and consulting the tables of tension, the temperature is determined.

A very full discussion of the subject of dissociation by Mène may be found in the "Revue Hebdomadaire de Chimie," vol. iii., 1871. See also the researches of Graham, Debray, Grove, Regnault, Lamy, Isambert, Frankland, and Clausius. CHARLES A. JOY.

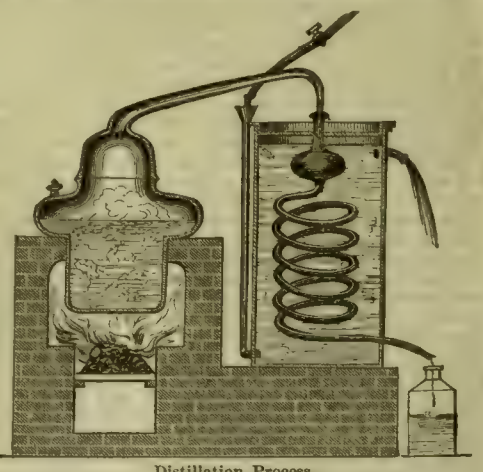
Dissolu'tion [from the Lat. *dis*, "apart," and *solvo, solutum*, to "loosen"], literally, the act or process of dissolving; the separation of any substance into its component parts; the liquefaction of a solid body in a menstruum. The term is also applied to the breaking up of a partnership or of a political or legislative assembly. Thus we speak of the dissolution of Parliament when the members are dispersed without the Parliament being regularly adjourned.

Dissol'ving Views are the enlarged images of transparent pictures thrown upon a screen by means of two magic lanterns placed side by side, with their lens tubes a little convergent, so that the projected images may be superposed. By means of mechanical contrivances, which differ in different forms of the apparatus, one of the images is gradually extinguished while the other is similarly developed. At the middle point the two are confusedly intermingled, and afterwards one seems to swallow up the other. (See MAGIC LANTERN.)

Dis'sonance [from the Lat. *dis*, negative, and *sono*, to "sound"] is the opposite of *consonance*, and is applied to those intervals in music whose relative proportions are unsatisfactory to the ear. In a special sense, the term is applied to a dissonant interval purposely introduced by the addition of a dissonant note to a concord, or by the substitution of a dissonant for a concordant note. The foundation of dissonance is generally allowed to be more æsthetical than intellectual. Dissonance is not a necessity of musical composition, and persistent dissonance would be a blemish; but its introduction transitionally, in passing from concord to concord, is a source of richer and more pleasing effects than could be produced by any succession of perfect harmonies. (See DISCORD.)

Dis'taff [Ang-Sax. *distæf*], an implement formerly used in spinning flax or wool, which was fastened on a staff from which the thread was drawn by the fingers. The Fates are represented as spinning the thread of life from the distaff. The distaff is at present not much used except in rude and barbarous countries; but no spinning-wheel, much less any machinery driven by water or steam, has ever produced work which can compare in delicacy with the finest products of the distaff.

Distance, in music, is the interval between two notes. In astronomy, "real distance" is an interval between two heavenly bodies expressed in terrestrial measures, as miles, métres, etc.; "mean distance" is a mean between the perihelion and the aphelion; "curtate distance" of a planet is the distance from the sun or earth to that point where a perpendicular let fall from the planet meets with the ecliptic. "Line of distance" in perspective is a straight line from the eye to the principal point of the plane. The "point of distance" is that point in the horizontal line which is at the same distance from the principal point as the eye is from the same. "Distance" in navigation is the number of miles from point to point in a ship's course. The arc of a rhumb line between two places is the "nautical distance." "Distance" in horse-racing is the last 250 yards of the course. Any horse not reaching the distance-post before the winning horse has reached the end of the course is said to be distanced.



Distem'per [Fr. *détrempe;* It. *tempera*], a method of painting in which the pigments are ground up with size and water, with gum-water, or similar vehicles. It is employed in scene-painting and in the preparation of wall-paper. Distemper was the ordinary method of painting in the higher departments of art before the invention of painting in oil. The rapidity with which the vehicle dries renders it difficult to blend the tints in distemper.

DISTEMPER, the name of certain diseases of animals. (See DOG DISTEMPER and HORSE DISTEMPER.)

Dis'tich [Gr. δίστιχος, from δί (for δίς), "twice" or "two," and στίχος, a "row," a "verse"], a couplet of verses. In the Greek and Latin languages this term is applied to a poetical sentence consisting of two lines in hexameter and pentameter verse. The distich was much used by the Greeks and Romans in the expression of single thoughts and sentiments, and in the composition of epigrams.

Distilla'tion [Lat. *destillare*, from *de*, "down," and *stillo, stillatum*, to "drip"], in chemistry and the arts, a process by which substances which are vaporized at different temperatures are separated from each other, or substances which can be vaporized are separated from those which cannot. When the vaporized substance assumes a solid form after distillation, the process is called "sublimation." Distillation is usually performed by means of a boiler for raising the vapor, and a condenser for reducing the vapor to a liquid or solid form. The condenser is often a spiral tube or "worm," which is kept cool by water while in use. Various instruments for distilling are used in the laboratory of the chemist. "Dry" or "destructive" distillation is the production of new compounds by submitting substances of organic origin to a high but carefully regulated heat. These products are often complex, but sometimes perfectly definite. "Fractional" distillation is the separation of one volatile substance from another, by keeping the mixture at that temperature at which the most volatile will pass over into the condenser.

To produce spirits two distinct operations are required: one to convert vegetable principles into alcohol; the other the separating of the alcohol from the several substances with which it is united while being produced. Sugar is the

Distillation Process.

principle which is necessary to the formation of alcohol, and is used *directly* when molasses and similar saccharine products are submitted to quick fermentation; and *indirectly* when sugar is produced from the starch which certain grains contain, and afterwards converted into alcohol. The latter method is commonly employed in distilleries, and grains of various kinds, generally with some malt, are *mashed*. To accomplish this, a mixture is made of the ground grain and crushed malt, and infusion made in hot

water, constantly shaken, in the mash-tun, after which the wort is run off and water added until the soluble matter of the grain is extracted. While in process of mashing, sugar is formed from the starch, and changes into alcohol while fermenting; the mash gradually becomes thinner in consequence, and as soon as the proper state is reached, which the hydrometer determines, in order to prevent acetic fermentation it should be distilled.

Much skill and care in mashing, fermentation, and distilling is necessary to the successful production of the greatest possible amount of alcohol from a given quantity of grain, fruit, or other raw material. According to Hermstadt, about 51 pounds of alcohol and 49 of carbonic acid may be obtained from 100 pounds of sugar: 100 pounds of starch yield 35 pounds of alcohol, and the same quantity of the following grains yields a spirit containing 45 per cent. of alcohol—namely, wheat, 40 to 45 pounds; rye, 36 to 42; barley, 40; oats, 36; buckwheat, 40; maize, 40.

REVISED BY CHARLES W. GREENE.

Distilled Water (*aqua destillata*) is the condensed product obtained by the distillation of water, which separates from it all saline matter and impurities, and also most of the air which it had previously contained. On this account it is flat and vapid to the taste. It is much used in chemical and pharmaceutical operations. In some points on the Gulf Coast of the U. S., as at Brazos Santiago, Tex., where streams are unknown and springs scarcely exist, water is procured for drinking and other economical purposes by distillation from the sea. On some sea-going steamers the product of the condensers of the low-pressure engines is utilized for cooking, washing, etc., and is used for drinking to some extent.

Distillery, an establishment fitted up with the necessary apparatus for the distillation of spirits. (See DISTILLATION.)

Distress', or Distrain', in English law, is the taking of a personal chattel without process of law out of the possession of a wrong-doer, by way of pledge for redress of an injury or for the performance of a duty, as for non-payment of rent or taxes, etc.

Distribution of Species. See GEOGRAPHICAL DISTRIBUTION OF SPECIES.

Dis'trict, a township of Berks co., Pa. Pop. 724.

Dis'trict [from the Lat. *distringo, districtum,* to "bind;" also to "divide"], a territorial division; a defined portion of a state or city, which is divided into districts for judicial, fiscal, or elective purposes. In the U. S. each State is divided into Congressional districts, which are nearly equal in population, and elect each one member of Congress. Every State is also divided into senatorial districts, each of which sends a member to the senate of that State. Townships in many parts of the U. S. are divided into school districts, each of which maintains and manages one or more public schools. There are also military and other districts.

District Attorneys of the United States. The name of these officers does not indicate their duties or the extent of their official jurisdiction. Formerly, in England, and now in some of the American States, a district of country embracing several counties was assigned to a judge, in which he held criminal courts called Oyer and Terminer—to "hear and determine." An attorney to represent the Crown or State was necessary to enter upon trials. As he was selected to proceed through the whole district, he received the appellation of "district attorney." In the Federal courts, and in many of the States, the duties of this officer have become local, confined to a particular county or place of holding a single court. But the name of the officer continues the same as formerly, when there was reason for its application to him. District attorneys represent the U. S. in all their business in the circuit and district courts, both civil and criminal. In civil suits they stand in the same relation to the government that other attorneys do to their clients. They also represent the U. S. in the prosecution of all crimes and misdemeanors. This office is one largely sought for by lawyers. The position is considered highly respectable, and is often exceedingly profitable. The district attorneys receive a nominal salary of two hundred dollars, and the residue of their compensation is mainly derived from fees prescribed by an act of Congress. When they defend officers and others at the instance of the government, their remuneration is not regulated by law, but depends upon agreement. The district attorneys are required by law to report to the attorney-general an account of their official proceedings, and the state and condition of their offices, at such time and in such manner as he may direct. (See "Federal Government," by R. H. GILLET.)

District Courts of the United States. See COURTS, by GEORGE CHASE, LL.B.

District of Columbia, a tract of territory lying on the Potomac River, about 300 miles from the ocean by that river and the Chesapeake Bay, between the parallels of 38° 51′ and 39° N. lat., and the meridians of 76° 58′ and 77° 06′ of W. lon. from Greenwich. The exact latitude and longitude of the "Observatory," which is our national prime meridian, is lat. 38° 53′ 39″ 25‴ N., and lon. 77° 2′ 48″ W. from Greenwich. It is bounded N., N. W., E., and S. E. by Maryland, and W. and S. W. by the Potomac River. Its present area is 64 square miles. Originally its area was 100 miles, consisting of a square tract lying on both sides of the Potomac, and measuring ten miles on each side. The portion E. of the Potomac, containing 64 square miles, was ceded to the general government by the State of Maryland, and that W. of the river, containing 36 square miles, by the State of Virginia in 1788–89, was accepted in 1790, and since 1800 has been used as the seat of government of the U. S. In 1846 a desire having been expressed, both by the inhabitants of the portion of the District W. of the Potomac and the State of Virginia, that that portion (which included the city of Alexandria) should be retroceded to Virginia, a resolution was passed in Congress July 9, 1846, consenting to the retrocession, upon condition of the approval of the citizens residing in that part of the District. On the 1st and 2d of September of the same year a vote was taken, and the retrocession was desired by a vote of 763 in its favor, and 222 against it. The President issued his proclamation ratifying the transfer Sept. 7, 1846. The present District therefore includes only the territory originally ceded by Maryland. This territory is about 10 miles long from N. W. to S. E., and forms the county of Washington, containing the two cities of Washington and Georgetown, and a tract of about 37 or 38 square miles outside of the cities. The surface is rolling and diversified, some of the hills being 200 or 300 feet in height. The sites of Columbian University and the University of Georgetown are both considerably elevated, and the Capitol and the President's Mansion are on high land overlooking the other portions of the city of Washington. The soil is a light, rather sandy, but tolerably fertile loam, easily tilled. The District is well watered. The Potomac, which washes its western and south-western borders, is navigable for the largest class of vessels as far as Greenleaf's Point, the southern extremity of the city of Washington, and for smaller vessels to Georgetown. Tidewater ceases at Little Falls, 3 miles above Georgetown. The Eastern Branch of the Potomac, called also Anacostia Creek or River, is a large and navigable stream for vessels of large draught as far as the navy-yard, and for coasting-vessels nearly to Bladensburg, and forms the S. E. boundary of the city of Washington. It has the U. S. navy-yard on its banks. There are nine or ten small creeks falling into the Potomac within the limits of the District, one of them, Rock Creek, though not navigable, being a considerable stream. The whole of the present territory of the District belongs, so far as superficial rocks are concerned, to that extensive cretaceous formation which extends in a belt from five to fifteen miles in width from Staten Island to Fort Washington opposite Alexandria, Va. Through West New Jersey, Northern Delaware, and Central Maryland, as well as in the District, it is characterized by large deposits of marl, and forms the basis of a soil which furnishes the means of its own renewal. It is underlaid by gneiss, the trend of which is nearly E. and W., and which comes to the surface, across the Potomac, in that part of Virginia which originally appertained to it. A considerable portion of the District is covered, above the cretaceous rocks, by drift, consisting of sandstone, limestone, jasper rocks, quartz in boulders, pebbles, gravel, sand, clay, and loam. The mixture of clay and loam abounds in a peculiar state of aggregation, as if it had been at first separate, and then conglomerated in masses of considerable size. Some of this conglomerate, having, however, a large mixture of pebbles and jasper rock, has been taken from the bed of the Potomac and cut and polished for use in pillars for the interior of the Capitol, for which purpose it is regarded as superior to breccia. The simpler forms of the conglomerate are well adapted to brickmaking. The minerals are those usually occurring in cretaceous deposits, and possess little special interest. Gold has been discovered in small quantities at the Great Falls of the Potomac.

Zoology.—In so limited and, for the most part, densely populated a tract as the District of Columbia it is not to be expected that there should be any great number of wild animals. The fauna of the district is generally identical with that of Maryland and Eastern Virginia. There are a few deer, and foxes of two species, the red and gray; rabbits, field-mice, muskrats, and squirrels are abundant. The otter, though now rare, is occasionally met with along the Potomac. The skunk, secure in his powers of offence and defence, is sufficiently plentiful, while the raccoon and opos-

sum, the mink, a species of weasel said to be identical with the English stoat or ermine, though not assuming the white coat, five species of squirrel, the wood-chuck, four species of wild rat, three of shrew-mice, the jumping mouse, two species of long-tailed wild mice, six species of bats, the common and star-nosed mole, make up the quadrupeds of the District. Of birds there have been 236 species collected within the District. There are included in these the numerous swimmers and waders which frequent Chesapeake Bay and the adjacent rivers, as well as the great variety of song-birds which abounds throughout the Middle States. Of the reptiles, 52 species have been collected, though some of them are very rare. Among these there are nine species of turtles and terrapin, three species of true lizards, twenty-one species of serpents, of which only the copper-head (*Ancistrodon contortrix*) is venomous, nine species of frogs and toads, and ten species of salamanders or water-lizards. The following fish are brought into market from the Potomac within the bounds of the District: Shad and herring (the Potomac herring is regarded as greatly superior to all others, and is taken in immense quantities), cat-fish, chub, eel, gar-fish, white and yellow perch, pike, rock-fish, sturgeon (of enormous size), sun-fish, suckers, and black and other bass.

Vegetation.—There are fifteen species of oak, of which the scrub or bear oak, the laurel oak, and Bartram's oak are the most common. The other forest trees are the chestnut, two or three species of hickory, black walnut, butternut, yellow pine, and, less abundant, the American elm, linden, and rarely the tulip tree and red maple. On the old fields the dwarf pine, Virginia cedar, and sassafras grow where other vegetation fails. Most of the forest trees are of the second or third growth.

Climate.—The temperature of the District has a wide annual range—from 105° F. (in the shade) to −12° F. But these are extremes rarely reached. The mean temperature of January, the coldest month, is about 32°, and of July, the warmest, about 77°. The mean temperature of the year is about 56°. The worst feature of the climate is one common to a large section of the Middle States—the sudden falling of the temperature to the extent of thirty degrees or more in the course of a few hours. These sudden changes come oftenest in winter, and are usually accompanied with a N. W. wind. The low grounds in the river-bottom are decidedly miasmatic, and bilious and remittent fevers and bilious pneumonia are very prevalent at that season. Of late years the winters have been much more moderate than they were in the early history of the District. The river is usually closed by ice in the early part of January, but of late years there has been no crossing of heavy teams on the ice, as was the case forty to sixty years ago. The prevailing wind in winter is from the W. or N. W., and in summer from the S. The average annual fall of rain is forty inches, the larger portion falling in the summer months. The range of the barometer is nearly or quite two inches. Storms seldom last so long as twenty-four hours, and foul weather usually commences about 4 A. M. or 3 P. M.

Agricultural Products.—The area of the District comprises 40,960 acres, but of this a considerable portion is water, and the cities of Washington and Georgetown occupy nearly 8000 acres. There were in 1870 only 11,677 acres reported as farms in the District (the market-gardens do not seem to have been reported); of these, 3411 were either woodland or other unimproved lands. The whole number of farms was 209, ranging from 3 acres to 100 or more. The value of the farms was stated at $3,800,230, an average of about $325 to the acre. The value of farming implements, etc. was $39,450; wages paid, $124,338; value of farming products for the year, $319,517; produce of market-gardens, $112,034; of orchard products, $6781. The staple products were—40 bushels of peas and beans; 27,367 bushels of Irish potatoes (*Solanum tuberosum*) and 5790 bushels of sweet potatoes (*Batatas edulis*); 900 gallons of wine; 4495 pounds of butter; 126,077 gallons of milk sold; 2019 tons of hay.

Manufactures.—According to the census of 1870 there were in the District 952 manufacturing establishments, the motive-power of which was 54 steam-engines of 789 horse-power and 15 water-wheels of 1100 horse-power. These establishments employed 4685 hands—viz. 4333 men, 216 women, and 136 children. The capital invested was estimated at $5,021,925; the wages annually paid at $2,007,600; the raw material used at $4,754,883; the annual product at $9,292,173. The manufacture of largest aggregate amount was of flour and grist-mill products (the flouring-mills of Georgetown having a national reputation); there are nine of these mills, and their annual product is reported at $1,543,576. Next to this is carpentering and building, in which 68 establishments, employing 506 men, report an annual product of $1,195,728; printing and publishing produced $688,605; bread, crackers, etc., $550,943; the manufacture of gas (two establishments), $550,760; men's clothing, $442,020; boots and shoes, $291,136; tin, copper, and sheet-iron ware (44 establishments), $246,157; plumbing and gas-fitting, $177,155; painting and paper-hanging, $245,305; brick, $257,800; lumber, $207,000; liquors, $168,950; marble and stone-work, including monuments, $241,050; carriages and wagons, $248,897; leather, tanning and dressing, $146,475; iron and iron castings, $146,695; blacksmithing, $151,258; masonry, brick and stone, $128,730; confectionery, $112,664; butchering and meat products, $124,372; sash, doors, and blinds, $109,000.

Railroads.—The territory of the District is so small that there is little room for railroad extension. It has, however, two lines of railway connecting it with Baltimore; a metropolitan branch railway, extending to Rockville; a line extending across the Potomac, and there connecting with the Washington and Ohio, the Orange and Alexandria, and other Southern R. Rs.; and several street railways. The entire length of railway track in the District is probably not far from 42 miles, of which all except the metropolitan and street railways is controlled by companies outside of the District.

Finances.—The valuation of real estate (except that of the U. S.) in the District for the year 1873 is $95,500,000. The real estate belonging to the government in the District is estimated at $104,500,000. There is no valuation of personal property by the District authorities. The "true" valuation reported by the U. S. marshal in 1870, of real and personal estate, was $126,373,618. The bonded debt of the District Nov. 1, 1873, was $9,902,251.18. How much floating debt there was aside from this at that date does not appear. The income from taxes (2 per cent.) for the year ending June 30, 1874, was estimated at $1,910,000; from other sources, $300,000; total, $2,210,000; the estimated expenditure, $2,224,907.46. To meet this excess there were arrears of taxes from previous years amounting in all to several hundred thousand dollars. Large sums had been expended by the board of city works in grading, paving, sewering, and improving the broad streets of the city of Washington, as well as in building drives and boulevards into the adjacent country, and the debt created for these purposes was large for the amount of property subject to taxation. The U. S. government has, however, made very liberal grants in aid of the District, as indeed it was in duty bound to do, from the large amount of government property in the District. The internal revenue receipts from the District for the year ending June 30, 1873, were $133,424.58.

Commerce.—Georgetown has a considerable coasting-trade, which has been steadily maintained for nearly eighty years. The city is a port of entry, and includes in its territory the whole District of Columbia. The imports at the port for the year ending June 30, 1873, were $18,867, and the exports $10,688. The amount of coastwise tonnage entered at the port in the year ending June 30, 1871, was 280 vessels (184 steam and 27 sailing). Their aggregate tonnage was 104,858 tons, and the crews numbered 3662 men and boys. The clearances for the same year were 158 (84 steam and 74 sailing) vessels, having an aggregate tonnage of 66,359 tons, and crews numbering 2219 men and boys. The monthly returns for 1873 indicate about the same number of vessels, etc.

Banks.—There were in 1871 six national banks in the District, but of that number two have since failed, and one has gone into liquidation. The capital of the remaining national banks is $650,000. There are two other banks of discount and deposit—the Farmers' and Mechanics' Bank of Georgetown, capital $300,000, and the Washington Bank, with $279,000 capital. There are also two savings banks—the Washington City Savings Bank and the Freedmen's Savings and Trust Company. There are also six or eight large private banking-houses.

Insurance.—There were July 1, 1873, seven fire insurance companies in the District, having an aggregate capital of $900,000, and assets reported at $2,265,000. There was one life insurance company—the National Life Insurance Company of the United States, capital $1,000,000, reported assets $2,563,912.

Population.—The population of the District in 1800 was 14,093; in 1810, 15,471; in 1820, 23,841; in 1830, 30,261; in 1840, 33,745; in 1850, 51,687; in 1860, 75,080; in 1867, the census of the educational department, 126,990; in 1870, 131,700; estimated population in Nov., 1873, 163,000. Of the population in 1870, 115,446 were natives of the country, 16,254 foreign born, 34,106 had one or both parents foreigners, 29,183 had both parents foreigners. Of the native population 72,107 were whites and 43,325 colored; of the entire population, 62,192 were males, 69,508 females; of the native population, 54,159 were males and 61,287 females; of the white population, 42,980 were males and

45,298 females; of the colored population, 19,197 were males and 24,207 females. There were 3 Chinese and 15 Indians among the inhabitants. Of the total male population, 26,824 were of military age—*i. e.* between eighteen and forty-five years; 33,329 were twenty-one years and upwards, of whom 31,622 were citizens. Of the entire population, 16,954 males and 18,615 females were of school age, or between five and eighteen years. The District in 1870 had 78 blind persons (43 males and 35 females), 134 deaf-mutes (92 males and 42 females), 479 insane persons (341 males and 138 females), and 50 idiotic persons (38 males and 12 females). It should be remarked in relation to the deaf-mutes and the insane, that there is a national institute and college for the former, and a national asylum for the latter, and to both large numbers are admitted who do not belong in the District. The area of the District is so small, and so much of it is covered by cities, that the density of the population is eleven times greater than that of any of the States or Territories. In the census of 1870 it is stated at 2057.81 per square mile.

Education.—Of the 35,569 children of school age in the District in 1870, only 19,941 were reported as attending school. Of these, 5122 were colored and 14,819 whites; 22,845 persons of ten years old and over could not read, and 28,719 could not write. The report of the commissioner of education for 1872 gives the following statistics of education for the year ending Aug. 31, 1872; school population (by the laws of the District between six and seventeen years), 31,671; pupils enrolled in 1872, 15,555; pupils in private schools, 5882; making in all 21,437 under instruction; 14,063 seats provided in the public schools; 263 teachers; amount of school-tax and other income for public schools in 1872, $355,640.07; total payments for public school purposes in 1872, $479,995.94; value of public school property, $951,700. The colored public schools of Washington and Georgetown are remarkably well conducted. There are nine school-houses, several of them very elegant and commodious buildings; 4661 children are enrolled, full one half of the school population; the average attendance is 3261; there are 4259 sittings in the school-houses, and in all 75 schools for the colored children; 84 teachers, all females, and the average salaries of the teachers $756 per year. The number of private schools in Washington and Georgetown in 1872 was 122, with an attendance of 6217. The colleges, etc. are—the Georgetown College or University, situated on the heights of Georgetown, founded in 1789, under the control of the Jesuits, having classical, law, and medical departments. The classical department has 21 professors and 179 students; the medical department has 10 instructors and 62 students; and the law department, 4 professors and 46 students. The library contains 22,000 volumes. It is liberally endowed. Columbian University, formerly Columbian College, on the heights overlooking Washington, established in 1814 and opened for students in 1822, has three departments, academic, medical, and law, and through the liberality of W. W. Corcoran, Esq., and other friends of the university, is now organizing scientific and art departments, for which the capital affords extraordinary advantages. It has 8 professors and 120 students in the academic department, 3 professors and 150 students in the law school, and 8 or 10 professors and 53 students in the medical school. Its library contains about 8000 volumes, and the students have access to the Library of Congress, the largest in the U. S., as well as to other local libraries. Howard University, incorporated in 1867, and intended to have preparatory, normal, academic, theological, medical, law, and agricultural departments, was founded mainly for colored men, though there is no restriction of race or sex in its act of incorporation. It has now in operation a normal school with 180 students, a preparatory with 60, and another with 30 pupils; a collegiate department with 32 students, a law department with 71, a commercial with 30, a medical with 37, and a theological with 26 students. There are 22 professors. The university is insufficiently endowed. It has a library of about 7000 volumes. The National Deaf-Mute College, in connection with the Columbia Institution for the Deaf and Dumb, is the only college for deaf-mutes in the world. It has 8 professors and 66 students. The course does not differ materially from that in other colleges. Gonzaga College is an institution in Washington under the direction of the Jesuit Fathers, and, though possessing a college charter, is rather a collegiate school than a college. It has 7 instructors and about 150 students. Wayland Seminary, a collegiate, theological, and normal institute for the training of freedmen as teachers and preachers, is under the control of the Baptists, and has 3 instructors and 85 students. There are besides these a business college with 160 students, the law college of the (projected) National University, with 3 professors and about 70 students, and a National College of Pharmacy, recently organized. There are also the Smithsonian Institution, with its magnificent collections from the government expeditions; the museums of the several departments, agricultural, naval, medical and surgical, etc.; the Library of Congress and numerous other public libraries; the Naval Observatory, etc. etc. There are in the District 5 hospitals (including one for the insane), 8 homes and asylums for different classes, 5 orphan asylums, and 4 industrial and reform schools. There were in 1870, 127 public libraries in the District, having an aggregate of 409,936 bound volumes, and 569 private libraries, with an aggregate of 383,766 volumes. The Library of Congress alone had 266,000 volumes in 1873, besides 45,000 pamphlets. The District in 1870 had 22 newspapers, with an annual issue of 10,092,800, and a circulation of 81,400 copies. Of these, 3, with a circulation of 24,000, were dailies; 1 tri-weekly, with 2000 circulation; 12 weekly, with 41,900 circulation; 6 monthly, with 13,500 circulation; 1 quarterly, with 3000.

Churches.—In 1873 there were 84 churches in Washington, and about 120 in the District. Of these, 21 were Baptist, with 18 ordained ministers and 7410 members, 22 Sunday schools, 387 teachers, and 2954 scholars; 1 Christian, with 400 sittings and $5000 church property; 2 Congregational, with 1800 sittings and $115,000 church property (in 1873 there was but 1 Congregational church, with 1000 sittings, an average congregation of 800, church property valued at $125,000; the membership was 338; there were 16 ordained ministers, besides the pastor (one since dead), and 2 licentiates; 1187 children in Sunday schools, and annual contributions $9873). In 1870 there were 16 Episcopal parishes, with 16 church edifices, having 6680 sittings, and church property valued at $563,500 (in 1873 there were 16 parishes, 24 clergymen, and an assistant bishop, residing at Bladensburg). The district is in the Protestant Episcopal diocese of Maryland, and its statistics cannot be separated from those of the diocese. The Evangelical Association is reported in 1870 as having 1 congregation, 1 church edifice, 800 sittings, and $20,000 worth of church property. The Friends had in 1870 and in 1873, 1 Orthodox and 1 Hicksite meeting, 2 meeting-houses, about 250 sittings, and not far from $30,000 worth of meeting-house property. There were 2 Jewish synagogues in 1873, 1 claiming to be Orthodox, with about 800 sittings and $30,000 of synagogue property. There were 10 Lutheran congregations in 1870, with 10 church edifices (7 of them in Washington), 3700 sittings, and $223,000 worth of church property. In 1870 there were reported 33 Methodist churches, 36 church edifices, 20,860 sittings, and the value of the church property $815,600. This included at that time the Methodist Episcopal Church, the Methodist Episcopal Church South, and the Protestant Methodists (in 1873 there were 21 of these churches in Washington and Georgetown). The number has somewhat increased in the District, but owing to the Methodist Episcopal division of their churches into several districts, and to the different denominations which claim the name, it is impossible to say just how much. There is 1 New Jerusalem (Swedenborgian) society and 1 church edifice, with 480 sittings and $15,000 property. In 1870 there were 13 Presbyterian churches and 15 church edifices, with 9250 sittings and $405,500 of church property. The number has since increased, and there are now 11 Presbyterian churches in Washington alone, and certainly 7 or 8 in the remainder of the District. There was 1 German Reformed church in 1873, with 1 church edifice, 300 sittings, and about $10,000 of church property. In 1870 there were 11 Roman Catholic congregations and the same number of church edifices, with 9250 sittings, with $886,000 worth of church property (in 1873 there were 14 congregations and the same number of churches and chapels, 22 clergymen, besides a number of professors in Georgetown and Gonzaga Colleges). The church property has also increased in value. There is also a Second Advent church, of which there are no published statistics, and 1 Unitarian society, with 1 church edifice, having 400 sittings and $30,000 worth of church property; one Universalist society, with 1 church edifice (hired); and one Christadelphian synagogue, particulars unknown.

Constitution, Courts, etc.—The District, as such, was an unorganized territory under the sole government of Congress from its first purchase by the U. S. government to Feb., 1871. It had indeed a county organization, and the cities of Washington and Georgetown had charters for their local government; but there was no territorial government; the citizens had no vote, either in District or national affairs, and were not represented in Congress by a delegate, as even the newest and least populous Territories were. Of all the inhabitants of the U. S., the inhabitants of the Federal District, as it was called, alone had no national citizenship. A committee of Congress at each session recommended such legislation and appropria-

tions as were deemed needful for them, but this committee were not, of course, citizens of the District, nor specially interested in its growth and prosperity. As the District increased in population, and came to have more inhabitants than most of the Territories, this condition of affairs naturally induced great discontent, and in the first session of the Forty-second Congress an act was passed organizing a Territorial government for the District of Columbia. This act was approved Feb. 21, 1871. Of course, a Territorial government was the only one possible for it, as it was selected as the site of the capital of the U. S. on the distinctly avowed principle that all interference with the national government by the influence of any State should be avoided. This organic act directed that the government thus created should be known by the name of "The District of Columbia;" that it should be constituted a body corporate with the usual privileges, have a seal, and exercise all other powers of a municipal corporation not inconsistent with the Constitution and laws of the U. S. and the provisions of the organic act. The act provided that the executive power and authority in and over the District should be vested in a governor, appointed by the President of the U. S. with the advice and consent of the Senate, to serve for four years and until his successor was appointed and qualified. The governor must be a citizen of the District, and have resided there for twelve months prior to his appointment. The governor was to have power to grant pardons and respites, commission officers, take care that the laws were faithfully executed, and possess a veto power on all bills passed by the District legislature, which could only be overcome by a two-third vote of both houses, taken by yeas and nays. The secretary of the District was also to be appointed by the President, to serve for four years, and to act as governor in case of death, resignation, disability, or absence of the governor. The legislature was to consist of a council and a house of delegates; the council to consist of eleven members, of whom two should be residents of Georgetown, two of the county outside of Washington and Georgetown, and seven from the city of Washington, all to be appointed by the President by and with the advice and consent of the Senate. They were to hold office for two years, but so classified that five were appointed one year and six the next. The District was apportioned into eleven districts for the appointment of the council. The house of delegates was to consist of twenty-two members, elected by the people by districts, each delegate to be an inhabitant of the district from which he was elected. Twenty-two districts were apportioned for this purpose. The delegates hold office for one year. The sessions of the legislature were annual, and were limited to sixty days, except the first, which might be one hundred days. The portions of the county outside of the cities might be laid out in townships not exceeding three in number, and township officers, to be elected by the people, be prescribed. Suffrage was declared to be universal to all male citizens of the U. S. of twenty-one years or over, except those who were *non compos mentis*, or convicted of infamous crimes. Defaulters, bribe-takers, perjurers, or persons convicted of infamous crimes were not to be eligible to the legislature nor to any office of profit or trust. Members of the legislature were required to take a very stringent oath both as to allegiance and to their not taking any bribes or presents to influence their action. The powers of the legislature were restricted in certain directions in accordance with the Constitution of the U. S. and the peculiar situation and circumstances of the District. A system of free schools was ordered to be established.

The courts of the District remain as established by Congress before the Territorial organization. They are—a supreme court of the District of Columbia, consisting of a chief-justice and four associate justices, having general jurisdiction in law and equity, and possessing also the powers formerly exercised by the judges of the orphans' courts; and a police court, presided over by a single judge. The justices of the peace are deprived of police jurisdiction, but have authority in all civil causes where less than $100 is involved, and to bind over persons arrested for crime to the supreme court. A board of health and a board of public works were to be constituted, the members of both to be appointed by the President of the U. S. and confirmed by the Senate. Of the latter board the governor was to be *ex officio* a member. The salary of the governor to be $3000 per annum; of the secretary of the District, $2000; of the members of the legislative assembly $4 a day, and of the presiding officer of each house $8 a day; the other officers of each house to receive the same pay as members. A delegate in Congress was to be elected by the people in the same way as in the Territories, and for the same time. The members of the board of public works receive a salary of $2500 each, and of the board of health a salary of $2000 each, paid by Congress, except that the governor receives no additional salary as a member of the board of public works, and that any army officer who may be a member of said board cannot receive any increase of pay for his services.

Counties and Principal Towns.—Since the retrocession of Alexandria county and the trans-Potomac portion of the District to Virginia in 1846, there has been but one county in the District, that of Washington. Its population in 1850 was 51,687; in 1860, 75,080; in 1870, 131,700. The only towns or cities in the county of considerable size are Washington and Georgetown. The population of Washington in 1870 was 109,199; of Georgetown, 11,384; and that of the remainder of the District, 11,117.

History.—That portion of the District comprised in the present site of the city of Washington was originally a favorite camping-ground and place of council for the Indian tribes inhabiting the shores of the Potomac (or "River of Swans," as they called it) and its vicinity. Here were held also their war-dances when they were preparing for a hostile expedition against any of the adjacent tribes. Not far from 1660 an English gentleman by the name of Pope, who was somewhat eccentric, purchased a considerable tract of land here, gave to a creek which flowed through his lands the name of Tiber, which it still bears; to the adjacent hill, on which now stands the Capitol, that of Capitoline Hill, and to the whole tract the name of Rome; and amused himself by drawing a plot of a city to be built on his lands, to which he affixed the names of the streets and public places of ancient Rome. He gravely signed his letters and documents "Pope of Rome." In 1718, George Boone, an English gentleman, grandfather of the celebrated pioneer, Daniel Boone, purchased several tracts of land in Berks co., Pa., Maryland, and Virginia, and among them that part of what was afterwards the District of Columbia which Georgetown and its vicinity now occupies. Here he laid out a town, which he named after himself, Georgetown, and which had in the next eighty years attained a considerable growth. The first idea of selecting a portion of territory for the seat of government seems to have been suggested by an insult offered to Congress in 1783, while in session in Philadelphia, by a mob of mutineers which the city authorities could not break up, and which compelled Congress to adjourn to Princeton, N. J. Elbridge Gerry, afterwards Vice-President, offered a resolution that a district should be selected on the banks of the Delaware, and also at the Falls of the Potomac, near Georgetown, for the seat of government. This resolution was adopted, but afterwards repealed. It contemplated two capitals, which was thought objectionable. An attempt was subsequently made to fix upon a site at the Falls of the Delaware near Lamberton, N. J., and commissioners were appointed for the purpose, but failed, and the matter rested till Sept., 1787, when a provision was inserted in the Constitution of the U. S., drawn by the Federal Convention, authorizing the legislature of the U. S. "to provide for the establishment of a seat of government not exceeding — miles square, in which they shall have exclusive jurisdiction." This was ratified by the requisite number of States, and at the first session of Congress under the new Constitution, in 1789, the subject was earnestly debated, offers of cession of territory not exceeding ten miles square being made by Pennsylvania, Virginia, and Maryland. The "act for establishing the temporary and permanent seat of the government of the U. S.," was finally approved July 16, 1790, and provided that the seat of government should be and remain in Philadelphia from Dec., 1790, to Dec., 1800, when it should be removed to "a district of territory not exceeding ten miles square located on the river Potomac between the mouths of the Eastern Branch and Conogocheague," and three commissioners were appointed to perfect the purchase and transfer of the territory and the cession of jurisdiction, and to "provide suitable buildings for the accommodation of Congress and the President, and for the public offices of the government of the U. S." President Washington, after a careful examination of the region, issued his proclamation Jan. 24, 1791, directing the commissioners to locate a part of the district within certain described lines, and submitted to Congress certain questions in regard to the location of the remainder. By another proclamation, Mar. 30, 1791, President Washington declared the entire district located. The commissioners appointed by him subsequently (July 22, 1791) to secure the title to the soil and its proper transfer, as well as a cession of jurisdiction, were Thomas Johnson, Daniel Carroll of Maryland, and David Stewart of Virginia. The land was mostly held by eighteen or nineteen proprietors, who sold it to the government at an agreed price, reserving to themselves rights to their buildings, graveyards, timber, and wood, except where they interfered with the plan for the Federal city. The small remainder of lands, whether owned by small proprietors or minor heirs, etc., were by an act of the Maryland legislature condemned

and appraised, and sold to the government on a fair valuation. The Federal city, afterwards called Washington, was laid out from a plan furnished by Major L'Enfant, and the buildings necessary for the accommodation of Congress and the government were erected and completed before Dec., 1800. Presidents Jefferson and Madison did much to ornament and beautify it. In the summer of 1814 it was occupied by the British naval and land forces, who wantonly set fire to the Capitol, the President's House, the public offices, navy-yard, and printing-offices, destroying property to the amount of nearly $2,000,000. These were all rebuilt on a larger scale, and some of them have been since that time again reconstructed, in accordance with the demand for greater room and accommodations. In 1846 the Virginia portion of the District was retroceded to Virginia.

During the late war the city and District were for a few days in April, 1861, isolated from the North by the destruction of the railroads between Baltimore and Washington. It was more than once in some danger of capture, and was protected by strong forts and earthworks manned by large bodies of troops. There were more than twenty of these fortifications within the boundaries of the District in 1863. There were also during the war many large hospitals for the sick and wounded soldiers in the vicinity of Washington and Georgetown. Since the war the District has made rapid progress in population and wealth, and every year adds largely to its resources for intellectual and æsthetic culture.

Governors.—Since its organization in Feb., 1871, the District of Columbia has had two governors—viz. Henry D. Cooke, from 1871 to 1873, and Alexander R. Shepherd, from 1873 to 1874. Its citizens have no vote for President.

(For many interesting facts and statistics of this article, as well as for the complete account of its Territorial organization, finances, etc., we are indebted to His Excellency Gov. Shepherd, and his very thoughtful and courteous private secretary, William Tindall, Esq.)

L. P. Brockett.

District Schools. See Common Schools, by Rev. John G. Baird, Asst. Sec. Conn. State Board of Education.

Ditch, or **Fosse** [Lat. *fossa*], in fortification, a deep trench or excavation around a fort, serving as an obstacle to the enemy and supplying earth for the parapet or rampart. It is generally dry, but is sometimes filled with water. In permanent works, such as the regular fortifications of a town, the rampart and ditch are the most important; the former being inside the latter, and formed of earth excavated from it. The ditch is often 100 feet wide, and twelve feet deep below the natural level of the ground.

Dith'yramb [Lat. *dithyrambus*; Gr. διθύραμβος: etymology doubtful], a kind of lyric poem sung in honor of Bacchus. It was of a lofty but often inflated style; hence the term *dithyramb* is frequently applied to any lyric of a wild and boisterous character, such as might be supposed to be composed in a state of intoxication.

Dit'marsch, North and **South** [Ger. *Norder* and *Süder Ditmarschen*], a portion of the duchy of Holstein between the Elbe and the Eider. Area, about 500 square miles. The people of this district have preserved in a remarkable degree the peculiarities of the ancient Germans and the distinctive features of the old Teutonic character. Ditmarsch has its own code or collection of laws, adopted in 1321. Pop. in 1871, 75,193.

Dit'tany [from the Gr. δίκταμνος; Lat. *dictamnus*, so named from Mount Dicte in Crete, where it grew in abundance], a genus of plants belonging to the order Rutaceæ, with the calyx 5-partite, five petals, unequal, ten stamens, and five one to three-seeded follicular capsules. The *Dictamnus Fraxinella* (*ruber* or *albus*) is a perennial indigenous in Southern Europe, and is often cultivated in gardens. It has red or white flowers, of a powerful spicy fragrance. In the U. S. the name of dittany is given to the *Cunila Mariana*, of the order Labiatæ. It is probable that the dictamnus of the ancients was the *Origanum Dictamnus*, a labiate plant to which the old authors ascribe the most marvellous powers.

Dittee'ah, or **Duttee'ah,** a town of Hindostan, in Bundelcund, 125 miles S. E. of Agra. It is enclosed by a stone wall thirty feet high. It is the capital of a rajahship of its own name. Pop. about 50,000.

Dit'ton (Humphrey), an English mathematician, born at Salisbury May 29, 1675, was minister of a dissenting church at Tunbridge. He was befriended by Sir Isaac Newton, who procured his appointment as mathematical master of Christ's Hospital. He wrote able works entitled "Laws of Nature and Motion" (1705), a "Treatise on Fluxions" (1706), and "Synopsis Algebraica" (1709). Died Oct. 15, 1715.

Di'u, a fortified seaport of Hindostan, on the Arabian Sea, and on an island of its own name near the coast of Guzerat. It has a tolerably safe harbor, and the remains of a famous Hindoo temple. It has been possessed by the Portuguese since 1515. Area of the island, 64 square miles. Pop. in 1864, 12,303.

Diur'nal [from the Lat. *diurnus*, "daily," from *dies*, a "day"], as an adjective, is employed either to designate that which pertains to the day as opposed to the night (thus, "diurnal insects" are those which are abroad in the day, while "nocturnal" ones fly by night), or more frequently it is applied to events which occur every day of twenty-four hours. "Diurnal" is also a name sometimes given to the Roman Catholic breviary.

Divan, de-van' [Persian *dîvân* or *diwân*; Fr. *divan*; Ger. *Divan*; It. *divano*; Sp. *divan*], a word common to several Oriental languages. It is employed by the Persians to denote a collection of poems by one author, as the divân of Saadi and the divân of Hafiz. The term is also applied to a muster-roll or military day-book. The Turkish divan is the great council of the empire or supreme judicial tribunal. The word *divân* is also among the Turks a common appellation for a saloon or hall which serves for the reception of company. Along the sides of this saloon are arranged low cushioned seats or sofas; hence the name has been given in Western Europe to a kind of sofa.

Di'ver (*Colymbus*), a genus of birds belonging to the family Colymbidæ. The bill is straight, strong, and pointed, tail and wings short, and the toes webbed. They dive with great facility, and pursue the fish on which they live under the water. The principal species are the loon or great northern diver (*Colymbus glacialis*), the black-throated diver (*Colymbus arcticus*), and the red-throated diver (*Colymbus septentrionalis*).

Divergent (or **Diverging**) **Series,** in mathematics, a series in which each succeeding term is greater than the term before it. Thus, a series constructed on the formula $x^2 + 2x$, by substituting for x each of the natural numbers in their order, increasing successively, which would give 3, 8, 15, 24, 35, etc., is a diverging series.

Di'vers (in the pearl-fishery) descend through the water

Divers in the Pearl-fishery.

to the bank round which the oysters are clustered, placing their feet, to secure greater rapidity, on a stone attached to the end of a rope, the other end of which is made fast to the boat. They carry with them another rope, the extremity of which is held by two men in the boat, while to the lower part, that descends with the diver, there is fastened a net or basket. Besides these, every diver is furnished with a strong knife to detach the oysters or serve as a defensive weapon in case he should be attacked by a shark. As soon as the diver touches bottom, he gathers the oysters with all possible speed, and having filled his net or basket, he quits his hold of the rope with the stone, pulls the rope which is held by the sailors in the boat, and rapidly ascends to the surface of the sea. Sponges are obtained by a similar process. (*Johnson's Natural History*, vol. ii., p. 525.)

Divertimen'to [an Italian word signifying a "diversion"], or **Divertissement** [Fr. for the same], a kind of musical composition arranged for one or more instruments. It has generally no fixed character, and may be classed between the *étude* and the *capriccioso*. The term is also

applied to a ballet, or songs introduced between the acts of an opera.

Div'idend [Fr. *dividende*, from the Lat. *divido*, to "divide"], in arithmetic, the number or quantity given to be divided; also the sum apportioned to creditors from the realized assets of a bankrupt's estate. The term dividend is also applied to the annual or half-yearly interest on the public funds or national debt, and to the distributed profits of joint-stock companies, which are paid annually or half-yearly to each stockholder.

Divi'ders are instruments for "dividing" or marking off distances, or for drawing circles, ellipses, and other curves. They sometimes consist of two or even three bars or legs, joined at one end by a hinge. Sometimes two movable points are arranged to slide along a "beam" or straight bar. "Proportional dividers" are made of bars crossing each other and pointed at both ends. By means of a sliding joint at the point of union, dimensions included between one of the pairs of points may be made greater or less than those included between the other at the same time in any proportion.

Dividing Engine, a machine for marking the divisions of scales of measurement in scientific, mathematical, and astronomical instruments. Scales for mechanics' work were formerly divided by hand, but it is impossible to attain accurate results by such methods, while by a carefully made engine a most surprising degree of precision is reached. The engines are of various kinds. Their success depends upon the skill, patience, and mathematical knowledge of the constructor. Test-plates for the microscope have been ruled by Mr. F. Nobert of Barth, Pomerania, with divisions only $\frac{1}{240000}$ of a French inch asunder.

Di'vi-di'vi (*Cæsalpinia Coriaria*), a leguminous shrub of tropical America, is valued for its pods, which contain tannin and gallic acid. It grows to the height of twenty feet, and the pod is three inches long. It is used principally for tanning leather and dyeing cloth, and large quantities are exported from Savanilla, Rio Hache, and Maracaibo.

Divi'na Comme'dia [It.], or **Divine Comedy,** the name of one of the most remarkable productions of the human mind, a poem composed by Dante Alighieri. (See DANTE.) It is not known when or where it was composed, but from the poet's having given "the middle of the journey of his life" (*i. e.* about 1300) as the date of the opening of his story, there can be no doubt that it was written after that time, and in all probability after his banishment, which occurred in 1302. The "Divine Comedy" describes a vision in which Dante visits in succession Hell, Purgatory, and Paradise. The structure of the poem consists of three great divisions—"L'Inferno," Hell; "Il Purgatorio," Purgatory; "Il Paradiso," Paradise. The Inferno is related in thirty-four cantos, but each of the other divisions in thirty-three, so that the whole poem contains one hundred cantos in all. The poet's conception of Hell makes it a vast, irregular, funnel-shaped abyss opening directly under Mount Sion, on which stands Jerusalem, and having its apex at the centre of the earth. The sides of this pit are not smooth, but broken by terraces or platforms, each of which extends round the whole circle, and is separated from those above it and from those below it, so that entrance and exit are impossible except to those who, like the poet, are divinely guided. Owing to the funnel-like shape of the pit, these circles necessarily grow smaller and smaller as they descend. Commentators have exercised their ingenuity in calculating the width and depth of the pit, the widths of the different platforms, and the distances that separate one from the other, but no common reckoning has been arrived at. We must imagine the platforms, or "circles," as they are usually called, to be not narrow ledges or steps, but regions of vast extent, and varying greatly in character. In one the ground, or at least a part of it, is covered with fresh, green grass; in another there is no footing, but Dante and his guide look out from the edge of the abyss to where the spirits are whirled about in air dark as pitch, like troops of starlings before the wind: another circle welters in darkness and cold, with hail and mud and snow, and the earth gives out a stench; another is a marsh, in which the sinners are immersed, and through it runs a river on whose opposite bank rises the city of Dis. In other circles are rivers of blood; here is a vast plain filled with tombs like those of the cemeteries at Arles and Pola; in another is a lake of pitch, and in another a vast forest where the trees contain the souls of sinners. In one place the ground is covered with hot sand, while a continual rain of fire falls upon those who tramp wearily along; in another the plain is honeycombed with pits, into which the sinners are plunged head-foremost; and in another still they are frozen in a lake of ice.

It seems obvious that we must argue from the implied vastness of the circles to the dimensions of the whole funnel-pit of the Hell, and not, by limiting ourselves to certain measurements of the breadth and depth of the pit, run the risk of belittling the platforms themselves. Yet this is what naturally results from the measurements given by the commentators, for we are told that "the latest calculation gives 245 miles as the diameter of the abyss at its opening, which reduces the different platforms to a size comparatively small." But no one can read the poem and think of the platforms as anything but vast, and any reasoning that ends by making them small must be wrong reasoning.

Dante is conducted through the Hell and through the Purgatory by the poet Virgil (representing human wisdom), who has been sent to his aid by Beatrice (representing heavenly wisdom), she herself having been despatched to Virgil with this commission by Lucia (enlightening grace), who had been sent by a gentle lady (Divine Mercy) to the aid of Dante, lost in a dark wood in the middle of his life's journey, and terrified by the aspect of threatening wild beasts. Under Virgil's guidance he begins his memorable journey. The events we have thus hinted at occupy the first and second cantos, which are merely introductory. In the third, after passing through the gate of Hell, Dante and his guide find themselves in a region where are the souls of those who, when on the earth, lived for themselves alone. They were mixed with the angels who in the war with Satan stood for neither side—hateful to God and to his enemies. "Do not let us talk about them," said Virgil, "but look at them, and pass on." They then come to the river Acheron, over which we are to infer that Charon ferries them, since Dante says that he fell asleep after a discussion with the grim ferryman as to his right to pass over with the condemned souls, and that when he awoke he was with Virgil in the First Circle. In this First Circle, however, it is not sinners who are punished, but the whole world of the unbaptized and of those who lived before the birth of Christ. This is the Limbo into which the legends make Christ to have descended, and from which he released certain souls. The doom of these is sorrow without torment; Dante hears no lamentations, but only sighs, with which the air trembles. With the Second Circle and the fifth canto begin the true punishments of sinners, the sins deepening in guiltiness as the pit descends, and the punishment growing more intense, painful, and horrible as the circles decrease in size. All the circles, beginning with the second, are included in three great divisions, each set of circles separated from the others by wide spaces. These divisions, to name them after the sins punished in them, are I. Incontinence; II. Malice; III. Bestiality. The sinners whose punishments are included in the first of these great divisions, that of INCONTINENCE, are—1. The carnal; 2. The gluttonous; 3. The avaricious and prodigal; 4. The angry and the sullen. In the circle of the sullen are included the heretics. The second division, that of MALICE, includes—1. The violent against their neighbors; 2. The violent against themselves; 3. The violent against God, or against Nature, the daughter of God, or against Art, the daughter of Nature. The third division, of BESTIALITY, has two subdivisions. In the first are seducers, flatterers, demoniacs, soothsayers, barrators, hypocrites, thieves, evil-counsellors, schismatics, falsifiers. In the second are traitors to their kindred, traitors to their country, traitors to their friends, traitors to their lords and benefactors. (*Longfellow, "The Divine Comedy,"* vol. i., p. 170.) On reaching the bottom of the pit Satan is found, a monster with three heads and champing a sinner in each bloody mouth. These sinners are the three arch-traitors, Judas Iscariot, who betrayed his God, and Brutus and Cassius, who betrayed Rome. Satan is plunged up to his middle in the vortex of the pit, and the two poets, Virgil leading, climb down his shaggy body, holding by his fell of hair, until they reach the monster's haunches, when they turn and climb up the legs, until at length they find themselves at the foot of a gloomy cavern up whose sides they mount with difficulty, and emerge at the foot of the Mount of Purgatory, a lofty cone that rises in the exact antipodes of Mount Sion on an island in the Southern Ocean. Around it are seven terraces, on which are punished those who have committed the seven mortal sins. These are pride, envy, anger, sloth, avarice and prodigality, gluttony, and lust. From the first canto to the ninth the action is outside the entrance to Purgatory. From the ninth canto to the twenty-eighth the seven circles are described, and from the twenty-ninth to the end the Terrestrial Paradise at the summit of the Mount of Purgatory. When the poets have reached the summit of the mountain they are met by Beatrice, who has descended from Heaven for the purpose, and returning draws Dante after her. The Paradise or Heaven is founded upon the Ptolemaic system, which was the one accepted in Dante's time. Beatrice leads Dante in succession to the seven planets—namely, the Moon, Mer-

cury, Venus, the Sun, Mars, Jupiter, and Saturn. From thence they mount to the sphere of the fixed stars, then to the primum mobile, and finally to the empyrean, where, after a vision of Christ and the Virgin, the poet has a glimpse of the Creator, and the poem closes.

This is the bare skeleton of a work which holds an eternal place in the heart, the intellect, and the conscience of the world, and which numbers now more students and admirers than in any preceding time. It must be closely read and studied to be in any degree understood, and no abstract, or even analysis, of it would be of much service to a person who had not read with deliberate care the whole poem from beginning to end.

The name "Comedy" was given to the poem by Dante himself. In a letter which he wrote to Can Grande, and of which an abstract and partial translation is given by Dr. J. A. Carlyle in the introduction to his admirable prose translation of the Inferno, we find that he says: The title of this work is, "Begins the Comedy of Dante Alighieri, a Florentine by birth, but not by manners" (Incipit Comœdia Dantis Allagherii, Florentini natione, non moribus). He then gives the definition of the words Comedy and Tragedy from their supposed etymologies, and says that Tragedy "speaks in a style elate and sublime, and at the beginning is admirable and quiet—at the end or exit fetid and horrible; while Comedy begins with the asperity of a subject, and ends prosperously, and speaks in a remiss and humble style;" from which he concludes it will be easy to see why the present work is called a comedy. For if we consider the subject thereof, at the beginning it is horrible and fetid, being Hell; at the end prosperous, desirable, and grateful, being Paradise. And if we consider the style of speech, that style is remiss and humble, being the vulgar speech, in which even the women talk with one another. Wherefore it is evident why the work is called a Comedy. As for the word "Divine" prefixed to the title, it is not known just when it began to be used. The first printed edition with the title "Divina Commedia" is said to be the one printed at Venice in 1516 by Bernardino Stagnino de Monferra. Dr. Carlyle says that this edition being very scarce he has not been able to verify this assertion, but he finds the title "Divina Commedia" in the edition printed by Gabriel Giolito di Ferrarii in Venice in 1555. Whoever may be responsible for the word, it is so appropriate, both from the argument of the poem and from its beautiful style, that it can never be separated from the title.

The "Divine Comedy" exists in a great number of manuscripts. Of these the most are in Italy, but there are several in England, and others in France and Germany. There have been over 300 editions printed, and it has been translated into every European language. The earliest printed edition is that of Johanni Numeister, Fuligno, 1472. Dr. Carlyle, in speaking of the edition of Vendelin da Spira, printed at Venice in 1477, says that in some verses at the end is found the epithet "Divino" applied to Dante (*divo* dante alleghieri Fiorentina poeta), and that "later editions speak of the *excelso, glorioso, divino,* or *venerabile* poeta Fiorentino long before they begin to apply the title of Divine to the poem itself." The earliest Florentine edition is that of 1481, to which was added the commentary of Christoforo Landino. Leaving these earliest editions, we find others following in an irregular way, of which Dr. Carlyle gives this brief summary: "Fifteen authentic editions, besides five of doubtful authenticity, were printed within the last thirty years of the fifteenth century; forty-two in the sixteenth; four in the seventeenth, or poorest century of Italian literature; forty in the eighteenth; and in the present century more than one hundred and fifty." The earliest of all the many commentaries upon the poem is that of Jacopo, Dante's son, written in the year 1328. Later came the comment called generally the Ottimo or Best, but also the Anonimo, Buono, Antico; then the comment attributed to Pietro, another of Dante's sons. This was first published by Lord Vernon in sumptuous style, at his own expense, at Florence in 1845. It was written in 1340. In Aug., 1373, the republic of Florence established a professorship of Dante, and Boccaccio was the first lecturer. The salary was 100 gold florins. He began his lectures in the church of San Stefano in Oct., 1373, and continued them till his death in 1375. Other valuable comments are those of Benvenuto da Imola, Boccaccio's pupil and friend; of Landino, one of the successors of Boccaccio, who lectured on Dante from the year 1457; Bernardino Daniello of Lucca, printed at Venice in 1568—this last especially well spoken of by Dr. Carlyle. Merely to name the translations of the "Divine Comedy" would overrun the limits of our article. The best are in England, Germany, and America. In England, Cary's translation of the whole poem is reckoned the standard one; Wright's is also a valuable translation. W. M. Rossetti has published a good translation of the Hell, but by far the best translation is that of Dr. J. A. Carlyle, which unfortunately is only of the Hell, though it has been reported that the other parts are to be translated by the same hand. This version is in prose, but prose so strong, so idiomatic, and so choice that it seems to give back the original almost in its own noble music. The introduction and notes, too, are almost models of what such illustrations should be.

In speaking of the comments upon Dante, we should have mentioned the "Commento Analitico" of the late Gabriele Rossetti, professor of the Italian language and literature in King's College, London. In this comment, and in his book "The Antipapal Spirit of Dante," the author endeavors to prove that Dante's poem was purely allegorical, and intended as a masked attack upon the Romish Church. Professor Rossetti was the father of the W. M. Rossetti mentioned above; and a daughter has recently published a useful guide to the study of the "Divine Comedy," called "A Shadow of Dante."

In Germany there are excellent translations and several editions of value. Kaunegiesser's translation is praised (3 vols., Leipsic, 1814–21); so is that of A. Kopisch (1 vol., Berlin, 1842). The first is a remarkable piece of work in the measure and rhyme of the original; the second is in blank verse, following the Italian line for line. But by far the best German translation is that by the late King John of Saxony, just dead in 1873. He translated the Inferno in 1839; the Paradise did not appear until ten years later (1849). His translation appeared with the *nom-de-plume* "Philalethes." The best German edition is that of Karl Witte; it was published in Berlin in 1862.

In America the "Divina Commedia" has been translated by H. W. Longfellow, and the Hell by Dr. T. W. Parsons, who is intending, however, to translate the whole, and has in fact nearly completed it.

It may not be amiss to mention the fact that illustrations of Dante's poem have been published by John Flaxman, William Blake, and in our own day by Gustave Doré. (See Batini's "Bibliografia Dantesca," Prato, 2 vols., 1845–48; also "Bibliographia Dantea ab anno 1865, inchoata. Edidit Julius Petzholdt, Dresdæ," 1872; Leigh Hunt, "Stories from the Italian Poets," a useful sketch, but injured by much childish animadversion.) Clarence Cook.

Divina'tion [Lat. *divinatio*, from *divino, divinatum*, to "foretell," to "divine"], the art of foretelling future events by superstitious experiments, etc., by observing the flight of birds, the planets, clouds, and also by the alleged influence of spirits. Among the ancient Romans divination was practised in various forms, and is supposed to have originated among the Etruscans. The Israelites were forbidden by the law of Moses from performing divination of any kind. Among the ancient Greeks divination was extensively practised, but it flourished especially in Chaldæa and Egypt.

Divine Right (of Kings), a term used to express the doctrine, probably of very ancient origin, that a monarch was the immediate representative of Deity, by whom alone he could be held responsible for his actions. It would appear that the idea was never clearly developed and systematically advocated till the early part of the seventeenth century, when the great controversies arose in England between the royalists and the parliamentary or commonwealth parties. The doctrine was maintained by Hobbes, Sir Robert Filmer, and others; it was opposed by Milton and Algernon Sydney.

Diving Bell, a hollow, bell-shaped chamber, open at the bottom, used by divers to descend into deep water for the purpose of conducting various subaqueous works or explorations. A kind of kettle is said to have been used by divers in the time of Aristotle. John Taisnier (born 1509) makes in his works the earliest mention of the practical use of the diving bell in Europe. In 1665 it was used to raise portions of the Spanish Armada. Though of clumsy dimensions and imperfect in the manner of supplying air, it was similar in construction to those of the present day. Dr. Halley's plan for supplying fresh air was introduced about 1715. His diving bell consisted of a wooden chamber open at the bottom, where it was loaded with lead to keep it perpendicular in its descent. Light was admitted through glass set in the upper part. Air was supplied by means of a hose attached to casks filled with air and weighted with lead, which were let down lower than the bell. In the year 1779, Smeaton first applied the diving bell to engineering purposes, and in 1788 he contrived to supply it with air by the use of the force-pump. He constructed a diving bell of cast iron, its greatest thickness being at the lower part, that it might not overturn. It sinks by its own weight. In shape it resembles a square chest, and it affords room for two men, being four and a half feet long, the same in height, and three feet wide. This construction of the diving bell gives those within it

no power to raise or sink it. The blows of a hammer on the inside of the bell can be heard by those above the water, and in this manner the divers communicate with the assistants by a series of concerted signals. On account of the cumbrousness of this apparatus, it is little used except for heavy works of subaqueous engineering. For most operations carried on beneath the water a "submarine armor" or diving dress is employed, described in the following article.

Diving Dress, the name applied to a waterproof dress worn by divers, enabling them to walk and work under water. An aquatic armor, consisting of a leather dress and a helmet, is described in Schott's "Technica Curiosa," published in 1664. An India-rubber cloth diving dress has been more recently used, with a metal helmet having in front pieces of plate glass. Attached to the helmet are two tubes—one to admit fresh air in the same manner as for the diving bell, the other to carry off the waste air. Leaden weights are attached to the diver, enabling him to descend and walk about. Communication can be carried on with those above by means of a cord running between the diver and the attendants. The diving dresses in use at present make the diver independent of any connection with persons above the water. They are elastic and hermetically closed. The diver carries upon his back a reservoir containing air compressed to thirty or forty atmospheres, which is supplied to him for breathing by a self-regulating apparatus at a pressure corresponding to his depth. When he wishes to ascend, he simply inflates his dress from this reservoir. Still other forms of diving dress are in use. (For full information on the subject of this article and the preceding, see PRES. BARNARD'S "Report on the Paris Exposition of 1867.")

Divi'ning Rod [Lat. *virgula divina*], a forked branch of wood used for discovering mines, treasures, or water under ground. This use of the divining rod is a superstition of very great antiquity. In Europe it is usually a forked branch of the rowan tree. The favorite in the U. S. appears to be the witch-hazel.

Divinity. See THEOLOGY, by PRES. E. G. ROBINSON, D. D., LL.D.

Divisibil'ity [from the Lat. *divido, divisum,* to "divide"] is that quality of bodies through which they may be separated into parts. The question whether matter can be infinitely divided or not has often been discussed by philosophers. The subdivision of matter in nature is beyond calculation, nor can it be appreciated by our senses. A tube of glass has been drawn out by the blowpipe to the fineness of a silk fibre, still preserving the form of a tube. In the gilding of buttons five grains of gold, applied as an amalgam with mercury, are allowed to each gross, so that the coating left must amount to the 110,000th part of an inch in thickness. A single grain of blue vitriol will tinge five gallons of water. The divisibility of matter is best illustrated in the case of odors. The particles which impress the sense of smell must fill the whole atmosphere for hundreds of cubic feet, and yet a grain of musk may perfume a large apartment for years with scarcely a sensible loss of weight.

Divis'ion [Lat. *divisio,* from *divido, divisum,* to "divide"], one of the four fundamental rules of arithmetic, its object being to find out how often one number is contained in another. The dividend is the number to be divided; the divisor, the number of parts into which it is to be divided; and the value of one of these parts is the quotient; or the divisor may be one of these parts, and the quotient the number of them in the dividend. Division is an inverse process, whose effect is annulled by the direct operation of multiplication. It is necessary in dividing a number to have recourse to tentative processes, suggested by previous knowledge, and the accuracy of the procedure may be tested by multiplication.

DIVISION in logic is the enumeration of the species which make up a given genus; thus tree is divided into oak, elm, etc.

DIVISION in military language signifies—1, two or more brigades under a general officer; 2, two guns of a battery of artillery, with their equipment, etc.; 3, two companies of a battalion arranged in column of two companies.

DIVISION in music is the separation of the interval of an octave into a number of lesser intervals.

Division of Labor, in political economy, designates the plan by which a mechanic or laborer, instead of finishing the whole of any piece of work, is kept employed upon one special department of that work. Many persons are in some trades employed in turning out a piece of work which would formerly have been finished by one man. The first result of the division of labor is the great increase of production, for ten men, each employed upon a special branch of work, will turn out more and much better work than the same ten men would do if each began and finished an entire piece of mechanism. It is objected, on the other hand, to the division of labor that it tends to diminish the versatility and excellence of individual workmen; and this objection is not without force. Division of labor is extending with the advance of civilization. Even the learned professions are influenced by it. Lawyers more and more devote themselves to particular departments of their professional work. Medicine is becoming divided into specialties. No one man is equally expert in every branch of a great science like chemistry, some giving their attention, for example, to organic chemistry, some to toxicology, others to analysis, etc. The general result will undoubtedly be beneficial to society.

Divorce [Lat. *divortium,* from *di,* "apart," "away," and *vorto,* an old form of *verto,* to "turn"] is the dissolution of a marriage by a court of law, or, in some cases, by a legislative or parliamentary act. In heathen nations divorces have generally taken place at the will of the parties concerned, and even the ancient Romans, during the later period of the republic and under the emperors, allowed the greatest license in this respect. Divorce existed to some extent among the Greeks, more especially at Athens. Easy divorce, which had prevailed among the Hebrews, was restrained and discouraged, though not done away with, by the laws of Moses. Among Christian nations marriage is for the most part looked upon as possessing at once a religious and a civil importance. The Roman Catholic Church denies the possibility of divorce, although there are cases in which, according to the canon law, the union is declared to have been illegal from the first, and in reality never to have existed at all. In English law, the word divorce has been applied to two distinct classes of cases—one where the marriage is by competent authority declared to be void from the beginning; the other, where it is conceded to have been valid in its origin, but for some cause subsequently arising it is dissolved or suspended. The first instance is sometimes termed a case of nullity—the second, a case of dissolution or of judicial separation. Sentences of nullity and of judicial separation, not amounting to dissolution, might take place in the ecclesiastical courts. A marriage could only be dissolved by act of Parliament. In the year 1857 an act was passed establishing the "Court for Divorce and Matrimonial Causes," in which was vested the power previously exercised by the ecclesiastical courts as well as by Parliament. In the U. S., as there are no ecclesiastical courts in the English sense, matrimonial jurisdiction is established by statutes in the different States, enumerating the causes of divorce, which are by no means uniform. These, as a rule, are more numerous in the Western States than in the Eastern. The power to grant divorces is in general exercised by courts having equity jurisdiction, though it exists in the legislature, unless taken away by the State constitution. This is the case in a number of the States, and among them New York.

REVISED BY T. W. DWIGHT.

Dix, a township of Ford co., Ill. Pop. 782.

Dix, a township of Schuyler co., N. Y. It contains the greater part of Watkins, the county-seat, as well as other villages. "Watkins Glen," in this township, is a favorite place of summer resort. Pop. 4282.

Dix (DOROTHEA LYNDE), an American philanthropist, born at Worcester, Mass., about 1794, was a school-teacher in her youth. She devoted much time to the work of ameliorating the condition and treatment of prisoners, lunatics, and paupers, for which purpose she visited nearly every State of the Union. She efficiently promoted the establishment of lunatic asylums in New York, Pennsylvania, North Carolina, Illinois, Indiana, and other States. She published several books for children and tracts for prisoners. By petitions to Congress she induced that body in 1854 to appropriate 10,000,000 acres of public land in order to endow hospitals for the insane, but President Pierce vetoed the bill.

Dix (JOHN ADAMS), LL.D., an American statesman and general, born at Boscawen, N. H., July 24, 1798. He entered the army in 1812, and became a captain in 1825, but soon resigned and studied law. He removed to Cooperstown, N. Y., joined the Democratic party, and was elected secretary of state in 1833. After he had passed several years in private life, he was elected to the Senate of the U. S. in 1845, to fill a vacancy. He advocated in the Senate the principles of the Free-Soil Democrats, whose candidate for governor he was in 1848. He was chairman of the Senate committee on commerce. His term expired in Mar., 1849, and he was then succeeded by Mr. Seward. Having visited various countries of Europe, he published a "Summer in Spain and Florence" (1855). He was secretary of the treasury of the U. S. for two or three months from Jan.

to Mar., 1861, and as such issued this famous order: "If any man attempts to haul down the American flag, shoot him on the spot!" In May, 1861, he became a major-general of volunteers, and in July, 1862, he took command of Fortress Monroe. He was appointed commander of an army corps in Sept., 1862, and ascending York River in June, 1863, cut Gen. Lee's communications. He was minister to France in 1867–68, and was chosen president of the Union Pacific R. R. In 1872 he was elected governor of New York by the Republicans.

Dix (MORGAN), S. T. D., a son of General J. A. Dix, noticed above, an Episcopalian divine, was born in New York City Nov. 1, 1827, and educated at Columbia College. He became in 1862 rector of Trinity church, New York; he is also president of the standing committee of the diocese of New York, vice-president of the New York Protestant Episcopal public school, and holds various other offices. Among his works are "Commentaries on Romans, Galatians, and Colossians," "Lectures on Pantheism," "Lectures on the Two Estates," a brochure on "Christian Art," and numerous sermons, pamphlets, etc.

Dix'field, a post-township of Oxford co., Me. It has manufactures of lumber and carriages. Pop. 1049.

Dix'ie, a name popularly applied to the Southern States of the Union. The name originated from a well-known song in praise of the charms of "Dixie's Land," a Utopian region so named, it is said, by slaves in honor of a gentleman named Dixie, who was celebrated for his kindness to his servants.

Dix Island, 10 miles S. by E. from Rockland, Me., contains about 55 acres, not of land but of rock, the very best of granite. The Treasury building at Washington was built of this stone. The U. S. post-office and court-house building now in process of erection in the City Hall Park, New York, at a cost of over $5,000,000, is built of granite obtained on this island; the stones are all fitted and marked for their place, and are made ready before they are sent. Each stone, large or small, has its own history; *e. g.* "first story; ornamented column, 15 feet 7 inches long. Time expended on it, 127½ days. Total cost, $745.11." The exact cost for one blacksmith, one cutter, one carpenter, and teaming is stated. It is the same with every stone in that immense structure. There are about 1200 men on the island, besides about 100 women and children. There are three large boarding-houses, besides some sixteen other houses; one school of thirty children; forty workshops, in which some 800 men are employed finishing the stone, and sixty forges for sharpening tools.—*Manuf. and Builder.*

Dix'mont, a post-township of Penobscot co., Me. It has manufactures of lumber, carriages, etc. Pop. 1309.

Dix'on, a county in the N. E. of Nebraska. Area, 550 square miles. It is bounded on the N. by the Missouri River. The surface is undulating; the soil is fertile. Grain is the chief product. Capital, Ponca. Pop. 1345.

Dixon, a post-village of Silveyville township, Solano co., Cal., on the California Pacific R. R., 21 miles W. by S. of Sacramento. Pop. 317.

Dixon, a city, capital of Lee co., Ill., on Rock River, and on the Illinois Central R. R. where it crosses the Chicago and North-western R. R., 98 miles W. of Chicago and 40 miles E. of Clinton, Ia. It has a seminary, seven churches, two national banks, and two weekly and one monthly newspaper, and has good water-power with flouring-mills, four plough and other factories. Pop. 4055; of Dixon township, 4687. ED. "TELEGRAPH."

Dixon, a post-village, capital of Webster co., Ky., about 62 miles E. N. E. of Paducah. It has one weekly newspaper. Pop. 330.

Dixon, a township of Preble co., O. Pop. 1123.

Dixon (JAMES), D. D., an English Methodist minister distinguished as a preacher and thinker. He occupied important pulpits in his denomination, was the president of its conference in 1841, and its delegate to the American Methodist General Conference in 1848. He wrote, besides other works, "Methodism, its Origin, Economy, and Present Position," and a "Tour in America." Died in 1872.

Dixon (JAMES), an American statesman, born at Enfield, Conn., Aug. 5, 1814, graduated at Williams College in 1834, became a lawyer, was a member of Congress from Connecticut (1845–49), and U. S. Senator (1857–69). Died at Hartford, Conn., Mar. 27, 1873.

Dixon (JOSEPH), an eminent inventor, born about 1798, was a printer in his youth, and afterwards a wood-engraver. He made important improvements in photography, lithography, banknote-printing, lens-grinding, steel-refining, etc. Died at Jersey City, N. J., June 14, 1869.

Dixon (WILLIAM HEPWORTH), an English author and critic, born in Yorkshire June 30, 1821, of dissenting parents, commenced life in a counting-house. He settled in London in 1846, and contributed to the "Daily News." His articles on "London Prisons," which subsequently appeared, revised and enlarged, in book form, in 1850, were the precursors of Mayhew's inquiries into the condition of the London poor. In 1849 he published a "Life of John Howard," which was successful. His reputation was established by "William Penn, an Historical Biography" (1851), in which he set right the mistaken animadversions of Macaulay on the character of the philanthropical Quaker. He became the chief editor of the "Athenæum" in 1853, and vacated the editorial chair in 1869. Among his other works are a "Personal History of Lord Bacon" (1861), "The Holy Land" (1865), "New America" (1867), "Spiritual Wives" (1868), "Her Majesty's Tower," "Free Russia" (2 vols., 1870), and "The Switzers" (1872).

Dixon Mills, a post-township of Marengo co., Ala. Pop. 1000.

Dixon's, a township of Pike co., Ala. Pop. 2240.

Dixon's Entrance, a strait on the W. coast of North America, is 100 miles long. It separates Queen Charlotte Island from the Prince of Wales Archipelago.

Dixon's Tavern, a township of Queen Anne co., Md. Pop. 3626.

Dix'well (JOHN), one of the famous English regicides, was a wealthy gentleman of Folkestone, Kent, born about 1608. He was an active Parliamentarian, and a colonel under Cromwell. Having been a member of the high court which condemned Charles I., he fled, after the Restoration, to Germany, but finally became a resident of New Haven colony in New England, where he died Mar. 18, 1689.

Djemil Pasha, or **Jemeel Pasha,** a Turkish statesman, born at Constantinople in 1827, was the eldest son of the late Resheed Pasha. He was educated at Paris and London, and has for many years been a public officer, especially in diplomatic affairs. In 1866 he was appointed ambassador to Paris.

Dmit'rof, a town of Russia, in the government of Moscow, 40 miles N. of Moscow. It has seven churches, one college, and manufactures of cotton and silk goods. Pop. 8042.

Dmitrovsk', a town in Russia, in the government of Orel, 28 miles S. W. of Orel. It has various manufactures. Pop. 7603.

Dniep'er (anc. *Borysthenes*), a river of Russia, rises in the government of Smolensk. It flows nearly southward to Kief, below which its direction is south-eastward to Ekaterinoslaf. It afterwards runs south-westward, and enters the Black Sea on the N. side. Its length, including windings, is about 1170 miles. The greater part of it is navigable, but numerous rocky rapids occur below Ekaterinoslaf. These obstructions have been partly removed by blasting. The Borysthenes was known to the ancient Greeks, who regarded it as the greatest river of the globe, next to the Nile.

Dnies'ter (anc. *Tyras*, afterwards *Danaster*), a river of Europe, rises in the Carpathian Mountains in Galicia, and flows south-eastward into Russia. It forms the boundary between Bessarabia on the right and Podolia and Kherson on the left, and enters the Black Sea near Akerman, about 30 miles S. of Odessa. Its total length is about 760 miles. The chief towns on its banks are Mohilef, Bender, and Akerman. The navigation of it is difficult.

Doâb' (*i. e.* "two waters"), a name applied in Hindostan to a tract between two rivers, and especially to that between the Ganges and the Jumna. This doâb extends from Allahâbâd to the base of the Himalayas, a distance of 500 miles or more.

Doane (GEORGE WASHINGTON), D. D., LL.D., an American bishop and poet, born at Trenton, N. J., May 27, 1799. He graduated at Union College in 1818, was ordained as an Episcopalian clergyman in 1821, preached in New York City, and was chosen bishop of New Jersey in 1832. He published a volume of poems (1824) and several works on theology. Died April 27, 1859.—One of his sons, WILLIAM CRESWELL DOANE, was on Feb. 2, 1869, consecrated bishop of Albany.—A second son, GEORGE H. DOANE, is a Roman Catholic priest, and was in 1873 appointed vicar-general of the diocese of Newark.

Dob'bin (JAMES COCHRANE), an American politician, born at Fayetteville, N. C., in 1814. He became a member of Congress in 1845, and was appointed secretary of the navy by President Pierce in 1853. Died Aug. 4, 1857.

Dobbs Ferry, a post-village of Greenburg township, Westchester co., N. Y., on the Hudson River and on the Hudson River R. R., 20 miles N. of New York. It is a place of summer residence, and has four churches and re-

mains of the military works erected during the Revolutionary war.

Dobell' (Sydney), an English poet, born at Peckham Rye in 1824, was a son of a wine-merchant. He began his literary career by "The Roman," a poem (1850). Among his other works are "Balder" (1854), "England in Time of War" (1856), and "England's Day" (1871). His poems exhibit a mixture of the philosophical and poetical spirit. Died Aug., 1874.

Dö'beln, a town of Saxony, on the Mulde, a railway station, 36 miles S. E. of Leipsic. It has a hospital, a realschule, and manufactures. Pop. in 1871, 10,078.

Do'brizhoffer (Martin), a Jesuit, born at Gratz, in Styria, in 1717. He went as a missionary to Paraguay in 1749, and published at Vienna in Latin a "History of the Abipones" (3 vols., 1784), which was translated into English by Sara Coleridge. Died July 17, 1791.

Dobrow'ski (Joseph), a Bohemian author and philologist, born near Raab Aug. 17, 1753. He was liberally educated, joined the Jesuits, and distinguished himself by his researches into the language and literature of the Slavonic nations. His most important works are a "Grammar of the Bohemian Language," a "History of the Bohemian Language and Literature" (1792), and a "German and Bohemian Dictionary" (2 vols., 1802–21). Died Jan. 6, 1829.

Dobrud'scha, or **Dobrujda,** a name given to the N. E. portion of Bulgaria, which is separated from Moldavia and Wallachia by the Danube. It is bounded on the E. by the Black Sea.

Dob'son, a post-village, capital of Surrey co., N. C., about 55 miles W. N. W. of Greensborough. Pop. of Dobson township, 1255.

Dobson (William), an English painter of portraits and history, was born in London in 1610. He succeeded Van Dyck as court-painter to Charles I. He was reputed the best English portrait-painter of his time. Died in 1646.

Do'ce, Rio (*i. e.* "sweet river"), a river of Brazil, rises in Minas Geraes, flows north-eastward, and enters the Atlantic 60 miles N. of Victoria. Length, including windings, about 500 miles. Its navigation is obstructed by rapids.

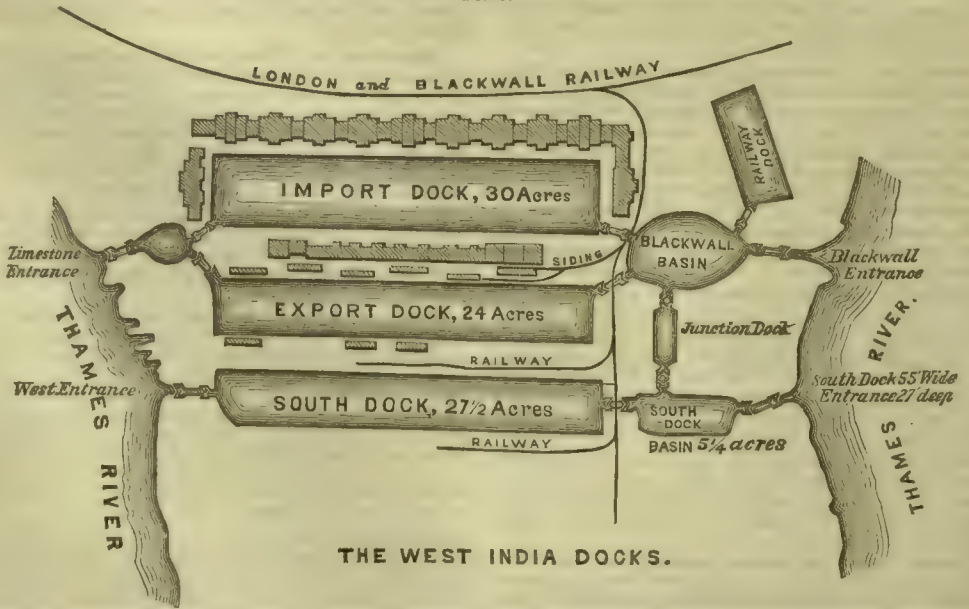
Doce'tæ [from the Gr. *δοκεω*, "to appear," to "seem"], an heretical sect which arose in the first century, denying the incarnation of God in Christ. Some of the Docetæ affirmed the body of Christ to be a mere deceptive appearance; others only denied its fleshly character. Docetism was a form of Gnosticism (which see).

Doç'imacy [Fr. *docimasie;* Gr. δοκιμασία, from δοκιμάζω, to "test," to "examine" or "prove"], or **Docimastic Art,** the art of assaying minerals or ores with a view of determining the quantity of metal they contain.

Dock, a perennial herbaceous plant of the order Polygonaceæ and genus *Rumex,* found chiefly in temperate climates. They have large ovate or lanceolate leaves, and greenish flowers in panicles. They increase rapidly from the seed, and having long tap-roots become very troublesome as weeds. The roots of several species are valued in medicine for their astringent properties; they are also used in dyeing. The yellow dock (*Rumex crispus*) is esteemed in the U. S. as an alterative.

Dockery (Gen. Alfred), born in North Carolina Dec. 11, 1791, was many years a prominent Whig politician and office-holder in his native State, from which he was elected to Congress in 1845 and 1851. He opposed the Democratic party after the close of the civil war. Died in Richmond co., N. C., Dec. 4, 1873.

Dock'et [from *dock,* to "cut off"], a summary, an abridged entry of a proceeding on a piece of paper or parchment. Exemplifications of decrees in chancery, fiats in bankruptcy, and other instruments are thus *docketed* for purposes of reference. The word docket is frequently employed to designate an abridged entry in a book, as in the case of judgments of courts, in order to make them a lien upon land. Docket also denotes a list or calendar of causes ready for hearing or trial, prepared for the use of courts.



Docks are artificial basins for the reception of ships, and are of two kinds, wet and dry. *A wet dock* is a large basin in which the water is kept at a certain level by means of walls, so as to be unaffected by tidal changes, in order to facilitate the loading and unloading of cargoes. *A dry dock* is intended for the repairing and examination of ships, the water, after the entrance of the vessel, being removed by pumps or other means.

In ports where vessels would be naturally much exposed during rough weather, or where the changes in the tide are very great, the necessity of secure and well-sheltered docks or artificial basins, in which ships may be safely moored and kept at one level, is especially manifest. In the northern parts of Europe the rise and fall of the tides are so great that every port which has any pretensions to a first-class mercantile harbor is necessarily supplied with one or more wet docks; at most of the ports of England, and especially at those of Liverpool and London, docks have been constructed on a truly magnificent scale.

Notwithstanding the obvious importance of wet docks to the vast trade of London, it was not until a few years previous to the beginning of the nineteenth century that plans for docks on anything like an adequate scale were, at the request of a parliamentary committee, submitted by Messrs. Telford and Douglas, among other plans for the improvement of the port of London. The act authorizing the construction of the West India Docks was passed in 1799; work was begun in Feb., 1800, and in 1802 they were so far completed that a homeward-bound vessel entered them.

These, the first docks of London, with their entrances

Fig. 1.

THE WEST INDIA DOCKS.

and basins, extend across the isthmus (at low water) of the island formed by the Thames on the Middlesex side of the river, and called the "Isle of Dogs." They originally consisted of an Import Dock containing an area of 30 acres, and an Export Dock with an area of 24 acres; connecting at both ends by basins and locks with the Thames. They were constructed of brickwork and timber. There was a canal on the S. side of the docks which has recently been

converted into a new dock called the South Dock. The retaining walls of this new dock, which is one of the finest basins of the West India Docks, are 34 feet 10½ inches in height from the bottom of the dock to the top of the coping, where the width is 11½ feet, spreading downward with a batter of 1 in 24; the face and back of the wall are of brick, the former 3 feet 4½ inches, the latter 18 inches thick, connected by vertical transverse walls 2 feet 3 inches in thickness, and placed 10 feet apart, the pockets thus formed being filled with concrete; upon a foundation of which, 3¼ feet in thickness, the wall stands. The bottom of the dock is covered throughout with a layer of puddle 18 inches in thickness. On the N. side are sixteen jetties, projecting into the dock, of timber, 130 feet in length, furnishing accommodations for thirty-two vessels, and opposite each jetty is a buoy for mooring vessels. The area of the South Dock is 27½ acres.

The general plan of these docks, with their entrances and connections, entrance-basins, locks, warehouses, railway connections, etc., is shown in the figure. The cost of the South Dock, with the machinery, railway extension, dock-basins, warehouses, etc., was $2,850,000. It will be seen from the plan that an incoming vessel can pass directly into the Import Dock, unload her cargo, and then, without being locked out into the Thames, when the tide permits may pass into the Export Dock to receive her outward-bound cargo.

The West India Docks proved a very successful undertaking; all West India vessels frequenting the Thames were, for twenty years after their completion, obliged to use them. After declaring annually a dividend of 10 per cent. they had in 1819 an accumulated fund of $2,500,000. Since then their monopoly has expired, and their dock-rates have been reduced from time to time, so that their profit has been greatly diminished.

The East India Docks, which are a short distance to the eastward of the above, were at first intended exclusively for ships in the East India trade, but are now open to vessels from all parts. Their area is 27 acres, exclusive of entrance-basins, and their depth of water is never less than 23 feet. They belong now to the same company as the West India Docks, and have attached to them magnificent warehouses for tea, indigo, drugs, spices, etc.

The London, the St. Katherine, and the Victoria London Docks, also on the N. side of the Thames, are under the control of one company. The London Docks have a water-area of 34 acres, the St. Katherine Docks a water-area of 11 acres, and the Victoria London Docks, situated immediately below the East India Docks, have an area of 74 acres in the inner dock alone, exclusive of 16 acres in the tidal basin. The depth of water in the inner dock varies from 24½ feet to 26½ feet. The entrance to this dock from the Thames is by means of a lock 320 feet in length, 80 feet in width, and with a depth of water on the sill of 28 feet. The jetties, with the sides of the dock and of the basin, provide a length available for quay-room of nearly 3 miles.

On the Isle of Dogs, S. of the West India Docks, are the Millwall Docks, recently constructed, and comprising two basins, one having a water-area of 25 acres, the other of 10½ acres. The Surrey Commercial Docks, intended for ships with bulky commodities, are upon the S. side of the Thames, and have a water-area of 176 acres.

The warehouses belonging to the different dock establishments are of immense size; that of the London Docks, intended for the storage of tobacco, is one of the largest, best-arranged, and finest buildings of its kind in the world. It will contain 24,000 hogsheads of tobacco, and covers nearly 5 acres; the vaults under this and the other warehouses of these docks have an area of 18¼ acres of storage space. On five of the jetties of the Victoria Dock are extensive warehouses, and on the N. side of the dock are several large ones, one of which has an area of 4 acres of flooring. In some cases the warehouses are built close to the water's edge, so that goods may be hoisted into them direct from the hold of the vessel; while generally railway connections are made with the dock, so that goods may be taken to any part of the kingdom without change of carriage. The docks are also provided with cranes and other appliances, worked by steam or hydraulic power, for the rapid transfer of cargoes.

The dock establishments of Liverpool are not excelled in extent and arrangement by those of any port throughout the world. Though the number of vessels belonging to this port is less than that of London, yet the fact that they cannot lie with safety or ease in the Mersey on account of its rapid current and exposed situation, and the great rise and fall of the tides (21 feet at neap and 31 feet at spring tides), require the dock accommodations to be of sufficient extent for the entire trade of the port; while at London the Thames affords a secure and convenient berth for a great number of vessels.

The Liverpool docks have, on the side next the river, a sea-wall of 5 miles in extent, which, when considered in connection with the obstacles to be overcome, is one of the greatest works of modern times. In most cases docks are formed by excavations made on the bank of the river, but at Liverpool they have been formed in the river itself by enclosing, within the wall referred to, a portion of the beach of the Mersey, and afterwards excavating the part thus reclaimed to a proper depth. The wall is 11 feet in thickness and 40 feet in height from the foundation, the more modern parts being faced with granite. There are between thirty and forty docks, having a water-area of 239 acres, exclusive of 19 acres of entrance-basins. The quay-space is over 18 miles. Most of the docks have a separate entrance from the Mersey, and communicate with each other, so that ships may pass from one to another without the necessity of being locked out into the river and back again into the docks. They are also connected with the different railways entering the town, and by a series of locks with the Leeds and Liverpool Canal.

The whole of this immense dock estate is vested in the Mersey Docks and Harbor Board, who enforce strict rules for the maintenance of good order and prevention of fire and depredation. Every precaution is taken to prevent the injury of the docks from the accumulation of mud, by the use of steam dredging-machines. The income of the Mersey Docks and Harbor Board for 1867 was $4,430,000. The revenue of this board, after paying expenses and interest on money borrowed, is applied to the reduction of the dock rates.

The present importance of the port of Liverpool may be said to be chiefly owing to these magnificent docks; for, though it is the emporium of a district rapidly increasing in manufactures and population, the advantages given to commerce and navigation by them have brought to it the greater part of its business and wealth.

Birkenhead, on the Mersey, directly opposite to Liverpool, has a water-area of 165 acres of docks and subsidiary basins; among them are two large docks, one of 52, the other of 59 acres. The quay-space is between 10 and 11 miles in length. Here are also warehouses with their appurtenances, planned on the most approved principles, for loading and unloading ships, safe storage of cargoes, etc. At Bristol about three miles of the old channel of the river was converted into a dock, about 55 acres of which are available for large vessels. Hull has five docks with a water-area of 49¼ acres. Grimsby, Lincoln county, has, in addition to the old works, a new dock of 25 acres, with a tidal basin of 15 acres; the new dock is entered from the basin by two locks of massive masonry, furnished with double sets of gates for ebb and flood tides, the largest of which is constructed to admit the largest class of war-steamers. At Southampton there are docks surrounded by quays, and bonded warehouses, and provided with powerful shears for shifting boilers, heavy machinery, masts, etc. Among other ports of the British Islands which possess large docks may be named Glasgow, Leith, Newcastle-on-Tyne, Tyne, Cardiff, Belfast, and many more.

At Havre, where the rise of the tides is from 20 to 27 feet, there are capacious docks. At Antwerp, where in 1803 Napoleon I., who intended to make it a great naval establishment, undertook the construction of docks on a grand scale, new and convenient ones with warehouses have been opened. At Bremen and Amsterdam docks have been constructed and recently improved.

To give an idea of the importance attached in England to dock accommodations may be mentioned the Barrow Docks at Barrow-in-Furness, a town of 20,000 inhabitants, on the sea-coast opposite the Isle of Man. These docks, opened in 1867, comprise 1½ miles in length of stone quays and 100 acres of wharf-area. The entrance-basin is closed by gates in the usual manner, while the dock is closed by a caisson placed across the entrance and held by a groove in the masonry on both sides. The caisson, when filled with water to the higher water-level, remains standing upon the dock-sill and closes the passage, but when water is allowed to escape from the caisson, so as to fall to the lower level, it floats, and can be drawn to one side, so as to leave the entrance clear. The water maintained in the dock is 22 feet above the dock-sill, the tide outside varying from 25½ feet at spring tides to 18 feet at neap tides.

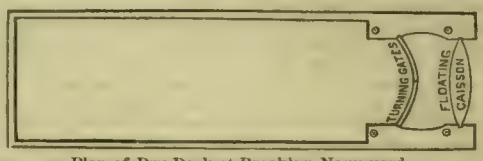
The new Hendon Dock at Sunderland has been constructed on land wholly reclaimed from the sea; and from the exposed character of the coast, great depth below the surrounding works, the great head of water constantly standing in the old docks in close proximity to the new works, and the exceedingly porous nature of the strata, the difficulties presented to the engineer were of unusual magnitude. The work was enclosed in sections, with barriers formed of timber planking and piling filled with well-puddled clay, and protected with heavy limestone blocks.

The rock was porous and crumbling, and the greatest care was necessary to prevent the water from penetrating and impoverishing the masonry before it set. In the case of the entrances the whole surface of the rock was covered with a watertight platform of brickwork set in the best Roman cement, filling up every crevice in the rock; and upon this the masonry of the walls and sills was laid.

This new dock is 11 acres in extent; the entrance is provided with two pairs of gates, and is crossed by a wrought-iron railway bridge, balanced and turned upon a water-centre, the usual rollers and turntable being entirely dispensed with. The gates and sluices are worked by hydraulic machinery, and there are hydraulic pumps to remove the water between the two pairs of gates, so as to maintain a head of water upon the outer or sea gates during stormy weather, and thus prevent their movement. The entrance is further protected at such periods by booms reaching from side to side, which, by means of a crane fixed on the pier-heads, are dropped into grooves in the masonry fitted for their reception. The walls of the entrance are faced with large blocks of freestone, ashlar masonry, none of the courses of which are less than 2 feet in thickness, backed up by rubble masonry composed of large flat-bedded stones built in the best blue lias pozzuolana. The width of the entrance is 60 feet, and the depth of water above the sills at high water of spring tides is 26½ feet.

In many ports throughout the world—such, for example, as that of New York, where the harbor is naturally protected, and as also in the Mediterranean, where the rise and fall of the tides is so small as not to obstruct the loading and unloading of ships—wet docks are not an absolute necessity to commerce, though there is no doubt that the excellent appendages which are attached to them, such as the wharf-room, the magnificent quays and warehouses, the railway connections, cranes, etc. of the docks of Liverpool and London, and, by no means least of all, the excellent police arrangements for effecting order and safety from fire and depredation, would most certainly greatly promote the commercial prosperity of any port.

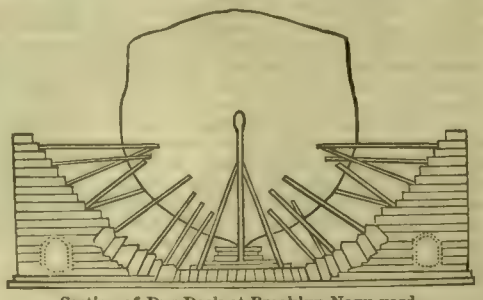
But, though in many cases wet docks may be dispensed with, all first-class ports need dry docks for the examination and repair of those parts of a ship which are usually immersed in water. Dry docks may be separated into two classes—the *stationary dry dock*, to which the name *graving dock* is generally applied; and *the floating dock*, of which there are several varieties, to be described hereafter.



In ancient times, where there was no rise and fall of the tides, vessels were hauled up on the beach and "careened;" where the tides permitted they were grounded at high water, so as to be exposed at low. Sometimes the heaving-down plan was adopted; this was to attach ropes to the heads of the masts of the vessel and to the mooring rings of a quay, or to the deck of another vessel, so as to haul the ship over into a nearly horizontal position on the water, the ballast or weights being removed or shifted. It was while undergoing this very dangerous operation that the Royal George foundered at Spithead in 1782, with 600 persons on board.

This method was supplanted by the *graving dock*, generally constructed of stone, though sometimes of timber, and usually of such dimensions as to contain only one vessel at a time. The sides are formed in steps or altars, so that the form of the dock is somewhat similar to that of the vessel which it is to contain, but sufficient space is left around it to enable the workmen to get at every part of the bottom of the vessel, and to afford sufficient light for their work. The entrance is closed by gates, which open sideways, like a lock or fall, upon the bed of the entrance, or by caissons; the latter, since the introduction of iron for shipbuilding purposes admits of their being made of that material, are almost universally adopted for large docks, and have the advantage of affording the means of retaining the water inside the dock, as well as of keeping it out; which is of importance, where the tide is ebbing rapidly, in allowing time to adjust the vessel before it settles down on the keel-blocks. The vessel is floated into the dock at high water, the gates closed, the sluices opened, and the water allowed to run out with the ebb of the tide, or, where the fall of the tide will not permit, is pumped out, leaving the dock perfectly dry; the vessel being supported on timber struts and shores resting upon the steps already mentioned as forming the sides of the dock.

The U. S. naval graving dock at the Brooklyn navy-yard is, in its dimensions and workmanship, one of the finest in the world. It also possesses many features and improvements that at the time of its construction were unequalled by any other graving dock. Owing to the nature of the soil selected for its site, the excavation for the foundation was attended with many obstacles, and afforded opportunity for the display of great engineering skill. This lower soil was an almost impalpable quicksand, becoming semi-fluid when saturated with water; and before the required level for the foundation had been reached springs coming from a great depth burst up through it, rendering necessary measures to overcome it. This was finally done by driving piles into the cavities formed by the springs, on which a flooring of plank was laid; upon this bricks were laid in hydraulic cement, and upon the brick floor concrete masonry; the whole being done with the greatest despatch; vent-holes for the water were left until the permanent foundations were completed, but in this manner the flow of sand was checked.



The floor, from 4 feet to 6 feet in depth, is an inverted stone arch, to strengthen it against the pressure of water from below. The masonry foundations are 400 feet in length and 120 feet in breadth. The facing of the masonry is of granite, the side walls being laid up with English bond—that is, alternate courses of headers and stretchers; the courses are generally 2 feet thick, a few near the bottom being 27 inches. The facing stones, averaging 6000 pounds in weight, were backed up with a course of scabbled stone, the interior and rear of the walls being laid up with coursed rubble. The mitre-sills and the keystone are massive granite blocks. The whole was laid in mortar made of the best hydraulic cement and sand. The gates, of iron, are supported on friction rollers, and, with the machinery for turning them, weigh near 200 tons. The caisson is an iron vessel, with keel and stems made to fit the grooves in the masonry at the entrance of the dock. It is 50 feet in length at the keel, and 68 feet 8 inches in length at the rail; its breadth at the centre of the top is 16 feet, at the keel 7 feet. The grooves in the masonry, in which the stems and keel of the caisson fit, are 26 inches in width and 12 inches in depth, from the top to the bottom of the side walls and in the floor. By admitting water into the chambers of the caisson it settles into these grooves and closes the entrance; it is removed by pumping out sufficient water to float it clear of the grooves. Its weight is nearly 218 tons, exclusive of ballast. It is used when greater length of dock may be required, when the turning-gates need repair, or to partially relieve the strain upon them. The engine and pumps are of very large capacity, and will relieve the dock of water in about two hours. In order that the bottom may be dry and free from water, there is a slight inclination in the bottom of the dock, and a gutter is carried across at the lower end, leading into a culvert which passes entirely around the dock, from which the water is constantly pumped. Several flights of steps are provided in the different parts of the dock for the use of the workmen, by which they are enabled to reach any part of the vessel with great facility. The main chamber of the dock is 286 feet in length and 30 feet in breadth at the bottom; 307 feet in length and 98 feet in breadth at the top; by using the caisson an additional length of 52 feet may be obtained, giving a total length of 359 feet. The height of the walls is 36 feet, and the sills are 26 feet below high water. The total cost, including all machinery and appurtenances, was about $2,000,000; the work was completed in 1851.

FIG. 2.

Plan of Dry Dock at Brooklyn Navy-yard.

FIG. 3.

Section of Dry Dock at Brooklyn Navy-yard.

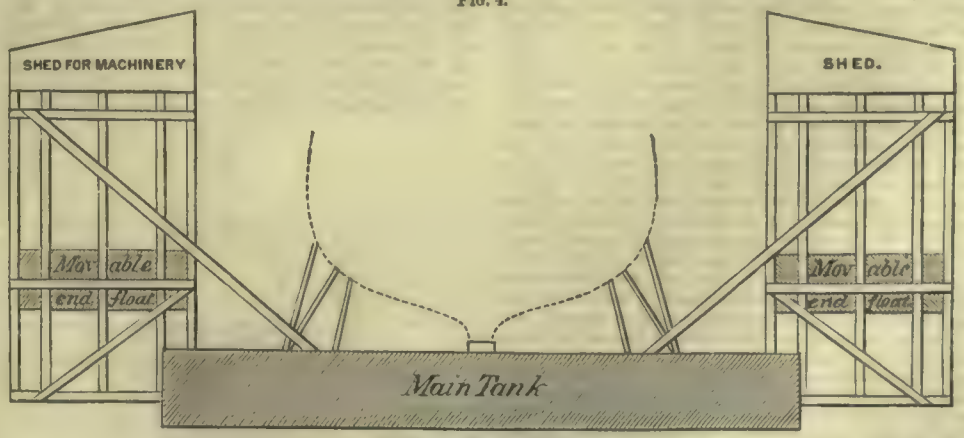
The naval graving dock at Boston, built of granite and completed in 1833, is 253 feet in length and 86 feet in width inside the chamber; the turning-gates and the caisson are

of timber and composition fastened with copper bolts; the caisson being 60 feet in length, 30 feet in height, and 16 feet in width amidships. The total cost of this dock was about $700,000. The naval graving dock at Norfolk is almost precisely similar in style and dimensions to that at Boston, and cost about $950,000.

The cost of the construction of graving docks depends greatly upon the situation selected. In some places they are simple to construct and maintain, as at Birkenhead, where they are hewn out of the solid rock, a red sandstone, which is sufficiently hard and homogeneous to support the heavy weights, and at the same time soft enough to be worked. At this place (Birkenhead) five graving docks, having an aggregate length of 1690 feet, were hewn out of the rock at a cost of $430,000. The materials of which the docks are constructed also affect the cost; most of those belonging to the governments of different countries being made of finely-dressed ashlar masonry in a manner involving a considerable expense, while many of the most successful docks on the Thames have been built of timber and brick at a cost which is trifling by comparison. A heavy item of expense in those places where the fall of the tide is not sufficient to empty the dock is the cost of the large engines and pumps needed to remove the water.

In addition to her magnificent wet docks, Liverpool possesses a large number of graving docks, there being on the side of the Mersey on which that city is situated no less than sixteen, having an aggregate length of over 1¼ miles; of these, the Sandon Graving Docks, six in number, are each 540 feet in length at the bottom, with entrances of from 45 feet to 70 feet in width. On the Birkenhead side are six docks, of which four belong to Laird Brothers.

Among the largest graving docks are the double dock at Brest, 721 feet in length, 92 feet in width, with a depth of 55 feet of water over the sill; and the double dock at Portsmouth, England, 644 feet in length by 80 feet in breadth. Portsmouth has besides nine single graving docks, the largest of which is 406 feet in length at the bottom. Devonport has five, Cherbourg eight, Sheerness five, Toulon six, Brest four. There are several on the Thames, and many other ports have one or more. Southampton has three; one of which, the Eastern Dock, is 425 feet in length, with a width of entrance of 80 feet, made in 1854 of brickwork with Portland copings, and is stated to have cost $260,000.



At the Southampton Docks, 693 vessels were docked during the seven years ending in 1867, average tonnage being 1400 tons per ship. The cost of docking, including pumping, labor, and repairs to the docks, was, on an average, $65 per ship, while the average sum paid for each vessel, for docking and for the use of the dock during the time it remained in it, was $275. Total amount earned during the seven years, about $192,000; expenses, $39,000. The capital of the Graving Dock Establishment at Southampton has been taken at $750,000, but this sum is considerably over the cost of the docks. As regards speed of working at Southampton, on one occasion three large ships of more than 2000 tons required to be docked in a hurry; two were docked and undocked, and the third docked and placed on the blocks, between daylight and dark.

One of the largest and deepest single graving docks is the Somerset Dock, constructed by the British government at Malta. The length on the floor is 428 feet, at the coping line 468 feet; the width of the floor is 42½ feet, and between the copings the width is 104 feet; the width of the entrance is 80 feet; the length of the entrance from the caisson in the centre is 256 feet; the depth of the entrance and floor is 33½ feet below the average sea-level. The caisson is 83 feet in length on the deck, 41 feet in height, and 12½ feet in width. The upper deck forms a roadway between the two sides of the dock-entrance, and the caisson is arranged to go into a camber when the entrance is to be opened. The caisson differs from those previously constructed in the fact that it is worked by steam, and not by hand. In excavating for this dock it was found necessary to cut a tunnel through the solid rock 230 feet in length, for the purpose of removing the excavated material. During the work fissures were met with discharging into the excavation large quantities of water charged with black mud, which gave great trouble. The inner or exposed lining was formed of ashlar masonry of the hard crystalline limestone of the Maltese Islands; the backing was from an inferior quality of the same rock, some of which came from the excavation. There being but little change in the tides, the dock is emptied by large pumps worked by two powerful engines. The engines and pumps are placed in a cast-iron tank sunk in the rock.

Of the floating dock there are several distinct varieties: *the sectional dock*, such as is in use in the Philadelphia and San Francisco navy-yards; *the Gilbert balance dock*, in use in the Portsmouth and Pensacola navy-yards; the *iron floating dock* of the Bermuda dock pattern; *G. B. Rennie's patent iron floating dock*, of which the Cartagena dock is an example; and *Edwin Clark's hydraulic lift dock*, in use in the Victoria London Docks.

The sectional floating dock in the Philadelphia navy-

FIG. 4.

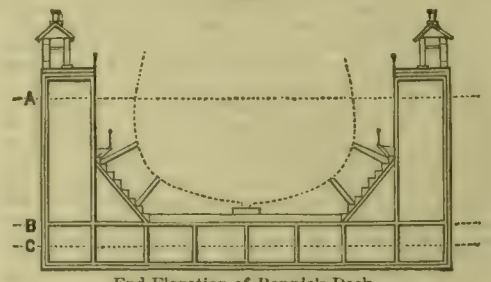
Sectional Floating Dock.

yard is made in nine separate and independent sections, differing only in their widths. Each section consists of a pontoon or tank, watertight, 105 feet in length, 30 or 32 feet in width, and 11 feet in depth; two end-frames, and two end-floats. Together, the sections form a floor of over 300 feet in length and 105 feet in width. At each end of each section is an open frame in which is a float, connected with the four posts of the framework, which is raised and lowered by machinery—raised to assist in sinking the main tank to the depth required, or lowered into the water to give it greater buoyancy.

When the dock is to be used a sufficient number of these sections are joined together to give the length required, and firmly connected by beams so arranged that they may be placed from 6 inches to 6 feet apart, though they are not generally farther apart than 3 feet. They are then connected by means of shafting with the engines, of which there are four. At each end of each section are three pumps. When the vessel is ready to be docked the main tanks or pontoons are filled with water, the end-floats raised by machinery upon the end-frames until the dock is sunk to the proper depth. The ship is then hauled over the dock, and the end-floats depressed into the water until its keel has a bearing upon the keel-blocks; the shores or supports for the vessel are then adjusted, and the water is pumped from the tanks, the end-floats being used, if necessary, to preserve the proper equilibrium.

This dock, as well as Gilbert's balance dock, is used in connection with a basin and railways. The basin in the Philadelphia navy-yard is 350 feet in length by 226 feet in width. The floor, of granite 10 inches in thickness, is laid upon a pile and concrete foundation, and is perfectly level; on three sides of this floor are granite walls 14½ feet in height. The "bed-ways" are two, and each consists of three "ways"—one to support the keel, and two to support the bilges; each is 350 feet in length and 26 feet in

width. The basin and "ways" are used thus: the dock, with the ship upon it, drawing from 8 feet to 10 feet of water, is hauled into the basin by means of capstans; the line of the ship's keel is brought into the line of the "bed-ways," water is admitted to the tanks, and the dock settled firmly upon the stone platform of the basin. The vessel, by means of hydraulic power and a cradle, is slid upon the bed-ways, and the dock may be immediately used for another vessel. The dock without the basin may be used for repairing a vessel. This dock was completed in 1851 at a total cost of about $814,000. Its lifting power is near 6000 tons.



The California sectional dock is composed of ten sections, 100 feet in length, 32 feet in breadth, and 11 feet 9 inches in depth.

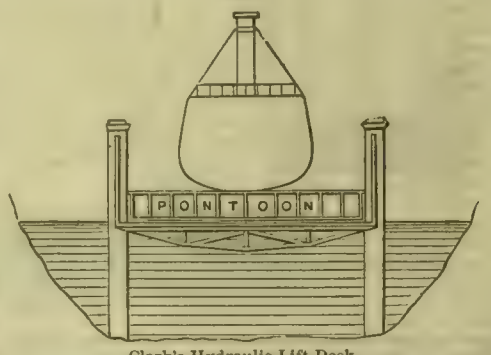
The balance floating dock was invented by Mr. John S. Gilbert of New York City. Like the sectional dock, it is constructed of timber, and consists of a pontoon bottom with two side walls, possessing sufficient displacement to carry the whole weight of the dock and the vessel to be raised. The side walls are hollow and of considerable width, serving, like the floats in the sectional dock, to preserve its stability in rising and sinking. The outside of these walls is vertical, while the inside is sloping, so as to conform to a certain extent to the shape of the ship. Port-holes are made in the walls for ventilation. The walls also afford the means of shoring up the ship, as in a stone dock; on the top are the engine-house, pumps, and working platform. There are sometimes gates at the ends for enclosing the dock, which are used only when vessels of great weight are to be lifted. Of this description is the Portsmouth navy-yard dock, which is 350 feet in length, 38 feet in depth, and 90 feet in inside width. This dock, with the basin and railways, cost $733,000. The Pensacola dock, which is similar, cost $923,000. There are also balance docks at New York, Charleston, Savannah, Mobile, and New Orleans. Mr. Gilbert constructed a balance dock for the Austrian government at Pola, a naval station on the Adriatic, with a width inside of 211½ feet, and a length of 311½ feet. There are also a basin and two railways for hauling vessels upon, each of 700 feet in length.

The iron Bermuda dock (or iron camel, as it is sometimes called) is made of wrought iron; the transverse section is U-shaped; the bottom and sides are hollow, and 20 feet through; the ends are closed by caissons 25½ feet through; the length of the dock over all is 381 feet, between the caissons, 330 feet; breadth over all, 124 feet, inside of the dock, 84 feet; depth over all, 72 feet. It is divided into six longitudinal compartments or chambers, watertight and distinct from each other, these compartments having transverse divisions. The weight of the dock without the caissons is about 8200 tons. This huge vessel, if it may be so called, was completed in the latter part of the year 1868, and in the summer of 1869, with two vessels on either side and two ahead, was towed down Sheerness harbor to the Nore. It was then taken under the stern of the Northumberland, and made fast to one of the immense hemp hawsers, 30 inches in circumference, made for the purpose; a second hawser was passed from the Northumberland to the Agincourt's stern and secured, the Terrible taking her position at the stern of the dock to assist in steering. These vessels took the dock to Madeira, where the Warrior and the Black Prince took the places of the Northumberland and the Agincourt, and proceeded directly to Bermuda. The voyage, a distance of 4000 miles, was successfully accomplished in thirty-six days. The caissons were sent out in sections. This dock is lowered by filling some of the chambers by means of pumps on the top of the dock, and by opening some of the valves; water is also allowed to run into the dock itself, and when the proper depth is reached, the caissons are taken out, the ship brought in over the blocks and shored, and the caissons put in place; the water in the dock is then allowed to run into some of the chambers, which have been kept empty; in which state the dock remains until the vessel is ready for undocking. By means of the admission or exclusion of water into or from the different chambers, the dock can be balanced in any position, and even be heeled over on one side, so as to expose the bottom for examination and repair. This dock is capable, without the caissons, of taking in the largest vessel afloat except the Great Eastern, and can lift and lay completely dry a vessel weighing 8000 tons.

An iron floating dock, after the patent of Mr. G. B. Rennie, an English naval architect, has been constructed for the Spanish naval yard at Cartagena; it is 320 feet in length; 105 feet in breadth outside; breadth inside, 79 feet; height outside, 48 feet; height inside, 36½ feet; weight, 4400 tons. This dock, possessing many points of resemblance to Gilbert's balance dock, may be described as an oblong rectangular box or trough, without top or ends; walls and bottom hollow, and divided into several independent chambers; the side walls act as floats to prevent the dock from sinking too rapidly, and eventually from being entirely submerged. The operation of docking is performed thus: Water is admitted to the base compart-

FIG. 5.

End Elevation of Rennie's Dock.



A. Level of water when ready to receive a ship.
B. " " with ship docked.
C. " " when light.

ments by sluices and pipes; the dock gradually sinks to a depth sufficient to admit the vessel, which is then hauled in and shored in the usual manner; the engines and pumps then discharge the water from the base compartments until the floor of the dock is out of water.

Among the largest vessels which this dock has lifted is the Spanish iron-clad Numancia, of 21½ feet draught and weighing 5600 tons. This vessel remained supported eighty days without damaging or straining the dock. The draught of water of the dock, with the Numancia in, and with 800 tons of water in the chambers, was 11½ feet; without a load the draught of the dock is 4 feet 7 inches. Mr. Rennie has also constructed at Cartagena a basin and railways similar to those used with the American floating docks.

Clark's Hydraulic Lift Dock.—This style of dock was first constructed by Mr. Edwin Clark at the Victoria Docks. The vessel to be docked is raised by hydraulic power, the dock (or rather the "lift") being formed of two rows of cast-iron columns placed at a sufficient distance apart to admit a vessel between them. Each column encloses a hydraulic press, the ram of which is connected by chains with a transverse beam extending to the opposite column. These transverse beams form a platform, upon which is floated a shallow pontoon of sufficient size to accommodate the vessel to be docked; the platform and pontoon are then sunk, and the vessel floated into its proper position over the latter. The pumps of the hydraulic presses are then set to work, the platform is raised, and with it the pontoon and the vessel, the latter being supported upon the keel-blocks

FIG. 6.

Clark's Hydraulic Lift Dock.

and the sliding bilge-blocks, which are hauled into their places by chains. When the pontoon is lifted clear of the water, the latter flows out through the valves in the bottom, these being closed when the pontoon is emptied; the platform is then lowered until the pontoon, with the vessel upon it, is afloat. Thus in about thirty minutes a vessel drawing 20 feet of water is left afloat on a shallow pontoon drawing only 4 or 6 feet, and may be taken into the shallow dock prepared for its reception. These docks are surrounded by workshops and tools, with shelter for the men close up to the bulwarks of the ship. The vessel is, in fact, brought bodily into the centre of a convenient workshop. It is taken to the smiths', the carpenters', or the machine shops, according to the nature of the repairs required, and is moved easily from one to the other. In the

Victoria Docks the shallow berths to which the pontoons are floated are only 6 feet in depth; there are in all eight berths, each 60 feet in width, and from 300 to 400 feet in length.

The pontoons are very shallow, and, being open-topped, do not possess any great amount of rigidity, but Mr. Clark considers this flexibility an advantage: and from the results of the practice at the Victoria Docks it certainly seems that it is not so excessive in amount as to do any harm. One great advantage of Mr. Clark's plan is, that by a single lift, in connection with a great number of pontoons, an equal number of vessels can be floated in shallow water at a comparatively slight expense. It seems particularly applicable to situations which are sheltered, where the tidal changes are not great, and where a foundation can be readily obtained for the columns. A dock on this plan has been recently constructed by Mr. Clark at Malta.

A plan has been proposed by a Mr. Zanicki before the French Society of Engineers for a floating dock composed of a number of pontoons from which the water is driven by compressed air; stability being given to the pontoons by lateral moving floats. SAMUEL H. SHREVE.

Dock-yards in Great Britain are government establishments corresponding to the U. S. navy-yards. There are dock-yards at Portsmouth, Devonport, Sheerness, Chatham, Woolwich, Deptford, Plymouth, Pembroke, Haulbowline, Gosport, etc.

Doc'tor [Lat. *doctor*, a "teacher," from *doceo*, *doctum*, to "teach"], a title of honor which was applied in early times to teachers of doctrine in the churches, and in more recent times conferred by universities; at first as the equivalent of "master" (*magister*), and afterwards as a still higher degree. Four of the Greek Fathers (Athanasius, Basil, Nazianzen, and Chrysostom), and three Latin Fathers (Jerome, Augustine, and Gregory the Great), were distinguished as "doctors of the Church." Thomas Aquinas, Bernard of Clairvaux, Bonaventura, and others bore the same title in later days. The distinction is usually conferred after death. The title "doctor" was given later in the Western Church to prominent teachers of scholastic theology. Many of these titles were conferred by their followers, and had an additional epithet, designed to be expressive of some special excellence. Thus, William Hales was called "Doctor Irrefragabilis"—the "irrefutable doctor;" William Ockham was called by his admirers "Doctor Singularis"—the "pre-eminent doctor," a title given to several others. Doctor of laws, LL.D., or J. U. D. (*doctor utriusque juris*, "teacher of both laws," *i. e.* the civil and the canon law), was the first title of the kind conferred by the universities. Bologna appears to have been the place where this title was first conferred, but the University of Paris soon followed, first giving this degree in 1145. Doctors of laws (except when bearing a merely honorary title) long had a certain jurisdiction in the courts, which is even now scarcely extinct in England. (See article DOCTORS' COMMONS, and also Shakspeare's "Merchant of Venice," act iv., scene i.) In the English universities the doctorate in law is given in course at Oxford under the form D. C. L., and at Cambridge and London under the form LL.D. At the two former universities it is occasionally conferred as honorary. The degree of S. T. D. (*Sacrosanctæ Theologiæ Doctor*, *i. e.* "Teacher of Sacred Theology"), or D. D. (Doctor of Divinity), otherwise written T. D. (Doctor of Theology), is still given at all the European universities after examination in the regular university course. It is also conferred in many cases as an honorary title. The popes and archbishops of Canterbury have long claimed and exercised the right of conferring the doctorate both in law and divinity. The degree of doctor in medicine has been traced back to 1384, and that of doctor of music is nearly or quite as old. Ph. D. (Doctor of Philosophy) is the title conferred at German and other European universities after examination by the faculty of philosophy, chiefly on students of philology. It is also conferred at several American colleges. The doctorate of literature, or of letters (*literarum humaniorum doctor*), written L. H. D., is conferred by the regents of the University of the State of New York, at Albany, as their highest honor. Besides the above there are several other doctorates, mostly of recent origin. (See ARTS, DEGREES IN.)

The word "doctor" as used in the New Testament is taken in its primitive Latin meaning, "teacher," and corresponds to the Hebrew word *mori* ("teacher") or to the title *rabbi* ("master"), which was conferred during the centuries immediately preceding and following the birth of Christ by the "nasi," the chief of the Sanhedrim, accompanied by the ceremony of the laying on of hands. At present, the Jewish doctorate is conferred by the universities.

Doc'tors' Com'mons, the popular name for the courts and offices once occupied by the body incorporated in 1768 under the title of "The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts." These courts were on the S. side of St. Paul's churchyard. The college consists of a president (the dean of the arches for the time being) and of those doctors of law who, having regularly taken that degree in either of the Universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the archbishop of Canterbury, have been elected fellows of the college in the manner prescribed by the charter. But the practical functions of this body of lawyers have been materially diminished, and the college has been empowered to sell its property and surrender its charter.

Doctors of the Church (see DOCTOR), in the Roman Catholic Church, are certain saints who after death receive this title on account of their superior wisdom and excellence. They are at present seventeen in number, viz.: Sts. Hilary of Poitiers (died 367 A. D.), Athanasius (373), Basil (379), Gregory Nazianzen (389), John Chrysostom (407), Jerome (420), Augustine (430), Peter Chrysologus (450), Leo (460), Gregory (604), Isidore (636), Peter Damian (1072), Anselm (1109), Bernard of Citeaux (1153), Thomas Aquinas (1274), Bonaventura (1274), and Alphonsus of Liguori (1787). The last-mentioned saint first received this honor Mar. 23, 1871, by decree of Pius IX. Outside the Roman Catholic Church the seven Christian Fathers mentioned in the article "Doctor" are more especially designated by the title "Doctors of the Church."

Doctrinaire, a French term, originally applied to a party of politicians who just after the restoration of 1815 occupied in the Chamber of Deputies a place between the Centre and the extreme Left. The chief men of this party were systematic writers and speakers on government, who wished to establish a form of constitution somewhat resembling that of England, and supported scientific doctrines of constitutional liberty against the arbitrary will of the king. The word *doctrinaire* was used by their opponents to stigmatize them as pedantic and unpractical theorists. The leaders of the Doctrinaires were Royer-Collard, Guizot, the duc de Broglie, and Decazes.

Doctrine. See THEOLOGY, by PRES. E. G. ROBINSON, D. D., LL.D.

Doc'ument [Lat. *documentum*, from *doceo*, to "teach," to "furnish information"], an original or official paper or writing relied on as the basis or proof of something; in law, a written instrument adduced for the purpose of evidence.

Dod (ALBERT BALDWIN), D. D., an American scholar and teacher, born in Mendham, N. J., Mar. 24, 1805, graduated at the College of New Jersey in 1822. Though licensed to preach, he was never a pastor. In 1830 he was chosen professor of mathematics in the College of New Jersey, discharging the duties of the office with signal ability till his death, Nov. 20, 1845. He contributed largely to the "Princeton Review." The family to which he belonged has for several generations been remarkable both for mathematical taste and talent.

Dod (DANIEL), an American machinist, born in Virginia in 1788, was the father of the preceding. He constructed the engine of the Savannah, the first steamboat that crossed the Atlantic. He was killed by the explosion of a boiler near New York in 1823.

Dodd (CHARLES), the assumed name of HUGH or RICHARD TOOTLE, a Roman Catholic priest of England who died about 1745. He was the author of Dodd's "Church History of England" (3 vols. folio, 1737–42), and of several other works, chiefly polemical. His history was a reply to that of Burnet, and has been in part republished (1839–43). Its value is regarded as considerable, though it is characterized by severity and unfairness.

Dodd (JAMES B.), an American mathematician, was born in Virginia in 1807. In 1841 he was chosen professor of mathematics, astronomy, etc. in Centenary College, Miss., and in 1846 became a professor in Transylvania University, of which institution he was acting president (1849–55). He has published several mathematical text-books, besides reviews, etc.

Dodd (MARY ANN HANMER), born at Hartford, Conn., Mar. 5, 1813, is the author of many poetical productions of unusual merit, printed chiefly in periodicals. A volume of her poems appeared in 1843.

Dodd (RALPH), an English engineer, born in Northumberland about 1756. He was the first projector of the Thames Tunnel, and he planned the Surrey Canal. He wrote, besides other works, an "Account of the Principal Canals of the World" (1795). Died April 11, 1822.

Dodd (WILLIAM), LL.D., an English clergyman, born at Bourne, in Lincolnshire, in 1729. He was ordained in 1753, and became a popular preacher in London. He was

also chaplain to the king, and preceptor to Philip Stanhope, earl of Chesterfield. Among his works are "Reflections on Death," "The Visitor," and "Sermons." In 1777 he was convicted of forging the signature of the earl of Chesterfield to a bond for £4000, and was put to death June 22 of the same year.

Dod'der [Ger. *Dotter*, signifying the "yolk of an egg," so called from the color], (*Cuscuta, Engelmannia*, etc.), leafless parasitical plants, generally placed by botanists in the order Convolvulaceæ, but sometimes made a distinct order called Cuscutaceæ. They have twining thread-like stems of an orange-yellow, and flowers in thick clusters. They are found native in the Old and New Worlds, and are sometimes injurious to crops by smothering the plants. The dodders are remarkable for having seeds without cotyledons. The vine grows up from the ground, and having attached itself as a climbing parasite to herbs and shrubs, the proper root dies, leaving the vine to subsist upon the juices of the plant which supports it. This it does by means of papillæ, which penetrate the bark of the plant on which it lives. Huge dodders in Afghanistan grow upon the trees, and even prey upon themselves. The dodders of the U. S. are quite numerous, and have been especially studied by the botanist Engelmann of St. Louis.

Dodder-laurels (Cassythaceæ), an order of parasitic plants having the habit and appearance of dodders, but in other respects resembling the laurels, to which they are generally referred. They replace the dodders in hot regions, where alone they grow. The U. S. have but one known species, the *Cassytha filiformis* of Florida.

Dod'dridge, a county of the N. part of West Virginia. Area, 300 square miles. It is drained by the Hughes River and Middle Island Creek. The surface is hilly; the soil is good for pasture. Grain, tobacco, and wool are raised. Coal and iron are produced. It is intersected by the Baltimore and Ohio R. R. Capital, West Union. Pop. 7076.

Dod'dridge (Philip), D. D., an eminent English preacher and author, was born in London June 26, 1702. He became pastor of a dissenting congregation at Kibworth in 1723, and removed in 1729 to Northampton, where he was principal of a theological seminary, and at the same time pastor of a large congregation. In 1730 he married Mrs. Mercy Maris. He was an earnest and devout preacher, and acquired a high reputation as a writer. His most important works are "The Rise and Progress of Religion in the Soul" (1745) and "The Family Expositor" (2 vols. 4to, 1739–40). He wrote 374 hymns, some of which are admirable. He died at Lisbon (whither he had gone for his health) Oct. 26, 1751. (See Job Orton, "Life of Doddridge," 1766.)

Dodec'agon [from the Gr. δώδεκα, "twelve," and γωνία, "angle"], a regular polygon of twelve equal sides and twelve equal angles.

Dodecahe'dron [from the Gr. δώδεκα, "twelve," and ἕδρα, a "base"], one of the five Platonic bodies or regular solids, is bounded by twelve equal and regular pentagons, has thirty equal edges and twenty equal solid angles, each formed by the meeting of three equal plane angles. Its volume is nearly 7.66312 times that of the cube of one of its sides.

Dodecan'dria [from the Gr. δώδεκα, "twelve," and ἀνήρ (gen. ἀνδρός), a "man or male"], the eleventh class of plants in the artificial system of Linnæus, characterized by the presence of twelve stamens; but as the number of plants so characterized is small, it was made to include all plants with more than ten and less than twenty stamens.

Dodeca'theon [from the Gr. δώδεκα, "twelve," and θέοι, "gods," probably an allusion to its curious nodding flowers, about twelve in number], a genus of plants of the order Primulaceæ. The *Dodecatheon Meadia* of the U. S. is an elegant plant called American cowslip, pride of Ohio, or shooting star. In cultivation it is very fine.

Dö'derlein (Ludwig), a German philologist, born at Jena Dec. 19, 1791. He was appointed professor of philology at Erlangen in 1827. Among his works are "Latin Synonyms and Etymologies" (6 vols., 1826–38) and "Homerisches Glossarium," 3 pts. (1850–58). Died Nov. 9, 1863.

Dodge, a county in S. Central Georgia, formed since the census of 1870. It is in the fertile valley of the river Altamaha, which bounds it on the S. W. The county is traversed by the Macon and Brunswick R. R. Capital, Eastman.

Dodge, a county in the S. E. of Minnesota. Area, 432 square miles. It is partly drained by the S. branch of the Zumbro River. The surface is undulating or nearly level; the soil is calcareous and fertile. Grain, wool, hay, and dairy products are raised. This county contains extensive prairies. It is intersected by the Winona and St. Peter R. R. Capital, Mantorville. Pop. 8598.

Dodge, a county in the E. of Nebraska. Area, 600 square miles. It is bounded on the S. by the Platte River and intersected by the Elkhorn. The surface is undulating; the soil is based on limestone and is fertile. Grain is the chief product. The Union Pacific R. R. passes through the southern part of this county, and it is intersected by the Sioux City and Pacific R. R. Capital, Fremont. Pop. 4212.

Dodge, a county in S. E. Central Wisconsin. Area, 930 square miles. It is intersected by Rock River and by Crawfish and Beaver Dam creeks. The surface is diversified by prairies, forests, and oak-openings; the soil is very fertile. Grain, cattle, wool, hay, and dairy products are raised. The manufactures include furniture, wagons, cooperage, saddlery, brick, flour, etc. Limestone and iron ore are found here. It is intersected by the Chicago and Northwestern R. R. and by the Milwaukee and St. Paul R. R. Capital, Juneau. Pop. 47,035.

Dodge, a township of Boone co., Ia. Pop. 1297.

Dodge, a township of Dubuque co., Ia. Pop. 979.

Dodge, a post-township of Guthrie co., Ia. Pop. 293.

Dodge, a township of Union co., Ia. Pop. 229.

Dodge (Ebenezer), D. D., LL.D., an American Baptist divine and scholar, was born at Salem, Mass., April 22, 1819, graduated at Brown University in 1840, and at Newton Theological Institution in 1845; was instructor in Hebrew at Covington Theological School (1845–46), professor in the theological department of Madison University, Hamilton, N. Y. (1853–68), and president of the university from 1868 till the present time (1874). He has published "Evidences of Christianity," several able reviews, etc.

Dodge (Grenville M.), an American general, born at Danvers, Mass., April 12, 1831. He commanded a brigade at Pea Ridge in Mar., 1862, and became a major-general of Union volunteers in June, 1864. He directed a corps of Gen. Sherman's army in the campaign against Atlanta (May to Sept., 1864), and succeeded Rosecrans as commander of the department of Missouri in December of that year. He represented a district of Iowa as a member of Congress in 1867–69.

Dodge (Henry), General, was born at Vincennes, Ind., Oct. 12, 1782. He served with distinction in the war of 1812 and in various Indian wars, was governor of Wisconsin Territory (1836–41 and 1845–48), a delegate to Congress (1841–45), and U. S. Senator from Wisconsin (1849–57). Died at Burlington, Ia., June 19, 1867.

Dodge (Mary Abigail), a popular American writer, whose assumed name is Gail Hamilton, was born in Hamilton, Mass., about 1830. She was a school-teacher in her youth. Among her works are "Country Living and Country Thinking" (1862), "Gala Days" (1863), "Woman's Wrongs, a Counter-Irritant" (1868), "Skirmishes and Sketches," and "The Battle of the Books" (1870). She has contributed to the "Atlantic Monthly."

Dodge (William E.), an American philanthropist, born in Hartford, Conn., Sept. 4, 1805, removed to New York in his thirteenth year. At the age of twenty-one he went into business on his own account, and became an extensive importer and manufacturer. He is an active member of many benevolent and religious societies, was a member of the peace convention of 1861, and a Republican member of Congress 1866–67.

Dodgeville, a post-village, capital of Iowa co., Wis., 45 miles W. by S. from Madison. It has six churches. Mines of lead and copper have been opened in the vicinity. It has one weekly newspaper. Pop. 1407; of Dodgeville township, 3708.

Dod'ington (George Bubb), Lord Melcombe, an English politician, born in 1691. He was elected to Parliament in 1715, and became a lord of the treasury in 1724. He was long a partisan of Walpole, but he turned against him in 1740. He was notorious for his venality and intrigues. He died July 28, 1762, and left a "Diary," which was published in 1784.

Do'do (*Didus*), an extinct genus of birds, usually classed among the Brevipennes or struthious birds, but by many authorities referred to the Columbidæ (pigeons), and peculiarly interesting from the fact that its extinction has but recently taken place—the *Didus ineptus* having been in existence less than three hundred years ago. The dodo was an inhabitant of the islands of Bourbon and Mauritius, and possibly of Madagascar. When Mauritius was first visited by voyagers, the dodo was very abundant, and running slowly and being wholly unable to fly, was easily killed. It is described as larger than a swan; of a clumsy form, with a large head and enormous bill, the upper mandible being the longer and hooked at the point; short, thick legs, covered with scales; four rather short toes, three before and

one behind; and a plumage of grayish down. The flesh, though tough, was eatable. In several works of the seventeenth century are rude representations of the dodo, the best being one in Bontius, edited by Piso, who calls the

Dodo.

bird doronte or dodaers. There is also a painting perfectly corresponding with this in the British Museum, and in Savery's picture of "Orpheus and the Beasts" at The Hague, Prof. Owen discovered what he considers a study of the bird from nature. A foot of the dodo is preserved in the British Museum, and a head and foot in the Ashmolean Museum at Oxford.

Dodo'na [Gr. Δωδώνη], an ancient city of Epirus, the seat of a celebrated oracle and temple of Jupiter. This was the most famous oracle of Greece except those of Delos and Delphi. Its origin was attributed to Deucalion. This oracle was consulted by the Athenians, Spartans, and other nations, and its responses were delivered from an oak tree. The temple of Dodona was destroyed by the Ætolians in 219 B. C. Its site has not been accurately identified.

Dods'ley (Robert), an English bookseller and author, born near Mansfield in 1703. He opened a bookstore in London, and became a friend of Pope, and prospered in business. He produced in 1737 a farce called "The King and the Miller of Mansfield," which was successful. His tragedy of "Cleone" (1758) was performed with great applause. He purchased Dr. Johnson's "London" for ten guineas, and his "Vanity of Human Wishes" for fifteen guineas. He published a "Select Collection of Old Plays" (12 vols. 8vo, 1780) and other works. Died Sept. 25, 1764.

Dod'son, a township of Highland co., O. Pop. 1710.

Dod'son's, a township of Tuscaloosa co., Ala. Pop. 924.

Dod'well (Col. Edward), an English antiquary and artist who left college in 1800. He afterwards passed many years on the continent of Europe, and published a valuable illustrated work called "Classical and Topographical Tour through Greece" (1818), also "Thirty Views in Greece" (1821), and other works. Died at Rome May 14, 1832.

Dodwell (Henry), a chronologist, born in Dublin, Ireland, in 1641. He became professor of history at Oxford in 1688, but was soon deprived of that chair because he refused to take the oath of allegiance to William III. Died June 7, 1711.—His oldest son, of the same name, who died in 1763, wrote a book covertly attacking Christianity.

Doe (John), the fictitious plaintiff in ejectment. (See Ejectment, by Prof. T. W. Dwight, LL.D.)

Doffer, that part of a carding-machine which takes the cotton from the cylinder when it is carded.

Dog, the *Canis familiaris* of the naturalists, a carnivorous mammal of the family Canidæ, nearly related to the wolf and the fox, is one of the most remarkable of all brutes, being possessed of sagacity, acute senses, and instincts often exceeding reason. He seeks the society of man, and makes himself a trusty servant, putting at man's disposal all the faculties which nature has given him. It is the opinion of some naturalists that the various kinds of dog are specifically identical with the wolf and the jackal.

The more important varieties of dog have been arranged in three classes, as follows:

I. Those having the parietal bones of the skull widest at the base and gradually approaching each other as they ascend, the condyles of the lower jaw being on the same line with the upper molar teeth. The Danish dog, the dingo, and the greyhound belong to this class.

II. Those having the head moderately elongated, and the parietals diverging from each other as they rise upon the side of the head, enlarging the cerebral cavity and the frontal sinus. The most valuable dogs, such as the spaniel, setter, pointer, Newfoundland dog, Esquimaux, etc., belong to this class.

III. Those having the muzzle more or less shortened, the frontal sinus enlarged, the cranium elevated and diminished in capacity. To this class belong the bulldog, the mastiff, some of the terriers, etc. The greyhound (*Canis familiaris leporarius*) is a variety of which there are many kinds, all characterized by a small head, slender limbs, and a gaunt form. In hunting they usually follow by sight, not by scent. They are not intelligent, nor are they distinguished by attachment to their masters. Some are favorites because of their swiftness, others for the extreme elegance of their shape. The Mount St. Bernard dog, often called the Alpine spaniel (*Canis familiaris montanus*), is one of the most celebrated of the shaggy or woolly breeds. It is peculiar to the Alps, and is noted for its sagacity, strength, and fidelity in saving the lives of travellers. The Newfoundland dog (*Canis familiaris Terræ Novæ*) originated in the island which gives it its name, and is probably derived from a cross of a dog carried thither by English settlers and a native breed. It is of large size, and is valuable and useful, remarkably docile, and obedient and very serviceable. The shepherd's dog is one of the most interesting and useful of the species. The hunting-dogs, hounds, and spaniels are generally of medium size, the ears are long and pendent, the scent acute, and intelligence great. In general the covering is smooth, though instances of rough hair occur.

The spaniel is probably of Spanish origin, hence his name. The ears are large and pendent, the tail elevated, the fur of a different length in different parts of the body, but longest about the ears, under the neck, behind the thighs, and on the tail, varying in color, but most commonly white with brown or black patches.

The dingo of Australia has an elongated head, flat forehead, and short and erect ears. Two kinds of hair thickly cover the body—one woolly and gray, the other silky and yellow. In form and proportions the dingo resembles the shepherd's dog. He very seldom barks, but whines and growls, like most wild dogs. These animals were formerly numerous in Australia, but are now rare.

Revised by C. W. Greene.

Doga'na (*i. e.* the house (*casa*) of the *doge*, who as head of the republic had charge of the customs; according to others, from the Arabic *al-dīvān;* Sp. *aduana*), the common name in Italian of a custom-house. It perhaps originated with the Venetians. From the same root comes the French *douane.*

Dog'bane (*Apocynum*), a genus of plants of the natural order Apocynaceæ, having bell-shaped flowers, no style, and the fruit a pair of follicles. Some of the species are herbaceous, others shrubby, and some are found in colder climates than is usual for plants of this order. The dogbane of North America (*Apocynum androsæmifolium*) is a perennial herbaceous plant about two feet high, with smooth stem, milky juice, smooth ovate leaves, and light pink flowers. It grows in open, barren places from Canada to Georgia, and is valued for the medicinal properties of the bark of the root, which is emetic, diaphoretic, and in small doses tonic. This and the Indian hemp (*A. cannabinum*) yield a copious fine flax-like fibre, used by the Indians.

Dog Bluff, a township of Horry co., S. C. Pop. 789.

Dog Days, or **Canic'ular Days,** the name given to the forty days between July 3 and Aug. 11. Canicular is derived from *Canicula,* the Latin name of Sirius, the dog-star, which rose heliacally near the 1st of July. The ancients ascribed the great heat of summer to the influence of this star, but it was by accident only that its rising coincided with the warmest season. The time of its rising depends on the latitude of the country, and, owing to precession, is later every year.

Dog Distem'per, a disorder common among young dogs, is considered to be of a catarrhal character. A general running from the nose and eyes is a leading symptom, together with a short dry cough, succeeded by loss of strength and wasting of the body. The flow from the nose, at first watery, in a little time becomes mucous and purulent, filling the eyes and choking up the nostrils, attended by coughing and vomiting, with an increased wasting of flesh and loss of appetite. A convulsive twitching, paralysis of the extremities, attended by fits, with symptoms of an affection of the brain, appear when the disease becomes malignant. At such a time the sight of another dog

often brings on a fit, which may be somewhat checked by fondling. The fits usually prove fatal if they continue to increase in violence and frequency. A frequent consequence of the distemper is inflammation of the lungs and a dysenteric discharge, indicating ulceration of the intestines.

The leading remedies, which must be applied in the early stage of the disease, are laxatives, emetics, occasional bleeding, etc. Astringents should be used to check the diarrhœa, and the violence of the fits may be quelled by warm baths and anodynes.

Doge, dōj [It. pron. do'jà, a modification of *duce* (from the Lat. *dux*), "duke"], the title of the chief magistrate in the republics of Venice, Amalfi, and Genoa. The origin of the office in Venice dates as far back as 697. Previously Venice had been governed by seven tribunes, but the intrigues consequent on their election, and the rising power of the republic, made it expedient to concentrate the power of the government. The first doge was Paoluccio Anapeste. The doges were elected by the people, and were invested with almost absolute power till 1177, when the legislative power was placed in the hands of a great council of 470 members. This council elected twenty-four of their members, who in turn elected twelve of their own number, upon whom the choice of the doge devolved. The first doge elected in this manner was Sebastiano Ziani, who, on the occasion of his installation in office, scattered money among the people to compensate them for the loss of their rights—a custom which was followed by his successors. This doge also introduced the custom of wedding the Adriatic Sea. This was a marriage ceremony which took place on Ascension Day, and which typified the absolute dominion which the Venetians claimed over that sea. On these occasions a ring was thrown into the sea from the ship Bucentaur. From this time the council gradually narrowed the powers of the doge, till in 1628 the offices of commander-in-chief of the army and high-admiral of the navy ceased to belong to the dogate (or dogado, as the dignity was called), unless by a special decree of the Council of Forty, a high court of justice composed of forty members. In the fourteenth century the Council of Ten was established, and vested with the highest power in the state, which entitled it to pass judgment even upon the doge himself. About this time the powers of the doge became so restricted as to be little more than nominal, and the constant espionage to which he was subjected made the office no longer an object of ambition. In 1339 it was found necessary to pass a law prohibiting a doge who had been elected from resigning his place. The office disappeared with the fall of the Venetian republic in 1797. Lodovico Manin, elected in 1788, was the seventy-third and last doge of Venice.

The first doge of Genoa was Simon Boccanera, elected by the people in 1339. Like that of the doge of Venice, his office was originally for life. His powers were shared, though not restricted, by twelve aldermen. In 1528 the Genoese framed a new constitution, by which the doge was to be re-elected every two years, and the powers of the office were restricted by two councils, of which one comprised 300 and the other 100 members. In 1797, when the French occupied Genoa, the office of doge ceased to exist. In 1802 it was restored with the restoration of the republic, but it finally disappeared in 1804. The republic of Amalfi in 897 A. D. exchanged its government by annually chosen consuls for the dogate, which was held for life; but its republican government ceased in 1350.

REVISED BY C. W. GREENE.

Dog-Fish, the name of several small species of shark belonging to the genera *Scyllium*, *Spinax*, *Mustelus*, etc., so named probably from their pursuing their prey like dogs hunting. They have five gill-openings on each side, the tail fin is longer than it is broad, and they have spout-holes. The spotted dog-fishes (*Scyllium canicula* and *Scyllium catulus*) are common on the British coast. The *Acanthias vulgaris*, or common dog-fish, is found in great quantities on the coasts of the Hebrides and Orkneys, where it is used as food. This fierce and greedy fish is abundant along the New England coasts, and is caught for its excellent oil. Other species occur on the American coast. Their bite is much dreaded by sailors. A sort of shagreen is made of their skins. The dog-fish of the Western States is the AMIA CALVA (which see).

Dog-Fox, the name of a small animal found in Asia and Africa, belonging to the family Canidæ, and of the genus *Cynalopex*. They have erect pointed ears, a sharp muzzle, somewhat resembling that of a greyhound, and a bushy tail.

Dog'ger [Dutch *dogger*, "cod-fish"], a two-masted fishing-boat of the ketch build, with bluff bows. It is used by the Dutch for the Doggerbank fishery.

Dog'gerbank, an extensive sandbank in the middle of the German Ocean, between England and Denmark. It extends from lat. 54° 10′ to 57° 24′ N., and from lon. 1° to 6° 7′ E. Length, about 320 miles; average width, 40 miles. In some parts it is covered with only nine fathoms of water. Here are important cod-fisheries. An indecisive battle was fought here between the Dutch and English fleets in Aug., 1781.

Dog'gett (DAVID SETH), D. D., a bishop of the Methodist Episcopal Church South, was born in Virginia in 1810. He was educated at the University of Virginia, and entered the itinerant ministry in the Virginia Conference of the Methodist Episcopal Church in 1829. He was professor in Randolph-Macon College, Va., for several years, and was consecrated bishop in 1866, since which time his residence has been in Richmond, Va. He is a learned and eloquent divine, and is very efficient in the exercise of his episcopal functions.

Dog Island Light, on the S. coast of Florida, is a revolving light 45 feet above the water; lat. 29° 46′ 51″ N., lon. 84° 38′ 37″ W. The island is 30 miles E. of Appalachicola, and the light is 1 mile E. of its W. end.

Dog'ma [Gr. δόγμα, from δοκέω, to "seem," "that which seems true;" Fr. *dogme*; It. *domma*; Sp. *dogma*], originally an opinion, afterwards an article of belief derived from authority. The term is sometimes applied to what are regarded as the essential doctrines of Christianity, as contained in the Scriptures or the writings of the Fathers of the Church. The study or science of dogmas (Dogmatik) has a separate professorship in the Protestant universities of Germany. The term "doctrine" is a preferable one, as "dogma" is coming more and more to be used in an unfavorable sense.

Dog's-Tail Grass (*Eleusine*), a genus of grasses, the species of which are found native in Europe and Asia. The crested dog's-tail grass (*Eleusine cristata*) is much prized in England for lawns and sheep-pastures. The *Eleusine Indica* is extensively naturalized in the U. S.

Dog Star, a popular name of Sirius, a star of the first magnitude in the constellation Canis Major, and the brightest fixed star in the firmament.

Dog'tooth, a township of Alexander co., Ill. P. 301.

Dogtooth Spar, a name given to certain pointed crystals of calcareous spar, from their fancied resemblance to the tooth of a dog.

Dog Watch, on shipboard, a short watch of two hours. There are two dog watches—the first usually from 4 to 6 o'clock P. M., and the second from 6 to 8 P. M.

Dog'wood, a township of White co., Ark. Pop. 513.

Dogwood, a name given in the U. S. to several small trees, especially to the *Cornus florida* and others of its genus, which contains also the cornel trees or dogwoods of Europe. The larger species are characterized by their hard wood, which is useful in turnery, and by their bitter tonic bark. The *Cornus florida* is well known for its white, showy involucral blossoms, appearing in May and June. In the West Indies, etc. various other trees are known as "dogwoods." One of these, the *Piscidia Erythrina*, or Jamaica dogwood, a small leguminous tree, found also in Florida, has a valuable and very hard timber. Its bark is a powerful narcotic and anodyne poison.

The "poisonous dogwood" or "poison sumach" (*Rhus venenata*) of the U. S. is probably much the most poisonous to the touch of all our native plants. It closely resembles the *Rhus Vernix* or varnish tree of Japan, and may be distinguished from the harmless sumachs by its panicles, which are loose (not thyrsoid or closely clustered in a spike, like the harmless ones), and which are axillary, while those of the harmless species are terminal. (See RHUS.)

Dogwood Neck, a township of Horry co., S. C. Pop. 573.

Dohud, a town of Upper India, on the boundary between Malwah and Guzerat; lat. 22° 55′ N., lon. 74° 20′ E. It is on the road to the Gulf of Cambay, and is much visited by merchants.

Doit [said to be derived from the Fr. *d'huit*, "of eight," it being the eighth part of a penny or stiver], the name of a small Dutch coin used in Scotland during the reign of the Stuarts, supposed to be worth about half a farthing.

Do'kos, a dwarfish race of negroes, inhabiting a region of Africa S. of Abyssinia, and living in a perfectly wild state. They are captured in large numbers by the slave-dealers.

Dolabel'la (PUBLIUS CORNELIUS), a profligate Roman patrician, born about 70 B. C., married Cicero's daughter Tullia. He fought for Cæsar at Pharsalia in 48 B. C., and became consul about the year 44. He was afterwards a partisan of Antony, was defeated by Cassius in Syria, and killed himself in 43 B. C.

Do'lan, a township of Cass co., Mo. Pop. 1475.

Dolan's Ranche, a township of Ellis co., Kan. P. 17.

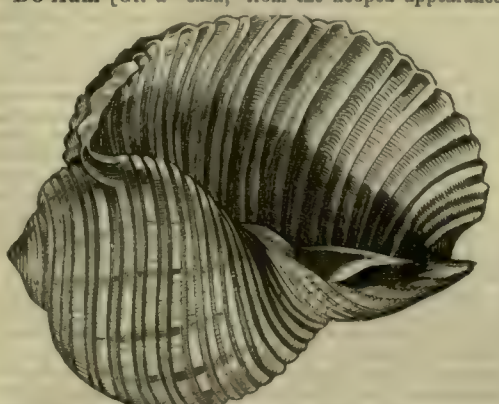
Dol'ci (Carlo), an Italian painter, born at Florence May 25, 1616, was a pupil of Jacopo Vignali. His works, which are numerous and scattered over all Europe, are very finely finished. Died Jan. 17, 1686.

Dol'cinites, or **Dul'cinists,** a sect founded by Dolcino, an Italian born at Novara in the thirteenth century. They opposed the popes, and, according to Milman, held kindred tenets with the Fraticelli or Spiritual Franciscans, with some leaven of the old doctrines of the Patarines (Puritans) of Lombardy. Dolcino and some of his followers were burned alive in 1307.

Dole [Ang.-Sax. *dælan;* Dutch *deelen;* Ger. *theilen,* to "distribute," "deal out in small quantities"], a gift of food or money to the poor at funerals. The custom was formerly very prevalent in Great Britain and Ireland.

Dôle [Lat. *Dola* or *Tollium*], a town of France, department of Jura, is at the base of a vine-clad hill on the river Doubs, about 30 miles S. E. of Dijon. It is connected by railway with Dijon and Lyons. It has a large cathedral, a court-house, a theatre, and a public library; also manufactures of hardware, pottery, straw hats, and chemical products. Dôle was formerly the capital of Franche-Comté. It is supposed to occupy the site of the ancient Roman *Dola Sequanorum.* Pop. 11,093.

Dolet (Étienne), a learned French writer, born at Orleans in 1509. He lived at Lyons, where he established a printing-press and published able works on theology and other subjects. His writings were burned by order of Parliament as heretical in 1543. He translated some works of Plato and Cicero, and wrote a "Commentary on the Latin Language" (1536). He was burned at the stake in Paris on a false charge of atheism Aug. 3, 1546.



Dolgelly, a market-town of Wales, capital of the county of Merioneth, on the Mynach, here crossed by a bridge, 46 miles W. of Shrewsbury. It is in a rich valley at the foot of Cader Idris, and is surrounded by beautiful scenery. It has manufactures of coarse woollens called webs.

Dolichocephal'ic [from the Gr. δολιχός, "long," and κεφαλή, the "head"], a term applied to human skulls which have the occipito-frontal diameter (that from the back to the front) much in excess of the transverse diameter. The native Australians and West African races afford extreme examples of this form of skull. Those skulls which have a relatively short occipito-frontal diameter are called *brachycephalic—i. e.* "short-headed." Examples of both forms here noted are found among the remains of the prehistoric races of Europe. Which of the two types belong to the earliest period is an unsettled question. Among the historic peoples of Europe the dolichocephalic form prevails among the Indo-European varieties, and the brachycephalic among the Finnic. (See Wilson, "Pre-historic Annals of Scotland," and Lubbock, "Pre-historic Races," pp. 90–116.)

Dol'ichos [Gr. δολιχός, "long," so called from the length of its pods], a genus of leguminous plants, allied to *Phaseolus.* They are natives of the East and West Indies, where the pods and seeds are used as food. The Chinese sauce called soy is made from the *Dolichos Soya,* or soy bean, and the tuberous roots of some species are eaten in China. Other species are cultivated for the beauty of their flowers.

Doli'na, a town of Austrian Galicia, about 75 miles S. of Lemberg. It has extensive salt-mines. Pop. 6200.

Do'lium [Gr. a "cask," from the hooped appearance of the shell], a genus of gasteropod mollusks of the whelk family, having spirally furrowed shells. Some fourteen living species are found in the warm seas of the Eastern hemisphere, and seven fossil ones, mostly from the tertiary.

Dolium Galea.

Doll [Fr. *poupée;* Ger. *Puppe;* perhaps a contraction of *Dorothy,* but supposed by some to be an abbreviation of *idol, i. e.* an "image"], a toy of wax, wood, or plaster, made like the image of a child, and used as a plaything. Dolls were in use in the earliest times, and those of the Greek and Roman children were buried with them when they died. Great Britain was formerly supplied with these toys principally from the Netherlands, but there are now many extensive manufactories of them in London and other English towns. Many of those which come to the U. S. are manufactured in Nuremberg, Germany.

Dol'lar [Ger. *Thaler;* Dan. *Daler;* see below], a gold or silver coin of different values current in the U. S. and several countries of Europe. Its name is derived from Joachimsthal (Joachim's Valley) in Bohemia, where dollars were first coined (1518). The dollar is the unit of account in the monetary system of the U. S. It was coined in silver only until 1849, when a coinage was authorized of dollars in gold. Its value was originally the same as that of the Spanish piastre of eight reals, but is now somewhat below. The weight of the silver dollar was fixed by law in 1837 at 412½ Troy grains. The U. S. dollar is not now represented by any silver coin. The silver half-dollar weighs 12½ grammes, or two silver half-dollars 25 grammes. (Act of Congress, approved Feb. 12, 1873.) The act referred to created also a silver "trade dollar," weighing 420 grains, for use in commercial transactions in the East. The gold dollar weighs 25.8 grains = 1.672 grammes, exceeding 1⅔ grammes, or 5 ter-grammes, by only six one-thousandths of a gramme. The standard fineness of both silver and gold for coinage is nine-tenths (*i. e.* one-tenth of it is alloy). The British standard of fineness is eleven-twelfths for gold, and thirty-seven-fortieths for silver. Half-dollars, quarter-dollars, and dimes are coined in silver. A silver half-dime was also coined before 1873. The half-dollar (since 1873) weighs twelve and a half metric grammes—the smaller coins proportionately less. The actual value of the U. S. gold dollar, in British currency, is 4*s.* 1½*d.* The gold coins of the U. S. are legal tenders for all sums; the silver coins are legal tenders only for sums not exceeding five dollars. Accounts in dollars and cents are written thus: $13.78 = thirteen dollars and seventy-eight cents. The coins are double-eagles, eagles, half-eagles and quarter-eagles, valued at twenty, ten, five, and two and a half dollars; also, three-dollar and one-dollar pieces. The German thaler has different values. The most current, that of Prussia, is worth seventy-one cents. (See Rixdollar; also Coinage, by E. B. Elliott.)

F. A. P. Barnard.

Dol'lart, The, a gulf of the German Ocean, is at the mouth of the river Ems, between Hanover and Holland. It is 10 miles long and 7 miles wide. It was formed by an inundation in 1276.

Döl'linger (Johann Joseph Ignaz), D. C. L., an eminent German divine and leader of the "Old Catholic" movement, was born at Bamberg, in Bavaria, Feb. 28, 1799. He received priestly orders in 1822, and almost immediately after became chaplain to the diocese of Bamberg. "The Doctrine of the Eucharist during the First Three Centuries" was published by him in 1826, and he was invited the same year to lecture on the history of the Church before the University of Munich. The substance of these lectures appeared in 1828 in his "Manual of the History of the Church," and again, more extended, in his "Treatise on the History of the Church" (1838). He turned his attention to politics in 1845, and represented the University of Munich in the Bavarian Parliament. In 1849, when a delegate to the Diet of Frankfort, he voted for the absolute separation of the Church from the State. He delivered in 1861 lectures advocating the abandonment of the temporal power by the Holy See. He published "Origins of Christianity" (1833–35), "The Religion of Mohammed" (1838), "The Reformation, its Interior Development and its Effects" (3 vols., 1846–48), "A Sketch of Luther" (1851), "Hippolytus and Callistus, or the Roman Church in the First Half of the Third Century" (1854), "Paganism and Judaism" (1857), "Christianity and the Church" (1860; 2d ed. 1868), "The Church and the Churches, or the Papacy and the Temporal Power" (1861), a translation of which appeared in 1862, "Papal Legends of the Middle Ages" (1863), and a "History of the Religious Sects of the Middle Ages" (3 vols., 1870). Dr. Döllinger has in particular obtained wide fame by his opposition to the decrees of the Vatican Council, and particularly to that one declaring the infallibility of the pope when addressing the Church *ex cathedrâ* on questions of faith and morals. He published on this subject the pamphlets "A Few Words on the Infallibility Address" and "The New By-Laws of the

Council" (1870), and he was commonly believed to be one of the authors of the "Janus," one of the most important works published against Papal infallibility. As he emphatically declined to submit to the decrees of the Vatican Council, he was, on April 17, 1871, formally excommunicated by the archbishop of Munich. On July 29, 1871, he was elected rector of the University of Munich, receiving 54 out of 63 votes cast. He took a leading part in the Old Catholic congresses of Munich (1871) and Cologne (1872). In the former he showed himself opposed to the measures adopted by the majority for effecting a permanent ecclesiastical organization of the Old Catholics; in the latter he was elected chairman of a special committee on the reunion of the Christian churches, a subject to which he has for years devoted a special attention. He has been for years a member of the first chamber of the Bavarian Diet.

Dol'lond (JOHN), F. R. S., an English optician well versed in mathematics, was born in London June 10, 1706. He was a silk-weaver in his youth, and employed his leisure hours in the study of sciences and languages. In 1752 he became a partner of his son PETER (born 1730, died July 2, 1820) in the business of optician. They fabricated telescopes of superior quality. John Dollond invented the achromatic telescope, for which he received the Copley medal of the Royal Society in 1758. Died Sept. 30, 1761.

Dol'men, a word of Cymric origin, nearly synonymous with CROMLECH (which see). The proper dolmen consists of one large unhewn stone, resting on two or more unhewn stones placed erect in the ground. The term is sometimes applied to structures where several blocks are raised on pillars so as to form a sort of gallery. Near Saumur in France is a dolmen called *Pierre Couvert*, which is sixty-four feet long and fifteen feet wide. Such structures are now generally referred to pre-historic races.

Do'lo, a town of Italy, in Venetia, on the river Brenta, 12 miles W. of Venice, on the railway to Padua. Here are many fine villas of the Venetian nobility. Pop. 5523.

Dolomieu, de (DÉODAT GUI SYLVAIN TANCRÈDE DE GRATET), a French geologist and mineralogist, born at Dolomieu, in Dauphiny, June 24, 1750. He joined the order of the Knights of Malta in his youth, and having returned to France in 1791, he explored the geology of that country, and wrote several geological treatises, which were inserted in the "Journal de Physique." He was one of the savants who accompanied Bonaparte to Egypt in 1798. He was thrown into a prison by the Neapolitans in 1799, and released the following year; he was appointed professor of mineralogy in the Museum of Natural History. He died Nov. 26, 1801. (See LACÉPÈDE, "Notice historique sur la Vie de Dolomieu," 1802.)

Dol'omite [named in honor of the savant Dolomieu], or **Magnesian Limestone,** a mineral consisting of carbonate of lime and carbonate of magnesia in variable proportions, which are sometimes nearly equal. Its crystals are usually rhomboidal. Dolomite is extensively used as a building-stone, and is converted into good lime by burning. The new British houses of Parliament are built of this stone. In England, fossiliferous dolomites form the greater part of the Permian limestones from Durham to Nottinghamshire. Large mountain-masses of crystalline dolomite occur in the Tyrol. It is also abundant in the eastern parts of New York, Pennsylvania, Maryland, and other States.

Dol'phin [Gr. δελφίν; Lat. *delphinus*; Fr. *dauphin*] is properly the name of a cetaceous mammal of the Mediterranean (*Delphinus delphis*), the dolphin of the classic poets. It is six or eight feet in length, and very active in its habits. There are many similar species known as dolphins in various parts of the ocean. The dolphin of modern sailors, the beauty of whose colors when dying is so celebrated, is a true fish, the *Coryphæna hippuris*, abounding in the warmer parts of the Atlantic, where it wages incessant warfare against the flying-fish and other inhabitants of the sea. It is often eaten, and is very palatable, but its flesh is said to be sometimes poisonous. The colors of the dying dolphin appear to be owing to the gradual evaporation of the water retained between the scales of the fish (which are translucent, while the body is white), causing the irised appearance seen in soap-bubbles, and known as the "colors of thin plates." The beauty, which is very real, has been much exaggerated by poets who have never personally observed it.

Dol'son, a township and post-village of Clark co., Ill. Pop. 1221.

Dom, or **Don** [from the Lat. *dominus*, a "lord"], a title originally assumed in the Middle Ages by the popes. It was afterwards borne by bishops, and sometimes given to monks, as Dom Calmet and Dom Mabillon. In Portugal the title *dom* is confined to the king and his family. The Spanish *don* was formerly a title confined to noblemen, but is given by courtesy as indiscriminately as the English *Mr.* In the U. S., Roman Catholic dignitaries of German origin have the title *dom*.

Domain' [Fr. *domaine*; Lat. *dominium*, from *dominus*, a "lord"], empire, authority; the territory over which authority is exercised; landed estate; an estate which a person has in his own right; that portion of the territorial possessions of a lord which he retains in his own occupation, sometimes called DEMESNE (which see). The term *domaine* is applied in France to public property in general. The public land belonging to the government or people of the U. S. is often called the public or national domain.

Domain, Eminent. See EMINENT DOMAIN, by PROF. T. W. DWIGHT, LL.D.

Domat (JEAN), a French jurist, born at Clermont, in Auvergne, Nov. 30, 1625. He was a friend of Pascal and other recluses of Port Royal. He officiated for many years as king's advocate at Clermont, and published an important systematic work entitled "The Civil Laws in their Natural Order" (1689). Died in Paris Mar. 14, 1696. (See E. CAUCHY, "Études sur Domat," 1852.)

Dom-boc, or **Doom Book** (*Liber Judicialis*), the name of a code of laws compiled by King Alfred, partly from the Kentish collection of Ethelbert and the Mercian laws of Offa, but chiefly from the laws made by his own ancestor, Ina. Alfred made few original laws, but restored and renovated those already existing. The laws of England, up to the time of the Norman Conquest, were administered in the vernacular speech of the people. Alfred's Christian character is clearly indicated in his code, which commences thus: "The Lord spake all these words, saying, 'I am the Lord, thy God.'" Then followed the ten commandments, a part of the Mosaic law, and passages from the New Testament, including the Golden Rule. The code was ratified by the Witan, as Alfred informs us.

Dombrow'ski (JOHN HENRY), a Polish general, born in the palatinate of Cracow Aug. 29, 1755. He fought against Russia in the war of 1792–94, during which he obtained the rank of general. In 1795 he entered the French service, and in 1797 passed into that of the Cisalpine republic as commander of a Polish legion. In 1806 he raised an army of 30,000 Poles to fight for Napoleon. He gained a victory at Dirschau in 1809, and took part in the Russian campaign of 1812. Died June 6, 1818.

Dombrowsky (JAROSLAV), a Polish revolutionist, born at Cracow in 1826, served first in the Russian army, and was in 1862 compelled to flee in consequence of having participated in the Polish insurrection. He is also accused of having been a counterfeiter and a traitor to the Poles. He formed in the beginning of the French-German war a Polish legion, was on April 8, 1871, appointed to the command of the insurgent troops at Asniers, and on May 9 succeeded Rossel as commander-in-chief of all the forces of the Paris Commune. On May 22 he was mortally wounded, and died on May 23.

Dome [It. *duomo*, originally the "house (*domus*) of God," afterwards applied in Italian to a cathedral, of which a *dome* in the common English sense of this word is one of the most remarkable features]. This word, though used often to signify a cupola, means, strictly, the outer part of a spherical roof, of which the cupola is the inner part. In Italy, however, it has a wider significance, being used to designate the chief church of a town. As all the chief churches were roofed in this way, the name of the church was applied to the kind or species of roof. The origin of the dome is often traced to the Eastern empire, because it was in the Byzantine provinces that it was first applied to ecclesiastical building. But the Romans really invented the dome, and originated all applications of the semicircular arch. The dome of the Pantheon is one of the most magnificent in the world, and domes of smaller size are in the temples of Bacchus, Vesta, Hercules, Romulus, etc. The three most renowned modern domes are those of St. Peter's at Rome, St. Paul's in London, and the Pantheon at Paris.

The dome of the Capitol at Washington is the finest in America. It is made of cast iron, and is surmounted by a bronze statue of Liberty twenty feet high, designed by Crawford. The dome is considered the finest iron structure in the world.

Domenichi'no, an Italian painter, whose proper name was DOMENICO ZAMPIERI, was born at Bologna Oct. 21, 1581. He was a pupil of Annibal Caracci at Rome, where he worked for several years. He was employed as painter and architect by Pope Gregory XV. Among his masterpieces are "The Communion of St. Jerome" (in the Vatican), "The Martyrdom of St. Agnes," and the "Cure of the Demoniac Boy." In the latter part of his life he worked in Naples, where he died April 15, 1641. (See LECARPENTIER, "Notice sur D. Zampieri," 1812.)

Domesday Book. See DOOMSDAY BOOK.

Domestic Animals are such as are reared by man for his own use, and at the same time tamed or familiarized to some extent to man's presence; for bees, silkworms, and a few other insects reared by man are never really tamed, though modified in many cases in form by the influence of man. A great many animals may be tamed, and yet not truly domesticated, for true domestication implies a course of breeding for many generations.

The more important domestic animals are the ox, buffalo, yak, sheep, goat, reindeer, camel, llama, alpaca (ruminants), the horse, ass, elephant, swine (pachyderms), rabbit, guinea-pig (rodents), dog, cat, ferret (carnivores), and of birds, the hen, turkey, peacock, guinea-fowl, pheasant (gallinaceous birds), goose, duck, etc. (natatores), besides the pigeons and various song-birds. The breeding of fishes for food is not true domestication.

The wonderful changes of form, habit, and temper observed in various breeds of the dog, and the still more remarkable variations in the form of pigeons, have suggested to many naturalists the idea of the mutability of species. (For a discussion of the question in this aspect, see DARWIN "On Domestic Animals and Cultivated Plants," 1867, and the articles EVOLUTION, by PROF. HENRY HARTSHORNE, and DARWINISM, by PROFS. YOUMANS and SEELYE.)

Dom'icile [Lat. *domicilium*, from *domus*, a "house;" Fr. *domicile*], a mansion; a place of permanent residence; in law, the place where a person has his home or his legal place of abode.

A distinction must be taken between residence and domicile. A person may have two or more residences, but can have only one domicile. A domicile may be said to be the place where a person has his true fixed and permanent home and principal establishment, and to which, whenever he is absent, he has the intention of returning. A domicile may be acquired in three ways—by birth, by choice, or by operation of law. Domicile acquired in the first mode is frequently called "domicile of origin." When of choice, it must consist both of an act and an intent. A mere intent to acquire a domicile will have no effect. Nor will a prolonged residence in a particular place constitute a domicile, unless accompanied by an intent to acquire it. Domicile is acquired by operation of law when it is a consequence of certain legal relations, as in the instance of a wife. The rules affecting domicile have much importance in international law, whether public or private, and for this purpose it may be distinguished into domestic and national. Questions concerning the validity of marriages and divorces, the execution and construction of wills, and succession to estates, frequently depend on the law of domicile.

The leading rules governing domicile are these: 1. The domicile of origin continues until a new one is acquired. The same rule of continuance applies to successive domiciles. 2. A person having legal capacity may, in general, change his domicile at will. Persons under legal disability, such as minors and lunatics, have no such power. The domicile of a minor is in general that of his parent or guardian. 3. The law in some cases fixes the domicile of a person at the place where the person is under a duty to reside. Under this rule the holder of an office may be domiciled at a place where official duty requires him to reside. On the same principle the wife's domicile follows that of the husband, though this rule is modified in matters of divorce. 4. To change one's domicile there must be both an intent and an act. The intent may be inferred from a variety of circumstances, and in some instances the inquiry ranges over a period of many years. Under this rule an enforced sojourn in a place will not in general constitute a domicile. (See INTERNATIONAL LAW, PRIVATE, by PRES. T. D. WOOLSEY, S. T. D., LL.D.) T. W. DWIGHT.

Dom'inant [Lat. *dominans*, present part. from *dominor*, to "rule," to "prevail"], in music, the fifth tone of the scale, agreeing with the note G. The dominant is the ruling tone of the key, and next in importance to the first tone of the gamut.

Domingo, Santo. See SANTO DOMINGO.

Domingo, Santo, Projects of Annexation to the U. S. Investigations and negotiations looking towards the annexation of the republic of Santo Domingo, or the cession of valuable parts of it, to the U. S. extend over a period of nearly thirty years. The series of Democratic administrations between 1844 and 1860 had constantly in view the policy of the acquisition of territory in the West Indies, and made several investigations within the territory of the Dominican republic. That this did not end in annexation was evidently due not so much to the opposition of the Dominicans as to the half-heartedness of influential American politicians, arising from the peculiar condition of parties in the U. S. The statesmen of the slave-holding States and their allies from the free States were then in power at Washington. They felt the need of additional slave States in the West Indies to balance the inevitable increase of free States in the North, but they evidently dreaded to add a republic in which the blacks were free and their equality recognized by law and custom.

The first negotiation seems to have been made in 1845, when President Polk sent Mr. Hogan as commissioner to the island. His reports were favorable, and during the next year Lieut. D. D. Porter, now (1874) admiral of the navy, was sent to make an additional investigation of the resources and condition of the country. His examination was thorough and his report favorable. But the difficulty arising from negro freedom and equality in the island was revealed as fully as its material wealth, and nothing was done.

The Taylor-Fillmore administration paid little if any attention to this subject, but one of the first acts of the succeeding administration, that of Pierce, was to send Capt. (since Maj.-Gen.) G. B. McClellan to make a more thorough survey than had been made, especially of the Bay of Samana. Capt. McClellan visited the island in 1854. His survey was made with great care, and he reported strongly in favor of the acquisition of at least a portion of the Samana peninsula as a naval station for the U. S. His only error seems to be in overrating the mineral wealth of Samana; the want of thorough geological knowledge caused him to mistake beds of lignite for beds of coal. But into this mistake even so eminent an authority as Sir Robert Schomburgk had fallen before him, and this error was persisted in until geologists connected with the commission of 1871 made thorough examination; it detracts, however, very little from the general value of McClellan's conclusions.

Another negotiation looking towards the acquisition of territory followed, but with no result. The struggle during the great civil war in the U. S. seems to have diverted thought in Washington from any efforts in the West Indies likely to arouse the ill-feeling of European powers. But hardly was that contest ended when the subject came up again. The necessity of an American naval station in the West Indies had been brought home to the administration by difficulties in dealing with blockade-runners during the civil war, and in 1867, Mr. Seward, the secretary of state, with a considerable retinue of officials, visited the Dominican capital, and had an interview with the authorities. But other projects of annexation were preferred by the Johnson administration, and this was postponed. Shortly after the accession of Gen. Grant to the presidency the subject was again brought up by overtures from the Baez government, then in control of the Dominican republic. For some time nothing was done. A reaction against the extension of territory had set in. There was a general feeling that the recently acquired territory of Alaska had cost more than its value, and this feeling was strengthened by the news of the St. Thomas earthquakes, which contributed so much to the failure of the attempt to acquire that island.

The early communications by President Baez were received with distrust at Washington, but at last a communication was received from him to the effect that the difficulties of the Dominican republic had become so great that if it could not make terms with the U. S., self-preservation would force it to do so with some other nation. In view of this, President Grant sent Gen. O. E. Babcock on a confidential mission to the Baez government. Gen. Babcock made two visits to the island, and the result was the project of a treaty signed by the Dominican government on the one hand, and afterwards ratified by the Dominican people; and on the other hand signed by the Washington administration, awaiting ratification by the Senate. The main points in the treaty were that the Dominican republic was to come under the government of the U. S. as a Territory, receiving $1,500,000 in order to extinguish her debt; and as security for such application of funds the U. S. was to have a lien on all the lands of the republic. It was also stipulated that no further grant or concession should be made by the Dominican government, and no further debts contracted, after the execution of the treaty. In addition to the annexation treaty, having reference to the entire territory of the republic, there was prepared a convention for the lease of Samana Bay to the U. S. for fifty years, the annual rental to be $150,000, and the first instalment to be paid at once. If the treaty for the acquisition of the island should be ratified, this first annual payment was to be deducted from the million and a half to be paid under that treaty. A clause in the treaty required it to be ratified by a popular vote of the Dominican people. This took place in Feb., 1870, the official returns showing for the measure over 15,000 votes, and against it less than 400.

The treaty having been sent to the Senate, a very strong opposition was developed, and in consequence it lingered

until it expired by its own limitation on May 29. On May 31 the treaty was renewed, and the debate upon it was one of the most earnest and brilliant in American annals. The leaders against the treaty were Senators Sumner and Schurz, and the leaders in its support Senators Morton and Conkling.

While the measure was pending, circumstances occurred which greatly embittered the whole question. A petition was received from one Davis Hatch, a citizen of Connecticut, claiming that he had been arrested and condemned to death by the Dominican government, and that, although the penalty in his case had been changed to banishment, he had been detained in prison longer than he would otherwise have been, by the machinations of the American negotiator of the treaty, Gen. Babcock. The cause alleged for this was fear lest Mr. Hatch should return to the U. S. and denounce the treaty before its publication. A special committee of the Senate, appointed to investigate this case, presented a majority report, very voluminous, declaring the charges against Gen. Babcock "totally unfounded," and that "his whole conduct had been marked by honor, truth, and fidelity, and the evidence leaves him without a stain."

An additional difficulty was caused by the dealings with the republic of Hayti, adjoining the Dominican republic. A war had been going on for nearly thirty years between the two republics, and a bitterly hostile feeling was the result. The efforts of the Haytians to overthrow the Baez government, and so prevent the treaty with the U. S., led to the sending of some American armed vessels upon the Haytian coast while the treaty was pending, and into the Haytian harbors; and it was charged that some of the American officers assumed too dictatorial a tone with the officials of the Haytian republic. The result was that the treaty was finally rejected.

In his message at the beginning of the next Congress, in view of the many charges which had been preferred, the President recommended the appointment of a commission to proceed to the island and make a thorough investigation of the important points that had been raised in the debates. A second struggle followed, more bitter than the first. The opponents of the administration were not less vigorous in opposing the investigation than they had been in opposing the treaty. But the measure was finally carried by an overwhelming vote in both Houses. The commissioners appointed were Benjamin F. Wade of Ohio, Andrew D. White of New York, and Samuel G. Howe of Massachusetts. To them were attached Judge Burton, formerly minister to Bogota, as secretary, and Frederick Douglass and Gen. Franz Sigel as assistant secretaries. In view of the fact that several of the questions to which answers were required by Congress demanded scientific investigation, a number of scientific gentlemen of eminence were attached. The commission sailed from New York Jan. 17, 1871, and reached Samana Bay the following week.

The work before them was carried out with great care. Expeditions were sent through various parts of the island. Full testimony was taken regarding the purchases or leases of land by Americans, the mineral wealth and agricultural capabilities, the fisheries, and the condition of the country as regards health. Botanists were also employed to examine into the production of choice woods, and agriculturists of experience to examine as to the capabilities of the soil. Besides this, a very careful investigation was made as to the general condition of the people, and their feelings regarding the annexation and the ratification of the treaty with the U. S., and especially to find whether the popular vote was fairly taken. In accomplishing this the commission took testimony at all important points in the republic. Dr. Howe made an extended journey from E. to W., and Mr. White crossed the island, passing from Santo Domingo City through the great valleys and over the mountains of the Cibao to the leading commercial city of Puerto Plata on the N. side of the island, making examinations at the intervening towns. Besides this, fourteen expeditions, provided with careful instructions and full schedules of questions to ensure careful investigation, were sent into the various parts of the republic; so that, with the exception of the extreme western part, overrun by Haytian troops, every part of the country was very thoroughly examined.

The report of the commission, with the accompanying testimony, has since been published by Congress. As to the condition of the country, the commission finds "that there is no opponent of the present administration of that republic who has now, or who ever has had, any claim to the chief magistracy by a title superior to that of the present incumbent." It condemns the factions seeking to overthrow the existing government, and submits proofs that they are inspired by the government of Hayti. It calls attention to the fact that, in spite of the sad condition of the republic, some local liberties have been preserved which show capacity for self-government. It also shows the reason why the Spanish government, after being called to the island, was necessarily expelled. Very thorough statements are made regarding the desire for annexation by the people. The commission found that everywhere this desire was most earnestly manifested. They attribute this feeling in part to ideas which have come from American colored colonists, but far more to the absolute necessity of some refuge from the constant war with Hayti, and the anarchy resulting from the cabals of military leaders. The commission found a remarkable absence of prejudice regarding class, race, and color. Also that there is no intolerance towards the small number of Protestants—that there is very little education, but considerable desire to obtain it. As to population, they set it down at about 150,000. As to race, they say: "White blood preponderates largely in Santo Domingo, but pure whites, in the popular sense of the word, are not numerous. The majority are of a mixed race, nearer white than black." As to mineral products, the geologists report the existence of iron, copper, gold, lignite, rock-salt, and petroleum. Iron ore is especially abundant. As to the soil, they find the eastern districts of the republic rich and fertile, but some of the western part arid; and sum up by saying that this is naturally the richest of the West Indian islands. The portion of the report devoted to agricultural products and forest products, and that regarding the fisheries, are very carefully given. As regards climate and health, the commissioners come to the conclusion that with care life is as safe in Santo Domingo as in the Northern States of the U. S., and that no more die of malignant fevers in Santo Domingo than of pulmonary complaints in New England. Much stress is laid upon the value of the Bay of Samana as a naval port. The public debt is shown to be about $1,500,000; the income of the government about $800,000. They find that the Dominicans do not at all expect to enter into the Union as a State. Much stress is laid upon the influence which the acquisition of Santo Domingo would have in breaking down slavery in the adjoining islands of Cuba and Porto Rico, as all duties on products would be a discrimination against slave-labor.

The commission also visited the capital city of Hayti, and made investigations there which confirm them in the opinion that the Haytian government, instead of being injured by the Dominican republic, is constantly provoking civil war within the boundaries of Santo Domingo.

The commission arrived in Washington early in April. On receiving their report, the President sent it with a message to Congress, stating that although it confirmed him in his opinions as to the desirableness of the island and the advantage to result from a treaty, he left it now entirely to the American people without any recommendation. No action resulted, and the matter was indefinitely postponed.

As it became evident that governmental action, even if it ever came, was to be long delayed, there was formed in New York "The Samana Bay Company," which leased from the Baez government the peninsula and adjacent waters of Samana, and obtained large privileges for trade at an annual rental of $150,000. This company, up to this day (1874), seems not to have met its own anticipations, and recent communications from the Dominican government are given urging upon the U. S. to take some final step in the matter, but so far nothing appears to be done in regard to it.

A. D. White.

Dom'inic [Sp. *Domingo de Guzman*], Saint, the founder of the order of Dominicans, was born at Calahorra, in Old Castile, in 1170. He gained distinction as a preacher and as a persecutor. He was one of the instigators of the crusade against the Albigenses in 1208. In 1215 he founded the order of Preaching Friars or Dominican monks, which was approved by the pope in 1216. (See Dominicans.) Dominic was the first general of the order. He died Aug. 6, 1221, and was canonized by Pope Gregory IX. in 1234. He was a canon, a priest, and an archdeacon successively.

Domin'ica ("Sunday Island"), discovered by Columbus on Sunday, Nov. 3, 1493, a British West India island, is 22 miles N. of Martinique; lat. 15° 18′ N., lon. 61° 24′ W. It is 29 miles long, and has an area of 291 square miles. It is of volcanic origin, and is the highest of the Lesser Antilles, the summit having an altitude of 5314 feet. The soil of the valleys is fertile. The staple productions are coffee, sugar, cotton, tobacco, cocoa, copper ore, rum, and timber. The abolition of slavery increased the prosperity of this island. Dominica was ceded to Great Britain by France in 1763. The public revenue in 1870 amounted to £15,721; the expenditure to £15,248; the public debt to £7230. The total tonnage of vessels entered and cleared (exclusive of coasting-trade) was 19,160; the total value of imports, £60,278. Pop. in 1870, 28,517.

Domin'ical [from the Lat. *dominica*, the "Lord's day"]

Letter. The Romans used the first eight letters of the alphabet (A to H) to mark the consecutive days of their recurring nundinal period. The early Christians adopted the same plan for marking the days of the week, dropping the last one (H) as unnecessary. In the Church calendar A has always stood for the first day of January, B for the second, and so on. G therefore marks the seventh day, and the cycle begins again with A on the eighth. A returns in like manner on the 15th, the 22d, and so on. Each day in the year has thus its calendar letter; and the letter which falls on Sunday is called the *dominical letter* of the year. The 28th of February has always the letter C, and the 1st of March has always the letter D. The 29th day of February in leap-year has therefore no letter provided for it; and this makes a change in the Sunday letter after February; so that in leap-year there are two dominical letters. As the common year contains fifty-two weeks and one day, the dominical letter changes from year to year, going backward one place for every common year, and two places every leap-year. This mode of representing the days of the week has been uninterruptedly employed in the calendar of the Church throughout the world from the earliest ages of Christianity. F. A. P. Barnard.

Domin'icans, an order of mendicant friars founded by Saint Dominic at Toulouse, was confirmed by Pope Innocent III. in 1216. They were called Black Friars in England, and Jacobins in France, from the Rue St. Jacques (Jacobus), where they first established themselves. In 1216, Honorius III. constituted the order under the rules of Saint Augustine, which enjoined almost continual fasts, perpetual silence, and other mortifications. In 1221 the order was introduced into England, and their first establishment made at Oxford. In 1276 the corporation of London granted the order two lanes near the Thames, where a monastery was erected, the neighborhood of which is still called Blackfriars. The order of Dominican nuns was founded in 1206.

Among the men of genius and eminent scholars belonging to this order were Thomas Aquinas and Albertus Magnus. The reputation of the Dominicans in history, however, is stained by their cruel persecution of the Albigenses and the prominent part they took in the establishment and administration of the Inquisition. Their principal rivals were the Franciscans, and the two orders for a long time divided between them the control of the Church, and frequently of the Catholic states of Christendom. The Jesuits in the sixteenth century gradually took possession of the power formerly exercised by the Dominicans. Dominican monks and nuns are, however, still found in most countries. In the U. S. their numbers are increasing.

Dominion of Canada. See Canada, Dominion of, by Prof. A. J. Schem.

Dom'inis, de (Marcantonio), an Italian theologian, born in the isle of Arba, near Dalmatia, in 1566. He became professor of philosophy at Padua, and wrote a curious treatise on light entitled "De Radiis Visus et Lucis in Vitris Perspectivis et Iride" (1611), in which the phenomena of the rainbow were explained for the first time. After he had been appointed archbishop of Spalatro he went to England in 1616, and became a Protestant. He wrote "De Republicâ Ecclesiasticâ" ("On the Ecclesiastical Republic," 1617). In 1622 he returned to Italy, and relapsed into the Roman Catholic Church. Died Sept., 1624.

Domin'ium [from *dominus*, a "master," a "lord"], a legal term of the Romans, signifying a full legal right in and to an object, but which could not be conferred by actual possession alone unless such possession had endured for the period of legal prescription.

Dom'ino, an Italian word, is the name of a long loose cloak of black silk, furnished with a hood, worn at masquerades by persons of both sexes.

Dom'inoes, a game played by two or more persons with twenty-eight pieces of ivory or bone variously dotted. It is said to have been first introduced into France from Italy, and soon became popular throughout Europe. Various games are played with dominoes.

Domi''tian [Lat. *Domitianus*], or, more fully, **Titus Flavius Domitianus,** a Roman emperor, born in 51 A. D., was the second son of Vespasian. He succeeded his brother Titus in the year 81, and began his reign with moderation and apparent respect for justice. In the year 87 he was defeated by the Dacians, who compelled him to pay tribute. He afterwards became extremely cruel and suspicious, and caused many innocent persons to be put to death. He banished a number of eminent men and philosophers, including Epictetus. He was assassinated by conspirators in his palace in 96 A. D., and was succeeded by Nerva. (See Suetonius, "Domitianus.")

Don. See Don.

Don (anc. *Tanais*), a river of Russia, rises in the government of Tula, and flows in a general S. E. direction to Katschalinsk. Below the town it runs nearly south-westward, and enters the N. E. part of the Sea of Azof near the town of Azof. Its total length is about 950 miles. The navigation of it is difficult during low water, but when the water is high (*i. e.* in April and May) vessels can ascend about 600 miles from its mouth. The Don is connected by a canal with the Volga.

Don, a river of Scotland, in Aberdeenshire, rises in Ben Aven, and enters the North Sea 1 mile from Old Aberdeen. Its general direction is eastward, and its length, including windings, 78 miles. Nearly a mile from its mouth it is crossed by the "Brig o' Balgownie."

Doña Aña, or **Don'na An'na,** a county in the S. E. of New Mexico, is bounded on the W. by the Rio Grande del Norte. The surface is partly mountainous. The soil in some places is fertile. Wheat, corn, and wool are raised. Silver is found. Salt lakes occur in some parts. Capital, Mesilla. Pop. 5864.

Doña Aña, a post-village of the above county, is on the Rio Grande, about 50 miles N. W. of El Paso (Texas).

Donaghadee', a seaport of Ireland, in the county of Down, and on the Irish Channel, 18 miles E. N. E. of Belfast. It has a good harbor, and trade in cattle, grain, etc. The embroidery of muslin is carried on here. Pop. in 1871, 2664.

Don'ahue, a village of Sonoma co., Cal., on San Pablo Bay, 35 miles N. of San Francisco. It is the southern terminus of the San Francisco and North Pacific R. R., and is connected with San Francisco by steamboats.

Don'aldson (Edward), U. S. N., born Nov. 17, 1816, in Maryland, entered the navy as a midshipman July 21, 1835, became a passed midshipman in 1841, a lieutenant in 1847, a commander in 1862, a captain in 1866, and a commodore in 1871. He commanded the steam-gunboat Scioto at the passage of Forts Jackson and St. Philip and capture of New Orleans April 24, 1862, and at the passage of the Vicksburg batteries June 28, 1862. Referring to the former battles, Commodore Henry H. Bell, Farragut's fleet-captain, writes: "Throughout the trying scenes of this dashing expedition, which is second to none on record, Captain Donaldson, his officers, and crew were conspicuous for their coolness, intrepidity, and good conduct." And in his report of the Vicksburg fight Rear-Admiral Farragut says: "It gives me great pleasure to mention that the officers and men of the ships which accompanied me up the river behaved with the same ability and steadiness on this occasion as in passing Forts Jackson and St. Philip." He commanded the steamer Seminole at the battle of Mobile Bay, and for his services on this occasion is thus highly complimented by Captain John B. Marchand in his official despatch of Aug. 7, 1864: "Commander Edward Donaldson, commanding the Seminole, which was lashed alongside of this ship, rendered most efficient service by his coolness and judgment in piloting both vessels until passing Fort Morgan, the regular pilot being sick. My additional thanks are due him and all his officers and men for volunteering to aid in manning the guns of the Lackawanna, and the continuous fire which they kept up whilst their guns could bear upon the enemy."

Foxhall A. Parker, U. S. N.

Donaldson (James Lowry), an American officer, born Mar. 17, 1814, at Baltimore, Md., graduated at West Point 1836, and July 28, 1866, assistant quartermaster-general U. S. A. (rank of colonel). He served in the artillery till Mar. 3, 1847, and subsequently in the quartermaster's department; on topographical duty 1838; in Florida war 1836–38; in emigrating Cherokees to the West 1838; on Maine frontier pending boundary controversy 1840–42; on the north-eastern boundary survey 1844–45; in the military occupation of Texas 1846; in the war with Mexico 1846–48, engaged at Monterey (brevet captain) and Buena Vista (brevet major); on quartermaster duty at various posts 1848–58; and chief of quartermaster's department of New Mexico 1858–62. He served in the civil war in command of the district of Santa Fé, N. M., 1861–62, engaged at Valverde; as quartermaster at Pittsburg, Pa., 1862–63; as chief quartermaster of the middle department 1863; as supervising quartermaster of the department of the Cumberland 1864–65, being in command of quartermaster's forces at the battle of Nashville; and as chief quartermaster of the middle division of the Tennessee 1865–66; of the department of the Tennessee 1866; of the military division of the Missouri 1866–69. Brevet colonel and brigadier-general Sept. 17, 1864, for distinguished services in the Atlanta campaign, and major-general U. S. A. Mar. 13, 1865, and major-general U. S. volunteers June 20, 1865, for faithful and meritorious services; and retired from active service Mar. 15, 1869. He

is author of "Sergeant Atkins," a tale of adventures in the Florida war, 1871. GEORGE W. CULLUM, *U. S. Army.*

Donaldson (JOHN WILLIAM), D. D., an English philologist, born in London in 1811. He published, besides other works, "The New Cratylus" (1839, enlarged in 1859), a Greek grammar and a Latin grammar. He was a fellow of Trinity College, Cambridge. Died Feb. 10, 1861.

Donaldson (THOMAS LEVERTON), PH. D., an English architect, born in 1795, studied architecture in Italy and in Greece. He was long the professor of architecture in University College, London, from which he retired in 1864. He has published works upon ancient and modern art, and designed many fine buildings in London and its vicinity.

Don'aldsonville, a post-village, capital of Ascension parish, La., is on the Mississippi River at the origin of the Bayou Lafourche, 82 miles above New Orleans. It was formerly the capital of the State. Pop. 1573.

Dona'ti's Com'et was first discovered in June, 1858, became distinctly visible in September, reached its perihelion about Oct. 1, and arrived at its nearest point to the earth Oct. 10, when its apparent length was 51,000,000 miles. It afforded a most magnificent spectacle. Its return to the solar system is expected after about 1950 years. Its aphelion distance is computed at 15,000,000,000 miles. The discoverer lived at Bologna, and died of cholera, which attacked him while visiting the Vienna Exposition in 1873.

Do'natists, in ecclesiastical history, a party in the North African Church which effected a schism that lasted from 311 A. D. till the sixth century. They took their name from Donatus the Great, who was their bishop after Majorinus, from 315 to 348. The early history of this deeply interesting movement is obscure and complicated. A powerful exciting cause of the schism was the question as to the mild or severe discipline of Christians who left the faith in times of persecution, the Donatists advocating rigorous measures; but there were numerous other questions involved in the controversy, the most important being that of the union of the whole people within the Church (as maintained by the Catholic party), while Donatus demanded the separation of the Church from the world. Early in his reign Constantine the Great excluded the Donatists from the privileges conferred upon the Church, and in 316 A. D. he issued penal edicts against them. A fierce persecution ensued, lasting till 321, when the emperor granted them liberty of conscience. After his death the penal laws against them were revived, but they defended themselves with much spirit until, in 361 A. D., Julian (the so-called Apostate) restored to them their full freedom. Prosperity followed, and they boasted at one time of having 400 bishops in Africa; but controversies sprang up with each other and with the Catholic party, and in 415 their assemblies were forbidden on pain of death, Augustine himself joining in the persecution. Donatism, as well as the African Church in general, was overwhelmed by the Vandal conquest (428 A. D.), yet it survived in a feeble condition for many years.

The Donatists are held by many historians to have erred by excessive fanaticism and a schismatical spirit, while it is generally conceded that the treatment they received from the state Church was severe and injudicious. In doctrine they were essentially orthodox, and the charges of immorality brought against them appear to have been the inventions of their enemies. There were doubtless errors on both sides, but the general position of the Donatist party appears to have been in accord with that now taken by those Protestant churches which demand a personal experience of regeneration, as separating their membership from the world at large. (See SCHAFF, "History of the Christian Church;" NEANDER, "Church History.")

REVISED BY R. D. HITCHCOCK.

Dona'to, or **Donatello,** called **Donato di Niccolò di Betto Bardi,** a distinguished sculptor. (DONATELLO is simply a diminutive.) He was born in Florence, probably in 1386, and died in that city, according to Vasari, on the 13th Dec., 1466, but according to Palmieri in 1468. His first work of importance was a beautiful bas-relief of the Annunciation in the church of Sta. Croce. On the campanile of the cathedral of Florence are statues of Saint Matthew and Saint Mark (on the western face). That of Saint Matthew has a bald head, and from the resemblance of this to a gourd the Florentines nicknamed it Il Zuccône, or the "great gourd." This, of all his works, was Donatello's favorite, and he was so pleased with the life he had been able to impart to his statue, that, as the story goes, while he was working at it he would strike it impatiently, crying, "Why don't you speak, then?" He also used, says Vasari, to express the confidence he had in anything by the expression, "By the faith I have in my Zuccône." Donatello was a prolific worker, and much of his work remains in good condition to attest his vividness of conception, his noble strong ideal, and his beautiful execution. His most famous work is the statue of Saint George, the patron saint of the sword-makers and armorers, which he made for that guild, and which was placed in a niche designed for it on the outer wall of the church of San Michele, under which was a bas-relief representing the fight of the saint with the dragon. To protect it from the action of the weather, the statue has been removed to another niche on the opposite side of the building.

Vasari makes Donatello one of the three successful competitors for the gates of the Baptistery—he and Brunelleschi withdrawing in favor of Ghiberti. Another famous work of this master is the bronze equestrian statue of Gattamelata (Erasmo da Narni, called Gattamelata, a *condottiere* (leader) of the Venetian troops), made at the command of the Signoria of Venice for the city of Padua. It stands on the platform of the church of Saint Antony. Donatello made a bronze statue of David, which is now in the Museo Nazionale (Bargello); a statue in wood of Mary Magdalen for the Baptistery, where it is still to be seen; and a statue of Judith, in a niche over one of the arches of the Poggia dei Lanzi, with a crowd of other works, no one of which is without interest.

Donatello's life has been very entertainingly written by Vasari. (See also PERKINS'S "Italian Sculptors," and LUBKE, "History of Sculpture," a superficial book, but useful. DR. HANS SEMPER began in A. Von Zahn's now discontinued "Jahrbücher für Kunstwissenschaft," 3d year, 1870, Part 1, a valuable series of articles: "Donatello, seine Zeit und Schule." Of this only the first part, "Erster Abschnitt: Die Vorläufer Donatello's," has appeared.)

CLARENCE COOK.

Dona'tus, bishop of Cassæ Nigræ in Numidia, an early leader in the Donatistic schism, but not to be confounded with Donatus the Great, a much abler man, who was the second schismatic bishop, as noticed above.

Donatus (ÆLIUS), an eminent Latin grammarian, born about 333 A. D., taught rhetoric at Rome. He was the teacher of Saint Jerome, who expressed a high opinion of his talents. He wrote a work on grammar, which was commonly used in the schools of the Middle Ages. The word Donat became synonymous with *grammar.*

Do'nauwörth, a walled town of Bavaria, on the Danube, at the mouth of the Wernitz, 25 miles N. N. W. of Augsburg. It was formerly a free town of the empire, but has declined in importance. It has several churches and hospitals. Here Marlborough defeated the Bavarians in 1704, and here the French general Soult gained a victory over the Austrian general Mack Oct. 6, 1805. Pop. 3559.

Do'nax [from the Gr. δόναξ, a kind of fish], a genus of bivalve mollusks of triangular form, belonging to the Tellinidæ. There are forty-five living European and tropical species, and thirty fossil ones from the eocene of Europe and the U. S. Donax is also the specific name of a reed or grass (*Arundo Donax*) found in the south of Europe, used for fishing-rods and other purposes.

Don Beni'to, a town of Spain, in the province of Badajoz, near the river Guadiana, 55 miles E. of Badajoz. It has manufactures of woollen goods, wine, and oil. Pop. about 14,800.

Don'caster (anc. *Danum*), a market-town of England, in the West Riding of Yorkshire, and on the river Don, 35 miles S. of York. It is pleasantly situated and well built. The Don is here crossed by two stone bridges. Doncaster has a fine parish church, a public library, and a theatre. It was burned by lightning in 759 A. D. It is famous for its annual horse-races. Colonel St. Leger founded in 1776 the stakes, for which the best horses of England annually contend. Pop. in 1871, 18,758.

Don'dra Head, the most southern extremity of Ceylon, is in lat. 5° 55′ N., lon. 80° 38′ E.

Donegal', a county in the extreme N. W. part of Ireland, province of Ulster, is bounded on the N. and W. by the Atlantic Ocean. Area, 1859 square miles. The coast-line is 395 miles long, and is deeply indented by many bays and loughs. The surface is mountainous, moory, and boggy. About one-third of it is arable. Granite, Devonian rocks, and carboniferous limestone are found here. This county has some manufactures of linen and worsted hose. Capital, Lifford. Pop. in 1871, 217,992.

Donegal, a seaport of Ireland, in the above county, on Donegal Bay, at the mouth of the Eske, 11 miles N. N. E. of Ballyshannon. It has a harbor for vessels which draw twelve feet of water. Lat. 54° 39′ N., lon. 8° 6′ W.

Donegal, a township of Butler co., Pa. Pop. 852.

Donegal, a township of Washington co., Pa. Pop. 2068.

Donegal, a post-township of Westmoreland co., Pa. Pop. 1304.

Donegal, Marquesses of (1791), earls of Donegal (1647), earls of Belfast (1791), Viscounts Chichester and Barons Belfast (Ireland, 1625), Barons Fisherwick (Great Britain, 1798), Barons Ennishowen and Carrickfergus (United Kingdom, 1841).—George Hamilton Chichester, third marquess, K. P., G. C. H., F. R. S., aide-de-camp of the queen, born Feb. 10, 1798, succeeded his father in 1844.

Don'elson (Andrew Jackson), LL.D., an American officer and diplomatist, born Aug. 25, 1800, near Nashville, Tenn., graduated at West Point in 1820. He served (1821–22) as lieutenant of engineers and as aide-de-camp to his uncle, Maj.-Gen. Jackson, when governor of Florida, just acquired from Spain. He resigned from the army Feb. 1, 1822, studied law, and became a cotton-planter near Nashville, Tenn. During President Jackson's administration (1829–33) he was his efficient private secretary; chargé d'affaires to Texas 1844–45, negotiating its annexation to the U. S.; and U. S. minister plenipotentiary to Prussia 1846–49; and to the federal government of Germany 1848–49. Soon after his return from Europe he became enlisted in efforts to secure the settlement of the slavery agitation growing out of the acquisition of territory from Mexico. With strong national views he became editor of the "Washington Union" 1851–52, and in 1856 the American candidate for Vice-President of the U. S. After his defeat he retired altogether from public life, and devoted his time to planting interests in Mississippi, till he died June 26, 1871, at Memphis, Tenn., aged seventy-one.

George W. Cullum, *U. S. Army.*

Donelson, Fort, a strong position on the W. bank of the Cumberland River, in Stewart co., Tenn., 2 miles below Dover, and 12 miles E. of Fort Henry. In the early part of the late civil war it was strongly fortified by the Confederates. On Feb. 14, 1862, this position, being held by Gen. J. B. Floyd with 15,000 men, was attacked by a fleet of gunboats under Commodore Foote, who was repulsed with considerable loss. Meanwhile, the army of Gen. Grant, advancing from the capture of Fort Henry, successfully fought the Confederates outside their works. Floyd and a large part of his force escaped by means of rafts. On the morning of the 16th, Gen. Buckner, in command of the remaining Confederates, proposed terms. Grant replied, "No terms except immediate and unconditional surrender will be accepted. I propose to move immediately upon your works." On the same day the fort was surrendered, with 8000 prisoners.

Doneraile, Viscounts (1785), and Barons Doneraile (Ireland, 1786).—Hayes St. Leger, fourth viscount, born Oct. 1, 1818, and elected a representative peer for Ireland in 1855, succeeded his father in 1854.

Do'nets, a river of Southern Russia, the chief affluent of the Don, rises in the government of Koorsk. It flows nearly south-eastward, and enters the Don 40 miles N. E. of Novo-Tcherkask. Length, about 400 miles.

Dong-nai, a river of Anam, enters the China Sea about 40 miles below the city of Saigon. It is navigable for large ships to Saigon.

Dong-nai, a town on an affluent of the above river, is about 25 miles N. E. of Saigon.

Don'gola, a province of Upper Nubia, is mostly included between lat. 18° and 19° 30′ N., and is about 150 miles long. It is a narrow plain intersected by the river Nile.

Dongola, New, also called **Mara'ka,** a town of Nubia, the capital of the above province, is on the left bank of the Nile, in lat. 19° 10′ N., lon. 30° 22′ E. It is important as a military dépôt and as a place of trade. Here is an indigo-factory. Pop. estimated at 20,000.

Dongola, Old, a ruined town of Nubia, on the Nile, 75 miles S. S. E. of New Dongola.

Dongo'la, a township and post-village of Union co., Ill., on the Illinois Central R. R., 26 miles N. of Cairo. Pop. 3095.

Don'iphan, a county which forms the N. E. extremity of Kansas. Area, 391 square miles. It is bounded on the N. E. and E. by the Missouri River. The surface is diversified by river "bottoms" and undulating prairies; the soil is fertile. Cattle, grain, and lumber are produced. It is intersected by the St. Joseph and Denver City and the Atchison and Nebraska R. Rs. Coal abounds here. Capital, Troy. Pop. 13,969.

Doniphan, a post-village of Wayne township in Doniphan co., Kan., on the Atchison and Nebraska R. R. and the Missouri River, 6 miles N. E. of Atchison. Pop. 528.

Doniphan, a post-village, capital of Ripley co., Mo., on the Current River, about 150 miles S. by W. of St. Louis. Pop. 146.

Donizet'ti (Gaetano), born at Bérgamo Sept. 25, 1798, received his musical education in his native city and in Bologna; produced his first opera, "Enrico," at Vienna in 1818; composed about thirty other operas, now forgotten, in the style of Rossini; entered a new stage of development by his "Anna Bolena," Milan, 1830, partly under the influence of Bellini, partly in rivalry with him; acquired a European fame by his "Lucia di Lammermoor," Naples, 1835; produced at Paris in 1840 "La Fille du Regiment," "Poliuto," and "La Favorita," at Vienna in 1842 "Linda di Chamouni," at Paris in 1843 "Don Pasquale;" was in 1844 struck by paralysis, and spent his last years for the most part in a lunatic asylum. He died at Bérgamo April 8, 1848.

Don'jon, or **Dun'geon** [from the Celtic *dun,* a "height" or "hill"], the central building, tower, or keep of an ancient castle or fortress of the Middle Ages. It was often erected on a natural or artificial elevation. The lower story of the donjon was used as a prison.

Don Juan, a mythical personage, was, according to Spanish tradition, a profligate nobleman who killed in a duel the father of a lady he had attempted to seduce. Having afterwards invited to a feast the statue erected to his victim, he challenges the spirit, whose existence he denies, to manifest itself to him. The spirit thereupon proves its power, and condemns him to perdition. This story was dramatized by Tirso de Molina; it also forms the subject of one of Molière's comedies and Mozart's celebrated opera, and gives name to one of Byron's most famous poems.

Donkey. See Ass.

Donkey-Engine, a small auxiliary engine used on shipboard, in factories, etc. for hoisting and lowering goods, for working the ship's rigging, raising anchors, etc.

Don'naldsville, a post-township of Abbeville co., S. C. Pop. 1155.

Donne (John), D. D., an English poet, born in London in 1573. He married a niece of Lord Chancellor Egerton, and became a priest of the Anglican Church, although of Roman Catholic parentage. Having gained distinction as an eloquent preacher, he was appointed dean of St. Paul's, London, in 1621. He wrote elegies, satires, and other poems, and belonged to the school called "Metaphysical Poets," whose works abound in forced conceits. Some of his early poems are very licentious, but many have great poetic merits. His sermons are justly admired. The first complete edition of his poems was issued in 2 vols., London, 1872. Died Mar. 31, 1631. (See Izaak Walton, "Life of J. Donne," 1640; H. Alford, "Life of Donne," 1839.)

Don'ner Lake, a small lake in Nevada co., Cal., near the Central Pacific R. R., 154 miles from Sacramento. It is a place of summer resort. It takes its name from the tragical fate of a party of overland emigrants, led by a man named Donner, who in the winter of 1846 were snow-bound at this point, and nearly all starved to death, the survivors having eaten the flesh of their dead comrades.

Don'nybrook, a parish and village of Ireland, in the county of Dublin. The village is about 2 miles S. E. of Dublin. It has a magdalen asylum, a dispensary, a hospital for incurables, and a lunatic asylum, called the Bloomfield Retreat, established by the Society of Friends. Here is a famous annual fair, held during the week commencing Aug. 26. Pop. in 1861, 1892.

Dono'so Cortés (Juan), Marquis de Valdegamas, a Spanish writer and diplomatist, born in Estremadura May 6, 1809. He opposed Don Carlos, and became secretary to Queen Isabella in 1844. In 1848 he was sent as ambassador to Berlin. He was conservative in politics, and defended the Roman Catholic religion in his "Essay on Catholicism, Liberalism, and Socialism" (1851). He died May 3, 1853, in Paris, whither he had been sent as minister.

Donoughmore, Earls of, and Viscounts Suirdale (1800), Barons Donoughmore (Ireland, 1783), Viscounts Hutchinson (United Kingdom, 1821).—John Luke George Hely Hutchinson, fifth earl, born Mar. 2, 1848, succeeded his father Feb. 22, 1866.

Don Quixo'te de la Man'cha is the title of a celebrated satirical romance by Cervantes, the most celebrated book in the whole Spanish literature. First part of it was published at Madrid in 1605; second in 1615; first collected edition in 1617. The best edition is that by the Academy of Madrid, in 4 vols., in 1780, reprinted several times; in 1819 in 5 vols. with good notes. There are about sixty French translations; that by Viardot, Paris, 1836, is said to be the best. The English translation by Motteux, the German by Ludwig Tieck, Berlin, 1815, and the Danish by Charlotta Dorothea Biehl, Copenhagen, 1776, are

good. The famous illustrations by Gustave Doré, Paris, 1863, have been reprinted in London, 1864, and in Berlin, 1867.

Doo (George Thomas), F. R. S., a skillful English historical engraver, born in Surrey Jan. 6, 1800. He became historical engraver to Queen Victoria in 1842, and was elected a Royal Academician in 1856. Among his works are "Ecce Homo," after Correggio; "Knox Preaching," after Wilkie; and "Pilgrims Coming in Sight of Rome," after Eastlake. He exhibited at the Great Exposition of Paris in 1867 his engraving of "Saint Augustine and Saint Monica," after Scheffer.

Doobov'ka, a town of European Russia, government of Saratof, on the river Volga, 180 miles S. S. W. of Saratof. It has an active trade by the river. Pop. in 1867, 13,676.

Doo'little (James Rood), LL.D., born Jan. 3, 1815, at Hampton, Washington co., N. Y., graduated at Hobart College in 1834, was elected U. S. Senator from Wisconsin in 1857, and re-elected in 1863. Mr. Doolittle resides at Racine, Wis., though in legal partnership with his son in Chicago.

Doo'ly, a county in S. W. Central Georgia. Area, 800 square miles. It is bounded on the W. by the Flint River. The surface is level; the soil is mostly fertile. Cotton, corn, and wool are raised. Capital, Vienna. Pop. 9790.

Dooly (John M.), a lawyer and judge of Georgia, greatly distinguished in his day, and the most famous wit ever produced in the State. His sayings and repartees have formed the staple of the raciest bar anecdotes throughout the commonwealth for the last half century, and are likely to be transmitted in legendary tradition, within the same sphere, to many generations hereafter. Born in 1772, and died in 1827.

Doom [probably allied to the verb "deem," to "think," to "judge"], the name formerly given to the Last Judgment, and to representations of it in churches by painting or otherwise. Most of these were obliterated in the time of Edward VI., but a fine one still exists in the church of the Holy Trinity at Coventry.

Doom (or **Dum**) **Palm** (*Hyphæne Thebaica*), a native of Upper Egypt and Central Africa, where it sometimes forms forests, growing even in the deserts. The lower part of the stem is single, and invariably divides at a certain height into two branches, each of these again being bifurcated, always in two sets. The wood is tougher than that of most other palm trees. It has fan-shaped leaves, globular fruit about the size of an orange, with the outer skin red, enclosing a thin spongy substance which resembles gingerbread. From this substance, which forms an article of food, it has been called the gingerbread tree. Ornaments are made from the hard, semi-transparent kernel of the fruit. This tree produces the gum resin called Egyptian bdellium, and its fibre is made into ropes which are dyed black.

Dooms'day Book, or **Domesday Book,** often called simply **Domesday,** the name of an ancient record of England containing a statistical account of the state of that country, made by William the Conqueror in the year 1086. Several of the northern counties were not included in this account. The origin of the name is not precisely known, but it seems to indicate the absolute authority of the book in doom or decision on matters of which it treats. The original record, in two parts, the "Great" and "Little Domesday," is still preserved at Westminster. It was also known as the *Liber Regis,* or the "King's Book;" the *Scriptura Thesauri Regis,* or "Record of the King's Treasury;" the *Liber Censualis Angliæ,* or "Rate Book of England," etc. This work is very comprehensive and minute, and forms the basis of all historical accounts of those times. It was the first great English record published at the cost of the nation, and appeared in two folios, printed with types cast for the purpose. It was ten years in passing through the press, being completed in 1783; and later supplementary records have been since published. Several other ancient English records are known as *Domesdays.* For example, the registers of the visitations and inquisitions made by the dean and chapter of St. Paul's, London (1181–1222), were published in 1857 by the Camden Society as the "Domesday of St. Paul's."

Doon, a river of Scotland, rises in Ayrshire, flows nearly north-westward, and enters the Frith of Clyde 2 miles S. of Ayr. It is 30 miles long, and passes through picturesque scenery. The Doon has been immortalized by the poet Burns. Loch Doon, an expansion of this river, is 5 miles long, and is enclosed by mountains.

Doon, a post-village of Lyon co., Ia. It has one weekly newspaper.

Door [a word etymologically related to the Dutch *door,* "through," the prominent idea being that of a "place to go through"], the panel of wood or other material by which the entrance of a house, etc. is opened or closed. Doors are of different kinds, the most common being made to move on hinges. Others, called sliding doors, are moved on rollers. A trap-door opens vertically over a hole in a roof or floor, while a jib-door is made even with the wall, and concealed as nearly as possible. Doors are also made of bronze, iron, and stone.

In architecture, great attention has been paid to the ornamentation of doors. Perhaps the finest example in the U. S. of ornate doors is afforded in the bronze doors of the old Representatives' Hall in the Capitol at Washington, which were cast in Munich, and are covered with beautiful historical and emblematic figures.

Door, a county in the N. E. of Wisconsin, is a narrow peninsula between Lake Michigan and Green Bay, and is surrounded by water on all sides except the S. Area, 400 square miles. Grain and wool are the chief products. Capital, Sturgeon Bay. Pop. 4919.

Doo'ra, or **Dhurra,** called also **Indian Millet** (*Sorghum vulgare*), a kind of grain much cultivated in Asia, Africa, and Southern Europe. The genus differs from *Andropogon* in having hermaphrodite spikelets and glumes, with three small teeth at the end. The species are mostly tall, broad-leaved annual grasses, with large panicles, and strong culms containing a sweet and juicy pith. The doora (sometimes called jowaree in India) has grain somewhat larger than mustard-seed; it yields abundant crops, and the stalks and leaves are food for cattle and horses. The sugar-grass or Chinese sugar-cane (*Sorghum saccharatum*), a sugar-producing plant, has been introduced into the U. S. and cultivated with success. The Caffer corn (*Sorghum Caffrorum*) is chiefly valued as food for horses. The doora grows well in the U. S., but has not been found profitable for culture.

Doorak', a town of Persia, in Khoozistan, at the confluence of the Doorak and Jerahi rivers, is about 200 miles S. W. of Ispahan. It has manufactures of silk handkerchiefs. Pop. about 8000.

Doorkeeper of the House of Representatives of the U. S. At the commencement of each Congress a doorkeeper is elected *vivâ voce,* and he continues in office until a successor is qualified. He takes the usual oath of office, with the addition that he will keep the secrets of the House. His general duties are those described as appertaining to the same officer in the Senate. He keeps hung up at each entrance-door of the Representatives' chamber printed lists of those entitled to enter, so that visitors may understand his duties and their privileges. The galleries of both houses are open to all orderly people; the diplomatic corps, the reporters, the ladies, and gentlemen without them, having separate entrances and divisions assigned them. His salary is $2592. (See Gillet, "Federal Government," 1872.)

Doorkeeper of the Senate of the U. S. The sergeant-at-arms of the Senate is, *ex officio,* doorkeeper to that body, having an assistant doorkeeper to aid him in performing his duties, and who, in fact, acts as doorkeeper. He keeps the doors of the Senate, and announces from them messages from the President and House of Representatives. As doorkeeper he appoints superintendents of the folding-room and document-room, messengers, pages, folders, and laborers, and discharges various duties not enumerated in the rules. He folds and distributes extra documents, furnishes members with printed bills, reports, and other documents, conveys messages for members, and keeps the hall, galleries, and committee-rooms in order. The assistant doorkeeper's salary is $2592. (See Gillet, "Federal Government," 1872.)

Doorn'boom ("thorn tree," *Acacia horrida*), a tree growing abundantly in South Africa, so named by the Dutch on account of its sharp and numerous spines. Its usual height is about thirty feet, and the wood is valued for building.

Doos'tee, a river of Beloochistan, enters the Arabian Sea in lat. 25° 15′ N., lon. 61° 50′ E. It is nearly 900 miles long, but is shallow in all parts of its course.

Dore, Mont, a group of high mountains in Auvergne, France, in the department of Puy de Dôme. They are of volcanic formation. The highest summit is the Pic de Sancy, which has an altitude of 6190 feet.

Do'ra, a township of Moultrie co., Ill. Pop. 924.

Do'ra Balte'a (anc. *Duria Major*), a river of Italy, in Piedmont, rises at the foot of the Little St. Bernard, and enters the Po near Crescentino. Length, about 90 miles.

Dora'ma, a town of Arabia, in Nedjed, 30 miles N. E. of Derayeh. The caravans moving between Persia and

Mecca halt here to obtain supplies. It was taken in 1818 by Ibrahim Pasha, who killed nearly all the inhabitants. Pop. about 8000.

Dor'cas Soci'ety, a benevolent association of ladies, usually of the same congregation, for the purpose of providing the poor with clothing. It is so called from Acts ix. 39: "And all the widows stood by him weeping, and showing the coats and garments which Dorcas made while she was with them."

Dor'chester (anc. *Durnovaria* and *Durinum*), a town and parliamentary borough of England, the capital of Dorsetshire, is on the river Frome and on the South Downs, 115 miles W. S. W. of London and 7 miles from the English Channel. It sends two members to Parliament. The South-western Railway connects it with London on the one hand and Weymouth on the other. Here are the remains of the most perfect Roman amphitheatre in England, 218 feet long and 163 feet wide. Pop. in 1871, 6915.

Dorchester, a county of Canada, in the E. part of Quebec, bordering on the State of Maine. It is partly drained by the Chaudière River. Pop. in 1871, 17,779.

Dorchester, a river-port and capital of Westmoreland co., New Brunswick, is on the Memracook River, near its mouth, and on the Intercolonial Railway, 115 miles E. N. E. of St. John. Large ships can ascend from the Bay of Fundy to this place, which has an active trade. Gas-coal and building-stone are largely exported. It has a court-house, jail, and many fine buildings. Pop. including Dorchester township, 5617.

Dorchester, a county in the S. E. of Maryland. Area, about 770 square miles. It is bounded on the W. by the Chesapeake Bay, on the N. by the Choptank River, and on the S. E. by the Nanticoke. Both of these rivers are navigable. The surface is level; the soil productive. Wheat, corn, fruit, timber, fish, and oysters are exported. Capital, Cambridge. Pop. 19,458.

Dorchester, a former town of Norfolk co., Mass., on Massachusetts Bay, 4 miles S. of Boston. It was annexed in 1869 to the city of Boston, of which it forms the sixteenth ward. It contains a national bank, and several paper-mills, iron-foundries, and other manufactories.

Dorchester, a post-township of Grafton co., N. H. It has manufactures of lumber and furniture. Pop. 689.

Dordogne, a department in the S. W. part of France, has an area of 3545 square miles. It is drained by the river Dordogne. The surface is diversified by hills, marshes, and fertile valleys. The soil is generally sandy. Chestnuts and wine are among the staple productions. Here are mines of coal, copper, and iron, and quarries of marble and alabaster. It has manufactures of paper, brandy, hosiery, and iron. Capital, Périgueux. Pop. in 1872, 480,141.

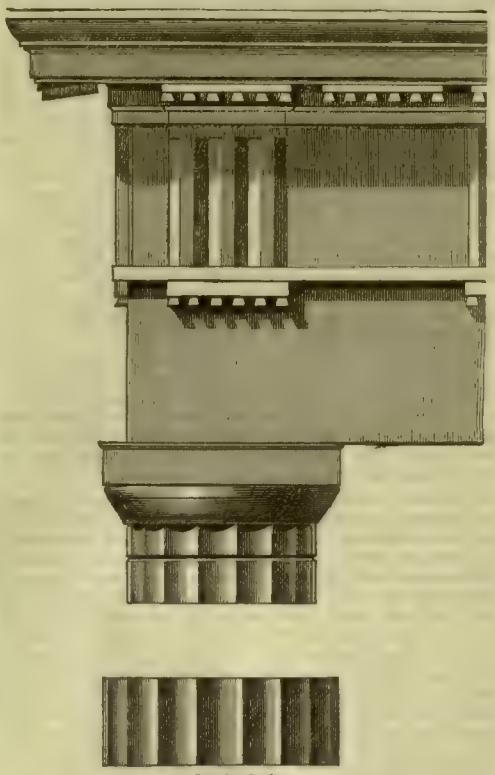
Dordogne, a river rising in the S. central part of France, flows nearly westward through the departments of Corrèze, Lot, and Dordogne, and enters the Garonne 13 miles N. of Bordeaux. It is about 220 miles long, and is navigable for 150 miles.

Dordrecht. See Dort.

Doré (Paul Gustave), a French painter and designer, born at Strasburg Jan. 6, 1833. He was educated at Paris, and in 1848 made his first public appearance as an artist with some pen-and-ink drawings sent to the Salon. His first successes were obtained by his paintings, chiefly of landscape subjects, but in 1854 he illustrated an edition of "Rabelais," and in 1856 published a series of designs illustrating the story of the Wandering Jew, by which performances the public attention was strongly directed towards him. In the same year (1856) he illustrated an edition of Balzac's "Contes Drolatiques," which is the work that shows all his powers in their fullest and freest exercise. One would say that the stories were written for the designs, so perfectly do these follow and reflect the audacious indecencies of that most libertine of books. Meanwhile, Doré was making himself known in a wider and happier circle with his designs for Perrault's "Fairy Tales" (1861), "Don Quixote" (1863), the "Travels in the Pyrenees" of Taine (1859), which has just been translated and published with Doré's designs in New York (1873), and the "Fables" of La Fontaine (1867). These works were suited to the artist's talent, but he overleaped the saddle when his ambition led him to try to illustrate Dante and the Bible. Though his designs for these works created a wide interest, and it was felt that he showed a great deal of facility and felicity in his inventions, yet it was also felt that they were wholly inadequate, and they have failed of any lasting success. Indeed, they were mere publishers' ventures, and of late years Doré has come to be a mere hack worker. His "Rabelais," however, published in 1873, an enlarged issue of his early work, shows him more at home in his proper field. In 1866–68 he was laid hold of by English publishers, who persuaded him to illustrate Tennyson's "Idyls," a work of whose very existence, and naturally, the Frenchman was ignorant, and into the spirit of which he was powerless to enter. The work was an unhappy failure. Doré is one of the most prolific designers that ever lived, but it would be unfair to conceal the fact that he owes much of his success to the admirable wood-engravers who have translated him to the public. In these successive publications Pisan and Dumont and Gauchard have created a new era in the art of engraving on wood. Clarence Cook.

Dorée [Fr. *dorée*, "gilded"], the name of several species of fish of the genus *Zeus*. The one most common on the British coasts is *Zeus faber*, commonly called john dory, a corruption of the French *jaune dorée* (golden-yellow). Its color is dusky-green, tinged with gold; the head is large, and on each side of its body is a dark oval spot. It is highly prized by epicures.

Do'ria, the name of one of the four most noble and powerful families of Genoa. It was attached to the Ghibelline party. In 1339 the families of Doria, Spinola, Grimaldi, and Fieschi, which had by their rivalry long troubled the republic, were exiled.—Paganino Doria, a famous Genoese admiral, gained a naval victory over the Venetian admiral Pisani in 1352.



Doria (Andrea), a celebrated Genoese admiral and patriot, born at Oneglia Nov. 30, 1468, is called the restorer of Genoese liberty. He entered the French navy about 1490, gained the rank of admiral, and commanded with success the fleet of Francis I. in the war against Charles V. In 1524 he defeated the imperial fleet near Marseilles. He also captured Genoa, from which he expelled the Adorni. In 1528 he abandoned the service of Francis I., and became an ally and adherent of Charles V., on the condition that Genoa should be a free and independent state. He entered Genoa in 1529, was welcomed by the citizens, and gave them a free constitution, which remained in vigor until the republic ceased to exist. He afterwards acted as admiral in the service of the emperor, and gained a victory over the Turks near Patras in 1532. In 1535 he contributed greatly to the conquest of Tunis. Charles V. gave him the title of prince of Melfi. Doria died without issue at Genoa Nov. 15, 1560. (See Carlo Sigonio, "De Vita et Gestis A. Doriæ," 1586; Richer, "Vie d'André Doria," 1789.)

Do'rians [Gr. Δωριεῖς], one of the four principal branches or tribes of the ancient Hellenic people, claimed that they were descended from Dorus, a son of Hellen. They are supposed to have originally lived in Doris, from which they migrated to the Peloponnesus, where they founded Sparta, Argos, and Messenia. The migration of the Dorians to the Peloponnesus, which is called the return of the Heraclidæ, and forms a celebrated epoch in ancient chronology, is said to have occurred soon after the siege of Troy, in 1104 B. C. Dorian colonies were planted in Crete, Sicily, and Asia Minor. The Dorians were the most powerful and warlike of the Hellenic tribes. They used a peculiar dialect, called the Doric. They surpassed the Ionians in solidity and earnestness of character, but were less refined and ingenious. (See K. O. Müller, "Die Dorier," 2 vols., 1824; 3d ed. 3 vols., 1844; Curtius, "History of Greece.")

Dor'ic Di'alect, one of the principal dialects of the ancient Greek language, took its name from the Dorians, among whom it was the principal dialect used. It was distinguished by its strength and the broadness of its sounds, and was much less finished than the Attic and Ionic.

Doric Order, one of the orders of classic architecture, takes its name from the Dorians, its possible inventors. It is popularly considered the oldest of the Greek orders, but Fergusson, Viollet-le-Duc, and other scholars think the Ionic or Ionian style was brought earlier from Asia into Greece. However it may have been—whether the earlier buildings were built of wood and so perished, or whether the style was simply abandoned for the severer Doric—it is certain that the Greeks showed a marked preference for the Doric, and used it in all the buildings of which we have any knowledge from their remains, until the time of the Roman conquest. The order is characterized by an air of dignity and strength. The true Doric column rests upon a stylobate of three courses, together equal to one inferior diameter of the shaft, which is itself from four to six diameters in height. Its superior diameter is three-fourths of the inferior, the latter being the unit of measure. This diminution is reached by an entasis or slight curve. Doric columns generally have twenty shallow flutes, separated by a sharp edge. The capital is about half a diameter in height, composed of an abacus, resting upon an echinus

of variable proportions. The columns incline slightly inwards towards the main building. The architrave, frieze,

Doric Order.

and cornice were ornamented with simple yet beautiful mouldings of various forms.

REVISED BY CLARENCE COOK.

Do'ris [from the Gr. Δωρίς, the name of a daughter of Nereus], a genus of marine gasteropodous mollusks belonging to the section Nudibranchiata. They are found mostly in southern seas, but several species are native on northern coasts. They have an oval body; the mouth is a proboscis with two tentacula, and the vent is encircled by branched gills. They are sometimes called sea-lemons.

Do'ris [Δωρίς], a small district of ancient Greece, was bounded on the N. by Thessaly, and on the other sides by Locris, Phocis, and Ætolia. The surface is mountainous. The people were called DORIANS (which see). Doris is now an eparchy in the government of Phocis.—The name DORIS is also given by some ancient writers to that part of Caria which was occupied by Dorian colonists and their descendants.

Dor'mant [present part. of the Fr. *dormir*, to "sleep"], in heraldry, a sleeping animal, with its head resting on its fore paws, as a lion *dormant*.

Dormant Animals. See HYBERNATION.

Dor'mer [probably from the Fr. *dormir* (Lat. *dormio, dormire*), to "sleep," because it lighted sleeping apartments], or **Dormer Window,** also written **Dorment** or **Dormar,** a window inserted on the inclined plane of the roof of a house, the frame being placed nearly vertically with the rafters. It is often used for the purpose of lighting the attic or garret of modern dwelling-houses.

Dor'mouse [a contraction of *dormant mouse*, because the animal is dormant in winter], a small rodent animal of the genus *Myoxis*, regarded as a connecting link between the Sciuridæ (squirrels) and the Muridæ (mice, etc.). Each jaw contains four molar teeth on each side; there are no cheek-pouches; each of the fore paws has four toes and a rudimentary thumb, and they have five toes on the hind feet. They have ears like mice; their fur is soft and fine, and the tail long. They are mostly natives of Southern Europe. The muscardine or red dormouse (*Myoxis avellanarius*) is the only British species. The fat dormouse (*Myoxis glis*) is about the size of a rat, of a brown-gray color, with a bushy tail. It is prized as food by the Italians. The garden dormouse (*Myoxis nitela*) is found in the central parts of Europe. It is often injurious to fruit trees. They all remain dormant the greater part of the winter.

Dorn (JOHANN ALBRECHT BERNHARD), a German Orientalist, born in Saxe-Coburg Mar. 11, 1805. He became in 1843 the chief librarian of the imperial library at St. Petersburg.

Dorn'birn, a town of Austria, in Tyrol, about 7 miles S. of Bregenz, which is on Lake Constance. The men are mostly carpenters, employed in the construction of wooden houses, which are exported. It has manufactures of cotton fabrics. Pop. in 1869, 8486.

Dor'ner (ISAAC AUGUST), D. D., an eminent Protestant theologian, born in Würtemberg June 20, 1809. He was educated at Tübingen, and became professor of theology at Tübingen (1838), Kiel (1839), Königsberg (1840), Bonn in 1847, and at Berlin in 1857. He wrote, besides other works, a "History of the Development of the Doctrine of the Person of Christ" (1839), and an able work entitled "History of Protestant Theology, especially in Germany" (1867). He visited the U. S. in 1873 as a delegate to the meeting of the Evangelical Alliance.

Dor'nic, Dornick, or **Dor'nock** [from *Doornik*, Flemish for Tournay], the name of a kind of figured linen of coarse qualiiy, originally made at Tournay.

Dor'noch, a royal burgh of Scotland, capital of the county of Sutherland, is on an inlet of the sea called Dornoch Frith, 14 miles N. of Cromarty. It has an old cathedral, which was restored by the duchess of Sutherland in 1837. Pop. in 1871, 625.

Do'rogoboozh', a town of Russia, in the government of Smolensk, on the river Dnieper, about 55 miles E. N. E. of Smolensk. The Russians here defeated the French in Oct., 1812. Pop. 7865.

Dorosma, a town of Central Hungary, in Little Cumania, 6 miles W. N. W. of Szeged. Pop. in 1870, 9688.

Dorp, a town of Prussia, in the Rhine province, on the Wupper, has iron, steel, and paper factories. Pop. in 1871, 10,690.

Dor'pat, or **Derpt** [Russ. *Yoorief*], a town of Russia, in the government of Livonia, is on the river Embach, 138 miles N. E. of Riga. It is well built, and has a stone bridge across the river. The old ramparts have been converted into gardens and public promenades. Here Gustavus Adolphus founded in 1632 a university which became a large and celebrated institution. Nearly all the lectures at the university are given in the German language, but the Russian government is making great efforts to substitute the Russian for the German. Struve and Mädler have successively directed the astronomical observatory of Dorpat, which their labors have made famous. The town has a gymnasium. Dorpat was founded in 1030, became an important town, sank into decay, but revived at the beginning of the last century. It was captured by the Swedes in 1625, and by the Russians in 1704. Pop. 20,780.

Dorr, a township of McHenry co., Ill. Pop. 2681.

Dorr, a township and post-village of Allegan co., Mich., on the Kalamazoo Allegan and Grand Rapids R. R., 18 miles S. of Grand Rapids. Total pop. 1518.

Dorr (BENJAMIN), D. D., was born at Salisbury, Mass., Mar. 22, 1796, graduated at Dartmouth in 1817, studied law and then theology, was ordained to the Protestant Episcopal ministry in 1820, was a rector in Lansingburg, Waterford, and Utica, N. Y., general agent for the domestic committee of the Board of Missions (1835–37), and afterwards rector of Christ Church, Philadelphia. He published, besides other works, "The Churchman's Manual," "Recognition of Friends in Another World," "Travels in Egypt, the Holy Land," etc. Died Sept. 18, 1869.

Dorr (THOMAS WILLIAM), born at Providence, R. I., Nov. 5, 1805, graduated at Harvard in 1823, was a Democrat and a leader of the suffrage party. Under the old charter the right to vote was limited to men who possessed a certain amount of real estate, and to their eldest sons. In 1841 the suffrage party formed a new constitution, and chose Mr. Dorr governor of the State. His official action was resisted in May, 1842, by the government chosen according to the old charter. Dorr was arrested, convicted of treason, and sentenced to imprisonment for life, but he was pardoned in 1847. Died Dec. 27, 1854.

Dor'rance, a post-township of Luzerne co., Pa. Pop. 646.

Dor'relites, the followers of a man named Dorrel, who lived in Leyden, Mass., and who claimed to be equal to Christ and invulnerable; but having been soundly beaten by one of his hearers, his congregation was at once dispersed.

D'Orsay (ALFRED GUILLAUME GABRIEL), COUNT, a French artist and leader of fashion, was born at Paris in 1798. He married a daughter of Lord Blessington in 1827, but subsequently separated from her, and became

the intimate friend of Lady Blessington. His wit, manners, amiability, and brilliant talents made him very popular in the society of London. Died at Paris Aug. 4, 1852.

Dorse (*Morrhua callarias*), a fish sometimes called

Dorse.

Baltic Cod, from the great numbers found in the northern seas. It is less in size than the cod, and differs from it also in having a longer upper jaw.

Dor'set, a county in the S. part of England, is bounded on the N. by Somerset and Wiltshire, on the E. by Hampshire, on the S. by the English Channel, and on the W. by Devonshire. Area, 988 square miles. The surface is partly hilly and occupied by chalk-downs. The chief rivers are the Frome and the Stour. Among the mineral resources are chalk, china clay, and the celebrated Portland building-stone. The chalk-downs or hills produce fine pasture, on which vast numbers of Southdown sheep feed. Dorset is mainly a pastoral county, and exports cattle, sheep, butter, and cheese. The chief towns are Dorchester (the capital), Poole, Bridport, Weymouth, and Shaftesbury. Pop. in 1871, 195,544.

Dorset, a post-township of Ashtabula co., O. Pop. 372.

Dorset, a post-township of Bennington co., Vt., on the Harlem Extension R. R., 22 miles S. of Rutland. It has manufactures of lumber, marble, leather, boxes, tubs, etc. Pop. 2195.

Dorset (Charles **Sackville**), K. G., sixth earl of, an English courtier and wit, born in 1637, was a son of Richard, the fifth earl of Dorset. He was brave, witty, and generous, and had superior talents, but was indolent and unambitious. His popular qualities rendered him a general favorite. He was distinguished as a patron of literary men, and bestowed his bounty with equal judgment and liberality. Dryden was one of the authors who enjoyed his bounty. Lord Dorset was appointed lord chamberlain by William III. in 1689. He wrote several admired satires and songs. Died Jan. 16, 1706.

Dorset (Thomas **Sackville**), K. G., first earl of, an English statesman and poet, born in 1536. He wrote a tragedy entitled "Gorboduc, or Ferrex and Porrex" (1561), which was praised by Sir Philip Sidney, and also the "Induction to the Mirror for Magistrates." He received the title of Lord Buckhurst in 1566, and was sent as minister to France in 1570. In 1599 he succeeded Lord Burleigh as lord treasurer of England. He was afterwards created earl of Dorset by James I. He died April 19, 1608, and was succeeded by his son Robert.

Dor'sey (John Syng), M. D., an American physician, born in Philadelphia Dec. 23, 1783, was a nephew of Dr. Physick. He studied in London and Paris, and became in 1813 professor of materia medica in the University of Pennsylvania. He published "Elements of Surgery" (1813), which was highly esteemed. Died Nov. 12, 1818.

Dort, also called **Dor'drecht** [Lat. *Dordracum*], a fortified town of the Netherlands, in South Holland, is on an island in the Meuse, 10 miles S. E. of Rotterdam. It is traversed by canals, is accessible to large ships, and has an active trade in grain, flax, timber, and salt fish. Here are shipbuilding docks, sugar-refineries, saw-mills, and manufactures of tobacco, white lead, etc. In 1421 a terrible inundation destroyed seventy villages, and converted the ground where Dort stands into an island. The Synod of Dort met here in 1618, and condemned the doctrines of Arminius. Pop. in 1870, 25,359.

Dort'mund, a walled town of Prussia, in Westphalia, on the Embscher and on the Cologne and Minden Railway, 47 miles N. N. E. of Cologne. It has several fine churches, three hospitals, a Protestant gymnasium, and a realschule; also manufactures of cotton, linen and woollen fabrics, cutlery, and nails. It was a city of the Hanseatic League, and was the chief seat of the Vehmic Court. Its trade was nearly ruined by the Thirty Years' war. Dortmund was ceded to Prussia by the Congress of Vienna in 1815. Pop. in 1871, 44,454.

Dort, Synod of [Lat. *Synodus Dordracena*], a great synod of the Dutch national Church, convened at Dort from Nov. 13, 1618, to May 9, 1619, consisting of 39 ministers, 18 ruling elders, and 5 professors, deputies from the several states of the Netherlands, besides 24 foreign deputies representing the Anglican and most of the Calvinistic churches. The synod was convoked by the States-General on account of the controversies between the Gomarists (Calvinists) and Remonstrants (Arminians). The synod was convened in the Calvinistic interest, and there has been much difference of opinion as to the fairness of its proceedings. The principal work of the synod was the preparation of canons setting forth the Calvinistic doctrines, and the publication of an Ecclesiastical Censure against the Remonstrants, calling upon the civil power to enforce the decrees of the synod by banishment, imprisonment, or fines imposed upon the refractory. The canons are ably drawn up, and were officially received by the Reformed churches of the Low Countries, France, Switzerland, and the Palatinate, but were some years later rejected by the Church of England. (See the official "Acta Synodi," 4to, 1620.)

Dosith'eans, the name of a Samaritan sect founded by Dositheus in the first century after Christ. In the fourth century there still remained a few Dositheans, who believed their master to have been the true Messiah.

Dotis, or **Totis,** a market-town of Western Hungary, in the county of Comorn, 37 miles W. N. W. of Pesth. It has several Roman Catholic churches, a synagogue, and a gymnasium. Here is a splendid château of the Esterhazy family, with extensive wine-vaults. Pop. in 1869, 9855.

Douai [Lat. *Duacum*], a fortified town of France, department of the Nord, on the river Scarpe and on the Railway du Nord, about 21 miles S. of Lille. It is well built, has several fine churches and hospitals, a theatre, an arsenal, a botanic garden, a national college, and a Roman Catholic college for the education of British Roman Catholics. Here are manufactures of cotton stuffs, lace, gauze, paper, glass, pottery, and soap. Douai existed in the time of Cæsar. It has often been besieged and taken by the French and Flemings. Pop. 24,195.

Douai Bible, The, was translated by English Roman Catholic divines connected first with the college at Rheims, and afterwards with the college at Douai. According to Dodd, the translators were Gregory, Martin, William Allen, Richard Bristow, William Reynolds, and others. The New Testament was published at Rheims in 1582. The Old Testament, then already translated, was published at Douai in 1609–10. Both Testaments were translated from the Vulgate. The annotations were quite copious, and intensely Roman Catholic. Numerous editions have appeared, which greatly vary both in the text and in the notes. An exact reprint of the original Rheims New Testament was published in New York in 1833. Of the original Douai Old Testament there has been no exact modern reprint. (See Cotton, "Rhemes and Doway," Oxford, 1855.)

Douarnenez, a town of France, in the department of Finistère, 14 miles W. N. W. of Quimper. It has large fisheries and a considerable coasting-trade. Pop. 5434.

Douay (Charles Abel), a French general, born in 1809, served in Algeria, in the Crimean war, and in 1859 in Italy, where he distinguished himself at Solferino, became in 1866 general of division, and 1869 inspector of the military academy at St. Cyr. In the French-German war he commanded the second division under MacMahon, and was killed on Aug. 4, 1870, in the battle of Weissenburg.

Douay (Felix), a French general, a brother of the preceding, born in 1816, served in Algeria, the Crimea, in the Italian war, and as general of division in 1862 in Mexico. In the war against Germany he commanded the seventh army corps, was taken prisoner at Sedan, and having returned to France in 1871, organized an army against the insurgents in Paris. He was the first one to enter Paris on the 22d of May. After the restoration of order he was appointed to the command of the fourth army corps.

Doub (Peter), D. D., an eminent minister of the Methodist Episcopal Church South, born in North Carolina Mar. 12, 1796. He joined the Virginia Conference in 1818. He performed an immense amount of service in Virginia and North Carolina. Many thousands were brought into the Church by his ministry. He was a polemic of great power. He was for three years before his death professor of biblical literature in Trinity College, N. C. He died in Greensboro', N. C., Aug. 24, 1869. T. O. Summers.

Double-acting Pump, a pump that lifts and forces water alternately on each side of the course by means of a solid piston or plunger, and an entrance and exit valve

communicating with each side. (See PUMP, by F. A. P. BARNARD.

Double Consciousness, sometimes called **Double Personality,** is a form of mental disease involving confusion in the idea of personal identity. Persons with this disorder are variously affected; some conceive that parts of their frame belong to another person; others that they are inhabited by another entity in addition to their own, and which opposes itself to their will and interests; others appear to be possessed at one time of one personality, at another of another, according to the mental or physical conditions under which they are placed. In the last-named form of the phenomenon neither consciousness has any knowledge of the other, nor can the person affected remember in one state the events which happened during the other. The phenomena of double consciousness have never received a satisfactory explanation. (For some striking examples of the last-named variety, see WAYLAND, "Intellectual Philosophy.")

Doub'le Dag'ger, in printing, a character marked thus, ‡, used as a reference to marginal notes.

Doub'leday (ABNER), an American general, born in Saratoga co., N. Y., June 26, 1819, graduated at West Point in 1842. He became a captain in 1855, and was one of the garrison of Fort Sumter in April, 1861. It is stated that he fired the first gun for the Union (April 12). He commanded a division at Antietam, Sept. 17, 1862, and obtained the rank of major-general of volunteers in November of that year. He served at Gettysburg, July 2 and 3, 1863.

Double-Eagle, a gold coin of the U. S. bearing the figure of an eagle, and equivalent to twenty dollars in value.

Double Refrac'tion, a phenomenon exhibited by Iceland spar and several other crystals. A ray of common light passing through them is divided into two polarized rays, which take different directions and are refracted according to different laws. (See REFRACTION and POLARIZATION.)

Double Shoal, a post-township of Cleveland co., N. C. Pop. 1410.

Double Stars, or **Binary Stars.** It was announced in 1803 by Sir William Herschel that there exist sidereal systems composed of two stars, one revolving around the other, or both about a common centre. Subsequent observations have confirmed this discovery, and in some instances the periods of revolution have been determined. Some of these binary systems have periods of great length. The period of 61 Cygni is supposed to be about 500 years, but others have much shorter periods, and have been observed through their entire orbits. The remarkable double star called Castor, or α Geminorum, is easily separated by a moderately good telescope. Sir J. Herschel computed its period at 252 years. The star η Coronæ completes a revolution in about forty-three years. Some of the binary systems afford curious instances of contrasted colors, the color of the smaller star being complementary to that of the larger. In such instances the larger star is usually red or orange, and the smaller star blue or green. "It may be easier suggested in words," says Sir J. Herschel, "than conceived in imagination, what variety of illumination *two suns*—a red and a green, or a yellow and a blue one—must afford a planet circulating round either." Catalogues containing several thousand binary stars have been published by Struve and others.

Doub'ling Gap Springs, in Cumberland co., Pa., 30 miles W. of Harrisburg, are 8 miles from Newville, on the Cumberland Valley R. R. A part of the springs have carbonated saline chalybeate waters, and others are saline sulphur springs. They are useful in a wide range of chronic disease.

Doub'ling the Cube, a geometrical problem of great antiquity, the object of which was to find the side of a cube containing twice as much as another given cube. Many ancient geometers attempted its solution without success. The problem was shown in its true light by the analytical method introduced by Descartes. It is only a special case of the solution of a cubic equation—a solution impossible by the use of the circle and straight line, though it may be represented by the intersection of two conic sections, one of which may be a circle. Descartes made use of the parabola with the circle, which is the simplest method. With numbers, the problem is only one of the extraction of the cube root. If the side of a cube is one foot, its solid content = 1 cubic foot. The side of a cube containing two cubic feet is $\sqrt[3]{2} = 1.259921$.

Doubloon' [Fr. *doublon;* Sp. *doblon,* from *doblar,* to "double"], a Spanish gold coin nearly equivalent to sixteen dollars. It is the double of a pistole.

Doubs (anc. *Dubis*), a river of France, rises in the Jura Mountains, flows nearly south-westward through the departments of Doubs and Jura, and enters the Saône at Verdun-sur-Saône. Total length, about 250 miles. The chief towns on its banks are Besançon and Dôle. It is navigable to Dôle.

Doubs, a department in the E. part of France, bordering on Switzerland. Area, 2018 square miles. It is intersected by the river Doubs. The surface is traversed by several ridges of the Jura Mountains, which are covered with forests of pine, walnut, and other trees. The soil of the valleys is fertile, and produces good pasture. Here are mines of coal and iron and quarries of marble. Among the exports are cattle, horses, iron, and butter. Capital, Besançon. Pop. in 1872, 291,251.

Dough'erty, a county in the S. W. of Georgia. Area, 300 square miles. It is intersected by the Flint River. The surface is nearly level; the soil is fertile. Cotton, corn, and wool are the chief products. It is traversed by a branch of the Atlantic and Gulf R. R. Capital, Albany. Pop. 11,517.

Doug'las, a seaport and the principal town of the Isle of Man, is on the E. coast, 80 miles N. W. of Liverpool. It stands on a picturesque bay, and has a harbor which will admit vessels drawing ten or twelve feet of water. It contains a custom-house, handsome villas, good hotels, and baths. The excellence of its sea-bathing renders this an important watering-place. Pop. 9894.

Douglas, a county in the E. of Colorado. Area, 5500 square miles. It is partly drained by the South Fork of the Platte and by Beaver Creek. The surface in the western part is mountainous. Copper, iron, lead, and coal are found here. It is intersected by the Kansas Pacific and the Denver and Rio Grande R. Rs. It has great quantities of pine timber. Grain, cattle, butter, and timber are produced extensively. Capital, Franktown. Pop. 1388.

Douglas, a county in the E. of Illinois. Area, 375 square miles. It is intersected by the Embarras and Kaskaskia rivers. The surface is nearly level; the soil is fertile. Cattle, grain, and wool are raised. It is traversed by the Chicago branch of the Illinois Central R. R. Capital, Tuscola. Pop. 13,484.

Douglas, a county in the E. part of Kansas, has an area of 470 square miles. It is bounded on the N. by the Kansas River and intersected by the Wakarusa. The surface is undulating; the soil is fertile. Cattle, grain, tobacco, wool, dairy products, hay, and potatoes are raised. Limestone abounds here. This county contains large prairies. It is traversed by the Leavenworth Lawrence and Galveston, and other railroads. Capital, Lawrence. Pop. 20,592.

Douglas, a county in the W. of Minnesota. Area, 720 square miles. It contains numerous small lakes, the outlet of which is Long Prairie River. The surface is pleasantly diversified by prairies and groves. Grain, hay, and dairy products are raised. Capital, Alexandria. Pop. 4239.

Douglas, a county in the S. of Missouri. Area, 648 square miles. It is drained by Bryant's Fork and the North Fork of White River. The surface is partly hilly. Lead is found here. Grain, tobacco, and wool are the chief products. Capital, Arno. Pop. 3915.

Douglas, a county in the E. of Nebraska. Area, 350 square miles. It is bounded on the E. by the Missouri River, on the W. by the Platte, and intersected by the Elkhorn River. The surface is undulating; the soil is very fertile. Wheat, corn, and hay are important crops. The manufacturing interests are important and varied. Manufactories of clothing, jewelry, and bread were the most numerous, according to the census of 1870. Limestone abounds in it, and the scenery is very beautiful. It is traversed by the Union Pacific R. R. Capital, Omaha. Pop. 19,982.

Douglas, a county in the W. of Nevada, is bounded on the W. by Lake Tahoe, which separates it from California. The surface is mountainous, and a granite mountain called Job's Peak rises here about 6000 feet. Gold and silver are found. The county contains much good land. Grain, hay, and stock are raised, and timber is sawed. Capital, Genoa. Pop. 1215.

Douglas, a county in the S. W. of Oregon, is partly bounded on the W. by the Pacific Ocean. It is intersected by the Umpqua River and its forks. The Cascade Range extends along the eastern border of this county, the surface of which is mostly mountainous. The long valley of the Umpqua is fertile, and is enclosed by ranges of grassy hills which produce good pasture. Cattle, grain, fruit, hay, wool, and dairy products are raised. It is intersected by the Oregon and California R. R. Capital, Roseburg. Pop. 6066.

Douglas, a county which forms the N. W. extremity of Wisconsin. Area, 1350 square miles. It is bounded on the N. by Lake Superior, and drained by the St. Croix, which rises in it. The surface is hilly, and extensively covered with forests of pine, oak, etc. Copper is found here. Capital, Superior City. Pop. 1122.

Douglas, a township of Arkansas co., Ark. Pop. 760.

Douglas, a township of San Joaquin co., Cal. P. 1751.

Douglas, a post-village, capital of Coffee co., Ga., about 120 miles W. S. W. of Savannah.

Douglas, a township of Clark co., Ill. Pop. 555.

Douglas, a township of Effingham co., Ill. Pop. 3222.

Douglas, a township of Iroquois co., Ill. Pop. 2399.

Douglas, a township of Saline co., Ill. Pop. 1437.

Douglas, a township of Adams co., Ia. Pop. 333.

Douglas, a township of Appanoose co., Ia. Pop. 590.

Douglas, a township of Boone co., Ia. Pop. 879.

Douglas, a township of Bremer co., Ia. Pop. 587.

Douglas, a township of Clay co., Ia. Pop. 320.

Douglas, a township of Harrison co., Ia. Pop. 185.

Douglas, a township of Ida co., Ia. Pop. 61.

Douglas, a township of Madison co., Ia. Pop. 938.

Douglas, a township of Mitchell co., Ia. Pop. 282.

Douglas, a township of Montgomery co., Ia. P. 467.

Douglas, a township of Page co., Ia. Pop. 503.

Douglas, a township of Polk co., Ia. Pop. 613.

Douglas, a township of Sac co., Ia. Pop. 358.

Douglas, a township of Union co., Ia. Pop. 824.

Douglas, a township of Webster co., Ia. Pop. 513.

Douglas, a township of Jackson co., Kan. Pop. 1760.

Douglas, a township and post-village of Worcester co., Mass., on the Boston Hartford and Erie R. R., 48 miles S. W. of Boston. It has stone-quarries, a public library, a weekly newspaper, five churches, and good water-power. At East Douglas axes and edge-tools are extensively manufactured. Total pop. 2182.

Douglas, a township of Montcalm co., Mich. P. 215.

Douglas, a township of Dakota co., Minn. Pop. 707.

Douglas, a township of Douglas co., Neb. Pop. 174.

Douglas, a township of Nemaha co., Neb. Pop. 393.

Douglas, a township of Berks co., Pa. Pop. 1072.

Douglas, a post-township of Montgomery co., Pa. Pop. 1604.

Douglas, a township of Clarendon co., S. C. Pop. 310.

Douglas, a township of Marquette co., Wis. Pop. 616.

Douglas, the name of an ancient noble family of Scotland which has produced many eminent men. The first member of the family who appears on record was William of Douglas, who lived about 1175–1200, and was succeeded by his son Sir Archibald. Sir William, a grandson of Sir Archibald, was a turbulent subject and the possessor of extensive estates. He fought under Sir William Wallace against the English in 1297. He was succeeded by his more famous son, Sir James the Good, who is called the hero of seventy fights, and was Robert Bruce's greatest captain. He commanded a wing at Bannockburn in 1314. During a journey to Palestine, to which he was carrying the heart of Robert Bruce, he was killed by the Saracens in Spain in 1331. His estate was inherited by his brothers, Hugh and Archibald, the latter of whom was slain at the battle of Halidon Hill in 1333. He left a son, Sir William, who, having fought with distinction at Poitiers and other places, was created earl of Douglas in 1357. He was a competitor for the crown, but he agreed to recognize his rival, Robert II., on the condition that his son James should marry a daughter of that king. He had a second son, George, earl of Angus. The earl of Douglas died in 1384, and was succeeded by his son James, earl of Douglas and Mar, who had married Margaret, a daughter of Robert II. He was a renowned warrior, and was killed at the battle of Otterburn in 1388. As he left no lawful issue, Archibald the Grim, a natural son of Sir James the Good, became the third earl of Douglas. He died in 1400, leaving a son, Archibald, the fourth earl, who married a daughter of King Robert III. Douglas fought at Shrewsbury (1403), where he is said to have unhorsed King Henry IV., and was killed at Verneuil in France in 1424. He was succeeded by his son Archibald, the fifth earl, who was also duke of Touraine (France). Died in 1439. His son and heir, William, the sixth earl, was born about 1422. His power and foreign possessions rendered him an object of fear and suspicion to the court. He was beheaded after a hasty trial, Nov. 24, 1440, and left no issue. The earldom was then given to his grand-uncle James, who died in 1443, and was succeeded by his son William, the eighth earl, a powerful and turbulent person. He was appointed lieutenant-general of the kingdom by James II., but soon lost the royal favor. He was killed by that king Feb. 22, 1452, and was succeeded by his brother James, ninth earl of Douglas, who waged open war against King James II. in 1454. He was defeated and taken prisoner in 1484, and died in 1488, when that branch of the Douglas family became extinct. The earls of Angus and earls of Morton, besides other noble lines, belonged to the family of Douglas, which is now represented in the peerage by the earls of Selkirk. WILLIAM JACOBS.

Douglas (ARCHIBALD), fifth earl of Angus, surnamed BELL THE CAT, was a son of George, the fourth earl, who died in 1462. He (the son) was a powerful and ambitious subject, and held the highest offices in the state. He was the father of Gawin Douglas, the poet, and of other sons. Died in 1514. His grandson Archibald became the sixth earl of Angus, and married in 1514 Margaret, who was a sister of Henry VIII. of England and widow of James IV. of Scotland. He had a daughter, who became the wife of the earl of Lennox and the mother of Lord Darnley. The sixth earl died about 1660, and his title was inherited by his nephew George, who was a brother of Regent Morton. The eleventh earl of Angus was created marquis of Douglas in 1633. (See DAVID HUME, "History of the Houses of Douglas and Angus," 1644.)

Douglas (DAVID), a Scottish botanist, born at Scone, in Perthshire, in 1798. As an agent of the London Horticultural Society he visited the U. S. in 1823 to collect botanical specimens. He returned to England in 1827, and afterwards went on a scientific excursion to the Sandwich Islands, where he was killed by a wild bull July 12, 1834.

Douglas (GAWIN), a Scottish poet, born in 1474, was the third son of Archibald, fifth earl of Angus. He was educated for the Church, and became bishop of Dunkeld in 1515. His most remarkable production is a translation of Virgil's "Æneid" into Scottish verse (1513), which is highly commended. His chief original poem is "The Palace of Honor." Died in 1522.

Douglas (Sir HOWARD), BART., D. C. L., G. C. B., a British general, born at Gosport, in Hampshire, July 1, 1776, was a son of an admiral. He served in the Peninsular war (1808–12), was governor of New Brunswick (1823–29), and a member of Parliament for Liverpool (1842–47). In 1851 he was raised to the rank of general. He wrote, besides other works, a "Treatise on Naval Gunnery" (1819), which is regarded as a standard authority in foreign countries as well as in England. Died Nov. 8, 1861.

Douglas (STEPHEN ARNOLD), one of the most eminent of American statesmen in his day, was born at Brandon, Rutland co., Vt., April 23, 1813. He was of poor but respectable parentage. His father was a practising physician, with prospects of success, but died suddenly of apoplexy soon after the birth of the subject of this notice. His mother, with another infant, a daughter, not yet two years old, was thus left a widow, with means, in addition to her own exertions, barely sufficient to support herself and her two orphan children, without being able to give them more than the rudiments of a good English education. At the age of fifteen the son, with the consent of his mother, engaged himself to work in the cabinetmaking business for the purpose of raising means to carry him through college. After a few years of labor in this trade he was able to enter upon an academical course, first at Brandon, Vt., and then at Canandaigua, N. Y. At the latter place he remained until 1833, and took up the study of the law at the office of the Messrs. Hubbel, and prosecuted this in connection with his academic course. Early in 1833, before he was twenty, his funds running low, he determined to abandon further attempts at education, and to enter at once into the conflicts of life with such acquisitions of knowledge as he had then obtained and might be enabled afterwards to obtain. After some wanderings in the Western States in quest of a new home where his fortunes were to be tried, he took up his abode at Jacksonville, Ill., where, after teaching school for three months, he was admitted to the bar, and opened an office in 1834. He rapidly rose in his profession. Within a year from the time that he received his license to practise he was elected attorney-general of the State. Having been reared in the Jeffersonian school of politics, Mr. Douglas zealously espoused the Democratic side on all public questions then agitated, and soon became one of the most popular orators of his party in Illinois. He was, at an early day in his political life, styled "The Little Giant," in allusion to his diminutive stature in contrast with the extent and comprehensiveness of his intellectual powers. In 1835 he resigned his position as attorney-general upon his being elected a member of the

State legislature. In 1841 he was chosen one of the judges of the supreme court of the State. This position he resigned in 1843 to take a seat in the House of Representatives of the Congress of the U. S. His *début* on this elevated arena was upon the bill to refund to Gen. Jackson the fine of $1000 imposed by Judge Hall in New Orleans during the war of 1812. His first speech placed him high in the ranks of the most promising young men of mark of that period. On all questions of constitutional law he at once took position among the ablest members of the House, in which then figured, as they had for years before, such men as Daniel D. Barnard, Alexander Dromgoole, Joseph R. and Charles J. Ingersoll, Garrett Davis, Robert C. Winthrop, R. Barnwell Rhett, Henry A. Wise, and John Quincy Adams, to say nothing of many others of the illustrious compeers of these acknowledged leaders, who were then making such a deep impress upon the history of the country. Mr. Douglas was among the most zealous, as well as the most efficient, advocates of the admission of Texas as a State into the Union by joint resolution of both houses of Congress. He sustained the constitutionality of the measure in a speech of great power and effect. He defended that feature of the resolutions known as the extension of the line of the "Missouri Compromise," simply as a pledge of his adherence to the principle of a division of the public domain between the two great sections of the country, North and South, as it had been tendered by the North and accepted by the South in 1820. As an original question Mr. Douglas did not believe that Congress had any rightful power to impose an anti-slavery restriction upon any of the Territories or States of the Union; but being willing to abide by the principle of division as established in 1820 as to the Louisiana acquisition, he was for its reaffirmance in 1845 as to the new acquisition then to be made on the acceptance by Texas of the terms proposed for her admission into the Union. He was also one of the ablest supporters of the administration of President Polk during the war which ensued with Mexico.

When Mr. David Wilmot of Pennsylvania, in Aug., 1846, moved his celebrated "Proviso" for slavery restriction to any new territory that might be acquired from Mexico in a treaty of peace, Mr. Douglas was one of five only in the House, from the entire North, who took decided position against that measure. He did it for the same reason and upon the same principles that Mr. Jefferson acted on when, though then in private life, he spoke and wrote against a like restriction upon the Louisiana Territory, when it was proposed in Congress in 1818–19. Mr. Douglas, like Mr. Jefferson, was opposed to African slavery, but, like him, he maintained that the Congress had no constitutional power to impose the restriction. The internal polity and domestic institutions of the several States composing the Union were subjects, in his judgment, over which the Federal legislative authority did not extend under the limitations of the Constitution. He was still willing to abide by a further extension of the "Missouri Compromise" line, so called, and in many speeches, with most patriotic fervor, urged the adoption of this policy.

In all the subsequent agitation of this question the speeches of Mr. Douglas, while he remained in the House, were clear, earnest, and masterly. In 1847 he was elected to the Senate for a full term of six years. In that body he was no less distinguished than he had been in the House. No man in the Senate, not excepting Mr. Clay or Mr. Webster, acted a more conspicuous part than he did in what is known as the "Compromise" or adjustment of the sectional questions of 1850. While the success of this compromise is generally attributed to the lead and auspices of Mr. Clay, yet it is due to Mr. Douglas to state that Mr. Clay's celebrated "Omnibus Bill," so called, which provided for the settlement of the five great questions of discontent, as stated by him, was made up of several distinct bills on the same subject previously introduced by Mr. Douglas. The full and minute history or nature of that compromise it is not proposed to give in this connection; suffice it to say that no one acted a more important and efficient part in effecting it than did Mr. Douglas, and that it was based throughout upon what he had ever maintained to be the true constitutional principles of the government. In 1852 he was again elected to the Senate for another full term. In 1854, when, as chairman of the committee on territories, he introduced bills for the organization of governments in the Territories of Kansas and Nebraska, the whole subject of slavery agitation in the Territories was again renewed, and with increased fierceness. The policy and provisions of these bills, he maintained by argument and eloquence seldom surpassed, were in strict accordance with the principles established by the territorial policy adopted in 1850. Under his lead the Kansas-Nebraska bill was triumphantly carried in the Senate, on the grounds that the principle of a division of the public domain between the sections by the Missouri or any other line had been totally abandoned by the adjustment of 1850, and the principle of non-intervention by Congress anywhere in the Territories substituted in its stead. On the like ground it was triumphantly carried in the House, and constitutes what is known as the "Territorial legislation of 1854." Mr. Douglas's views of the rights of the people of a Territory under the Constitution of the U. S. gave rise to what is styled the doctrine of "squatter sovereignty," for which he was assailed quite as bitterly at the South as at the North. It is not the purpose of this notice to go into any elaboration on this point. His doctrine, briefly stated, was, that the inestimable right of local self-government was the seminal principle from which all American free institutions sprung; it was on this that each of the original thirteen colonies had been planted; and that it was for the maintenance of this sovereign right on the part of the peoples of the several States of the Union that their independence had been declared and their first confederation entered into. With Mr. Jefferson and all strict constructionists, Mr. Douglas held that the Federal government possessed no inherent powers, and could exercise none except those delegated by the States; that the delegated powers are specific and enumerated in the Constitution; and that Congress cannot rightfully exercise any power which is not thus enumerated or incident to some or more which are. The power conferred upon Congress in the Constitution, "to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the U. S.," he, with the Jeffersonian school generally, maintained referred to the territory as land or public domain only, and carried with it no power whatever for the government of the inhabitants thereof. The Territories, with their inhabitants, politically considered, he regarded as inchoate States, and bearing towards the government of the Union a relation not unlike, in many respects, that which the colonies bore towards the mother-country. The great right of local self-government belonged equally to both. This is a brief outline of what he styled popular sovereignty in the Territories. His views at large upon it are to be found, not only in numerous speeches in the House and Senate during a period of many years, but in a very compact and condensed form in "Harper's Magazine" of Sept., 1859. This article was republished in pamphlet form, and extensively circulated. It consisted of forty pages, and, however it may have been regarded by extreme partisans of either side at the period of its publication, it unquestionably presents an argument which every student of American history may read with both interest and profit. Among American state papers it is entitled to rank with Madison's celebrated report on the Virginia resolutions of 1799. In 1858, Mr. Douglas was again re-elected to the Senate for another full term, after one of the fiercest and bitterest contests ever before waged in the U. S. for a similar position. At this time he successfully breasted all the combined powers of the opposing party, then styled Republican, under the lead of Mr. Lincoln, his competitor, and that of the Democratic administration at Washington, under the patronage of Mr. Buchanan, the President.

As early as 1852 the name of Mr. Douglas had been brought prominently before the Democratic nominating convention at Baltimore as a candidate for the presidency, but, at his own instance, was not pressed by his friends. In 1856, it was again, in like manner, presented to the Cincinnati Convention, but as soon as he discovered that Mr. Buchanan had a majority in that body he gave positive instructions to his friends in that convention, by telegram from Washington, to withdraw his name, and not to allow it to be used in any contest for the nomination under the two-thirds rule. The platform of political principles which had been adopted there before the subject of nominating candidates had been taken up was just such as had governed the whole of his public life, and he gave Mr. Buchanan a cordial support upon his endorsement of them. In 1860, after his triumphant return to the Senate at his last election, he was the most prominent candidate of the Democracy of the U. S. for the presidential nomination at the convention held that year in Charleston, S. C., and very probably would have received it by a two-thirds vote but for the withdrawal of the delegates of the States of Alabama, Arkansas, Florida, Louisiana, Mississippi, South Carolina, and a majority of those from Georgia. On the withdrawal of these delegations the friends of Mr. Douglas moved and carried an adjournment of the convention, to reassemble at Baltimore on a subsequent day. This was done with a view that the Democratic party, in the mean time, in the several States, might fill the seats made vacant in the convention by the withdrawing delegates. The object failed of accomplishment. On the reassembling of the convention another withdrawal of delegations took place. These now met in

another part of the city and put in nomination for the presidency John C. Breckenridge of Kentucky. The Democratic party of the Union was thus irreconcilably torn asunder. Those who adhered to the regularly called convention, which had first met at Charleston, and had adjourned to Baltimore, constituted the larger portion. This body now unanimously put the name of Mr. Douglas in nomination for the presidency, though against what was known to be his wishes. The presidential canvass this year was perhaps the most exciting that had ever occurred since that between Mr. Jefferson and the elder Adams in 1800. Four tickets for President and Vice-President were in the field —Lincoln and Hamlin, supported by the Republicans; Bell and Everett, supported by those styling themselves the American party; Douglas and Johnson, supported by one wing of the Democracy, and Breckenridge and Lane, supported by the other. The chief objection to Mr. Douglas on the part of his former Democratic associates, who refused to support him, was what was called his squatter-sovereignty doctrine. The result of the election, by the popular vote, was, for Lincoln and Hamlin, 1,857,610; for Douglas and Johnson, 1,365,976; for Breckenridge and Lane, 847,953; and for Bell and Everett, 590,631. The result by the college of electors, however, was very different. By this Messrs. Lincoln and Hamlin received 180 votes; Messrs. Breckenridge and Lane, 72; Messrs. Bell and Everett, 39; Messrs. Douglas and Johnson received 12 only.

The great events of 1861 followed in rapid succession. Mr. Douglas was spared their full development. He died after a short illness, at his residence in Chicago, on the 3d of June, 1861, soon after reaching the 48th year of his age. On the 15th of March, a little over two months before his death, and after seven of the Southern States had passed their ordinances of secession, in view of the then threatening prospect of affairs, he spoke, in the Senate, at great length on the general state of the country, and in the course of his remarks used these words in addressing the Republican side: "In my opinion, we must choose, and that promptly, between one of three lines of policy: 1. The restoration and preservation of the Union by such amendments of the Constitution as will ensure the domestic tranquillity, safety, and equality of all the States, and thus restore peace, unity, and fraternity to the whole country. 2. A peaceful dissolution of the Union by recognizing the independence of such States as refuse to remain in the Union without such constitutional amendments, and the establishment of a liberal system of commercial and social intercourse with them by treaties of commerce and amity. 3. War, with a view to the subjugation and military occupation of those States which have seceded or may secede from the Union. I repeat, that in my opinion you must adopt and pursue one of these three lines of policy. The sooner you choose between them, and proclaim your choice to the country, the better for you, the better for us, the better for every friend of liberty and constitutional government throughout the world. In my opinion, the first proposition is the best, and the last the worst."

Soon after the fleet sailed from New York to provision the garrison in Fort Sumter, "peaceably if possible, but forcibly if necessary." After the fall of that garrison, Mr. Douglas, in Springfield, Ill., and at other places, made speeches in which he sustained Mr. Lincoln's call for 75,000 troops to defend the Federal Capital. The last intelligible words uttered by him were a message to his sons, Robert and Stephen, then at college, "to obey the laws and support the Constitution of the U. S."

Mr. Douglas was twice married. His first wife was Miss Martin of North Carolina. She was the mother of his two sons referred to, who were his only surviving children. His second wife was Miss Cutts, a most beautiful and accomplished lady of Washington City. By her he left no child. As a debater Mr. Douglas was never overmatched, either in the House or Senate. His death at the time was regarded in all sections as a great public calamity. However widely many differed with him on some questions, all acknowledged his very great ability, while very few, if any, seriously questioned either his integrity or patriotism.

ALEXANDER H. STEPHENS.

Doug'lass, a county in the N. W. of Georgia, constituted since the census of 1870. It contains about 450 square miles, and is bounded on the S. E. by the Chattahoochee River. Capital, Douglassville.

Douglass (DAVID BATES), an eminent American civil and military engineer, born at Pompton, N. J., Mar. 21, 1790, graduated at Yale College Sept. 18, 1813, and Oct. 1, 1813, was appointed a second lieutenant in the corps of engineers U. S. A. He entered upon duty at West Point as commander of sappers and miners, and was later commander of the post. In the war with Great Britain he commanded in 1814 his company of sappers and miners on the northern frontier; participated in the battle of Niagara and siege of Fort Erie, followed by the memorable sortie from that work Sept. 17, 1814, breaking the enemy's lines and compelling him to retire. For "distinguished and meritorious services in superintending the construction of defensive works, in command of battery, etc.," on this occasion, he was promoted first lieutenant and brevet captain. On the close of the war he returned to West Point, 1815, and during the subsequent fifteen years was variously engaged as professor of natural and experimental philosophy, of mathematics, and of engineering till 1831, when he resigned to enter upon the profession of civil engineering. During these years he was engaged upon important inspections, surveys, and estimates for important canals and other works of internal improvement. He was also astronomical surveyor of the commission for determining the U. S. boundary from Niagara to Detroit in 1819; was consulting engineer of the board of commissioners of internal improvements of Pennsylvania. Having become greatly interested in the introduction of inclined planes into operation in place of locks for canal navigation, and having accepted from the Morris Canal Company the appointment of chief engineer of the same, which duty he found required all his time, his sense of duty led him to resign his position in the army Mar. 1, 1831; he was at once appointed chief engineer of the Morris Canal Co., and devoted himself entirely to the improvement with which he had become identified. The inclined plane proved a success. In Oct., 1830, a trial of the plane at Montville was made, and in six minutes and a half a boat containing 200 persons passed a plane 1040 feet long, with a descent of 70 feet, and advancing 770 feet. The canal was carried forward to a successful completion in 1832. During this year he was appointed professor of natural philosophy and civil engineering in the University of the City of New York, but relinquished this position in 1833, though his name was continued on the rolls of the college as professor of civil engineering and architecture till 1840. In 1833 he surveyed the Brooklyn and Jamaica R. R., Long Island; was one of the engineers of the Croton Aqueduct from 1833 to 1835, during which time he made the surveys, plans, and estimates for supplying the city of New York with water from the Croton River, the entire duty falling upon him in consequence of other professional engagements which occupied the entire time of the engineer named in connection with Major Douglass. His report showed so clearly the practicability of the project that the necessary legislation to procure its execution was obtained in May, 1834, and Major Douglass as chief engineer completed his plans and laid out the line of the aqueduct until Oct., 1836, at which date, owing to difference of views which existed between himself and the board of commissioners, he was removed; but his reports and surveys were adopted and followed in the construction of that important work. From 1837 to 1840, in addition to other duties, he was chief engineer of Greenwood Cemetery, which he planned and the location of which he selected; his engineering ability as well as his artistic taste and skill are shown in the present development of that beautiful city of the dead. In 1840 he resigned his superintendence of Greenwood to accept the presidency of Kenyon College, O., with which institution he remained till 1844, when he returned to New York, and was engaged until 1848 as chief engineer to plan and lay out the Albany and Quebec cemeteries; in important engineering work at Brooklyn, such as providing for a supporting wall for Brooklyn Heights, the supplying of that city with water, etc., and in developing the landscape features of Staten Island. In 1848 he accepted a call from Geneva College, N. Y., as professor of mathematics, which position he retained during the remainder of his life. Died at Geneva, N. Y., Oct. 9, 1849. At the request of the cemetery board his remains were removed to Greenwood Cemetery. G. C. SIMMONS, *Clerk Board of Engineers.*

Douglass (FREDERICK), an American orator, originally a slave, was born in Talbot co., Md., about 1817. He learned to read and write by stealth, ran away from his master in 1838, and became a resident of New Bedford, Mass. In 1841 he began to give public lectures against slavery. He gained distinction as a public speaker, published his "Autobiography" in 1845, and visited England, where he made eloquent anti-slavery speeches. He afterwards became the editor of the "North Star," a journal published at Rochester, N. Y. In 1870 he began to edit the "National Era." In 1872 he was the first in the list of presidential electors chosen by the Republican party of the State of New York.

Doug'lassville, a post-village, capital of Douglass co., Ga., about 30 miles W. of Atlanta.

Doug'lastown, a port and post-village of Northumber-

land co., New Brunswick, on the N. bank of the Miramichi, 3 miles above Chatham and 3 miles below Newcastle. It saws and ships large amounts of lumber. Pop. about 400.

Dour, a town of Belgium, department of Hainaut, 9 miles W. S. W. of Mons. It derives its prosperity from mines of coal and iron, iron-works, weaving, and bleaching. Pop. 8501.

Dou'ro [Sp. *Duero;* anc. *Durius*], a large river of Spain and Portugal, rises in Old Castile, in the province of Soria. It flows generally westward through the provinces of Valladolid and Zamora until it touches the N. E. extremity of Portugal. It next runs south-westward, and forms part of the boundary between Spain and Portugal. Resuming a westward direction, it traverses the northern part of Portugal, and enters the Atlantic 3 miles below Oporto. Its total length is nearly 500 miles. Rocks, sand-banks, and the rapid current render its navigation difficult.

Dove (in natural history). See PIGEON.

Dove [supposed to be derived from a root akin to "dive;" Lat. *columba;* Ger. *Taube*]. The dove in Christian art is used as a symbol of purity and an emblem of the Holy Spirit. Issuing from the lips of dying saints and martyrs, it represents the soul purified by suffering. Holding in its mouth an olive branch, it is the emblem of peace. In Catholic churches the pyx or ciborium containing the Host is sometimes in the form of a dove.

Do've (HEINRICH WILHELM), an eminent German physicist, born at Liegnitz, in Silesia, Oct. 6, 1803, graduated at the University of Berlin in 1826. He became professor of physics in that university in 1829, after which he made researches into the laws of climate and atmospheric phenomena. He published, besides other works on meteorology, electricity, etc., "Meteorological Researches" (1837), "On Electricity" (1848), and a "Treatise on the Distribution of Heat on the Surface of the Globe," which was published in 1853 by the British Association.

Dove (RICHARD WILHELM), an eminent German jurist, son of the preceding, born in Berlin in 1833, became in 1859 privatdocent at the University of Berlin, in 1862 professor at the University of Tübingen, in 1865 at Kiel, and at 1868 at Göttingen. In 1871 he was elected to the German Reichsrath, where he votes with the national liberal party. He began in 1860 the publication of the "Zeitschrift für Kirchenrecht," the leading periodical in Europe on all questions relating to church law, of which he has ever since remained the chief editor.

Do'ver (anc. *Dubris*), a city and seaport of England, in the county of Kent, on Dover Strait, 66 miles E. S. E. of London and 27 miles from Calais, in France. It is the point in England that is nearest to the Continent, and is the terminus of the South-eastern Railway. It stands at the entrance of a deep depression in an amphitheatre of chalk-hills and cliffs. This city is defended by Dover Castle, which is built on chalk-cliffs 320 feet high, and is a fortress of great strength and extent. This castle is said to have been founded by the ancient Romans. Dover contains a custom-house, a town-hall, a theatre, and a military hospital. The harbor is protected by a stone pier built of solid masonry, 60 feet wide, and extending about 1800 feet into the sea. Dover is the chief port of communication between England and France, and is only 21 miles distant from the nearest part of the Continent. Steamers ply daily between this port and Boulogne and Calais. Dover returns two members to Parliament, and is one of the Cinque Ports. A submarine cable was laid from Dover to Calais in 1850. Pop. in 1871, 28,270. (See BREAKWATER, by GEN. J. G. BARNARD, U. S. Army.)

Dover, a post-township and village, capital of Pope co., Ark, about 90 miles N. W. of Little Rock. Pop. of township, 1063.

Dover, the capital of the State of Delaware and seat of justice of Kent co., is on the Delaware R. R., 48 miles S. of Wilmington and about 5 miles W. of Delaware Bay. It has a State-house, with a State library containing 30,000 volumes, 6 churches, 1 national bank, 1 State bank, 1 weekly newspaper, 2 fruit-packing houses, 2 steam saw-mills, 1 large water and steam flouring-mill, sash and fruit-crate factory, gasworks, 1 foundry, 1 carriage manufactory, 2 public schools, 3 select schools, and 1 Methodist Episcopal academy for boys. It is the centre of a great fruit-growing section. Pop. 1906; of Dover hundred, 6394.
ED. "DELAWAREAN."

Dover, a post-township of Bureau co., Ill. Pop. 1402.

Dover, a township of Fayette co., Ia. Pop. 1150.

Dover, a post-township of Shawnee co., Kan. Pop. 611.

Dover, a post-village of Mason co., Ky., 12 miles below Maysville. A large quantity of tobacco and hemp is exported from this place. Pop. 532.

Dover, a post-village, capital of Piscataquis co., Me., on the Piscataquis River and the Bangor and Piscataquis R. R., 53 miles N. W. of Bangor. It has one weekly newspaper, a heavy trade, and manufactures of woollens. Pop. of Dover township, 1983.

Dover, a township and post-village of Norfolk co., Mass. Here are three churches and a paper-mill. Pop. of township, 645.

Dover, a township and village of Lenawee co., Mich., on the Lake Shore and Michigan Southern R. R., 5 miles W. of Adrian. Pop. 1494.

Dover, a township of Monongalia co., Minn. Pop. 266.

Dover, a township and village of Olmsted co., Minn. Pop. 822.

Dover, a post-township of Lafayette co., Mo. Pop. 2251.

Dover, a handsome town, capital of Strafford co., N. H., is on Cocheco River and on the Boston and Maine R. R., 68 miles N. of Boston and 12 miles N. W. of Portsmouth. The Dover and Winnipiseogee R. R. connects it with Alton Bay, and the Dover and Portsmouth R. R. connects it with the last-named place. It is at the head of sloop-navigation and at the lower falls of the river, which has here a fall of thirty-two feet and affords abundant water-power. It contains a city-hall, ten or more churches, three national banks, one daily and four weekly newspapers, and one monthly publication. The printing establishment of the Free Baptist denomination is also located here, which issues two semi-monthly juvenile papers, denominational and Sunday-school books, etc. It has an efficient public high school, a flourishing private academy, and a city library of considerable value. Here are four large cotton-mills and an extensive printery belonging to the Cocheco Manufacturing Company. Dover has also manufactures of shoes, woollen cloths, flannels, oil-cloths, glue, etc. It was founded in 1623, and is the oldest town in the State. Pop. 9294. GEORGE T. DAY, ED. "MORNING STAR."

Dover, a post-village of Morris co., N. J., on the Morris Canal, the Rockaway River, and the Morris and Essex R. R., 33 miles W. N. W. of Newark. It has several iron-forges, iron-foundries, steel-works, spike-factories, and rolling-mills; also one weekly newspaper, and one national bank.

Dover, a township of Ocean co., N. J. It contains Tom's River, the capital of the county. Pop. 3044.

Dover, or **Dover Plains,** a post-village of Dutchess co., N. Y., on the New York and Harlem R. R., 78 miles N. N. E. of New York. It has a national bank and one weekly newspaper. The township has five churches, marble-quarries, iron-mines, and much fine scenery. Pop. of Dover township, 2279.

Dover, a township and post-village of Craven co., N. C., on the Atlantic and North Carolina R. R., 24 miles W. of Newbern. Pop. 2206.

Dover, a township of Athens co., O. Pop. 1697.

Dover, a township and post-village of Cuyahoga co., O. Pop. 1445.

Dover, a township of Fulton co., O. Pop. 930.

Dover, a township of Tuscarawas co., O., contains the village of CANAL DOVER (which see). Pop. of township, 3515.

Dover, a township of Union co., O. Pop. 929.

Dover, a township and post-borough of York co., Pa. Pop. of township, 2281; of borough, 418.

Dover, a post-village, capital of Stewart co., Tenn., on the Cumberland River, 75 miles W. by N. from Nashville, and 1 mile E. of Fort Donelson. It has one weekly newspaper, and a national cemetery a quarter of a mile W. of Dover. Pop. 430. JAMES P. FLOOD, ED. "WEEKLY RECORD."

Dover, a post-township of Windham co., Vt. It has manufactures of lumber, tubs, kegs, etc. Pop. 635.

Dover, a township of Goochland co., Va. Pop. 3667.

Dover, a township and village of Racine co., Wis., on the Western Union R. R., 21 miles W. of Racine. P. 1047.

Dover Hill, a post-village, capital of Martin co., Ind., 92 miles S. S. W. of Indianapolis.

Do'ver's Pow'der [named from Dr. Dover, its inventor, an English physician], (*Pulvis Ipecacuanhæ et Opii*), consists of ipecacuanha and opium in fine powder, sixty grains each; sulphate of potassa, a troy ounce: rubbed together to a very fine powder. Dover's powder acts as a sudorific, and where the brain is unaffected and the tongue and skin moist, is of great service. Its composition now differs considerably from that given in Dover's formula.

Dover, Strait of [Fr. *Pas de Calais;* Lat. *Fretum Gallicum*], the strait which separates England from France, and connects the English Channel with the North Sea. It

is about twenty miles wide at the narrowest part. The depth varies from six to twenty-nine fathoms. The English side of the strait is bordered by chalk-cliffs, some of which are about 600 feet high. Chalk-cliffs also occur on the French shore.

Dov'refield, a mountainous plateau in Norway, forming the northern end of the central mass of the Scandinavian system. It extends along the N. side of the Rauma Valley, which separates it from the Langfjeld plateau, to the sources of the Lougen, and thence N. E. to those of the Glommen. Its highest peak is the Snechattan, 7613 English feet, formerly considered the highest in Scandinavia.

Dow, or **Douw** (GERARD), a celebrated Dutch painter, born at Leyden April 17, 1613, was a pupil of Rembrandt. He excelled in chiaroscuro and in technical skill, and finished his works with excessive delicacy. Among his works, which are small in dimensions, are "The Charlatan," "The Dropsical Woman," "The Dentist," and "The Village Grocer." He died in Feb., 1675.

Dow (LORENZO), an eccentric Methodist preacher, born in Coventry, Conn., Oct. 16, 1777. He labored in many States of the Union, and also in England and Ireland. He was distinguished for his courage and zeal, and for some singularities in his habits. Died Feb. 2, 1834.

Dow (NEAL), a reformer, born at Portland, Me., in 1803. As a member of the legislature of that State he procured in 1851 the passage of a law to prohibit the sale of ardent spirits, which is called the "Maine law." He became a brigadier-general of Union volunteers early in 1862, and was taken prisoner near Port Hudson in July, 1863.

Dow'ager [Fr. *douairière*, from *douaire*, a "dower"], a widow endowed; that is, who either enjoys a dower from her deceased husband, or has property of her own brought by her to her husband on marriage, and settled on herself after his decease. This is called her dowry. In England the queen-dowager, as the widow of the king, enjoys most of the privileges which belonged to her as queen-consort, but no man can marry a queen-dowager without special license from the king. A queen-dowager does not lose her regal title when she marries a subject.

Dowa'giac, a post-village of Cass co., Mich., on the Dowagiac River and the Michigan Central R. R., 105 miles E. of Chicago. It has one national bank and one weekly newspaper. Pop. 1932.

Dow'el, a name given to a pin used horizontally for joining two pieces of material in a building, the dowel being inserted in its socket in the one piece before the other substance with its socket is forced into its place.

Dow'er [from the Fr. *douer*, to "endow"], in the common law of England, is an estate for life which a widow has in one-third part of all the lands and tenements of which her husband was seized beneficially, or of an estate of inheritance at any time during the marriage.

1. *The Nature of the Estate.*—Dower passes through three stages. While the husband lives it is but an inchoate right and incapable of enforcement. Should the husband sell to a stranger and leave her destitute, she would have no claim to the land while the husband lived. On her husband's death, and before dower is assigned, she has a right of action. After dower is assigned she has an estate in the land. The rights of dower depend upon a rule of law which is founded on public policy. The law of the place where the land is situated governs it.

2. *The Requisites of Dower.*—These are threefold—marriage, seizin of the husband, and his death. The leading questions on this subject concern seizin. By this is meant beneficial ownership of a present estate of freehold, which may descend to the husband's heirs. There can be no dower in an estate for years, however long it may last. Nor can there be in a reversionary estate which is preceded by a prior estate of freehold or for life owned by another person, though there may be where the prior estate is for years. The widow of a trustee cannot be endowed, as he is not a beneficial owner. This proposition would be applied to the widow of a deceased partner, who could only be endowed subject to the adjustment of the affairs of the partnership. Formerly, the trust estate itself was not the subject of dower. This rule does not prevail in the U. S., and dower may sometimes be had in money, which by a legal fiction is a substitute for land. Whenever the husband's estate is defeated by a superior title, dower falls with it.

3. *Assignment of Dower.*—As dower is one-third part of the husband's estate, it must be assigned either by the parties or by act of the law. Certain legal rules must regularly be followed, when dower is said to be assigned of common right. These may be relaxed by agreement under seal, when the assignment is said to be against common right.

4. *Barring of Dower.*—The right cannot be destroyed by the mere act of the husband. Creditors also take subject to this claim. It can in general be barred only by the wife's own act, as by joining in a conveyance with the husband, or by a jointure settled before marriage. The husband often in his will, either expressly or by implication, gives his wife property in lieu of dower. In this case she may, after his death, elect to take such property or her dower, but cannot take both.

This right occasioned much inconvenience in England by impeding the conveyance of property. For this reason, by the Dower act of Aug. 29, 1833, the right of dower was virtually placed entirely in the hands of the husband in the case of all marriages contracted after Jan. 1, 1834. The husband may now dispose of his lands by will or otherwise, free from any claim of dower on the part of his wife. If, however, he dies intestate, his widow, under the statute of distribution, receives not merely for life, but absolutely, one-third of his personal estate. In the U. S. the general rules of the English common law still prevail. As a general rule, also at least one-third of the husband's personal estate is given to the wife, as by the English statute of distribution. T. W. DWIGHT.

Dow'las [supposed to be derived from *Doullens* in France, which was noted for its manufacture], a strong, coarse linen fabric much used by the working class, is manufactured in the north of England and in Scotland.

Dow'latâbâd, a fortified and decayed town of Hindostan, in the Nizam's dominions, 10 miles N. W. of Aurungâbâd. It is defended by a rock-fortress which occupies the summit of an isolated rock about 500 feet high. The lowest third of this rock is perpendicular, so that the summit is accessible only by a passage excavated in the interior. Near this town are the cave-temples of Elora.

Dow'ler (BENNET), M. D., born at Elizabethtown (now Moundsville), Ohio co., Va., April 16, 1797, was educated at the University of Maryland, and has long been a leading physician of New Orleans. He has published many valuable contributions to the periodical literature of the profession, and is the author of a "Tableau of the Yellow Fever of 1853," etc. (1854). He is editor of the "New Orleans Medical and Surgical Journal," and a member of many American and European scientific associations. He founded the New Orleans Academy of Sciences.

Dow'ling (JOHN), D. D., was born in the county of Sussex, England, May 12, 1807, and became a resident of the U. S. in 1832, and an eminently successful writer and Baptist preacher of New York City. He has published a "Vindication of the Baptists," "Defence of the Protestant Scriptures" (1843), "History of Romanism" (1845), and other works.

Down, or **Dune** [Fr. *dune*, from the Celtic *dun*, a "hill"], a name of the sandbanks or sandhills which the sea gathers and forms along its shores. The term *down* is also applied in England to large tracts of poor hilly land which is covered with short grass and appropriated to pasturage. It is specially applied to two broad ridges of undulating chalk-hills S. of the Thames. From the middle of Hampshire these extend eastward—the one (the North Downs), through Surrey and Kent, to Dover, and the other (the South Downs), through the south-eastern part of Hampshire, to Beachy Head. Between the two ridges, the former of which is nearly 120 miles long, lies the valley of the Weald, from which the chalk strata are supposed to have been removed by denudation. The highest point of the down is 880 feet above the level of the sea. These uplands produce fine aromatic grass, on which the famous South Down sheep are pastured.

Down, a county in the N. E. part of Ireland, in Ulster, is partly bounded on the N. by Belfast Lough and on the E. and S. E. by the Irish Sea. Area, 954 square miles. The chief rivers are the Bann and the Lagan. The surface is mostly hilly or undulating, and the southern part is occupied by the Mourne Mountains, the highest peak of which is 2796 feet high. The soil of many parts is fertile. The chief articles of export are linen fabrics, hosiery, grain, butter, pork, and hides. Capital, Downpatrick. Pop. in 1871, 277,775.

Down'cast is a name which is sometimes given in mines to the shaft through which air for ventilation descends. A fire is kept up at the bottom of a flue or "upcast," and the impure air ascends through this flue, while a fresh supply of air descends through the "downcast." In other mines various forms of the blowing-machine are used to secure ventilation.

Downe, a township of Cumberland co., N. J., on Delaware Bay. Pop. 3385.

Downe, VISCOUNTS (Ireland, 1680).—HUGH RICHARD DAWNAY, eighth viscount, born July 20, 1804, succeeded his father in 1857.

Down'er's Grove, a township and post-village of Du Page co., Ill., on the Chicago Burlington and Quincy R. R., 22 miles W. by S. of Chicago. Pop. 2518.

Downes (John), an American naval officer, born at Canton, Mass., in 1784, entered the navy in 1802. He served as lieutenant of the Essex, under Capt. Porter, against the British (1812–14). He captured an Algerine frigate in 1815, and became a captain in 1817. Having taken command of a squadron in the Pacific in 1832, he chastised the people of Quallah Batoo in Sumatra for outrages on American seamen. Died Aug. 11, 1854.

Downes (John), U. S. N., born Aug. 25, 1822, in Massachusetts, entered the navy as a midshipman Sept. 4, 1837, became a passed midshipman in 1843, a lieutenant in 1851, and a commander in 1862. He commanded the iron-clad Nahant at the bombardment of Fort McAlister, Mar. 3, 1863, and in the first attack upon Fort Sumter of April 7, 1863, and is mentioned in Rear-Admiral Dupont's "detailed report" of the latter fight as one of those "who did everything that the utmost gallantry and skill could accomplish in the management of their untried vessels." He participated in the capture of the Confederate iron-clad Atlanta, and is thus spoken of in Rear-Admiral Dupont's report of that affair, dated June 19, 1863: "Commander Downes, with his usual gallantry, moved as rapidly as possible towards the enemy, reserving his fire until he could get into close action, but lost the opportunity, from the brief nature of the engagement, of using his battery." Died Sept. 21, 1865. Foxhall A. Parker, U. S. N.

Dow'nieville, a post-village, capital of Sierra co., Cal., is on the North Yuba River, 62 miles N. E. of Marysville. It is surrounded by high mountains, and has deep gravel, hydraulic, placer, and quartz mines in its immediate vicinity. It contains a court-house, foundry, a graded school, waterworks, and one weekly newspaper. Altitude, 3000 feet. P. 704. J. A. Vaughan, Ed. "Mountain Messenger."

Downieville Butte, a mountain-peak in Sierra co., Cal., about 12 miles E. N. E. of Downieville. Altitude, about 8800 feet above the sea.

Down'ing (Andrew Jackson), an American landscape-gardener and pomologist, born at Newburg, N. Y., Oct. 31, 1815. He was almost entirely self-taught. In 1841 he published an excellent "Treatise on the Theory and Practice of Landscape Gardening." His "Fruit and Fruit Trees of America" (1845) is highly esteemed, and has passed through many editions. He began in 1846 to edit the "Horticulturist," published monthly at Albany. Among his other works is "Cottage Residences" (1842). He was a man of fine taste, and had a high reputation as a landscape-gardener. He was drowned in the Hudson River July 28, 1852, when the steamboat Henry Clay, on which he was a passenger, was burned. (See George W. Curtis, "Memoir of A. J. Downing," prefixed to a volume of "Rural Essays," edited by Mr. Curtis after Downing's death.)

Down'ingtown, a town of Chester co., Pa., in Chester Valley, on the Pennsylvania Central R. R., at the junction of the Waynesburg branch railroad, 32 miles W. of Philadelphia. It is the western terminus of the Chester Valley R. R. It has one national bank and one weekly newspaper, waterworks, a carriage and a shoe factory, a limestone quarry, a young ladies' academy, and the Chester Valley Academy for young men and boys. Pop. 1077.
J. S. Cordery, Ed. "Independent."

Downpat'rick, or **Down,** a seaport of Ireland, the capital of the county of Down, is near the mouth of the Quoyle (which enters Lough Strangford), 21 miles S. S. E. of Belfast. It has a cathedral, a court-house, and a hospital; also manufactures of linen, soap, and leather. It is said to be the oldest city in Ireland, and was burned by Edward Bruce in 1315. The see of Down was united with that of Connor in 1442, and with that of Dromore in 1842. Pop. 3685.

Downs, a township and village of McLean co., Ill. Pop. 1196.

Downs, The, a portion of the North Sea off the S. E. coast of Kent, England, between the North and South Forelands, is important as a shelter for shipping, which is protected by Goodwin Sands, a natural breakwater. This large natural harbor of refuge is 8 miles long and 6 miles wide, having an anchorage which varies from four to twelve fathoms in depth. It is safe except during a S. wind. In time of war it is a place of rendezvous for the royal navy.

Down'shire, Marquesses of (1789), earls of Hillsborough (1751), Viscounts Hillsborough (1717), Viscounts Kilwarlin (1751), Barons Hill (Ireland, 1717), earls of Hillsborough and Viscounts Fairford (1772), and Barons Harwich (Great Britain, 1756).—Arthur Wills Blundell Trumbull Sandys Roden Hill, fifth marquess, born Dec. 24, 1844, succeeded his father Aug. 6, 1868.

Dow'ry [from the Fr. *douer*, to "endow;" Lat. *dos*; Fr. *dot*], the marriage portion brought by a wife to her husband. This term is often confounded with *dower*, but it has a different signification.

Doxol'ogy [Gr. δοξολογία, from δόξα, "praise," and λόγος, a "word," "expression"], a form of praise said or sung in divine service, commonly at the close of a prayer. The Great Doxology, as it is called, is an expansion of the angelic hymn, and is sung in the Roman Catholic Church at the celebration of the Eucharist. It begins with the words "Gloria in excelsis Deo." The Lesser Doxology is the "Gloria Patri," the substance of which appears in the metrical doxologies in use amongst Protestants generally.

Doyle, a township of Clarke co., Ia. Pop. 965.

Doyle, a post-township of Marion co., Kan. Pop. 124.

Doyle (Richard), an English artist and caricaturist, born in London in 1826, was a son of John Doyle, a popular artist, whose political sketches were signed "H. B." He contributed satirical designs to the London "Punch." Since 1850 he has been employed in the illustration of books.

Doylesport, a post-township of Barton co., Mo. P. 385.

Doylestown, a post-borough, the capital of Bucks co., Pa., on a branch of the North Pennsylvania R. R., 25 miles N. of Philadelphia, has waterworks built in 1869, gasworks, a public library founded in 1856, two private academies, and five weekly newspapers. It is much frequented by summer visitors from Philadelphia, and its situation is elevated and healthy. It has one national bank. Pop. of borough, 1601; of township, 1954.
H. T. Darlington, Ed. "Bucks Co. Intelligencer."

Do'zy (Reinhart), a Dutch Orientalist, born at Leyden Feb. 21, 1820, graduated in the university of that city in 1844. In 1850 he became professor of history at Leyden. Among his works is "Researches into the Political and Literary History of Spain during the Middle Ages" (1849; 2d ed. 1860).

Dracæ'na Dra'co, or **Dragon Tree,** a tree belonging to the order Liliaceæ, some examples of which grow to prodigious size in the Canaries and India. The height is not proportioned to the thickness of the stem, and the head is crowned with short branches having tufts of sword-shaped leaves. It produces a part of the resin called Dragon's Blood (which see). A specimen in the island of Teneriffe is described by Humboldt as having a stem about forty-five feet in circumference in 1799. It had the same measurement in 1402. It was worshipped by the Guanches, and its hollow trunk was converted by their conquerors into a chapel. This extremely old tree has been lately reported to have fallen.

Drach'enfels (*i. e.* "dragon's rock"), a mountain-peak in Rhenish Prussia, on the Rhine, about 8 miles S. E. of Bonn, has an altitude of 1056 feet. It rises abruptly from the river, and is renowned in Byron's verses commencing—

> "The castled crag of Drachenfels
> Frowns o'er the wide and winding Rhine."

Its summit, crowned by a ruined castle, commands a beautiful prospect.

Drachm, or **Dram** [Gr. δραχμή; Fr. *drachme*; Lat. *drachma*; see below]. There are two drachms in our system of weights—namely, the avoirdupois drachm, which is one-sixteenth part of an avoirdupois ounce; and the apothecaries' drachm, which is the eighth part of a troy ounce. The orthography *dram* is commonly employed in avoirdupois weight, and *drachm* in apothecaries' weight. In apothecaries' measure a fluiddrachm is one-eighth of a fluidounce. Drachma was also the name of a silver coin, the unit of the monetary system of ancient Greece. The Athenian drachma was equivalent to six oboli, or nearly twenty cents, and weighed from sixty-three to sixty-six grains. Other Greek states had drachmas of different values.

Dra'co [Δράκων], a Greek physician, son of the celebrated physician Hippocrates, to whom some of the writings that pass under the name of the latter are ascribed.
Henry Drisler.

Dra'co, or **Dra'con** [Gr. Δράκων], an Athenian legislator who was archon in 624 B. C., and was the author or compiler of the first written laws among the Athenians. This code was extremely severe and sanguinary, and made even petty larceny a capital crime. It remained in force until the time of Solon, who substituted milder penalties. The term *draconic* is sometimes applied to laws which are excessively severe.

Draco, or **The Dragon,** a constellation of the northern hemisphere. It was from observations upon the star γ Draconis that Bradley was led to his brilliant discovery of the aberration of light. It is a star nearly in the solstitial colure, and consequently the minor axis of the small ellipse

which its apparent place describes in the heavens lies in the meridian at its transit.

Draco [Δράκων], of Stratonicea, in Caria, a Greek grammarian, of whose life few traces are found, but who flourished probably about 125 A. D. Suidas and Eudocia assign to Draco a great number of works on grammar, on metre, and on the poems of Pindar and Alcæus, which have all, with one exception, perished. There is extant a treatise on Greek metres (περὶ μέτρων ποιητικῶν), which Hermann considers an epitome of Draco's work, with numerous interpolations from other quarters by a later hand. This was edited by Hermann, Leipsic, 1812.

HENRY DRISLER.

Dracon'tium [Gr. δρακόντιον, a "little dragon," probably from the burning taste of some species], a genus of plants of the natural order Araceæ. The *Dracontium polyphyllum*, a native of Guiana, India, and Japan, has a powerful action on the nervous system, and is used as a remedy for asthma. The flower emits an intolerable stench when it first opens. The *Dracontium* of the U. S. Pharmacopœia is the skunk-cabbage (*Symplocarpus fœtidus*), which has similar medical properties. It is kindred to the true *Dracontium*, and like it has a strong offensive odor.

Dracon'tius, a Christian poet of Spain who lived under Theodosius II., about 431 A. D. Isidorus ascribes to him a poem in hexameter verse entitled "Hexaëmeron," which is a poetical narration of the six days of Creation. This poem was somewhat changed and enlarged by an account of the seventh day by Eugenius, bishop of Toledo, in the seventh century. A supplement to his work was written by the author in elegiac verse, addressed to the younger Theodosius. Both works are contained in the edition of Carpzov, Helmstädt, 1794. (For further information consult Bähr's "History of the Christian Poets of Rome," vol. i., p. 59.) HENRY DRISLER.

Dra'cut, a post-village of Middlesex co., Mass., on the Merrimack River opposite Lowell. It has large woollen and paper mills, and is in a good agricultural township. Pop. of Dracut township, 2078.

Draft [originally *draught*; Ang.-Sax. *drôht*, past part. of *dragan*, to "draw;" literally, "something drawn," hence a "drawing"], a bill of exchange; an order for the payment of money drawn by one person upon another.

Drag [Ang.-Sax. *dreage*, from *dragan*, to "drag," allied to the Ger. *träge*, "slothful," "slow"], the name given to inventions used for the purpose of slackening the speed of vehicles. It consists of a mechanical combination of rods and levers, which may be operated upon by the driver without leaving his seat. By means of a handle a species of shoe is pressed against one of the wheels with sufficient force to retard the motion. It is more frequently called a brake.

Drag'oman [Fr. *dragman*; It. *dragomano*, a corruption of the Arabic *tarjumân*, "interpreter"], a name given in the Levant to an interpreter or guide for foreigners. The ordinary dragoman corresponds to the Italian *cicerone*. The dragoman of the Sublime Porte is an important Turkish officer, who forms the medium of communication between his own government and foreign ambassadors. The term is also applied to the interpreters attached to European embassies and consulates in the Levant. They are usually natives of Italian extraction. They and their families are not subject to the Turkish laws, but are under the protection of the embassies which they serve.

Drag'on [from the Gr. δράκων, a "serpent," a "dragon;" Lat. *draco*; Fr. *dragon*; Ger. *Drachen*], small, inoffensive East Indian lizards of the genus *Draco*, called winged dragon, or flying dragon (*Draco fimbriatus* and *volans*), remarkable for an expansion of the skin on each side, forming a kind of wing, which sustains the animal like a parachute. Other species, the dragon lizards (*Ada*), belonging to the Tegidæ, are natives of America only. They have the tongue forked like a serpent, back and tail crested, and are sometimes six feet long. They have no parachute; they are bold and resolute in self-defence.

Flying Dragon: *Draco volans.*

The name DRAGON has also been given to a fabulous monster, represented in the mythology of many nations as a huge winged serpent. In the New Testament the word is used for the personification of sin, and in Christian art it is the type of sin and idolatry. Hercules, Perseus, and Apollo in Greek mythology, and Thor in the Scandinavian, were renowned as dragon-slayers, as was Saint George in the early Christian legends. The dragon is still an heraldic bearing in Europe.

Among the Chinese the dragon was believed to be a being of superhuman power, a sort of deity; and hence became a symbol of divinity. According to Chinese tradition, some of the earliest emperors of that country are represented as having the form of flying dragons, and representations of such dragons belong to the heraldry of the imperial coat-of-arms.

Drag'onet (*Callionymus*), a genus of fishes belonging to the Gobiadæ, or goby family. They have no air-bladder, the ventral fins are larger than the pectorals and placed under the throat, and the gill-openings are reduced to a small hole on each side of the nape. One of the finest species is the gemmeous dragonet (*Callionymus lyra*), of a golden color, variegated with sapphire-blue. They are found on the European coasts.

Gemmeous Dragonet.

Dragon-Fly [Fr. *démoiselle*; Ger. *Stechfliege*], the popular name of a family (the Libellulidæ) which includes an immense number of species of neuropterous insects. They have large globular heads, strong mandibles, eyes lateral, large, and projecting, antennæ short, four narrow, gauze-like wings, strongly reticulated, and the abdomen often remarkably slender. They are found in northern countries, but they are most common in the warmer climates, and frequent marshes, lakes, and rivers. Their food is insects, which they devour with great voracity. They are sometimes known as "devil's darning-needles," and are often regarded by the ignorant with groundless dread.

Dragon-Fly: *Agrion.*

Dragonnade, a name of the persecutions which the French Protestants suffered in the reign of Louis XIV., which were so called because dragoons (Fr. *dragons*) were employed as instruments of the persecution. A body of

dragoons led by a bishop and intendant marched through the provinces, requiring the Protestants to abjure their religion, and persecuting those who refused.

Dragon's Blood, or **Gum Dragon** [Lat. *sanguis draconis*], a resin obtained from various trees growing in warm climates. Among these are the DRACÆNA DRACO (which see), the red sandal-wood (*Pterocarpus Santalinus*) of the East Indies, the *Pterocarpus Draco*, a leguminous tree of South America, and the *Calamus Draco*, an East Indian rattan palm. The dragon's blood of commerce is of a dark reddish-brown color, smooth, and brittle, and dissolves in oil, alcohol, and ether. The solution is used for staining leather, wood, and even marble. The resin is also an ingredient of some varnishes and lacquers. It comes from the Moluccas, Socotra, Brazil, and Teneriffe.

Dragoon. See CAVALRY, by GEN. WADE HAMPTON.

Dragnignan, a town of France, capital of the department of Var, about 40 miles N. E. of Toulon. It is charmingly situated in a valley between hills which are covered with vineyards and olive trees. It has a court-house, a botanic garden, and many public fountains; also manufactures of woollen fabrics, hosiery, silk stuffs, brandy, pottery, and oil. Pop. 9819.

Drain'age, the removal of the excess of water from the soil, either by means of canals and open ditches, or by underground sewers, pipes, and hollow tiles. The drainage of cities is noticed under SEWER (which see). No part of farm-husbandry pays a larger profit upon capital invested than the judicious drainage of land. There is very little ground that is not too wet in rainy weather and too dry in our frequent and long-continued droughts. Thorough drainage not only relieves the first-mentioned evil, but, strange as it at first appears, it greatly mitigates the bad effects of dry weather. When soil is drenched with water and dried by evaporation, it becomes hard, especially if it be argillaceous; land that is dried by drainage is porous and permeable to the dews and showers; while the soil deepened by drainage permits growing crops to put forth longer roots, and thus become secured against drought.

It appears also that good drainage diminishes the relative number of fevers, especially those of a malarial origin, while it is almost certain that excessive moisture in the soil is a fruitful cause of consumption. So important is this subject considered in England that Parliament in 1846 offered in the Drainage act to advance money on easy terms to landholders for the purpose of improving the drainage of land. The act has proved a very great blessing to the country.

Underground drainage is the best for land that is not decidedly marshy; and of all underground drains those made with tiles (hollow cylinders of porous burned clay) are the most effective. The tiles should be laid near enough to the surface to effect a thorough drying after rains, and deep enough to escape the plough. It is very important to avoid curves and angles in the vertical plane of drains, because any earth which may enter the tiles will be sure to lodge at depressed points, and spoil the drains.

Draining lakes and marshes is a matter requiring great capital and much engineering skill, but it is sure to become a very important question in our Southern and Western States. In Holland, steam-pumps, wind-mills, and tide-gates are used extensively. The great Haarlemer-meer was drained and is kept drained by steam-power.

Drainage of Cities. See SEWER, by GEN. Q. A. GILLMORE.

Drake (BENJAMIN M.), D. D., a distinguished minister of the Methodist Episcopal Church South, born in North Carolina Sept. 11, 1800. He joined the Tennessee Conference in 1820, but the next year was transferred to the Mississippi Conference, in which he rose to an imperial position. He built the first Methodist church in New Orleans, was president of Elizabeth Female Academy (the first Methodist school established in Mississippi), and was president of Centenary College. He was greatly loved and revered. He died in Mississippi in 1860. T. O. SUMMERS.

Drake (CHARLES D.), a jurist, a son of Dr. Daniel Drake, was born at Cincinnati, O., April 11, 1811. He served as midshipman in the navy (1827–30), and was admitted to the Ohio bar in 1833. In 1834 he removed to St. Louis, where he became eminent as a lawyer and politician, was U. S. Senator (1867–71), and was appointed chief-justice of the U. S. court of claims in 1871. He has published "Law of Attachments" (1854) and "Life of Dr. Daniel Drake" (1871).

Drake (DANIEL), M. D., born at Plainfield, N. J., Oct. 20, 1785. In infancy he was brought to Kentucky, then almost a wilderness, and received a very limited preparatory education. At fifteen he was apprenticed to Dr. Goforth, and attended lectures in the University of Pennsylvania, where he took the degree in medicine in 1815. Soon after this he accepted a professorship in the University of Transylvania at Lexington, Ky.; in 1819 he founded the Medical College of Ohio at Cincinnati; then filled a chair in the Jefferson Medical College, Philadelphia; was called twice to the school in Louisville, and finally returned to Cincinnati, where he died. He had an intense love for the great West, especially for Cincinnati; was ever active in the profession, establishing journals, sustaining hospitals, blind asylums, the temperance cause, and doing all he could for Church and State. Dr. Drake was a true philanthropist, a noble patriot, a sincere Christian. Among his works is a "Systematic Treatise on the Principal Diseases of the Interior Valley of North America, etc." (2 vols., 1850–54). Died Nov. 6, 1852. PAUL F. EVE.

Drake (Sir FRANCIS), an English navigator, born in Devonshire about 1540. He served as a captain under Sir John Hawkins in his expedition to the Spanish Main in 1567, obtained a commission from Queen Elizabeth in 1570, cruised in the West Indies, and enriched himself by plunder taken from the Spaniards. He conducted in 1572 an expedition against the Spanish in America, captured valuable prizes, and saw the Pacific from the Isthmus of Darien. He sailed in 1557 with five vessels on a marauding expedition against the Spaniards. He entered the Pacific, sacked several towns of Chili and Peru, and captured a galleon laden with silver. Hoping to find another passage to the Atlantic, he sailed northward to lat. 48° N., but he failed, and took shelter in the Bay of San Francisco. He next steered to the Moluccas, returned by the Cape of Good Hope, and arrived at Plymouth in Sept., 1559. He was the first Englishman who circumnavigated the globe. The queen rewarded him with knighthood. He was appointed commander of a fleet in 1587, when Spain was preparing the Armada. He entered the harbor of Cadiz, where he destroyed nearly one hundred vessels and captured immense booty. The exploit was called "singeing the king of Spain's beard." He was vice-admiral of the fleet which in 1588 opposed the Invincible Armada. In 1592 he was elected to Parliament. He died near Puerto Bello Dec. 27, 1595.

Drake (FRANCIS SAMUEL), an American author, born at Northwood, N. H., Feb. 22, 1828, is a son of the well-known antiquary and historian, S. G. Drake, noticed below. He has published a valuable "Dictionary of American Biography" (1872), the most complete work that has been published on the subject, and has prepared a volume of memorials for the Massachusetts Society of the Cincinnati, and a "Life of General Henry Knox" (1873).

Dra'ke (FRIEDRICH), a German sculptor, born at Pyrmont June 23, 1805, was a pupil of Rauch. He gained a high reputation by statues and busts of many eminent Germans of the present century, including the Humboldts, Rauch, and Oken, and two colossal statues of King Frederick William III. Among his other works is an allegorical group of the "Eight Provinces of Prussia" (1844), in the castle of Berlin.

Drake (JOSEPH RODMAN), an American poet, born in the city of New York Aug. 7, 1795. He studied medicine, graduated about 1815, and married in 1816 a daughter of Henry Eckford, a noted naval architect. He became an intimate friend of Fitz-Greene Halleck. Among his works are "The Culprit Fay" and verses on the American flag, which are greatly admired. Died Sept. 21, 1820.

Drake (SAMUEL GARDNER), an historical writer, born at Pittsfield, N. H., Oct. 11, 1798. He opened an antiquarian bookstore in Boston in 1828. He published, besides other works, "Indian Biography" (1832), "The Book of the Indians" (1833), "History and Antiquities of Boston" (1856), and "Annals of Witchcraft in the U. S." (1869). Died 1875.

Drakeville, a township and post-village of Davis co., Ia., on the Chicago Rock Island and Pacific R. R., 137 miles S. W. of Davenport. Pop. 534.

Dram. See DRACHM.

Dram'a [Gr. δρᾶμα, from δράω, to "do," to "act;" literally, an "acting," a "performance;" Fr. *drame;* Ger., Dutch, Dan., Sp., and Port. *drama;* It. *dramma;* Sw. *dram*] signified originally the exhibition of human actions (especially those which reveal the feelings and passions) upon the stage. The ancient Greek drama, comedy as well as tragedy, had its origin in the worship of Bacchus (Dionysus). The Dionysian dithyrambs sung at the festivals of Bacchus sometimes expressed wild and boisterous gayety, at other times passionate sorrow. From the former was at length developed the old Greek comedy, which may be said to have attained its highest perfection in the plays of ARISTOPHANES (which see); from the latter arose the Greek

tragedy, which found its most perfect expression in the immortal works of Æschylus, Sophocles, and Euripides.

The Roman drama was derived from the Greek, to which, in the opinion of all the most distinguished critics, it was much inferior. The most celebrated Roman dramatic poets were Plautus and Terence, who appear to have taken Menander and Philemon (of the New Greek comedy) as their models, and whose productions have exercised considerable influence on the modern comedy. In tragedy ancient Rome produced one truly great poet, Seneca.

The Hindoo drama, quite independent in its origin of the drama of Europe, has produced some works of great merit, the most celebrated of which is the "Sakoontalâ, or the Lost Ring," of Kâlidâsa (who is supposed to have lived about 50 B. C.)—a work which has received the highest commendation from some of the most eminent critics of modern Europe, and has been pronounced not unworthy of the genius of Shakspeare. This remarkable production, instead of being divided into five acts, like the classic and modern drama, consists of seven acts.

The Chinese also have a drama, but greatly differing in some respects from that of the Western nations; a single piece, it is said, being often extended through no inconsiderable portions of several successive days.

In modern times the drama has been cultivated with success, it may be said, by all the principal European nations, but more especially by the Italians, the Spaniards, the French, the English, and the Germans. For a long period the French were generally supposed to surpass all other nations in the genius and skill of their dramatic writers, as well as in the admirable performance of their actors. The French critics usually insisted on the strictest adherence to the rules of the classic drama, and particularly to what are commonly termed "the three unities." Until the time of Lessing the German theatre was scarcely more than a reflection of that of Paris, but that great author and critic taught his countrymen to throw off the trammels and affectations of a foreign school, and to give entire freedom to the cultivation of the national genius. Since that time the German authors, taking the English for their models rather than the French, but without servilely following any, have produced the finest dramatic works that have appeared in Europe since the time of Shakspeare. Among the German dramatic writers, Goethe and Schiller, by universal consent, occupy the foremost rank. Denmark has also produced some eminent dramatic writers, among whom (Ehlenslæger (which see) is the most celebrated. Italy can scarcely be said to have produced any dramatic poets of the highest order; among her best are perhaps Goldoni in comedy, and Alfieri, Manzoni, and Silvio Pellico in tragedy. The Spanish drama has given to the world many productions displaying rare genius, but none that are worthy to be placed by the side of the greatest dramatic works of Greece, England, Germany, or France. The most celebrated names in Spanish dramatic literature are those of Lope de Vega and Calderon; the former surpassing all that is recorded in the history of the human mind in the marvellous fertility of his genius; the latter pre-eminent for the brilliancy of his imagination, as well as for the fertility of his invention, but neither of them producing any work of the very highest order.

The French drama justly holds a very high place in European literature. It is not too much to say that in comedy the writers of no other nation, either in ancient or modern times, have equalled the French. The best plays of Molière may be said to be not only unrivalled, but unapproached, by those of any other author, Shakspeare alone excepted. In tragedy, Corneille, Racine, and Voltaire all exhibit genius of the very highest order, but Racine, in the natural, graceful simplicity, as well as in the exquisite finish, of his productions, is generally admitted to have approached most nearly to the most perfect specimens of the ancient Greek tragedy.

Though the dramatic literature of England presents us with fewer writers of the highest order than that of France, the former can boast of one whose dramatic genius surpasses everything to be found in ancient or in modern times. While in his best comedies Shakspeare is perhaps not inferior to Molière, in his tragedies, not merely in the exhibition of the conflict of the mightiest human passions, but also in his representation of the workings of the most intricate and subtlest of human motives, he has no equal nor second among the sons of men.

In the opinion of many critics the highest exhibition of poetic genius is to be found in the tragic drama, which naturally combines the fire and passion of lyric inspiration with that representation of outward circumstances, conduct, and events which belongs to epic poetry. It thus unites every advantage for the exhibition of human character. It not only shows us the external conduct, but in the various soliloquies and discourses of the *dramatis personæ* it reveals to us the hidden thoughts and passions of the soul. In this last respect, it has a great superiority over epic poetry, in which, though the expression of feeling occasionally occurs, it is always made subordinate to the events of the story. J. Thomas.

Dram'atis Perso'næ, a Latin term signifying the characters or persons represented in a drama.

Dram'burg, a town of Prussia, in the province of Pomerania, 53 miles E. of Stettin, has a normal school and large woollen factories. Pop. in 1871, 5473.

Dram'men, a seaport-town of Norway, in Aggershuus, on both sides of the river Drammen, near its entrance into the Christiania Fiord, about 24 miles S. W. of Christiania. It has a college, and manufactures of sailcloth, ropes, etc. Large quantities of timber are exported from this port. Pop. in 1870, 15,458.

Dranesville, a post-village and township of Fairfax co., Va., 17 miles W. by N. of Washington, was the scene of a very spirited engagement and Federal victory Dec. 20, 1861. Pop. of township, 2055.

Dra'per (John William), M. D., LL.D., a distinguished chemist and writer, born near Liverpool, England, May 5, 1811, was educated at the University of London, and emigrated to the U. S. in 1833. He graduated as M. D. in the University of Pennsylvania in 1836, was professor of chemistry and physiology at Hampden-Sidney College (1836–39), and became professor of chemistry in the University of New York in 1839. In 1841 he was appointed professor of chemistry in the newly-founded medical department of that university. In 1839 he took the first photographic portrait ever taken from the life. He discovered many of the fundamental facts of spectrum analysis, and published them (1841–50). He published, besides other works, "Human Physiology, Statistical and Dynamical, of the Conditions and Course of Life in Man" (1856), a "History of the Intellectual Development of Europe" (1863), and a "History of the American Civil War" (3 vols., 1867–68), and numerous monographs on mathematics, chemistry, and optics.

Draper (Lyman C.), an author, was born near Buffalo, N. Y., Sept. 4, 1815. Since 1833 he has edited four volumes of the Wisconsin Historical Society's "Collections," and has written much upon the history and biography of the West. He published in 1857 an account of Madison, the capital of Wisconsin.

Draper (Simeon) was born in 1804, and became a merchant in New York. He was the active political friend of W. H. Seward, fulfilled for many years important public duties, was appointed provost-marshal of New York in 1862, and collector of the port in 1864. Died Nov. 6, 1866. He was a man of ability, generosity, and integrity.

Dra'pery [Fr. *draperie*, from *drap*, "cloth"], cloth or woollen stuffs, clothing, or apparel. The dealers in such commodities are called *drapers* in England. Drapery in painting and sculpture is the clothing applied to the human figure, the various costumes and modes of dress used by different nations and classes of people. The ancient Greeks, although they often executed nude statues of heroes and gods, surpassed all other artists in the representation of drapery and costume. The art of disposing the folds of drapery forms a considerable part of the painter's and sculptor's study, and requires good taste and judgment.

Dra'pier Let'ters, The, were written under the signature of "M. B. Drapier" by Dean Swift. They attacked the government for granting a patent in 1722 to a man named Wood, in order to supply a deficiency of £108,000 in the copper coinage of Ireland. They created an almost unparalleled sensation in Ireland on their first appearance in 1723. Harding, their printer, though prosecuted and imprisoned by the Crown, refused to betray the author. The patent was abandoned after £40,000 in halfpence had been coined, and Wood was compelled by the popular indignation to leave the country.

Draught, or **Draught of Water,** a nautical term for the depth a ship sinks in water when afloat. The draught is marked from the keel upward—on the stem and on the stern-post.

Draughts [probably because a move was formerly called a "draught;" Fr. *le jeu de dames;* It. *dama;* Ger. *Damen,* probably from *damek,* the Egyptian name of the game], commonly called **Checkers** in America, a game played by two persons upon a board divided into sixty-four squares of alternate colors, each person having twelve pieces or counters, distinguished by their color from those of the opposite party. The success of the game depends upon the skill of either party in capturing all the pieces of an adversary, or hemming them in so that no further move can be made. The counters of each player are placed before

him upon the first three lines of squares of the same color, and each piece is moved diagonally forward one square to the right or left. It is the duty of each player to take the piece of the other when a vacant square is found behind it, which is done by jumping over into that square, and removing the piece "jumped" or passed over. Several pieces may be jumped at one time when the diagonals forward are exposed, and the taking piece is placed upon the square behind the one taken last. When the last row on the opposite side of a board is reached, the piece is called a king, and is crowned by placing one of the counters before captured upon it; and this king can then be moved diagonally forward or backward, one square only at a time. If a piece is touched it must be moved if possible. The piece exposed must be taken by the player having the move; in case he neglects to do so, his adversary may remove the piece which should have made the capture. When lots are drawn for the first move, he who gains the choice may move or require his adversary to do so. The game is supposed to have originated more than 2000 years B. C., and to have preceded chess. It was introduced into Europe from Egypt three or four centuries ago.

Draughts'man, a person who draws pictures, plans, or maps; one who delineates or draws a sketch or design. The term is not usually applied to those who produce original designs.

Drave [anc. *Dravus;* Ger. *Drau;* Slavonic *Drava*], a river of Europe, rises in the Tyrol, and flows nearly eastward, through Carinthia and Styria, to the western frontier of Hungary. It afterwards runs south-eastward, and forms the boundary between Hungary on the left and Croatia and Slavonia on the right, until it enters the Danube 14 miles E. of Essek. Its total length is nearly 400 miles. It is navigable for 200 miles or more.

Draw'back, a loss of advantage, success, profit, or value; anything that deducts from a step gained; a discouragement or hindrance. Commercially, an allowance made by the government to merchants on the re-exportation of certain imported goods liable to duties; also a repayment or remission of a duty laid on any article produced in a country and suitable for the foreign market, when such article is entered for exportation. In some cases this allowance or remission consists of the whole of the customs or excise duties; in others, of a part only. In the U. S. drawback has been regulated by various acts of Congress. Such duties are, of course, an enhancement of the natural price of the commodity on which they are imposed. The object of the allowance or remission is to establish or stimulate a trade with foreign countries in the commodity. Adam Smith, in his "Wealth of Nations," thus speaks of the remission or repayment of the latter form of duty: "To allow," he says, "the merchant to draw back, upon exportation, either the whole or a part of whatever excise or inland duty is imposed upon domestic industry, can never occasion the exportation of a greater quantity of goods than what would have been exported had no duty been imposed. Such encouragements do not tend to turn towards any particular employment a greater share of the capital of the country than what would go to that employment of its own accord, but only to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally establishes itself among all the various employments of the society, but to hinder it being overturned by the duty; they tend not to destroy, but to preserve what it is in most cases advantageous to preserve, the natural division and distribution of labor in the society." These remarks are subject to this qualification: provided the drawback is equally applicable to all domestic productions that are sought to be exported. It might, perhaps, be shown also, by experience, that the practice of giving drawbacks is liable to abuse; for, supposing a great fall in the value of some excisable article, it may be exported with a view, partly or entirely, to get the drawback. An important species of commerce would thus be fostered. Of course the government must guard against deceptions by exercising an oversight of the packing, weighing, tying, and sealing of such goods, of their ownership, of the time when such goods were charged with the duties, and of the exportation; and in some particulars it requires a verification by oath.

REVISED BY T. D. WOOLSEY.

Draw'bridge, the name applied to the whole or part of a bridge which may be moved to admit or hinder communication. There are several varieties of these structures. They are respectively known as bascules or lifting bridges, from their turning vertically on a hinge; swivel or swing bridges, from moving horizontally on a pivot; and rolling bridges, from being propelled on friction rollers. They are principally used on navigable streams to permit vessels to pass and at the portals of fortifications.

Drawbridge, a post-township of Dorchester co., Md. Pop. 1087.

Draw'ing, in the fine arts, is the delineation of form in contradistinction to color, light, and shade, and, as it includes a knowledge of anatomy, proportion, and perspective, is the foundation of everything in art, and the most important feature of a finished painting. In power and beauty of drawing the Italian and Flemish schools stand pre-eminent. At the period when Greek art had attained its highest perfection drawing was a regular branch of education, as it is at present in the public schools of Germany, Switzerland, and other European nations. In Massachusetts drawing is taught in the public schools of the larger towns, and artisans, mechanics, and others who may desire it receive gratuitous instruction in free-hand as well as mechanical drawing in the evening schools. Similar instruction is given in several of the larger cities of other States.

Draw-plate, a metal plate placed before or over a fireplace, for the purpose of forcing the air through the fire; also a steel plate with graduated orifices, through which metals are drawn into bars or wires.

Dray'ton, a post-village of Wellington co., Ontario, Canada, on the Guelph branch of the Great Western Railway. It has some manufactures and one weekly newspaper. Pop. about 500.

Drayton (MICHAEL), an English poet, born in Warwickshire in 1563. Few events of his life have been recorded. His chief work is "Poly-Olbion" (1613), a poetical description of the mountains, rivers, valleys, and forests of Great Britain, with the traditions connected with them. Drayton was appointed poet-laureate in 1626. Among his numerous works are "The Barons' Wars" (1596) and "Nymphidia," a fairy poem (1627). Died in 1631.

Drayton (PERCIVAL), U. S. N., born Aug. 25, 1812, in South Carolina, entered the navy as a midshipman Dec. 1, 1827, became a passed midshipman in 1832, a lieutenant in 1833, a commander in 1855, and a captain in 1862. He served in the South Atlantic squadron from the fall of 1861 to the summer of 1863, commanding the steamer Pocahontas at the battle of Port Royal, and the iron-clad Passaic during the bombardment of Fort McAlister of Mar. 3, 1863, and at the first attack upon Fort Sumter of April 3 of the same year. He is handsomely mentioned in several of the official despatches of Rear-Admiral Dupont, who in his last report speaks of him as an officer "of the highest professional capacity and courage." He commanded the Hartford at the great battle of Mobile Bay, Aug. 5, 1864, and is thus commended by Farragut in his detailed report of the events of that glorious day: "The Hartford, my flag-ship, was commanded by Captain Percival Drayton, who exhibited throughout that coolness and ability for which he has been long known to his brother-officers. But I must speak of that officer in a double capacity. He is the fleet-captain of my squadron, and one of more determined energy, untiring devotion to duty, and zeal for the service, tempered by great calmness, I do not think adorns any navy. I desire to call your attention to this officer, though well aware that in thus speaking of his high qualities I am only communicating officially to the department that which it knew full well before." Early in 1865, Drayton was appointed chief of the bureau of navigation, in the discharge of which high office he died (Aug. 4, 1865), universally regretted. FOXHALL A. PARKER, U. S. N.

Drayton (WILLIAM), an American officer, the father of the preceding, was born in St. Augustine, Fla., Dec. 30, 1776. He served as colonel in the war of 1812, became a member of Congress in 1825, and was a leader of the Union party of South Carolina in 1830. He was chosen president of the U. S. Bank in 1839, as the successor of Nicholas Biddle. Died May 24, 1846.

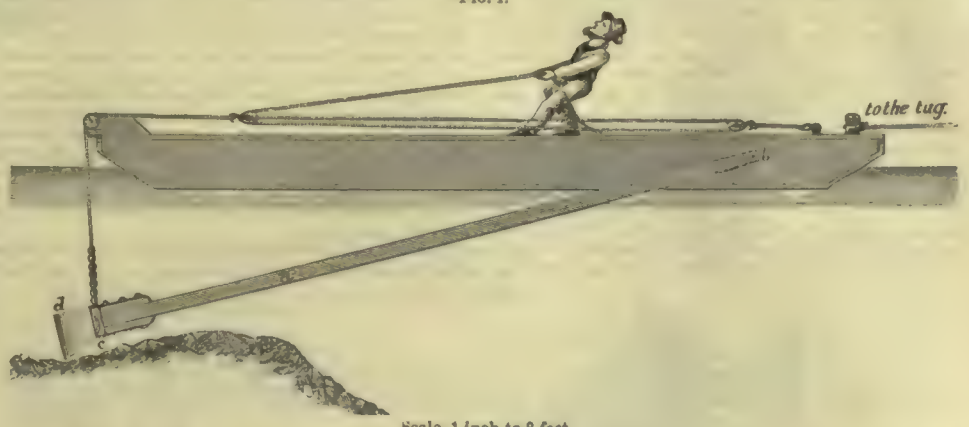
Drayton (WILLIAM HENRY), an American patriot, born in South Carolina Sept., 1742. He wrote political works, was chosen chief-justice of South Carolina in 1776, and president of that State in 1777. In 1778 he became a member of the Continental Congress. He died Sept. 3, 1779, leaving in MS. a "History of the Revolution," which was published by his son (2 vols., 1821).

Dray'ton-in-Hales, or **Market-Drayton,** a town of England in Shropshire, on the Tern, 19 miles N. N. E. of Shrewsbury. It has manufactures of paper and of hair seats for chairs. Here the partisans of the house of York defeated the Lancastrians in 1459. Pop. 5242.

Dray'tonsville, a township of Union co., S. C. Pop. 1864.

Dream [Lat. *somnium;* Fr. *songe* and *rêve;* Gr. *Traum*], a series of thoughts, feelings, and acts of the imagination occurring in sleep. In some cases the reasoning powers are abnormally active in dreams, but in general the mental action is incongruous. Dreams usually are evidence of im-

perfect sleep. They take their character from some preceding state of the mind, and are often modified by the conditions of the health. The Bible speaks of dreams as being sometimes prophetic or suggestive of future events. This belief has prevailed in all ages and countries, and there are numerous modern examples, apparently well authenticated, which would appear to favor this hypothesis. The interpretation of dreams was a part of the business of the soothsayers at the royal courts of Egypt, Babylon, and other ancient nations.



Dreb'bel, van (Cornelis), a Dutch philosopher, born at Alkmaar in 1572. He removed to England about 1620, and was patronized by James I. He invented several curious machines, and wrote two works entitled "On the Nature of the Elements" and "Quintessence" (1621). He is said to have invented the thermometer, but the statement has been disputed. Died in London in 1634.

Dredging and Scouring, terms applied to those processes by which materials are removed from the bottom of ship-channels and harbors, and the navigable depth of water increased thereby. By *dredging* is meant more particularly the raising of the materials to the surface by mechanical appliances, and their transportation and deposition elsewhere, while *scouring* implies their gradual and progressive removal by the force of the current. In order to increase the effective scouring-power of streams it is customary to narrow and straighten their natural waterway by bulkheads, jetties, and other works of improvement; and sometimes the drainage waters in inland, and the ebb flow in tidal streams, are held back by gates, and let out through the channel at stated periods with great violence. This method of scouring, called *flushing* or *flushing*, is a very efficient mode of dredging in the few locations favorable for its application. At Ramsgate, Dover, and other places in England large scouring-basins or reservoirs to retain the water have been constructed. To facilitate the scouring, the bottom may be loosened up by dragging heavy rakes over it during the period of strongest current. The oldest dredging-machines were probably of this character, and were used in Holland. They consisted of floating frames, with teeth or bars projecting down to the bottom from the under side, which stirred up the sand and mud as the machine was floated along by the current.

Where bars are short, with deep water on either side, or where the bottom is lumpy, scrapers have been advantageously employed to smooth off the bottom. The material scraped from the shoal places subsides in deep water, and the available depth is thereby increased. The scrapers may be attached to a tug moving up and down the channel, or to a scow towed by a tug. Fig. 1 shows a side view of a scow and scraper designed and used by Major Houston, U. S. corps of engineers. On each side of the scow there is a long arm *a* pivoted at *b*, and connected at the lower end by a crossbar *c*, to which the scrapers *d*, three in number, are attached side by side. Each scraper is a semi-cylinder of ¼-inch boiler iron, 3 feet in diameter and about 2¼ feet long on the longest side, open at both ends, the lower end terminating obliquely to the axis, like a scoop.

The effective velocities of currents in moving materials

Fig. 1.

Scale, 1 inch to 8 feet.

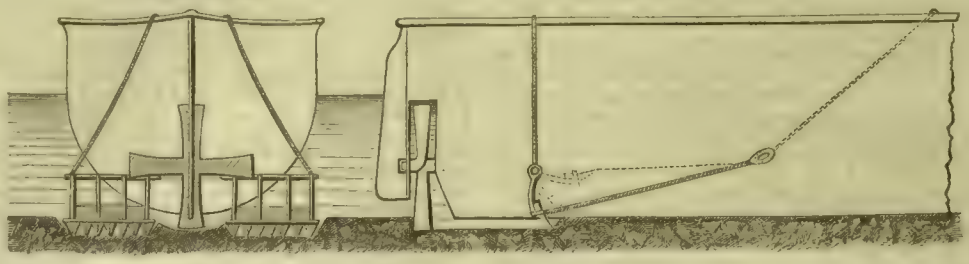
of various kinds and sizes, as established by different observers, are as follows:

0.170	miles	per	hour	will just begin to work on fine clay.
0.340	"	"	"	will lift fine sand.
0.454	"	"	"	will lift sand.
0.682	"	"	"	will sweep along fine gravel.
1.364	"	"	"	will roll along round pebbles nearly one inch in diameter.
2.045	"	"	"	will move slippery, angular stones the size of a hen's egg.

Sir John Leslie gives the formula $V = 4\sqrt{a}$ for finding the velocity required to move rounded stones or shingle, in which V denotes the velocity of the water in miles per hour, and *a* the edge of the stone if a cube, or the mean diameter if a rounded stone or boulder.

The mode of deepening channels by stirring up the bottom in streams where there are effective currents in one, or alternately in both directions, has been successfully followed at the mouth of the Mississippi River. The apparatus used was a large double-ender dredge-boat, of like shape and construction at both ends, provided with two strongly built, four-bladed propellers, one at each end, on separate shafts, powerfully driven by separate engines, and with water compartments or tanks, such that when they are empty and the coal-bunkers full, the boat will draw fourteen feet, and when full twenty-two feet. The blades of the propellers extend about two feet below the vessel's keel. When operating, the boat is sunk by means of her tanks to a draught fully equal to and generally exceeding the soundings on the bar; she then steams alternately up and down the channel, cutting her way through and stirring up the bottom with the propellers. The material thrown into suspension is carried off by the current and subsides in deep water. In exceptional cases the boat, when drawing fifteen feet, has cut her way through where there were but ten feet of water. The up-stream or stern end of the boat has a deflector a few feet in rear of the propeller. When steaming down stream on an ebb current, the effect of this deflector is to carry upward into the upper and stronger current the backwater from the propeller, and consequently the solid material with which it is charged. Upon one occasion the amount excavated by this dredge-boat in four days, working twenty-eight and a quarter hours, was upwards of 22,000 cubic yards, but this is considerably in excess of the average results. Auxiliary scrapers are also used with this boat to stir up the bottom on each side of the propellers. To guard against stoppage from accidents, two boats are deemed necessary to maintain a constant depth of twenty feet at low tide. (See Fig. 2.)

In tidal streams the inward and outward flow of the tidal wave is a most efficient scouring agent for maintaining the channel at the greatest practicable depth of which it is capable; and a judicious regulation and control of the tidal currents, by giving uniformity in depth and width to the channel, and straightening it wherever practicable, has in many instances converted a narrow, crooked, and shallow stream into a deep and navigable channel. A recognized principle in hydraulic engineering is that the flow of the tidal wave should be *facilitated*, and not *obstructed*; hence a deepening of the water-way should always accompany a reduction in width. The tidal wave is propagated with greater velocity in deep than in shallow channels, the ratio of velocities for different depths being approximately as the square roots of those depths.



Scoops of various forms, filled by drawing them along the bottom, and then raising them to the surface and emptying them into scows, have been used in many places—a device which was afterwards extended by attaching a series of scoops or buckets to an endless belt or chain attached to the side of the vessel, or over an opening amidships, and working over pulleys or wheels so arranged that the chain can be lowered or raised to suit various depths of water.

The buckets descend empty, fill themselves at the bottom, and when they rise over the upper wheel discharge into troughs leading to scows alongside.

Fig. 3 shows a longitudinal section, and Fig. 3*a* an enlarged view of buckets and lower wheel, of a powerful steam-dredger used on the river Clyde, Scotland. The hull is of boiler plates and angle iron, being 161 feet long, 29 feet breadth of beam, and 10 feet greatest depth of hold. An endless band, carrying 40 dredge-buckets of nearly 14 cubic feet capacity each, works through a well amidships, passing over two wheels, one at either end of an iron bucket-girder 90 feet long, and weighing 125 tons when working, inclusive of the contents of the ascending buckets and hoisting chains. The axis of the upper wheel is stationary at the height of about 30 feet above the water, and the girder revolves about this axis sufficiently, by raising and lowering the submerged end, to allow the dredging to be carried on at any depth from 6 feet to 30 feet. One man by means of a lever on deck has complete control of raising and lowering the bucket-girder. The main frame carrying the girder and its gear is well secured and braced, so as to distribute the strain it has to bear over a large portion of the hull.

The dredged material is delivered, after passing over the upper wheel, into inclined shoots at either side of the vessel, with suitable arrangements, worked by steam, for closing

FIG. 2.

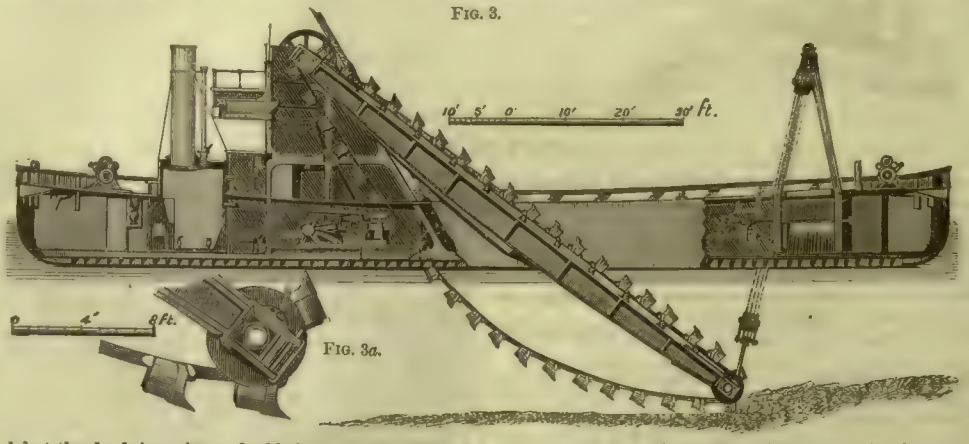
one shoot and opening the other simultaneously. At the bow there are three large independent double-powered crab winches, combined in one machine for convenience in handling by one man. These crabs control one 1¼-inch head chain and two ¾-inch side mooring chains, provided for guiding the dredger to the cutting place. At the stern four similar crabs are placed to work the stern and side moorings. By these appliances provision is made for moving the vessel ahead, astern, and athwartship. Surging heads are also fitted to the crabs to haul the hopper barges alongside, also hand gear to work the surging heads independent of steam. Friction gearing is provided and adapted to work these moorings at three different speeds. The main gearing and girder hoisting gear are also fitted with adjustable friction-wheels, to prevent accidents in case of undue strain coming on the buckets or girder. Steel has been used in various parts of the machinery of this dredger, such as the dead-eye brackets for suspending the top end of the bucket girder, bars for upper and lower tumblers, bearings of lower tumbler shaft, spindles of bucket rollers, bucket cutting lips, and bushes for the bucket link-eyes.

The working power consists of a pair of horizontal condensing engines to drive the buckets, hoisting gear for bucket girder, and bow crabs. Two pairs of non-condensing engines are also provided to drive the stern crabs, side shoots, etc. A donkey double-acting pump connected to bilges and sea feeds the boiler, etc.

This dredger working at full speed in 10 or 15 feet of water can raise about 500 tons or 380 cubic yards of ordinary soil per hour.

This method of dredging, considerably modified, was applied on a very extensive scale in excavating the Suez

FIG. 3.



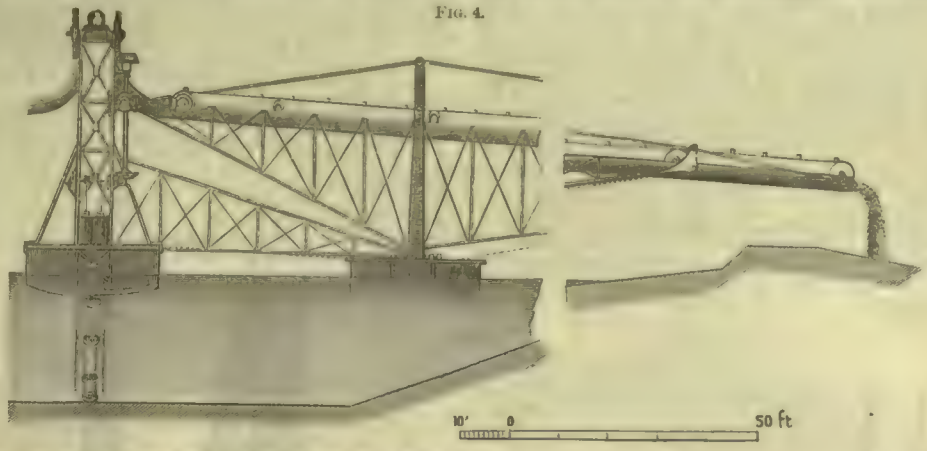


FIG. 3*a*.

Canal, but the dredgings, instead of being always delivered into scows alongside, were generally deposited on the banks of the canal through long shoots having but a slight inclination. The dredge-boats were built of boiler iron, and the largest ones were 108 feet long, 27 feet broad, and 10½ feet deep in the hold, with 5 feet draught of water. The engine was vertical, direct acting, and condensing, with two cylinders, and nominally 35 horse-power, the boiler heating surface being 1163 superficial feet. The capacity of some of the dredge-buckets was 10.6 cubic feet, and others 14.74 cubic feet. The upper rollers, over which the endless chain carrying the buckets passed, were in some dredges 37 feet 5 inches above the water, and in others 48 feet. For the former the shoots to deliver the materials on the canal banks were 195 feet long, and for the latter 227½ feet long. The shoots are not supported by the dredger, but are constructed each upon a separate barge, and are sustained by a lattice girder resting upon the barge on telescopic supports, so that it can be raised and lowered by a hydraulic hoist and set at different angles of inclination. To accommodate the changes of inclination, the attachment of the shoot to the dredger is made by means of a horizontal joint, and the lattice girder can also be revolved horizontally on its supports, so that it can be turned parallel to the sides of the barge and of the canal when moving it from place to place. The shoot is semi-elliptical in cross section, being 1 foot 11½ inches deep and 5 feet 11 inches wide. To aid the flow and discharge of the dredgings, a stream of water is thrown into the upper end of the shoot by two rotary pumps placed upon the dredge; and in case this supply is insufficient a portable engine located on the barge supporting the shoot, and working a pump capable of throwing 5000 cubic feet of water per hour, is set in motion. This pump delivers its water along the entire length of the shoot, through a pipe pierced with holes at short intervals. The shoot is further provided with an endless chain, carrying scrapers which move along in the bottom whenever the dredgings are not voided freely by water alone. Fine sand confined within a channel will descend rapidly on an inclination of 4 to 5 feet in 100, when washed with half its bulk of water. For clays a descent of not less than 6 to 8 feet in 100 is necessary, but less water is required.

Fig. 4 shows a section of dredge with long shoot. A

portion of the shoot and supporting girder, about 73 feet in length, is omitted for want of space. Where the banks of the canal were too high to use the long-shoot dredger, an elevating apparatus was employed, consisting of a portable tramway supported by two parallel lattice girders, the lower end, about 10 feet above the water, resting upon a barge in the canal, and the shore end, 15 feet above the water, upon a truck running upon a railway laid along the bank of the canal. In operating this apparatus the dredgings are first delivered from the dredge into boxes arranged

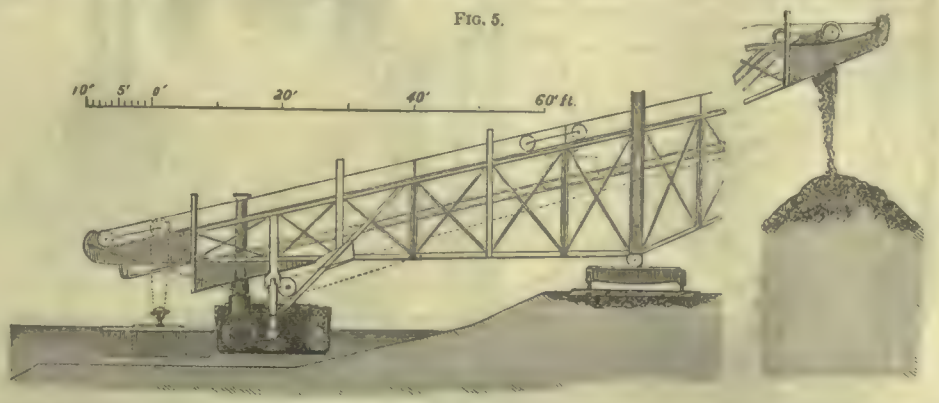

FIG. 4.

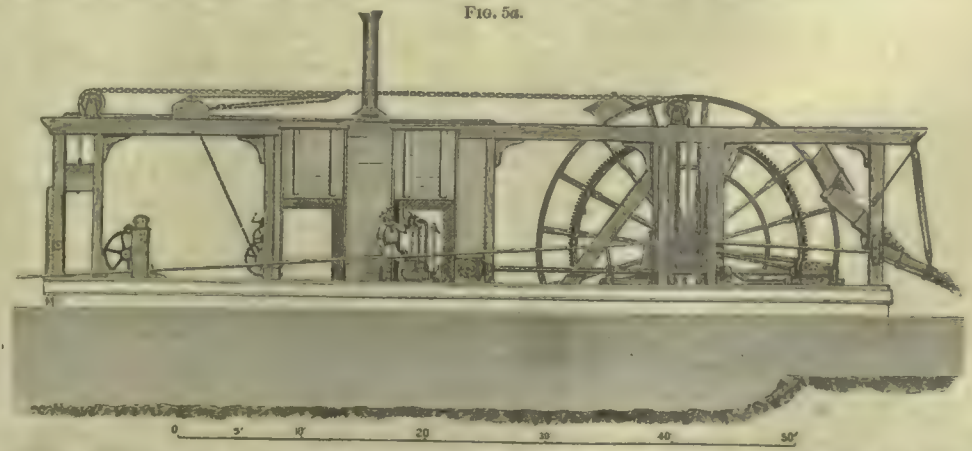
side by side upon a raft or float; the raft is then floated under the lower end of the tramway, and the boxes are hooked on, one after another, to the lower side of the tramway truck, and conveyed to the upper end of the tramway and tipped by steam-power. This arrangement is shown at Fig. 5, a portion of the shore end being omitted for want of room. The tipping is effected by two wheels attached to the lower rear edge of the box which run up a steep incline at the upper end of the tramway.



Wheel Dredgers.—Instead of an endless chain to carry

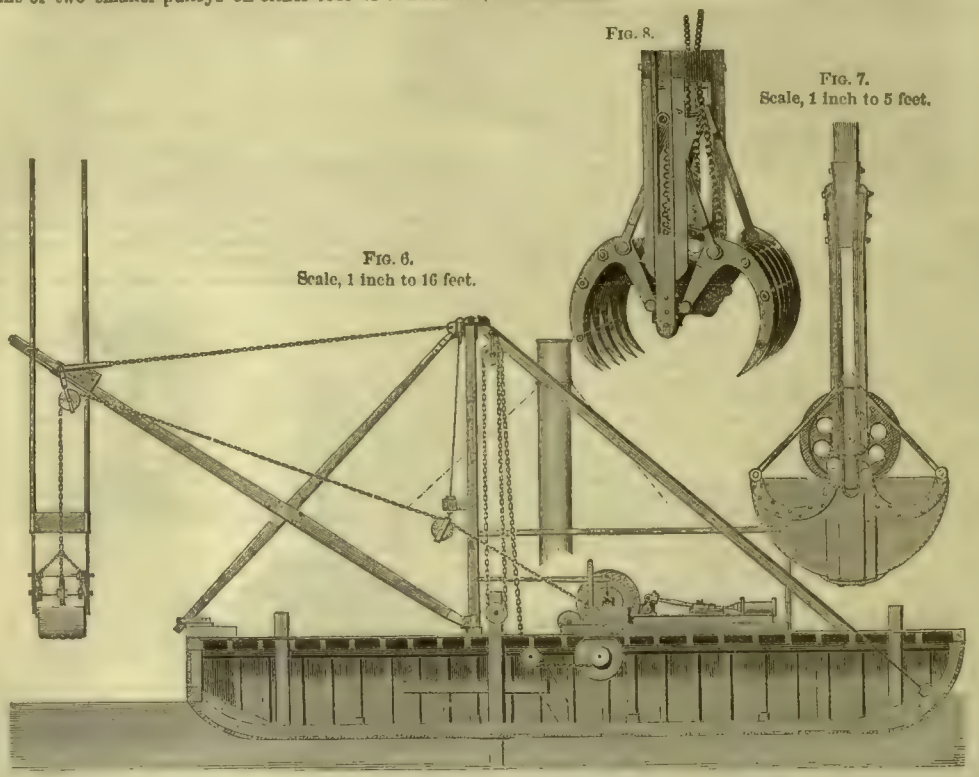
FIG. 5.

the buckets, these are sometimes placed upon the perimeter of a wheel 25 to 30 feet in diameter, or larger according to the depth to be dredged. This wheel is set in a well in the boat, its axle or shaft working in boxes that can be lowered or raised by suitable machinery as the depth requires. As the wheel revolves the buckets scoop themselves full at the bottom, and in ascending lift in succession the upper end of a shoot adjusted against the perimeter of the wheel, which, falling back to its place, causes the bottom of the bucket to unlatch, and the contents to be discharged into the shoot, and thence into a scow alongside. The dredge-boat is drawn along by a cable leading to the engine at the precise rate which the progress of the excavation requires. Under favorable circumstances a 24-foot wheel carrying four buckets has been known to excavate 1200 cubic yards in ten working hours. (See Fig. 5*a*.)

FIG. 5a.

Clam-shell Dredgers.—Each dredge-boat operates but one bucket, which is in two parts hinged together horizontally, something like a clam shell, with arrangements by which it is opened and closed by the same power which lowers and raises it through the water. The bucket being open and suspended from the end of a crane-jib, descends vertically through the water until it rests on the bottom. It is then filled by closing together the two parts, when it takes the

form of a short horizontal trough or hollow semi-cylinder closed at the ends. It is then raised out of the water, swung round over a scow, opened and emptied.



The two parts of the bucket—each being a quarter of a hollow cylinder with closed ends—are hinged along their common axis, and from their outer upper edges tie-rods or links extend to a crossbar directly over the centre or axis. This crossbar works in guides up and down. By raising the crossbar in the guides the two parts of the bucket are opened; by lowering it to its lowest point the bucket is closed. This raising and lowering of the crossbar in the guides—and consequently the opening and closing of the bucket—is effected by two chains passing over pulleys at the end of the crane-jib and down to separate drums operated by the engine. One chain is attached directly to the crossbar, and supports the weight of the open bucket whilst descending to the bottom. The other chain is made fast to the groove of a pulley placed below the crossbar, and (by means of two smaller pulleys on either side of it fixed to the same shaft) working on the principle of the wheel and axle, transmits its leverage (by means of chains fastened to the grooves of the smaller pulleys) to the under side of the crossbar. The strain being brought upon this last-mentioned chain after the bucket reaches the bottom, the crossbar is by this means hauled down, the two parts of the bucket are closed, and the bucket filled before it commences to ascend. When working in hard material like compact clay, hard sand, or gravel, the cutting edges of the bucket are provided with sharp teeth.

The hoisting apparatus consists of a pair of horizontal engines, which by means of a friction-clutch can be made to drive either of the chain drums at pleasure. The bucket is guided in its descent by a pair of wooden poles attached to the guides of the crossbar, and working up and down through eyes near the end of the crane-jib. For raising stones, logs, fragments of wreck after blasting, etc., a strong grapple with steel-pointed prongs is used in place of the bucket.

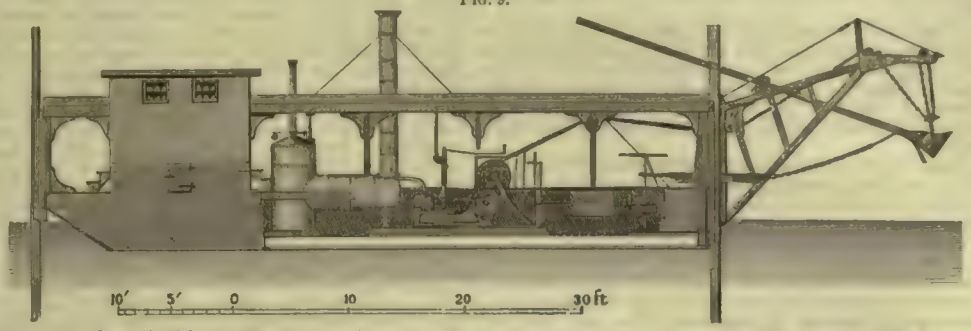
FIG. 8.

FIG. 7.
Scale, 1 inch to 5 feet.

FIG. 6.
Scale, 1 inch to 16 feet.

Perhaps the best type of the clam-shell dredger is that manufactured by Messrs. Morris & Cuming of New York City. Fig. 6 is a longitudinal section of their dredger above described; Figs. 7 and 8 give enlarged views of the bucket and grapple. For these dredges two sizes of buckets are usually made; the smallest weighs 3500 to 4000 pounds, with 1½ cubic yards actual capacity, or 2 yards when heaped up, and the largest weighs 6500 or 7000 pounds, with 3 cubic yards actual capacity, or 4½ to 5 yards when heaped up. The teeth are made from 6 to 9 inches long. The grapples also are of various sizes, the largest being 5 feet along the hinge, and 8 feet wide between the points of the prongs when open. In 25 feet of water three lifts can be made in two minutes with the 3-yard bucket. The largest dredge-boats are 80 feet long and 30 feet wide, and the smallest 60 feet long and 25 to 30 feet wide. The power for the heavy grapple is supplied by two 20-inch cylinders with 20 inches stroke, 45 pounds steam-pressure, and making from 40 to 60 revolutions per minute; for the large buckets, two 12½-inch cylinders with 30 inches stroke, 75 pounds steam-pressure, and making from 60 to 70 revolutions per minute; and for the small buckets, two 10-inch cylinders with 24 inches stroke, 75 pounds steam-pressure, and making from 60 to 70 revolutions per minute.

In Baltimore harbor a machine with a 3-yard bucket, operating partly in soft mud and partly in oyster shells, in 26 working days, of which 7 were lost by breakages and bad weather, leaving only 19 days' work of 10 hours each, raised 26,334 cubic yards, or a daily average of 1386 cubic yards. The best day's work was 1980 cubic yards. The average depth of water-way was 21 feet, with occasional lumps with 16 feet soundings. The depth to be attained was 24 feet. Another machine with bucket of the same size, in 26 days, of which two were lost, raised 48,800 cubic yards. In the same harbor, operating in soft mud in a 16-feet channel, to make it 24 feet deep, a machine with a 1½-yard bucket, working 26 days, of which 7½ were lost, raised 23,310 cubic yards. The best day's work of 10 hours was 1665 cubic yards. Another machine of the same size, working 21 days, of which two were lost, raised 19,109 cubic yards. The aggregate quantity raised by the four dredgers during the respective periods above specified, agreed to within about 150 cubic yards with the return made by the engineer inspector, upon which payment for the work was made. At South Amboy, a dredger with a 3-yard bucket, working in stiff mud mixed with sand, in deepening a 9-feet channel to 15 feet, raised 73,000 cubic yards in 35 working days, an average of 2085 yards per day of 10 hours. In the same place a 3-yard bucket, working 12 consecutive days, raised 19,200 cubic yards, an average of 1600 cubic yards per day of 10 hours. Another 3-yard machine averaged 1383 cubic yards per day of 10 hours. The falling off in the two last-mentioned cases was attributed to an increase in the proportion of sand in the material raised. In Boston harbor a Morris & Cuming 3-yard bucket, working 26 days in stiff whitish-gray clay, raised only 3335 cubic yards, or 128¼ yards per day of 10 hours. In this case the teeth did not penetrate more than 8 or 9 inches, tearing up the clay in large lumps, but not so as to fill the bucket. At the foot of Pike street, New York, a 1½-yard bucket, working 6 days in mud, gravel, and cobble-stones, raised 4075 cubic yards, or 679 cubic yards per day of 10 hours.



In making shallow cuts much time is lost in moving

the dredger forward. A small Morris & Cuming dredger with a 1-yard bucket, working in a mixture of soft mud and sand in the Savannah River, to deepen a 10-feet channel to 12½ feet, had to be moved for every 15 yards raised. In 11 working days of 8 hours 4054 cubic yards were raised, or 369 yards per day. Only one scow could be kept alongside, in consequence of the tide. The actual time lost in fleeting and changing scows was 4 hours out of 8. The dredger working from a fixed position would therefore have doubled the amount of work actually performed.

The crew required for working the small dredger consists of captain, who handles the levers; engineer, who tends to the fire and machinery; and five deck-hands; on board the larger dredgers about eight deck-hands are required. When the dredged material has to be deposited at any considerable distance, it has been found that with a tow of from one to one and a half miles, one tug and two scows will keep a dredger in constant work. When the tow is increased to 7 or 8 miles, two or three tugs with seven or eight scows are required. The power of the tugs varies from 50 to 100 horse-power, and the sizes of their cylinders range from 16 to 30 inches diameter. The crew of a tug-boat consists usually of captain, engineer, fireman, cook, mate, and two or three deck-hands. Each scow has also one man constantly on board to attend the doors.

Single-Scoop Dredgers (Fig. 9).—By these machines

FIG. 9.

dredging is performed with a single bucket, shaped, as the name implies, like a scoop or dipper, having a swinging door closing with a catch at its back, by which it is emptied. This bucket is fixed to a beam or handle of a length suitable for any depth of water in which the dredger is intended to work. The bucket with its handle is worked from a crane, which has its post set on a movable platform placed in the centre of the bow of the dredge-boat. The crane-post, jib, and stay are each built of two parallel timbers, secured to one another at the foot of the stay, neck of the post, and end of the jib. The bucket handle works in the space left between these parallel timbers. This beam or handle is slotted for the greater portion of its length, and on the back, on either side of the slot, has two racks working on pinions whose shaft is fixed upon the crane-jib about one-third its length from the post. These racks are kept in contact with their pinions by a friction-roller pressing on the front of the handle, and made fast by a link passing through the slot to the shaft of the pinions. When digging, in order to prevent the handle rising on its pinions when the hoisting chain is lifting the bucket through its cut, a hand-lever, worked by the crane-man and connected with the pinions by an endless chain passing round a rag wheel on the pinion shaft, stops their motion, and consequently the rising of the handle, and compels the bucket to describe an arc of a circle with the pinion shaft as its centre. Immediately the bucket has made its cut the leverage is taken off and the handle rises on its pinions. The hoisting chain is fastened near the nose of the bucket, passes over a shive at the outer end of the crane-jib, returns through a pulley on the bucket, is carried over a second shive at the end of the crane-jib, and, guided by pulleys through the centre of the swinging points of the crane, is then carried to the hoisting drum operated by the engine. Another chain, called the backing chain, is fastened to the lower part of the handle near the bucket, and is carried to the backing drum. The backing chain is used for bringing the bucket back from its centre of gravity to any point near the bow of the dredge-boat where the cut is to be commenced. The bucket and handle are lowered by their own weight, regulated by the hoisting chain, and placed in position by the backing chain. The hoisting apparatus consists of a pair of horizontal engines, which by means of clutches or friction bands move either the hoisting or backing drums independently of one another.

An improvement on the ordinary crane, which had a radius of about nineteen feet, has been lately applied to the scoop machine manufactured by Messrs. Osgood of Troy—namely, an extension of the end of the crane-jib, by which a longer cut ahead can be made by the bucket and a greater width of bottom covered by the swing of the crane, thus saving time which would otherwise be lost in moving the machine. The extension of the jib is carried out nearly horizontally, the bucket being suspended as before described, with the exception that the outer shive at the end of the jib becomes a travelling one, with a tendency to keep a position directly over the bucket. In making a cut, therefore, the outer shive, starting from the inner edge of the horizontal extension, follows the bucket in its cut, which is not immediately the arc of a circle with the pinion as a centre, but a continual forward thrust until the travelling shive is at the outer end of the extension, and not until then does the pinion become the centre from which the arc is described for the remainder of the cut. When the extension is used, the strain is carried from its outer end to the neck of the crane-post by tie-rods, as shown in the drawing. In machines with the larger-sized buckets the cranes have a counterpoise attached. In very hard ground the bucket is taken off and a pick or plough attached, with which the ground is broken up, to be afterwards picked up with the bucket. The method of operating is as follows: the bucket, being clear of the water, is drawn back by the backing chain, at the same time descending by the slackening of the hoisting chain and its own weight; as it strikes the water and is drawn back, the pressure closes the swinging door or back of the bucket, when it is immediately caught and held fast by the catch. Having reached the bottom, the strain is brought upon the hoisting chain, and the backing chain slackened. The bucket then travels forward as before described, the racks and pinions being stopped at the proper time by the lever applied by the crane-man. The bucket having passed through its cut, the leverage is taken off, the bucket and handle raised, and the crane on its movable platform swung to either side as desired. A line attached to the catch of the swing door at the back of the bucket, which by the raising has come to be the under side, is then pulled by the crane-man, the back opened, and the bucket emptied.

These machines are made of various sizes, those most commonly built having buckets of ¾, 1⅛, and 1½ cubic yards capacity. The dimensions of boat for the larger machines are about 65 feet length, 26 feet beam, and 6½ feet depth of hold, and having a hoisting chain of 1¼ inches. Their power is derived from a pair of 15-inch cylinders with 12 inches stroke. The dimensions of boat for the smaller machines are somewhat less, being about 60 feet length, 24 feet beam, and 5 feet depth of hold, the power being derived from 7 to 10 inch cylinders, with from 12 to 15 inches stroke.

The larger machines of this pattern, with 3 yards capacity of bucket, when working in soft mud under the most favorable circumstances—that is to say, from a fixed position—will average in 20 feet of water about 2000 cubic yards per day of 10 hours. Under ordinary circumstances it may be expected, in a series of working days of 10 hours each, to average about 1300 cubic yards of soft mud or 800 cubic yards of gravel and sand.

In the slips of New York a machine with a bucket of 1½ cubic yards capacity, 7-inch cylinders with 12 inches stroke, a steam-pressure of 60 pounds, and with 200 revolutions, working in soft mud, in 12 days of 10 hours lifted 10,302 cubic yards, or 859 yards per day. The best day's work was 968 yards. The same machine working in soft mud at Wallabout, Brooklyn, with a cut of from 2 feet above to 10 feet below low water, in 131 working days of 10 hours lifted 72,621 cubic yards, or nearly 555 yards per day of 10 hours. At the same place the same machine, working in gravel and sand, with a cut of from 15 to 22 feet below low water, in 14 days lifted 5591 cubic yards, or nearly 399 yards per day of 10 hours.

Another machine, with a 1¾-yard bucket, and with cyl-

inders of 10 inches diameter and 15 inches stroke, cutting to a depth of 10 feet through a meadow at the junction of the Delaware and Schuylkill rivers, the material seemingly consolidated mud, in 26 working days of 10 hours lifted 12,532 cubic yards, an average of 482 yards per day. The same machine, near Philadelphia, working from a fixed position, picking up soft mud which had been dumped under it from scows, and loading into cars, lifted 1000 cubic yards in 10 hours; its average, however, was about 800 yards per day. These working days include the time lost in repairing chains and other slight damages incidental to the best running machines.

The crew of one of these dredgers consists of engineer, fireman, and two or three deck-hands, including craneman.

A tug of 100-horse power can, with 4 scows of about 150 yards capacity each, keep one of the smaller machines busy when the tow does not exceed three miles. The smaller dredger consumes about 1¼ tons, and the tug about 1½ tons, of coal per day. A tug is usually manned by a captain, engineer, fireman, cook, and one or two deck-hands.

Pump Dredger.—A novel device for utilizing the powers of the centrifugal drainage pump has recently been put in successful operation by the writer in deepening the channel over the bar at the mouth of the St. John's River, Fla. Upon this bar the ocean swell which constantly prevails is of such exceptional magnitude and violence that the usual method of dredging into lighters or scows, ordinarily pursued in still water with either of the dredgers above mentioned, is entirely impracticable. The plan adopted was to provide a suitable steamer by charter, and fit her out with a 9-inch centrifugal drainage pump, two branches of 6-inch suction pipe, and timber bins on deck for holding the sand pumped up from the bottom; the pump engine to be driven by steam from the steamer's boiler, and the sand to be discharged overboard at selected points by flooding the bins with clear water from the pump.

The steamer is 132 feet long on the keel, 24½ feet broad on the beam, and when ballasted to an even keel draws about 5½ feet of water. She was modelled with a view to speed, and carries only 100 tons on a draught of 7 feet, is strongly built with side wheels and short guards, has one low-pressure engine of 120-horse power, and ample boiler capacity. A boat with more beam and a fuller model fore and aft under the water-line would have been better.

The Pump.—A No. 9 centrifugal drainage pump of the Andrews patent is located on the main deck aft, about 35 feet from the stern-post. Its suction and discharge openings are each 9 inches in diameter. To the suction opening there are connected, by a 2-way branch-pipe, two 6-inch suction-pipes, instead of one 9-inch, as usual, the object being not only to work on both sides of the boat simultaneously, but to render the necessary handling of the pipes as easy and prompt as possible. There is, on the other hand, considerable disadvantage in working with two suction-pipes instead of one, on account of a greater amount of friction for an equivalent suction capacity; for while a 9-inch pipe has an area of 81 circular inches, two 6-inch pipes have an aggregate area of only 72 circular inches. The friction surface is therefore increased as 27 to 36, making the disadvantage from or loss by friction from this cause as 2 to 3. As a partial compensation for this increased amount of friction, an increased velocity is given to water in suction-pipes of less aggregate area than the discharge-pipe, and a larger proportion of sand is thereby carried up.

It was necessary also to encounter another disadvantage by using several bends, of which there were two in each of the suction-pipes and one in the discharge-pipe, those in the suction being each one-eighth of a circle, and that in the discharge-pipe one-fourth of a circle. These bends reduce the delivery at the rate of 10 per cent. for each turn of 90°, and about 6 per cent. for each turn of 45°, the reductions in each case being calculated upon the quantity passing the preceding bend. Thus, the first one-eighth bend in the suction reduces the quantity to 94 per cent., the second to 88 per cent., and the one-fourth bend in the discharge to 79 per cent. The disadvantages, therefore, under which the apparatus labored may be briefly summed up as follows: 1. The loss by friction due to the use of two 6-inch, instead of one 9-inch, suction-pipe is increased 50 per cent.; 2. The unestimated loss by friction due to the use of suction-pipes three times as long as the height to which the material is to raised; 3. The loss of 21 per cent. by bends in the suction and discharge-pipes.

The *engine* used to drive the pump consists of two cylinders connected upon one crank at right angles to one another, and 10 inches in diameter by 10-inch stroke each. Steam is conveyed from the steamer's boiler to the pump-engine through a 3-inch iron pipe, the usual pressure carried upon the boiler being about 25 pounds to the square inch. This pressure develops about 26 useful horse-power (after deducting 25 per cent. for friction of engines and difference of pressure in the cylinder and boiler), and gives a speed of about 180 revolutions per minute to the engine shaft. On this shaft is a pulley 42 inches in diameter, carrying a rubber belt 12 inches wide, communicating the power to the pump-shaft through a pulley 24 inches in diameter, thus giving the pump-disk and wings about 315 revolutions per minute. This speed in the No. 9 pump is equal to the work of raising 3000 gallons of clear water per minute 30 feet high through a 9-inch straight vertical pipe. The actual height raised above the water on the St. John's bar varies with the amount of sand taken on board, from 10 to 11 feet, but as the pipes are 50 feet long, with bends, and are in two branches instead of one, and as a mixture of sand and water is heavier and more impeded by friction than clear water, the loss by friction from all these causes combined reduces the useful working of the pumps considerably below the average attainable under more favorable conditions. For these reasons, although 200 revolutions of the pump-disk per minute will easily raise 3000 gallons of clear water 12 feet high through a straight vertical 9-inch pipe, 300 revolutions are required to raise 2500 gallons of sand and water 11 feet high through the two inclined suction-pipes having two turns each, discharged through a pipe having one turn. To prevent the ends of the suction-pipes being lifted off the bottom by the pitching of the boat, and as a precaution against accident, a portion of each pipe is made flexible, being composed of 6-inch rubber hose stretched over a coil of wire. In addition the ends are loaded with an iron frame or drag, each weighing about 250 pounds, which is intended to move flat along the bottom during the operation of dredging. To the under surface of this frame, directly below the mouth of the pipe, a number of teeth or knives are attached to stir up the sand and aid its entrance into the pipes. A chain attached to each drag, and leading to the deck of the steamer on either side, takes the strain from the pipe when the drag is down and the steamer in motion. Tackles are arranged for lifting the pipes from the bottom when not dredging, or when pumping clear water to discharge the sand from the bins.

For receiving the sand, bins are located along the main deck, fore and aft, on each side of the steamer's engine, each bin being provided with a sliding gate over the steamer's side, which can be opened and closed at pleasure. The bottom of the bins slopes downward towards the gates. They are filled from two open troughs, one from each branch of the discharge-pipe, provided at suitable intervals with valves or gates, so that the load can be distributed to the bins wherever desired.

The proportion of sand that can be pumped depends greatly upon its specific gravity and fineness. The calcareous and argillaceous sands flow more freely than the silicious, and fine sands are less liable to choke the pipe than those that are coarse. When working at high speed, 50 to 55 per cent. of sand can easily be raised through a straight vertical pipe, giving for every 10 cubic yards of material discharged 5 to 5½ cubic yards of compact sand. With the appliances used on the St. John's bar the proportion of sand seldom exceeded 45 per cent., generally ranging from 30 to 35 per cent. when working under the most favorable conditions. In pumping 2500 gallons, or 12.6 cubic yards, of sand and water per minute, we would therefore get from 3.7 to 4.3 cubic yards of sand. During the early stages of the work, before the teeth under the drag had been properly arranged to aid the flow of sand into the pipes, the yield was considerably below this average, not often exceeding, and frequently falling below, 2 cubic yards of sand per minute during the time actually employed in pumping.

The manner of conducting the dredging may be briefly described as follows: The steamer, with the suction-pipes up, first crosses the bar to the outside, then turns around and steams slowly over the bar with just sufficient speed to maintain steerage-way, lowering the pipes and starting the pump as soon as the outer edge of the bar is reached. Arriving at the inside, the pump is stopped, the pipes raised, and the steamer turned round again. She then crosses slowly to the outside, pumping as before; and the quantity of sand discharged into the bins during these two passages over the bar is a load, whether great or small. While the steamer is turning around on the outside, preparatory to taking in another load, the side gates of the bins are opened, the suction-pipes are raised from the bottom, and the pump is run at full speed on clear water. By this means, assisted to some extent when necessary by men in the bins with hoes, the sand is all discharged into deep water by the time the steamer has again reached the outer edge of the bar, when the dredging is resumed. The time

required to turn the steamer twice is 12 to 13 minutes, one half of which, or the time occupied in making the turn on the inside, is lost, as neither the work of dredging the sand nor discharging it from the bins is in progress during that interval.

The last work carried on with this dredger was during the first few months of the fiscal year ending June 30, 1873, for a period of 74 days, of which 23 days were lost by bad weather. The expenses were the same as for working days, the boat being under charter.

The average time worked per day was 6 hours; the average quantity of sand removed per hour was 78 cubic yards; the average quantity of sand removed per day was 468 cubic yards, the total quantity in 51 working days being 23,868 cubic yards; the average cost for the entire period was $31\frac{1}{8}$ cents per cubic yard. The least cost during any one month for dredging and dumping the sand was in July, 1872, when it amounted to 23½ cents per cubic yard; the least cost during any one week was 19½ cents per cubic yard; the least cost during any one day was 15 cents per cubic yard.

With a centrifugal drainage pump sand can be easily discharged at a height of 30 feet above the level of the water; and when the distance to which it has to be conveyed is so great that open troughs from the discharge-pipe to the dumping-ground cannot have sufficient inclination to secure a free flow of the sand and water, it would be necessary to make the discharge through pipes, increasing the power expended in proportion to their length, so as to ensure a velocity that will transport the sand and prevent choking. The pump itself should in all cases be placed as low as possible, and it would generally be practicable to locate it from three to five feet above the surface of the water.

The first or contractor's cost of dredging under these circumstances, with a 9-inch pump, would probably not exceed 8 or 9 cents per cubic yard, inclusive of running expenses, wear and tear of machinery, and all stoppages for repairs and other contingencies. Indeed, assuming the pump on St. John's bar to have worked continuously in raising sand 10 hours per day, except Sundays, during the month of May, 1872, with the same average results per hour actually attained while pumping, thus charging the six working days of each week with the expense of seven, the cost of raising the sand into the bins would have been only $8\frac{6}{10}$ cents per cubic yard, and if it could at the same time have also been continuously discharged to the dumping-ground through either open troughs or pipes, no additional expense, except a trifle for increased power, would have been incurred. There were, moreover, constant losses encountered on the bar while actually pumping which would not occur in still water, and of which no account has been taken, due to the pitching of the boat, which frequently lifted the ends of the suction-pipes from the bottom. It is therefore considered safe to estimate the contractor's cost of removing sand at 9 cents per cubic yard when the conditions are such that the work of raising the sand and discharging it to the dumping-ground can be carried on simultaneously and continuously. (See DEEP-SEA DREDGING, by PROF. A. E. VERRILL.)

Q. A. GILLMORE, *U. S. Army.*

Dred Scott Case (the case of Scott *v.* Sandford in the Supreme Court of the U. S. in 1856, 19 Howard R., 393). A slave named Dred Scott was carried by his master (Sandford) from Missouri into Illinois and Wisconsin, and thence back to Missouri. Scott was descended from African ancestors, who were slaves. He brought an action in the circuit court of the U. S. to assert his title to freedom. The judgment of that tribunal was carried by writ of error to the Supreme Court. It was there decided by a majority of the court that if Scott were assumed to be free, he was not a "citizen of a State," so as to bring the action; and further that he was still a slave. Accordingly, the case was dismissed for want of jurisdiction on the part of the circuit court. In reaching the conclusion that he was still a slave, the court held that the act of Congress which prohibited a citizen from holding slaves in the Territories of the U. S. north of thirty-six degrees and thirty minutes N. latitude was unconstitutional and void. The action of the court has been severely criticised in respect to this last point, as being unwarranted after the decision was made that Scott, considered as a freeman, was not a citizen. It is maintained, on the other hand, that both questions under the pleadings were properly decided. Some recent information as to the circumstances under which the decision was rendered will be found in letters of Justices Campbell and Nelson in Tyler's "Life of Chief-Justice Taney," pp. 382–385. The chief-justice, when delivering the opinion of the court, made an historical survey of the public opinion of the civilized world, at the time of the formation of the American Constitution, concerning the African race. Among other things he said: "They (the Africans) had for more than a century before been regarded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations, and so far inferior that they had no rights which the white man was bound to respect." Much injustice has been done him by an erroneous statement, still occasionally repeated, that the chief-justice had himself affirmed that the negro had "no rights which the white man was bound to respect."

T. W. DWIGHT.

Dreisse'na [named in honor of Dr. Dreyssen, a Belgian naturalist], a genus of fresh-water lamellibranchiate mollusks of the mussel family (Mytilidæ), differing, however, from the true mussel in having the mantle closed except at the branchial and anal slits. *Dreissena polymorpha*, a Russian species, is remarkable for its recent arrival into English waters, where it has invaded even the water-pipes of London. Ten species are fossil in Europe.

Drelincourt (CHARLES), a French Protestant minister, born at Sedan July 10, 1595. He preached at Charenton near Paris, and gained great popularity. He was also distinguished as a writer of polemical theology. Among his very numerous works was "Consolations against the Fear of Death" (1651), which was translated into English, and passed through many editions. Died in Paris Nov. 3, 1669. —His son, CHARLES DRELINCOURT (1633–97), physician to William III. and Queen Mary, was the author of numerous medical works.

Drenthe, a province of the Netherlands bordering on Prussia, has an area of 1032 square miles. The surface is level, and partly occupied by marshes. A large portion of the soil is poor. The rearing of cattle is the principal branch of industry. Pop. in 1870, 108,056. Capital, Assen.

Drepa'nius (LATINUS PACATUS), a Gallic rhetorician, born in Aquitania, in the south of Gaul, is classed among the Latin Panegyrists. He attained the rank of proconsul A. D. 390, and under this title was addressed by Ausonius in one of his poems, in which he pays a high tribute to the poetical abilities of Drepanius. Of his poetry nothing remains, but the panegyric which he delivered in the presence of the emperor Theodosius in 389 A. D., when he was sent to congratulate the conqueror on the overthrow of Maximus, is extant, and is contained in the collection entitled "Panegyrici Veteres," edited by Jaeger, Nuremberg, 1799, 2 vols. 8vo. It is published separately also by Arntzen, 1753, 4to, Amsterdam.

HENRY DRISLER.

Dres'bach, a post-township of Winona co., Minn. Pop. 311.

Dres'den, the capital of the kingdom of Saxony, is situated in a beautiful valley on both sides of the river Elbe, 116 miles by railway S. of Berlin and 62 miles E. S. E. of Leipsic; lat. 51° 3′ 16″ N., lon. 13° 44′ E. It is divided by the Elbe into the old town and new town, the latter of which is on the right bank of the river, here crossed by a fine stone bridge. Railways extending in several directions connect Dresden with Berlin, Leipsic, Prague, and other cities. The Altstadt has narrow streets bordered by high houses. The most remarkable public edifices are the royal palace, founded in 1534; the prince's palace; the Japanese palace or Augusteum; the Brühl terrace; a handsome church called Frauenkirche, which has a tower 355 feet high; the Roman Catholic church, with a tower 378 feet high; and the Sophienkirche. Dresden has a royal public library containing over 300,000 volumes; an academy of art; a museum of natural history; an opera-house; a theatre; a mint; two gymnasia; a polytechnic school, realschulen, two normal schools, one female high school, two schools of commerce and veterinary medicine, and asylums for the blind and for the deaf and dumb; and a celebrated picture-gallery, which is considered the richest collection in Germany. It contains nearly 1500 paintings, mostly by Italian and Flemish masters. In the royal palace are the celebrated "Green Vaults," containing a very large and valuable collection of gems, articles of vertu, etc. This city has manufactures of silk and woollen stuffs, jewelry, porcelain, silver-ware, gloves, carpets, musical instruments, chemical products, and painters' canvas. Steamboats navigate the Elbe between this place and the sea. The environs of Dresden are delightful, and are furnished with fine gardens and promenades. The city was founded about the eleventh century, and became the capital of Saxony in 1270. It was fortified in 1510, and suffered severely in the Thirty Years' war, and also in 1813, when it was the head-quarters of Napoleon's army. (See DRESDEN, BATTLE OF.) Pop. in 1871, 177,089.

Dresden, a township of Chickasaw co., Ia. Pop. 535.

Dresden, a township and post-village of Lincoln co., Me., on the Maine Central R. R., about 20 miles S. of Augusta. Pop. 990.

Dresden, a post-village of Elk Fork township, Pettis co., Mo., on the Missouri Pacific R. R., 70 miles W. by N. of Jefferson City. Pop. 348.

Dresden, a township of Washington co., N. Y. P. 684.

Dresden, a post-village of Torrey township, Yates co., N. Y. It is situated on Seneca Lake, at the terminus of Crooked Lake Canal, and has a steamboat landing.

Dresden, a post-village of Muskingum co., O., at the head of navigation of the Muskingum River, is the northern terminus of the Cincinnati and Muskingum Valley R. R., 14 miles N. of Zanesville, and is on the Pittsburg Cincinnati and St. Louis R. R. Coal is mined in the vicinity. It has one weekly newspaper. Pop. 1156.

Dresden, a post-village, capital of Weakley co., Tenn., on the Nashville and North-western R. R. It has two churches, a high school, and one weekly newspaper. Cotton and corn are the chief exports. Pop. 355.

T. H. Baker, "West Tennessee Democrat."

Dresden, Battle of. Dresden was occupied by a French army of 30,000 men, when, on the 23d of Aug., 1813, the army of the allies appeared before it. Napoleon, with the main army, came to relieve it, and entered the city on the 26th of the same month. Schwarzenberg, the commander of the allied army, immediately assaulted and bombarded the city. Having been repulsed by a sally of the French guard on the 26th, he renewed the attack on the 27th, when a great pitched battle was fought, Napoleon gaining the victory.

Dress [from the Fr. *dresser*, to "make straight," to "adjust"], the general name for the artificial vesture worn more or less by nearly all the human race. Among savage nations such coverings were originally made of the skins of animals, the inner bark of plants, etc., and were worn sometimes for protection against the weather, and sometimes from a desire of ornament. As civilization advances these primitive coverings give place to manufactured fabrics of silk, wool, cotton, and flax. Profane history has no mention of a time when clothes were unknown to the human race; and the distinction between the dresses of the different sexes appears to have been observed from immemorial time. Homer mentions the "trailing robes" of the Trojan ladies, and the oldest sculptures seem to confirm this view.

Dres'sing, a term applied to gum, starch, and other substances used to stiffen and prepare linen, cotton, and similar fabrics.

Dressings, in architecture, mouldings and simple sculptured decorations around doors and windows.

Dreux (anc. *Durocasses*), a town of France, department of Eure-et-Loir, on the river Blaise, about 50 miles W. S. W. of Paris and 22 miles N. of Chartres. It has a fine Gothic church, a town-hall, and a theatre; also manufactures of serge, woollen hosiery, hats, etc. Here the Catholic army led by Constable Montmorenci defeated the prince of Condé and the Huguenots in 1562. Pop. 7237.

Drew, a county in the S. E. of Arkansas. Area, 900 square miles. It is partly drained by Bayou Bartholomew, and the Saline River forms part of the western boundary. The soil is fertile. The surface is level, partly timbered and partly prairie. Corn and cotton are raised. Capital, Monticello. Pop. 9960.

Drew (Daniel), a noted New York capitalist, was born in Carmel, Putnam co., N. Y., in 1797, commenced active life as a cattle-drover, became conspicuous in the steamboat business, still later in that of railroads, especially in the fortunes and misfortunes of the Erie road, and at last was recognized as a chieftain in the stock speculations of Wall street. He has also been distinguished by liberality to certain educational interests of the Methodist Episcopal Church, having founded the Drew Ladies' Seminary at Carmel, N. Y., and the Drew Theological Seminary at Madison, N. J.

Drew (Samuel), a noted Wesleyan theologian and metaphysician, was born at St. Anstell in 1765, settled in London in 1819, and died at Helston in 1833. He was an intimate friend of the famous Dr. Adam Clark, and of Dr. Thomas Coke, the first American Methodist bishop, whose "Life" he wrote. Among his other works, the principal are "Essay on the Immateriality and Immortality of the Soul" (1802), "Essay on the Identity and General Resurrection of the Human Body" (1809), and "History of Cornwall" (1820–24). "His theological writings, though showing more of ingenious subtlety than of logic, are surprising examples of intellectual power in a special direction, and have given him a widespread, if not a permanent, fame." (*Stevens's History of Methodism.*)

Drew Plantation, a township of Penobscot co., Me. Pop. 85.

Drew'rysville, a post-township of Southampton co., Va. Pop. 1811.

Drew Theological Seminary was founded in 1868 at Madison, N. J., by a donation of about half a million dollars from Daniel Drew. (See above.) It was organized chiefly by the Rev. Dr. J. McClintock, who became its first president. (See McClintock.) Its real estate and buildings are ample and beautifully located, and its faculty effective. It has (in 1873) about a hundred students. It is under the control of the Methodist Episcopal Church.

Drey'se, von (Johann Nikolaus), the inventor of the "needle-gun," was born at Sömmerda, in Prussia, Nov. 20, 1787. He was the son of a locksmith, worked from 1809 to 1814 in a Paris gun-factory, established after his return to Germany, in his native town, an iron-ware factory, and devoted his attention chiefly to the improvement of fire-arms. After several attempts, he perfected the famous Needle-Gun (which see) in 1836. It was introduced into the Prussian army in 1840. In 1841 he established an extensive gun and ammunition-factory. He died Dec. 9, 1867. —His son, Franz von Dreyse, born Mar. 2, 1822, has considerably enlarged the establishment.

Drift, in geology (more fully **Glacial Drift**), is a term applied to boulder clay and collections of stones and earth formed in the tertiary period by the agency of glaciers. Some geologists limit the term *drift* to material that has been recently moved by water, thus including sands, marls, and gravels, stratified and unstratified. Such deposits are sometimes called *diluvium*. They include the remains of animals that have recently inhabited the earth, and of some species which are now extinct. Human remains have also been found in these drift deposits in sufficient abundance to render it probable that the human race existed contemporaneously with the elephants, rhinoceroses, and gigantic deer of the tertiary period. These remains render the drift one of the most interesting of deposits. (See Geology, by Prof. J. W. Dawson, LL.D., F. R. S., and Glacial Period.)

Drift, in navigation, signifies the deviation in a ship's course caused by the action of a contrary wind, or the angle which the line of a ship's course makes with the meridian when she is driven by the wind or waves, and is not governed by the helm.

Drift'way, a small subterranean gallery driven in advance of a tunnel, is the first operation in tunnelling, and everything depends on its being correctly planned and located.

Drift'wood, a township of Jackson co., Ind. Pop. 922.

Drill, or **Drilling** [Ger. *Drillich*], a strong and fine linen fabric of a satin-like finish, used for summer clothing for gentlemen. Ordinary plain drills are worked with five shafts.

Drill. See Blasting, by Gen. J.G. Foster, *U. S. Army.*

Drill, an old English word for an ape, is supposed by Huxley to be the source of the name *mandrill* (*i. e.* a "man-like ape"), but the latter word appears to be the original one. (See Mandrill.) The term drill is now applied especially to the *Cynocephalus leucophæus*, a baboon of Africa.

Drill, in agriculture, the sowing of crops in rows by means of various machines of comparatively recent invention. The advantage of this mode of cultivation is, that it admits of destroying the weeds and stirring the soil between the rows of plants. Wheat is cultivated in drills in parts of Europe with great success.

Drill, Military, the name given to the instruction of soldiers and the exercises through which they are required to pass. There are many varieties of drill, that of the cavalry, infantry, and artillery being all different. The battalion-drill, company-drill, squad-drill, and skirmish-drill likewise vary in the routine of exercises. In the navy, also, the drilling of seamen is different, according to their duties.

Drip, in architecture, the same as Corona (which see).

Dris'ler (Henry), LL.D., an American scholar, born Dec. 27, 1818, graduated at Columbia College in 1839, was classical instructor in its grammar-school for several years, appointed tutor of the Greek and Latin languages in the college (1843), adjunct professor in the same department (1845), professor of Latin (1857), and transferred to the chair of Greek on the death of Dr. Anthon, in 1867; in the same year was acting president of the college during President Barnard's absence as a commissioner to the Exposition Universelle in Paris. For several years after leaving college he was engaged with Dr. Anthon on his series of classical text-books, etc. Besides several pamphlets and school-books, his contributions to classical learning are an enlarged edition of Liddell and Scott's translation of Passow's "Greek Lexicon" (1846), and a revised and

greatly enlarged edition of Yonge's "English-Greek Lexicon" (1870).

Dri'ver, also called the **Spanker,** in navigation, is a large quadrilateral sail hoisted on the mizzen gaff, and extended at the bottom by a boom called the *driver-boom*. It is the principal "fore-and-aft" sail, and is very important in an adverse wind.

Dri'ving Wheel. In machinery, this term is applied to the wheel which communicates the motion to the pinion, or the second wheel deriving its motion from the first, which may be either a multiplying or diminishing wheel. The large wheels of locomotive engines are also called driving wheels.

Drogh'eda, a seaport-town of Ireland, in Leinster, on the boundary between the counties of Louth and Meath, and on the river Boyne, 4 miles from its entrance into the sea, and 25 miles N. of Dublin; lat. 53° 44′ N., lon. 6° 12′ W. The Dublin and Belfast Railway here crosses the Boyne by a viaduct ninety-five feet high. It has a Roman Catholic cathedral, a custom-house, and several convents; also manufactures of cotton and linen fabrics, steam-engines, etc. Vessels of 400 tons can ascend the river to this port, from which grain, cattle, linen, hides, butter, and ale are exported, mostly to Liverpool. Pop. in 1871, 16,135.

Drogheda, Marquesses of (1791), earls of Drogheda (1661), Viscounts Moore (1621), Barons Moore (Ireland, 1616), Barons Moore of Moore Place, Kent (United Kingdom, 1801).—Henry Francis Seymour Moore, third marquess, K. P., P. C., born Aug. 14, 1825, succeeded his uncle in 1837.

Drohobicz, a town of Austria, in Galicia, is on a tributary of the Dneister, 18 miles S. E. of Sambor. It has a castle, two handsome churches, a monastery, and extensive salt-works. Pop. in 1869, 16,884.

Droit'wich (anc. *Salinæ*), a town of England, in Worcestershire, on the Bristol and Birmingham Railway, 7 miles N. N. E. of Worcester. It derives its prosperity chiefly from its trade in salt, for which it has been famous from remote times. Here are brine-springs rising from a depth of 200 feet through new red sandstone, and yielding annually about 100,000 tons of salt, said to be the best in Europe. Pop. in 1871, 3504.

Drôme, a department in the S. E. part of France, has an area of 2519 square miles. It is bounded on the W. by the river Rhone, and drained by the Drôme. The surface is partly hilly and mountainous. Coal, copper, iron, lead, and marble are found here. The highlands are covered with forests of oak, pine, beech, and chestnut. Among the staple productions are grapes, olives, chestnuts, silk, and wine of excellent quality. The wine called L'Hermitage is celebrated. Drôme is intersected by the Lyons and Avignon Railway. Capital, Valence. Pop. in 1872, 320,417.

Drom'edary [from the Gr. δρόμος, a "running," so named from its swiftness], (*Camelus dromedarius*), the name given to the Arabian and African camel, a species differing from the Bactrian camel in having only one hump on the back. It has also more slenderness and symmetry of form. Its usual pace is a trot, which it often maintains for many hours together at the rate of nine miles an hour. The dromedary surpasses other camels in speed, and can travel several days without drink. It is extensively used as a beast of burden in Africa and Arabia. (See Camel.)

Drontheim. See Trondhjem.

Dropping Tube, in chemistry, a slender tapering tube open at both ends, but terminating at the lower in a narrow orifice, used to supply liquids in delicate experiments, drop by drop. A bulb to hold the liquid is blown near the upper extremity. The flow is regulated by placing the finger on the open upper end, so as partially or entirely to close it.

Drop'sy [a corruption of the old English *hydropesy;* Gr. ὕδρωψ, from ὕδωρ, "water;" Lat. *hydropisis;* Fr. *hydropisie;* Ger. *Wassersucht* (*i. e.* "water-sickness")], a disease characterized by excess of the natural secretion of fluid in any of the serous cavities of the body or in the areolar tissue. If the cerebro-spinal fluid be increased, it constitutes *hydrocephalus*, or "water on the brain." If the excessive secretion (exudation) takes place from the pleura, it is called *hydrothorax*, or "dropsy of the chest." If the fluid collect in the abdominal cavity, the disease is called *ascites* (from the Gr. ἀσκός, a "skin" or leathern bag for water or wine, alluding to the form of the patient's body), a disease which may arise without assignable cause, but which most frequently comes from cirrhosis of the liver, a contracted, hardened condition of that organ, mechanically obstructing the portal circulation, and thus leading to transudation of serum from the blood-vessels. Habitual intemperance is its most frequent cause. General dropsy of the serous and areolar tissues is called *anasarca* (from the Gr. ἀνά, "throughout," and σάρξ (gen. σαρκός), the "flesh"). Obstructive organic disease of the heart and degenerative diseases of the kidneys are the most frequent causes of general dropsy, which is therefore a very important symptom. *Hydropericardium*, or "water on the heart," *hydrarthrus*, or effusion into a joint, *hydrorachis*, which is seated in the spinal canal, and *hydrocele*, in the scrotum, are forms of dropsy. Ovarian dropsy or ovarian tumor is a fluid collection occurring in ovarian cysts, which may be unilocular (of one sac) or multilocular (composed of many aggregated cysts), the whole frequently forming a mass of enormous size. Thus far, its only successful treatment consists in the removal of the cysts by excision, one of the boldest, and, on the whole, one of the best, of the more recent surgical operations.

Revised by Willard Parker.

Dros'era [from the Gr. δροσερός, "dewy"], a genus of perennial herbaceous plants of the order Droseraceæ, popularly called sun-dew, several species of which are natives of the U. S. and of England. From the glands of the leaves exude drops of a clear fluid glittering like dewdrops; hence the name. The flower opens only in sunshine.

Drosera'ceæ [from *Drosera*, one of the genera], a natural order of herbaceous exogenous plants which grow in bogs or marshy places in many parts of the world. They mostly have glandular hairs, and hypogynous, pentamerous flowers. The fruit is a 1-celled pod or capsule. This order comprises the Venus's flytrap (see Dionæa) and the *Drosera* (sun-dew), several species of which are natives of the U. S.

Drosom'eter [Gr. δρόσος, "dew," and μέτρον, "measure"], an instrument for measuring the quantity of dew which falls upon the surface of an exposed body. It is in the form of a balance; the body under observation is supported by one arm, while the weights are placed in a scale-pan attached to the other, and protected from the dew.

Dros'sen, a town of Prussia, in the province of Brandenburg, has a normal school, tanneries, cloth-factories, and important cattle-markets. Pop. in 1871, 5231.

Dros'te zu Visch'ering, von (Clemens August), Freiherr, a German archbishop, born Jan. 22, 1773, became vicar-general in 1805, assistant bishop of the diocese of Münster in 1825, and archbishop of Cologne in 1835. In consequence of difficulties with the Prussian government in regard to mixed marriages, which the archbishop forbade the priests to solemnize unless they received the promise that all the children would be brought up in the Catholic religion, he was imprisoned in the fortress Minden in 1837, but was released in 1841, and died Oct. 19, 1845. His imprisonment called forth an extraordinary excitement in Germany, and greatly strengthened the influence of the Catholic Church.

Drouyn de Lhuys (Édouard), a French diplomatist, born at Paris Nov. 19, 1805. He was appointed director of the commercial bureau in the ministry of foreign affairs in 1840. Having voted in the Chamber of Deputies against the ministry, he was removed from office in 1845. He was minister of foreign affairs in the first cabinet of Louis Napoleon in 1848, was sent as minister to London in 1849, and was a conservative member of the National Assembly in 1851. He was appointed minister of foreign affairs in July, 1852, resigned in 1855, and was restored to that position in Oct., 1862. He again resigned office in 1866.

Drown'ing, death by long-continued submersion in water. The recovery of persons after apparent death from drowning is a very important subject. The following rules are derived from the experience of the best physicians: (1) It is necessary in all cases to keep the body cool until respiration be re-established, since the application of warmth (both in frozen and nearly drowned persons) seems to arouse those dormant energies that absolutely require the aëration of the blood, which failing, death ensues. (2) Respiration must be artificially established, either by direct inflation of the lungs by the breath or the bellows, or, much better, by the "Marshall Hall method" or some of its modifications. The patient being in a horizontal position to facilitate the exit of water from the lungs, and the head being slightly raised, the lungs are alternately inflated and compressed by gently rolling the body from a prone to a half-prone position (upon one side), and reversing the process. The lungs may also be inflated by retracting the arms with some force, and by pressure upon the thorax. (3) Expose the face and chest to the air, unless the weather be very cold. (4) Rub the limbs upward, and as soon as dry clothing can be procured put it upon the patient. (5) Avoid the use of the galvanic battery, which is always dangerous, even in experienced hands. (6) Continue these operations until, if possible, natural respiration be re-established. Cases are reported where artificial respiration had to be kept up

for hours before signs of life appeared. Similar treatment should be employed in all cases of so-called "asphyxia" from whatever cause. (See RESUSCITATION.)

REVISED BY WILLARD PARKER.

DROWNING, as a capital punishment, was formerly practised in various parts of the Old World. In the Anglo-Saxon codes women convicted of theft were condemned to be drowned. The ancient Burgundians condemned a faithless wife to be smothered in mud. This form of punishment was common in the Middle Ages, and seems to have been principally inflicted upon women. It was not abolished in Scotland till 1685, and in Austria it lasted till 1776.

Droyls'den, a village of England, in Lancashire, on the Lancashire and Yorkshire Railway, 4 miles E. of Manchester. It has extensive manufactures of cotton and several dye-works. It has increased rapidly in recent times. Pop. 5980.

Droy'sen (JOHANN GUSTAV), a German historian, born at Trepton July 6, 1808. He became in 1833 lecturer on history in the University of Berlin, in 1840 professor at Kiel, in 1851 at Jena, and in 1859 at Berlin. He published, besides other works, a "History of Alexander the Great" (1833), a "History of Hellenism" (2 vols., 1836–43), a "Life of Field-marshal Count Tork von Wartenburg" (4th ed. 1863), and an "Outline of the Science of History" (3d ed. 1869). His "History of Prussian Politics" (vol. i.–iv., 1855–70) is called his most important work.

Droz (FRANÇOIS XAVIER JOSEPH), a French author and moralist, born at Besançon Oct. 31, 1773. He produced in 1806 an "Essay on Happiness," and gained the Montyon prize in 1824 for his treatise "On Moral Philosophy." His reputation is founded chiefly on his "History of the Reign of Louis XVI." (3 vols., 1839–42). Died Nov. 4, 1850.

Druey (CHARLES), a Swiss politician, born in 1799, was a leader of the liberal party. He was president of the provisional government formed in 1845, and was an opponent of the Sonderbund. He promoted the adoption of the new constitution in 1848, and was president of the federal council in 1850. Died Mar. 29, 1855.

Drug [Fr. *drogue;* It. *droga*], any substance used in the preparation of medicine. In commerce, the term includes also dyestuffs, chemicals, varnishes, etc.

Drug'get, a coarse woollen fabric used for covering carpets or as a substitute for carpets. It was formerly used for clothing by the women of the lower classes.

Dru'ids [Gr. δρυΐδαι; Lat. *druidæ,* thought by some to be derived from the Celtic *deru;* Gr. δρῦς, an "oak," a tree which they revered, but perhaps from the Celtic *de-rouyd,* "God's speaker"], the priests of the ancient Celtic religion. In Cæsar's time they formed an exclusive class, which shared with the nobility and the knights the rule over the people, and were free from taxes and from military service. They presided at the sacrifices, instructed the youth, and guarded the secret doctrines of religion. They acted as judges in the difficulties between different tribes, and exercised the art of prophecy and of sacred minstrelsy. They were also skilled in medicine, in astrology, the division of time, and other branches of knowledge, which were kept secret from the masses of the people. They practised the sacrifice of human beings, recognized a ruling destiny and the immortality of the soul, and reverenced the oak and mistletoe as sacred. Their political importance ceased on the subjection of Gaul to the Romans, and their religious service was abolished by a decree of the emperor Claudius. There were also druidesses of several ranks. Of the druidical doctrines little is known.

Druids, Orders of. In London in 1781 a club of "Druids" was founded for mutual entertainment. The society thus begun gradually extended, forming an organization for reciprocal assistance in cases of sickness or death. A system of ceremonies was adopted similar to that of the Freemasons, but professedly based on traditions handed down from the ancient Druids. As the society extended, many changes were introduced, and the original organization in course of time was divided into a great number of independent "Orders of Druids." The oldest branch of the society holds its sessions in London. Another branch, calling itself the "Order of Druids in England," is very numerous in that country; in 1870 it numbered 1022 lodges, with 52,946 members. The whole number of members belonging to the different orders in Great Britain, Australia, and the U. S. is estimated at above 100,000. The first lodge in the U. S. was founded in New York in 1833. The society continued to extend, and at length arose the "Grand Grove of the U. S. of the United Ancient Order of the Druids," under whose auspices there had been established in 1870, 149 "groves," numbering in all about 15,000 members. Of latter time different degrees have been instituted. In America, besides the degree conferred at the first entrance, there are five others. Degrees have also been instituted in England, but they are different from those used in the U. S. Though of purely English origin, the German element in the orders of Druids has of late obtained a decided preponderance in the U. S., so that nearly if not quite two-thirds of the "groves" conduct their proceedings in the German language.

Drum [Fr. *tambour;* Ger. *Trommel*], a martial musical instrument, is a hollow cylinder of wood or metal having skin or parchment stretched across one or both ends, on which the drummer beats with a wooden stick called a *drum-stick.* The military drum is used to give various signals, as well as for music. There are three kinds of drums—the *side* drum, the big or *bass* drum, and the *kettle* drum. The first of these is suspended at the side of the drummer, who beats on one end of it only. Strings of catgut, called *snares,* are stretched across the other end; hence it is often called a *snare* drum. The bass drum is beaten on both ends. The kettle drum is of hemispherical form, and has but one head or parchment. It was formerly used in martial music, but is now confined to the orchestra.

DRUM, in architecture, the upright part of a cupola above or below a dome. The term is generally applied to the lower part. The solid part or vase of a Corinthian or Composite capital beneath the acanthus leaves is called a drum. The term drum is applied in machinery to a hollow cylinder fixed upon a shaft for the purpose of driving another cylinder by a band.

DRUM, the name given in the eighteenth century to a crowded fashionable assembly, so styled, says Smollett, "from the noise and emptiness of the entertainment." A large assembly of the kind was called a "drum-major."

Drum (SIMON H.), an American officer, born in 1807 in Pennsylvania, graduated at West Point in 1830, and Aug. 18, 1846, captain Fourth Artillery. He served at the Military Academy as assistant instructor 1830–32; on Black Hawk expedition 1832; chiefly at sea-board posts 1833–36; in Florida war 1836–37 and 1838–39; removing Cherokees to the West 1838; suppressing Canada border disturbances 1839–41; as assistant quartermaster 1846; in the military occupation of Texas 1846; and in the war with Mexico 1846–47, engaged at Vera Cruz, Cerro Gordo, Contreras (recaptured Capt. O'Brien's guns lost without dishonor at Buena Vista), Molino del Rey, Chapultepec, and assault of the city of Mexico, where, after entering the Belen Gate, and while directing the fire of a captured 9-pounder (added to the battery commanded by him) with consummate skill, indomitable energy, and most conspicuous gallantry, he was killed Sept. 13, 1847, aged forty.

GEORGE W. CULLUM, *U. S. Army.*

Dru'mann (KARL WILHELM), a German historian, born near Halberstadt June 11, 1786. He obtained the chair of philology at Königsberg in 1817. His most important work is a "History of Rome" (6 vols., 1834–44), which is highly esteemed. Died July 29, 1861.

Drum'fish (*Pogonias chromis*), a marine fish of the U. S. coasts, found as far S. as Florida. It derives its name from the peculiar sound it emits, somewhat resembling the beat of a drum. It produces this sound after it is caught as well as when in the water. It is caught in great numbers on the south shore of Long Island, and when young is delicate eating. It sometimes reaches eighty pounds in weight. The *Pogonias fasciatus* of the American Atlantic coasts emits the same sounds. These fishes are of the family Scienidæ, many members of which can produce remarkable sounds.

Drum'mer, a person who beats on a drum. Each company of U. S. infantry has one fifer and one drummer, who rank as privates. They execute signals, perform at parades, drills, and reviews, and attend the wounded on the battle-field. The drummers and fifers collectively constitute the regimental music or drum-corps, and are under a principal musician, sometimes called a drum-major.

Drum'mond, a county of Canada, in Quebec, has an area of about 600 square miles. It is intersected by the river St. Francis. Capital, Drummondville. Pop. in 1871, 14,281.

Drummond (THOMAS), CAPTAIN R. E., a Scottish engineer, was born in Edinburgh in Oct., 1797. He was well versed in mathematics and skilful in mechanics. He was one of the royal military engineers employed in the trigonometrical survey of Scotland. In 1825, while engaged in this operation, he made successful experiments with incandescent lime to render distant objects visible. (See DRUMMOND LIGHT.) He was appointed under-secretary for Ireland in 1835. Died April 15, 1840.

Drummond (WILLIAM) **of Hawthornden,** a Scottish poet, born of a noble family, Dec. 13, 1585, was liberally educated. He studied law in France, from which he re-

turned in 1609. He resided on his beautiful paternal estate of Hawthornden, where he passed his life in retirement and in literary pursuits. He married Elizabeth Logan about 1630. In 1619, Ben Jonson travelled several hundred miles in order to visit Drummond, who wrote "Notes of Ben Jonson's Conversation" on this occasion. These notes are among his most interesting productions. He was author of sonnets, and a poem called "The River Forth Feasting." Died Dec. 4, 1649.

Drummond Grove, a township of Ford co., Ill. P. 568.

Drummond Island, in Lake Huron, is the most western of the Manitoulin Islands, and belongs to Michigan. It is 20 miles long and 10 miles wide.

Drummond Light [named from Thomas Drummond, its inventor], also called **Lime Light, Calcium Light,** etc., an intense light produced by throwing the oxyhydrogen blowpipe flame upon a pencil of lime, which is thereby raised to very vivid incandescence. If magnesia or metallic magnesium be used instead of lime, the light is very rich in actinic rays, and hence is useful in photography. Zirconia is often employed instead of lime, on account of its non-volatility.

Drum'mondville East, a post-village, capital of Drummond co., Quebec (Canada), in Grantham township, and on the St. Francis River, 24 miles from Melbourne. Pop. about 400.

Drummondville West, a post-village of Stanford township, Welland co., Ontario (Canada), half a mile from Niagara Falls, has two observatories, each 74 feet high, which afford a fine view of the Falls and the surrounding region. Pop. about 1000.

Dru'more, a township of Lancaster co., Pa., on the E. shore of the Susquehanna. Pop. 3061.

Drunkenness. See DIPSOMANIA and INTEMPERANCE.

Drupa'ceæ [from DRUPE, which see], a natural order of plants, regarded by most botanists as a sub-order of the Rosaceæ. It is characterized by polypetalous regular flowers, a solitary carpel, the style of which proceeds from the apex, and a drupaceous fruit. The peach, apricot, plum, and cherry are examples.

Drupe [Lat. *drupa*; Gr. δρύπτα (from δρυπετής, "overripe," "ready to fall from the tree")], in botany, a 1-celled, superior indehiscent fruit, having a single seed or kernel, usually enclosed in a hard and bony *endocarp* called a stone, as a peach or a plum. The outer part of the fruit, which is succulent or fleshy, is called the *sarcocarp* or *mesocarp*. The term *putamen* is applied to the hard, stony substance which encloses the kernel.

Dru'ry, a post-township of Rock Island co., Ill. P. 1331.

Dru'ses, written also **Druzes** and **Droozes** [from *El Dorazy*, a Persian and minister of state to El Hakem, sixth Fatimite caliph in Egypt; Ger. *Drusen*], a people of mixed race (largely Persian and Arab), almost limited to the Lebanon, Wady-el-Teim, and the Hauran, speaking the Arabic language, and professing a religion of which until quite recently almost nothing was known. They number, some say, nearly 100,000; others say, only about 50,000. They are industrious, hospitable, and very proud of their birth and pedigree. Their chief business is the production and manufacture of silk. For about 800 years they have maintained a distinct religion and an independent nationality. El Dorazy, who was the first to assert the divinity of El Hakem, is now repudiated by the Druses, who honor Hamzeh-ibn-Ahmed, another Persian, as the real founder of their religion, which dates from the early part of the eleventh century. They emphasize the unity of God, successive manifestations of God, and the transmigration of souls. A terribly bloody war between them and the Maronites led, in 1860, to European intervention on behalf of the Christians. (See MARONITES. See also the EARL OF CARNARVON'S "Druses of the Lebanon," 1860; REV. JOHN WORTABET, "Researches into the Religions of Syria," 1860.)

Dru'sus (CLAUDIUS NERO), a Roman general, born in 38 B. C., was a younger brother of the emperor Tiberius. His mother Livia was a wife of the emperor Augustus. He married Antonia, a daughter of Mark Antony. In 13 B. C. he defeated the Germans near the Rhine. Having conquered the Sicambri and Frisii, he extended the Roman empire to the German Ocean and to the river Elbe. For these victories he received the surname of GERMANICUS. He died in 9 B. C., leaving two sons, Germanicus and Claudius, the latter of whom became emperor.

Drusus (MARCUS LIVIUS), a Roman orator and politician, who became tribune of the people in 122 B. C. as a colleague of Caius Gracchus. He supported the cause of the senate and optimates, opposed the policy of Gracchus, and gained popularity by planting colonies. He was elected consul for 112 B. C.

Drusus (MARCUS LIVIUS), called DRUSUS JUNIOR, was a son of the preceding and an uncle of Cato Uticensis. He is said to have been ambitious, proud, and arrogant, and a champion of the senate or aristocratic party. Having been chosen tribune of the people for 91 B. C., he courted the popular favor by passing an agrarian law. He formed a design to admit the Italiotes to the right of citizenship. His official conduct was condemned by the senate. He died in 91 B. C.

Dry'ad [Gr. δρυάς, plu. δρυάδες (from δρῦς, an "oak" or any tree); Lat. *dryades*]. In Greek mythology, the dryads were nymphs or goddesses supposed to preside over woods and groves.

Dry Bank Light, on the Florida Reef, stands on Sombrero Shoal, near Dry Bank, Coffin's Patches, and Sombrero Key, in lat. 24° 37′ 36″ N., lon. 81° 6′ 43″ W. It is an open framework of iron 149 feet high, with a fixed white dioptric light of the first class.

Dry Creek, a township of Blount co., Ala. Pop. 442.

Dry Creek, a township of Sacramento co., Cal. P. 603.

Dry Creek, a township of Howell co., Mo. Pop. 177.

Dry Creek, a township of Maries co., Mo. Pop. 422.

Dry'den, a post-township of Lapeer co., Mich. Pop. 1695.

Dryden, a township of Sibley co., Minn. Pop. 443.

Dryden, a township and post-village of Tompkins co., N. Y., on the Southern Central R. R., 32 miles N. of Owego. It has one weekly newspaper, one large woollen-factory, a tannery, a graded school, and a magnetic spring. Here is the Dryden Spring Place, a resort for invalids. Total pop. 4818; of village, 672. W. E. ORUM, PUB. "HERALD."

Dryden (JOHN), an eminent English poet, born at Aldwinckle, Northamptonshire, on the 9th of Aug., 1631, was a grandson of Sir Erasmus Driden, created a baronet in 1619. He was a pupil of Dr. Busby, and entered Trinity College, Cambridge, in 1650. Having graduated as master of arts in 1657, he became a resident of London. He wrote "Heroic Stanzas on the Death of Cromwell" (1658), and celebrated the restoration of Charles II. in 1660 by a poem entitled "Astræa Redux." His first drama was the "Wild Gallant" (1662). He married Lady Howard, a daughter of the earl of Berkshire, in 1663, and produced in 1667 a poem called "Annus Mirabilis, or Year of Wonders." In 1668 he was appointed poet-laureate, with a salary of £200 annually. He afterwards wrote numerous comedies and tragedies, among which are "Marriage à la Mode," "All for Love" (1678), and "Aurungzebe." His political and poetical satire of "Absalom and Achitophel" (1681) is a very famous and brilliant production directed against the party of which Lord Shaftesbury and the dukes of Buckingham and Monmouth were the leaders. He announced his conversion to the Roman Catholic religion by his allegorical poem called "The Hind and the Panther" (1687). He produced in 1696 a metrical translation of Virgil, which Pope commended as "the most noble and spirited translation I know in any language." It is, however, deficient in fidelity. Among his other works are an excellent prose "Essay on Dramatic Poesy" (1660) and an "Ode for Saint Cecilia's Day." He died May 1, 1700, and was buried in Westminster Abbey. His later works exhibit a purer taste and a more natural style than his dramas.

Dry Dock. See DOCKS, by S. H. SHREVE, C. E.

Dry Fork, a township of Randolph co., West Va. Pop. 659.

Dry Grove, a township of McLean co., Ill. Pop. 1267.

Drying Machine, a term applied to various inventions for extracting the moisture from fabrics. A machine most commonly used by dyers and large laundry establishments, called an "extractor," consists of two cylinders, one within the other. The inner one is the receptacle for the goods, and is made to revolve with great rapidity, expelling the water through perforations made in the sides. The outer cylinder receives the water, and from thence it is carried off by means of a pipe. By this process the drying is not quite complete, but what remains is expelled by drying in a hot chamber or in the open air. A more simple drying machine for domestic use is constructed of two wooden or India-rubber rollers mounted one above the other. They are parallel, and arranged in such a manner that the distance between them can be varied at will. The end of the goods being inserted between the rollers, one is turned by a handle, causing both to revolve and the clothes to pass between, thus extracting the moisture by pressure.

Drying Oil, the name given to linseed and several other seed-oils used in painting, and which have the property of drying quickly. The process of drying is hastened by heating the oil with oxide of lead.

Dryobalanops. See CAMPHOR.

Dry'ophis [from δρῦς, a "tree," an "oak," and ὄφις, a "serpent"], a genus of snakes belonging to the Colubridæ, are natives of tropical America and the East Indies. Like the *Dendrophis*, to which they are allied, they have elongated forms and live on trees.

Dry Pile, a kind of voltaic pile or battery, constructed without liquids, and furnishing a feeble electric current. The dry piles of Zamboni and De Luc consist of disks of copper and zinc papers placed in pairs back to back and piled up or packed in glass tubes, with the copper surfaces all in the same direction.

Dry Point, a sharp etching-needle used by engravers to incise fine lines in a copper plate which is not covered with etching-ground. No acid is applied to eat the lines made by the dry point, which produces very delicate work.

Dry Point, a township of Shelby co., Ill. Pop. 1671.

Dry Process. See PHOTOGRAPHY, by PROF. C. F. CHANDLER, PH. D., LL.D.

Dry Rot, called also **Sap Rot,** is a diseased state incident to timber, which reduces its substance to a mass of dry dust by decomposing the fibres. It is caused by various species of fungi, among which are *Merulius lachrymans* and *Polyporus destructor*. In the navy-yards of Great Britain great ravages have been ascribed to some species of *Sporotrichum*. The ends of the timber are generally affected by this disease, and the decay often makes great progress without being suspected. The chief causes of dry rot are stagnation of air, as under the floor of a building or behind a wainscot, and imperfect drying of the timber. That which is well seasoned will resist the fungi for many centuries, as is shown by wood brought from the frieze of the Parthenon, which had been placed there more than 2300 years ago. Various substances have been used for the prevention of dry rot, one of the most successful of which is a solution of corrosive sublimate introduced into the pores of the wood by an air-pump.

Dry'-stove, a glazed structure designed for the protection of the plants of dry, arid climates; a hot-house in which the air is kept less moist than in the bark stove. It is particularly adapted to succulent plants. The temperature should be higher than that of a green-house.

Dry Tortu'gas [Sp. *tortuga*, a "tortoise"], a group of ten small, low, barren islands belonging to Monroe co., Fla., situated over 40 miles W. of the most western of the Florida Keys proper. On the south-westernmost island, called Loggerhead Key, stands a brick lighthouse 150 feet high, with a fixed white dioptric light of the first order; lat. 24° 38′ 5″ N., lon. 82° 52′ 53″ W. There is also a smaller light for Dry Tortugas Harbor (lat. 24° 37′ 47″ N., lon. 82° 52′ 53″ W.). This lighthouse stands inside Fort Jefferson, an important fortification on Garden Key. The Dry Tortugas served as a place of imprisonment for persons under sentence by courts-martial during the late civil war. Several criminals concerned in the conspiracy in which President Lincoln was murdered were confined here.

Dry'town, a post-township of Amador co., Cal. P. 853.

Dry'wood, a township of Bourbon co., Kan. P. 1199.

Drywood, a post-township of Vernon co., Mo. P. 475.

Du'alin [so called because it is a mixture of two different substances], an explosive compound introduced in 1868 by Dittmar, is composed of NITRO-GLYCERINE (which see) mixed with saw-dust, or wood-pulp such as is used in paper-mills; the latter being first treated with nitric and sulphuric acids. The object of the mixture is to diminish the danger connected with the storage and transportation of nitro-glycerine. (See EXPLOSIVES, by GEN. H. L. ABBOT, U. S. Army.)

Du'alism [from the Lat. *dualis*, "containing two"], in metaphysics, the doctrine that the universe exists by the concurrence of two principles, the spiritual and the material, each necessarily independent and eternal. The "dualism" of Zoroaster belongs rather to religion than to philosophy. It assumed two independent principles—one good, the other evil—through the collision of which was explained the disorder, moral and physical, of the world. The Gnostics in the second century adopted these views in a greater or less degree. The Greek philosophers are called dualists, inasmuch as the most of them held to the belief that matter and spirit were each self-existent and independent in origin. Their statements of the doctrine differ from each other, and are vague and indistinct. But the Stoical doctrine of a soul of the world, contradistinguished from matter without qualities (ἄποιος ὕλη), represents the general drift of the Greek thought. The prevailing mode of thought among Christian theists recognizes the real being of mind and matter in the constitution of man and the order of the universe, while it attributes self-existence and creative power solely to the Supreme Mind. In connection with theories of perception the term Dualism has been used to denote the soul and the modes of matter in relation and opposition while the mind is in the act of acquiring knowledge of the external world. (See HAMILTON'S ed. of Reid, p. 817.) REVISED BY M. B. ANDERSON.

Duality, Principle of (in math.). See POLAR.

Du'al Num'ber, in grammar, is that form of the noun, adjective, or verb denoting in some languages the number two. For example, in the ancient Greek there were three numbers in grammar, the singular, the dual, and the plural; but the dual was not very often used, and is never found in Æolic or in Hellenistic Greek. It occurred most frequently in the Attic dialect.

Duane, a post-township of Franklin co., N. Y. It has beds of magnetic iron ore. Pop. 234.

Duane, du-ān′ (JAMES), a mayor of New York, was born in that city Feb. 6, 1733. He became a lawyer and a leading revolutionist in the war of Independence, was a member of Congress (1774–77 and 1780–82), was the first mayor of New York in 1784, and U. S. district judge (1789–94). Died at Duanesburg, his patrimonial estate, Feb. 1, 1797.

Duane (JAMES C.), an American officer, born in 1824 in New York, graduated at West Point in 1848, and Mar. 7, 1867, lieutenant-colonel of engineers. He served at the Military Academy with engineer troops and as assistant instructor 1848–54; in the construction of fortifications 1849–56; as lighthouse engineer 1856–58; on Utah expedition 1858; at the Military Academy as instructor of practical engineering, etc., 1858–61. In the civil war he served in defence of Fort Pickens, Fla., 1861; in the defences of Washington, organizing engineer troops and equipage, 1861–62; in the Virginia Peninsula 1862, engaged in command of engineer battalion at Yorktown, Gaines's Mill, and construction of field-works, roads, and bridges; in the Maryland campaign as chief engineer of the Army of the Potomac 1862, engaged at South Mountain, Antietam, and several skirmishes; as chief engineer of the department of the South 1862–63, engaged in the attack on Fort McAllister, Ga., and operations against Charleston, S. C.; as chief engineer of the Army of the Potomac 1863–65, engaged at Manassas Gap, Rappahannock Station, Robertson's Tavern, Wilderness, Spottsylvania, Cold Harbor, Petersburg, Hatcher's Run, and Appomattox Court-house. (Brevet lieutenant-colonel and colonel for meritorious and faithful services in the Richmond campaign, and brigadier-general for gallant and meritorious services in the siege of Petersburg and subsequent operations.) He has served since in the construction of the defences of the eastern entrance to New York harbor 1865–68; member of engineer boards 1867–73; and is now lighthouse engineer of the N. E. Atlantic coast and superintendent of the fortifications in Maine and New Hampshire. Author of "A Manual for Engineer Troops," 1862.

GEORGE W. CULLUM, *U. S. Army.*

Duane (WILLIAM), an American politician and printer, was born near Lake Champlain, N. Y., in 1760. He passed some years in India and in England, from which he returned to the U. S. in 1795. He then became the editor of the "Aurora," which was published at Philadelphia, and was the influential organ of the Democratic party. He served in the war of 1812 as adjutant-general with the rank of colonel, and published a "Military Dictionary" (1810), besides numerous other works, chiefly upon military subjects. Died Nov. 25, 1835.

Duane (WILLIAM JOHN), an able lawyer and statesman, born at Clonmel, Ireland, in 1780, was a son of the preceding. He practised law in Philadelphia, and published, besides other works, "The Law of Nations Investigated in a Popular Manner" (1809). He was appointed secretary of the treasury of the U. S. early in 1833, but was dismissed from office in September of that year by President Jackson, because he refused to remove the deposits of public money from the Bank of the U. S. Died Sept. 27, 1865.

Duanesburg, a township and post-village of Schenectady co., N. Y., on the Albany and Susquehanna R. R., 24 miles N. W. of Albany. A branch railroad extends to Schenectady. Pop. 3042.

Duban (JACQUES FÉLIX), a French architect, born in Paris Oct. 14, 1797. He completed the Palace of the Fine Arts, and became a member of the Institute and commander of the Legion of Honor (1868).

Dubhoy′, a town of the East Indies, in the dominion of the Guicowar, 38 miles N. E. of Baroach. It was once strongly fortified. It contains handsome gates and a splendid temple. In the last century it had 40,000 inhabitants.

Dubic'za, a fortified town of European Turkey, is on

the northern frontier of Bosnia, and on the river Unna about 10 miles from its entrance into the Save, and 23 miles W. of Gradiska. Pop. 6000. On the opposite bank of the Unna is Austrian Dubicza, which is a fortified town.

Dub'lin, a county of Ireland in Leinster, has an area of 354 square miles. It is bounded on the E. by the Irish Sea, and is intersected by the river Liffey, which flows into Dublin Bay. The surface is nearly level; the soil is productive and well cultivated. Granite, copper, lead, and carboniferous limestone occur here. Chief town, Dublin. Pop. in 1871, 405,625.

Dublin [said to be derived from the Irish *dubh-linn*, *i. e.* "black pool;" anc. *Eblana*], the capital of Ireland, is in the above county, on the river Liffey at its entrance into Dublin Bay, 66 miles W. of Holyhead and 135 miles W. of Liverpool; lat. 53° 20′ 38″ N., lon. 6° 17′ 30″ W. Mean annual temperature, 49° F. The river, which runs eastward, divides the city into two nearly equal parts, which are connected by seven stone and two iron bridges. In the north-eastern and south-eastern parts are many beautiful squares, streets, and terraces, occupied by the aristocratic class. The mercantile business is mostly transacted in the central and north-western portions, where are many residences of the middle class. The city is surrounded by the Circular Road, nearly 9 miles long, which is a favorite drive and promenade of the citizens. The most imposing street of Dublin is Sackville street, which is 120 feet wide and nearly 700 yards long. Among the numerous squares is Stephen's Green, having an area of nearly twenty acres. The most remarkable public buildings are the Bank of Ireland (formerly the Parliament House), Trinity College, the custom-house, the Four Courts, Dublin Castle, occupied by the lord lieutenant, and St. George's church with a steeple 200 feet high. Near the N. end of Sackville street is a monument to Lord Nelson, which is 134 feet high. Among the literary and scientific institutions are the University (see DUBLIN, UNIVERSITY OF), the Royal College of Science, the Roman Catholic University, the College of Surgeons, the Royal Dublin Society, the Royal Irish Academy, the Hibernian Academy for Paintings, and the National Gallery. Dublin is the seat of a Protestant Episcopal and a Roman Catholic archbishop. In the environs of Dublin, which are remarkably beautiful, is Glasnevin, once the favorite residence of Addison, Steele, Swift, and Sheridan; and Phœnix Park, which contains nearly 2000 acres, and is frequented by great numbers of persons for recreation. The fine scenery of this noble park, the massive public buildings, the spacious squares, the clean granite quays which line the river, and the beauty of the bay which expands before the city, render Dublin one of the most beautiful and agreeable capitals of Europe. Railways extending in several directions connect this place with the chief towns of Ireland. It is the eastern terminus of the Grand and Royal Canals, and has a good harbor, which has been improved by the construction of two breakwaters. Vessels of 900 tons can come up to the wharves and docks. This city has several glass-works, foundries, and distilleries: also manufactures of poplin, which is much celebrated. Dublin returns two members to Parliament, besides two who represent the university. It is a very old town, and occupies the site of the *Eblana* of Ptolemy. It was captured by the Danes in the ninth century. Pop. in 1871, 246,326, of whom 195,180 were Roman Catholics, and 39,897 Protestant Episcopalians. REVISED BY A. J. SCHEM.

Dublin, a township of Dallas co., Ala. Pop. 707.

Dublin, a post-village, capital of Laurens co., Ga., is near the Oconee River, and 120 miles W. by N. from Savannah.

Dublin, a post-village of Wayne co., Ind., on the Pittsburg Cincinnati and St. Louis R. R., 17 miles W. of Richmond. Pop. 1076.

Dublin, a post-village and township of Harford co., Md. Pop. of village, 123; of township, 3862.

Dublin, a township of Somerset co., Md. Pop. 1454.

Dublin, a post-township of Cheshire co., N. H. P. 930.

Dublin, a township of Mercer co., O. Pop. 1599.

Dublin, a township of Fulton co., Pa. Pop. 879.

Dublin, a township of Huntingdon co., Pa. Pop. 984.

Dublin, a township and post-village of Pulaski co., Va., on the Atlantic Mississippi and Ohio R. R., 104 miles W. S. W. of Lynchburg. Total pop. 2722.

Dublin, University of, otherwise called **Trinity College, Dublin,** is said to have been founded in 1320, but having gone to decay, was re-established in 1593 by Queen Elizabeth. It was endowed by the corporation of Dublin and by private gifts, and still further by grants of James I., who in 1613 gave it representation in Parliament, which it still possesses, sending since 1832 two members to the House of Commons. Its government is modelled upon that of the English universities, but its fellows (since 1840) are at liberty to marry. It has a very full corps of professors in all departments of knowledge, who, like the fellows, are liberally supported from the income of the college. The students are of four classes: (1) Noblemen, baronets, and the sons of noblemen, who have peculiar privileges, and, with the exception of baronets, obtain the degree of B. A. without examination. They pay about $500 a year in fees. (2) Fellow-commoners, who dine with the fellows, and have one less examination than the third class, at about one-half the cost in fees of the preceding. (3) Pensioners, to which class most of the students belong. Their fees are little more than half as great as those of the second class. (4) Sizars, thirty in number, who pay a nominal fee. Each of the ranks wears a distinctive dress. The examination on entrance is thorough. It is possible to obtain degrees without great exertion, but the honors can be obtained only by severe study. No restriction is made with regard to the admission of those who are not members of the Anglican Church. The fees for graduation are much higher than in American colleges. Dublin University occupies a high rank among European institutions of learning. It has special departments for the study of medicine, divinity, and engineering. Among the eminent graduates were Berkeley, Ussher, Swift, Burke, Goldsmith, and Sheridan. An unsuccessful attempt made Mar. 11, 1873, in the British Parliament to unite the Catholic University, Magee College, Belfast, and the Queen's Colleges of Cork and Belfast to the University of Dublin, and to abolish the Queen's College at Galway, led to the temporary disruption of the Gladstone ministry.

Düb'ner (FRIEDRICH), a French philologist, born at Hörselgau, in Germany, Dec. 21, 1802. He was from 1826 to 1831 professor at the gymnasium of Gotha, and after 1831 lived in Paris, where he at first took an active part in Didot's new edition of the "Thesaurus" of Stephanus, and was subsequently one of the editors of the "Bibliotheca Græca" of the same publishers. Besides editions of a number of Latin and Greek classics, he published a Greek grammar (1855) and a French-Greek Lexicon (1860). Died Aug. 16, 1867.

Dubnit'za, a town of European Turkey, province of Room-Elee, on the river Djerma, 22 miles S. of Sophia. It has extensive iron-works. Pop. about 7000.

Dub'no, a town of Russia, in Volhynia, is on the small river Irwa, 32 miles W. of Ostrog. It has several Greek and Roman Catholic churches. The houses are mostly built of wood. Pop. 7628.

Dubois', a county in the S. W. of Indiana. Area, 420 square miles. It is intersected by the Patoka River, and partly bounded on the N. by the East Fork of White River. The surface is nearly level; the soil is fertile. Coal is found here. Tobacco, wool, cattle, and grain are raised. Capital, Jasper. Pop. 12,597.

Dubois (GUILLAUME), a French cardinal and prime minister, born at Brives-la-Gaillarde Sept. 6, 1656. He was preceptor to the duc de Chartres, who became duke of Orleans and regent of France in 1715. Having gained the favor of this prince by pandering to his vices, he was appointed a councillor of state. He exhibited much political cunning and talent for intrigue. Among his important diplomatic acts was the treaty between France, England, and Holland called the Triple Alliance (Jan., 1717). He became about 1718 minister of foreign affairs, and, though his morals were depraved, archbishop of Cambray in 1720. He was appointed prime minister in 1722, and retained power until he died, Aug. 10, 1723.

Dubois (JEAN ANTOINE), ABBÉ, a French missionary, born in Ardèche in 1765. He spent many years in India, and wrote in English a valuable work on "The Character, Manners, Customs, and Institutions of the People of India" (1816). Died in Paris Feb. 7, 1848.

Dubois (PAUL FRANÇOIS), a French politician, born June 2, 1795, at Rennes, became professor of rhetoric at the Lyceum Charlemagne in Paris in 1814. As one of the founders of the "Globe," he contested the restoration of the Bourbons. In 1840 he succeeded Cousin as director of the Normal School, and for many years took a prominent part in public instruction.

Du Bois-Reymond (EMIL), a German physiologist, born Nov. 7, 1818, succeeded in 1858 his teacher, Johannes Müller, as professor at the University of Berlin, and became a member of the Academy of Sciences, of which he has been secretary since 1867. He is regarded as one of the foremost writers on physiology, his chief work being "Researches on Animal Electricity" (1857).

Dubossa'ry, a town of Russia, in the government of

Kherson, on the Dniester, 85 miles N. E. of Odessa, has several factories. Pop. 5547.

Dubuat (The Chevalier), an eminent French experimentalist and writer on hydraulics. He may be said to have laid the foundations of hydro-dynamics, being the first who succeeded in ascribing to the different forces, friction, cohesion, etc., which act on fluids in a state of uniform motion, their effective share in determining their velocity. He was the first to ascertain and measure by striking and original observations (long neglected, but which have since claimed attention) the effect of the cohesion and inertia of the air in retarding the motions of the pendulum. His most important work is entitled "Principles d'Hydraulique et de Pyrodynamique," Paris, 1816; the latter subject being the action of heat upon matter in its different states of solid, fluid, and vapor. He was an officer of the "corps du génie" (engineers), in which he became a colonel—subsequently engineer in ordinary to the king.

Dubufe (Claude Marie), a French painter of history and portraits, was born in Paris in 1790. He was a fashionable portrait-painter. Died April 21, 1864.

Dubufe (Édouard), a portrait-painter, a son of the preceding, was born in Paris about 1818. He painted portraits of several eminent persons with success.

Dubuque, du-bŭk′, a county in the E. of Iowa. Area, 600 square miles. It is bounded on the N. E. by the Mississippi River. The surface is undulating; the soil is fertile. Cattle, grain, wool, hay, potatoes, and dairy-products are raised. Carriages, beer, clothing, and flour are among the chief articles of manufacture. Limestone occurs here as a surface-rock. This county has rich mines of lead. It is intersected by the Dubuque and Sioux City R. R. and other railroads. Capital, Dubuque. Pop. 38,969.

Dubuque, a city of Iowa, capital of the above county, occupying 13 square miles of plateau and bluff on the W. bank of the Mississippi River, 470 miles N. of St. Louis, 321 miles S. of St. Paul, and 199 miles W. of Chicago. It is the centre of a large and ever-widening railroad system, and during the season of navigation has two lines of steamers plying to St. Louis and St. Paul. It is distinguished for the excellence of its educational institutions. It is the seat of the Iowa Institute of Science and Arts, a widely known and very useful institution. Dubuque is opposite the point where the line between Wisconsin and Illinois reaches the Mississippi, and is in one of the richest lead-regions known. It was in 1870 the largest city in the State except Davenport. Dubuque is the terminus of a railroad which extends westward 327 miles to Sioux City. The Chicago Dubuque and Minnesota R. R. extends from this place to La Crescent in Minnesota. This city is also the north-eastern terminus of the Dubuque and Southwestern R. R. It is the chief dépôt of the lead region of Iowa, Illinois, and Wisconsin. It is the seat of a Roman Catholic bishop. It contains a large cathedral, a city-hall, a custom-house, three national banks, a German Presbyterian theological school, and an Episcopal seminary. It has large and increasing manufactures of shot, steam-engines, farming-implements, machinery, brick, white lead, leather, wooden ware, etc. Three daily and six weekly papers are published here. Dubuque is connected with Dunleith (Ill.) by a noble railway iron bridge, which is a "marvel of lightness and strength," and cost several millions of dollars. This bridge belongs to the Illinois Central R. R. This city was named in honor of Julien Dubuque, a French trader who, with ten others, settled here in 1788 to mine the ores of lead. This was the first settlement in what is now the State of Iowa. The settlement was abandoned after Dubuque's death in 1810, and the site was not again occupied till 1833. This last was the first permanent settlement in Iowa. It is the entrepôt of a very extensive trade, both by rail and river. Pop. in 1860, 13,000; in 1870, 18,434.

S. W. Russell, formerly Asso. Ed. of "Herald."

Du Cange (Charles du Fresne), a French historical writer, born at Amiens Dec. 18, 1610. He was liberally educated and studied law. Among his most important works are a "History of the Empire of Constantinople under the French Emperors" (1657), a "Glossarium ad Scriptores Mediæ et Infimæ Græcitatis" (2 vols. folio, 1688), and a "Glossarium ad Scriptores Mediæ et Infimæ Latinitatis" (3 vols. folio, 1678, enlarged to 6 vols. folio in 1733–36, and reissued with additions, in 7 vols. quarto, in 1840–50). He passed many years of his mature life in Paris, where he died Oct. 23, 1688.

Du′cas (Michael), [Gr. Μιχαὴλ ὁ Δοῦκας], a Byzantine historian who flourished about 1450, was related to the imperial family of Constantinople. He wrote a "History of the Decadence of the Byzantine Empire, 1355–1453." This work is a part of the collection called "Historia Byzantina." He retired to Lesbos when the Turks captured Constantinople in 1453. Died after 1463.

Duc′at [from the Lat. *dux* (gen. *ducis*), a "leader" or "duke," because it was first coined by Italian dukes; It. *ducato;* Sp. *ducado*], a name of a gold coin which originated in Italy, and was afterwards coined in several countries of Europe. In 1559 the ducat was adopted as a legal coin of the German empire. There was much difference in the value of the ducats which circulated in various countries. Those of Austria, Holland, and Hamburg contain about 52.8 grains of pure gold, and are nearly equivalent to two dollars of our coin. The Spanish silver ducat (*ducado*) is worth about one dollar. The ducat is said to have been first struck in the sixth century by Longinus, duke or *duca* of Ravenna, but Gibbon attributes its origin to the dukes of Milan.

Du Chaillu (Paul Belloni), a French traveller, born about 1830, the son of a French merchant in Equatorial Africa, was naturalized as a citizen of the U. S. He explored the Gaboon region, etc., and published, besides other works, "Explorations and Adventures in Equatorial Africa" (1861), "A Journey to Ashango Land" (1867), and "My Apingi Kingdom" (1871). He was one of the first travellers who described the gorilla.

Duchâtel (Charles Marie Tanguy), Comte, a French politician, born in Paris Feb. 19, 1803. He became a political friend of Guizot, and minister of finance in Sept., 1836. He resigned in April, 1837, and was minister of the interior from Oct., 1840, until Feb., 1848. Died Nov. 5, 1867.

Duchâtel (Pierre), [Lat. *Castellanus*], a liberal French prelate who was born in Burgundy about 1500. He became a thorough Greek scholar, assisted Erasmus, was a proof-reader at Bâle, studied at Rome, travelled in the East, was made bishop of Tulle by Francis I. (1539), bishop of Mâcon (1544), bishop of Orleans (1551), grand almoner of France (1547), and died at Orleans Feb. 2, 1552. He was a zealous advocate of the interests of the Gallican Church.

Duché (Jacob), D. D., an American Episcopal clergyman, born in Philadelphia in 1739. He gained distinction as an eloquent preacher, and was chosen chaplain to the first Continental Congress in 1774. He served as chaplain to several successive Congresses, but after the British occupied Philadelphia he abandoned the popular cause, and wrote to Washington a letter in which he urged him to submit and become a Tory. Duché soon fled to England, but he returned to Philadelphia in 1790. Died Jan. 3, 1798.

Duchesne (André), a learned French historian, born in Touraine in May, 1584. He became geographer and historiographer to the king. He wrote many valuable works, among which are "Ancient Historians of the Normans" ("Historiæ Normanorum Scriptores Antiqui," 1619) and "Contemporary Writers of the History of the Franks" (in Latin, 5 vols., 1636–41). Died May 30, 1640.

Duch′ess [Fr. *duchesse*], the title given to the wife of a duke or the female possessor of a duchy in her own right.

Duchobor′zi (*i. e.* "champions of the Spirit"), a sort of Quaker sect among the peasantry of Russia. They seceded from the Molokan sect in the eighteenth century, and are at present not very numerous. The sect was founded by one Ilarion Pobirochin, who taught the Trinity and the transmigration of souls, forbade his followers from serving in the army, and considered himself, it is said, to be the son of God. They were banished in consequence to the regions near the Sea of Azof. In 1839 they were banished to the Trans-Caucasus, where they are now chiefly found, though they probably still exist in small numbers in other parts of Russia.

Duchonquet, a township of Auglaize co., O. It contains the village of Wapakoneta (which see), the capital of the county. Pop. of township, 3959.

Du′cie, Earls of (United Kingdom, 1837), Barons Ducie (England, 1763), Barons Moreton (United Kingdom, 1837).—Henry John Reynolds Moreton, third earl. P. C., F. R. S., born July 26, 1827, was M. P. for Stroud 1852–53, and succeeded his father in 1853.

Duck [from the verb *duck*, to "dive;" Lat. *anas;* Ger. *Ente;* Fr. *canard*), a name applied to many swimming birds of the family Anatidæ, belonging to the old genus *Anas*, which is now divided into many smaller genera. The true ducks, or Anatinæ, frequent fresh water, feeding on both animal and vegetable matter. They are grega-

rious, and the males are larger and handsomer than the females. They are shot for food and for sport, and in Europe they are caught in great numbers by nets. The common domesticated duck is a descendant of the mallard (*Anas boschas*), which is found wild in Europe, Asia, and America. Eight genera of true ducks are found in North America, and several species are common to the Old and New Worlds. The sea-ducks (Fuligulininæ) differ from the foregoing in having a large flap or lobe under the hind toe. The eider-duck, the canvas-back, and the surf-duck are well-known examples of this sub-family. There are also tree-ducks, which approach the character of geese. The more important birds of this numerous group are described under their alphabetical heads.

The different breeds of domesticated ducks, with the probable exception of certain varieties in China and the neighboring countries, are all descended from the mallard, as above stated; but in domestication the ducks become polygamous, although they always live in pairs when wild. The male also ceases to care for his offspring; and even the females are sometimes not good mothers, so that it is always better to hatch ducks' eggs under a hen. The eggs, from their somewhat rank taste, are less prized than those of the hen; but the flesh of some breeds, such as the Aylesbury duck, is considered a great delicacy. Young ducks should be allowed free access to the water.

Duck [from the Dutch *doek*, "coarse linen cloth," "canvas," akin to the Ger. *Tuch*, "cloth"], a name given to a coarse, heavy linen fabric, highly glazed, which is used as a material for clothing by sailors, men employed in smelting-furnaces, and others. Duck is also a heavy cotton or linen fabric used for sailcloth, water-hose, etc.

Duck-bill, the English name of the *Ornithorhynchus paradoxus*, a monotrematous mammal found in Van Die-

Duck-bill: *Ornithorhynchus.*

men's Land and Australia. In its bill-like jaws, its spurs, its monotrematous character, its non-placental development, and its anatomy, it appears to be a connecting link between birds and mammals.

The duck-bill is the only animal of its genus. It is about fifteen inches long, with a brown fur. It has a sort of horny tooth near the base of each jaw or mandible, and the males have spurs on the hind legs. The female has no nipple, but the young (which are at first very slightly developed) draw the milk through a slit-like opening.

This animal inhabits ponds and quiet streams, where it swims about on the surface of the water with its head somewhat elevated, often diving for its food, which consists of insects and other small aquatic animals. It climbs trees with facility, and is sometimes seen in small parties on the limbs of trees near the water. It digs a burrow, often thirty feet long, in the river-bank, with one opening above and another below water.

Duck Creek, a hundred of Kent co., Del. Pop. 4279.

Duck Creek, a township of Madison co., Ind. P. 789.

Duck Creek, a township of Stoddard co., Mo. P. 781.

Ducking-Stool, a contrivance formerly used in Great Britain and in some parts of the U. S. for the punishment of scolds. The most common form seems to have been that of a strong wooden chair attached to one end of a beam, which pivoted midway on a post planted in the ground at the edge of a pond or stream. The woman having been secured in the chair, the beam was worked up and down by a chain at the other end, and she was thus plunged into the water or "ducked." The practice of ducking originated towards the close of the fifteenth century, and very generally prevailed until the early part of the eighteenth, and in some places to a later date. At Leominster, England, a ducking-stool was in use as late as 1809.

Duck River, of Tennessee, rises in Coffee co., flows nearly westward through Middle Tennessee, and enters the Tennessee River in Humphries co. Length, about 250 miles.

Duck Spring, a township of Etowah co., Ala. P. 372.

Duck'town, a post-village of Polk co., Tenn. It is in the S. E. corner of the State, about 60 miles E. of Chattanooga. It has remarkable copper-mines.

Duck'water, a township of Nye co., Nev. Pop. 145.

Duck-weed (*Lemna*), a genus of endogenous plants placed by some botanists in the natural order Lemnaceæ, while others refer them to the order Araceæ. They are mostly floating plants, with unisexual flowers, without calyx or corolla, and with loose hanging roots. They are widely distributed over the world, and several species are found in the U. S., covering the surface of stagnant waters with their flat green fronds.

Duclos (Charles Pineau), a witty French writer, born at Dinan Feb. 12, 1704. Having written several successful romances, he was admitted into the French Academy in 1747. He was appointed historiographer of France in 1753. Among his works are moral essays entitled "Considérations sur les Mœurs de ce Siècle" (1750) and "Secret Memoirs of the Reigns of Louis XIV. and Louis XV." Died Mar. 26, 1772.

Ducrot (Étienne), a French general, born in 1817, commanded a brigade in the Italian campaign, and the first division of the first army corps in the German-French war; was taken prisoner of war at Sedan, but escaped to Paris, where he took a prominent part in the defence of that city. After the capitulation he was elected a delegate to the National Assembly.

Ductil'ity [Lat. *ductilitas*, from *ductilis*, "easy to be drawn" (from *duco, ductum*, to "draw")], a capability of being drawn out into a long and slender form without a breach of continuity. This term is applied almost exclusively to that property of certain metals which enables them to be elongated or drawn out into wire. The metals having the greatest ductility are gold, silver, platinum, and iron. A grain of gold may be drawn into 500 feet of wire, and a wire of platinum not exceeding a 30,000th of an inch in diameter has been obtained by placing a fine wire of platinum in the axis of a larger silver wire, then drawing the compound wire in the usual mode, and finally dissolving the silver by nitric acid. The ductility of glass (when melted or heated to a red heat) is almost unlimited. The ductility of many bodies is modified by temperature.

Dudevant, Madame. See Sand, George.

Dud'ley, a parliamentary borough of England, is a part of Worcestershire, surrounded by the county of Stafford, 9 miles W. N. W. of Birmingham. It is well built, and is one of the chief seats of the iron-trade. Here are manufactures of glass, grates, fire-irons, nails, vices, chain-cables, etc. Near Dudley are the ruins of Dudley Castle, founded in 760 A. D. by Dudo, a Saxon prince. Mines of coal and iron and quarries of Silurian limestone are worked in the vicinity. Dudley returns one member to Parliament. Pop. of municipal borough in 1871, 43,781.

Dudley, a township of Henry co., Ind. Pop. 1339.

Dudley, a post-township of Worcester co., Mass., on the

Norwich and Worcester and a branch of the New York and New England R. R. It is the site of Nichols Academy, and has woollen, linen, and jute mills. Pop. 2388.

Dudley, a township of Hardin co., O. Pop. 1008.

Dudley, a post-village of Huntingdon co., Pa., is the E. terminus of the Broad Top City branch of the Huntingdon and Broad Top R. R.

Dudley (Benjamin Winslow), M. D., LL.D., was born in Virginia in 1785. Receiving an imperfect preliminary education, he commenced the study of medicine in Lexington, Ky., and took his degree in the University of Pennsylvania in 1806. He went to Europe in 1810, and during his four years of absence studied with Sir Astley Cooper, Abernethy, Cline, Larrey, Dubois, Boyer, Marjolin, and others. In 1817, in conjunction with Blythe, Caldwell, Brown, Richardson, Drake, etc., he organized the medical department of the University of Transylvania, which was long the leading school of medicine in the West. In all its changes Dr. Dudley ever was emphatically its head; he occupied the professorships of anatomy and surgery, which required him to lecture nine times every week. He never had his equal W. of the mountains, and probably but one in America—viz. Valentine Mott. Few surgeons operated more cautiously, although Dr. Physick may have done so. None ever prepared his patients more thoroughly, none did more with the roller, prescribed simpler diet or fewer medicines than he. A distinguished English surgeon in London declared him to be "*the* lithotomist of the nineteenth century." It has been published that he cut a hundred times in succession for stone in the bladder, without a death or failure. The last report of his lithotomy cases—and they were all carefully selected—numbered 225, with an admission of some six deaths; unfortunately, however, the important particulars in regard to age, sex, when and where operated upon, condition of patient, etc. etc., are generally omitted. Nevertheless, this report is a wonderful one. Dr. Dudley performed the lateral operation exclusively, and almost always with the gorget, an instrument now becoming obsolete. He was a small man, very active in his movements, strictly temperate, using cold bathing every morning, and is said never to have worn gloves or used an overcoat until injured by a fall on the ice in the streets of Lexington. He died Jan. 20, 1870. Paul F. Eve.

Dudley (Charles Edward), a Senator, born in Staffordshire, England, May 23, 1780, emigrated to the U. S. in 1794. He was elected mayor of Albany in 1821, and a Senator of the U. S. for an unexpired term of four years in 1829. He founded at Albany the Dudley Observatory, to which his widow gave $70,000. Died Jan. 23, 1841.

Dudley (Joseph) was born in Roxbury, Mass., July 23, 1647. He was appointed chief-justice of Massachusetts in 1686, chief-justice of New York in 1690, and was governor of his native province from 1702 to 1715. Died April 2, 1720.

Dudley (Paul), F. R. S., a lawyer, a son of the preceding, was born Sept. 3, 1675. He was distinguished for eloquence and talents, became attorney-general of Massachusetts in 1702, and chief-justice in 1745; founded the Dudleian Lecture at Harvard College. Died Jan. 25, 1751.

Dudley (Thomas), born at Northampton, England, in 1576, served in Holland in Queen Elizabeth's army, and in 1630 came to Boston as deputy-governor of Massachusetts Bay under his son-in-law, Governor Bradstreet. He held the office twelve years. He was governor of the colony in 1634, '40, '45, and '50, and became major-general in 1644. Died July 31, 1653, at Roxbury, where he left an estate long held by his descendants.

Dudley (Thomas V.). See Appendix.

Dudley Lake, a township of Jefferson co., Ark. P. 292.

Dud'leyville, a twp. of Tallapoosa co., Ala. Pop. 1600.

Dud'weiler, a town of Prussia, in the Rhine province, has several large coal-mines. Pop. in 1871, 8920.

Dueast's', a township of Cabarrus co., N. C. P. 1015.

Du'el [Lat. *duellum* (perhaps a contraction of *duorum bellum*, a "war of two"); Fr. *duel;* Ger. *Duell* and *Zweikampf;* It. and Port. *duello;* Sp. *duelo*] appears to have signified originally a trial by battle resorted to by two individuals, either for the purpose of determining the guilt or innocence of a person charged with a crime, or of deciding a disputed right. In more recent times it is used to denote a hostile meeting between two persons in consequence of an affront given by one to the other, and for the purpose of affording satisfaction to the injured party.

The practice of fighting duels as a means of deciding private differences seems to be of comparatively recent date. That it originated with the feudal system is sufficiently clear. We should not, however, confound two very different institutions—the appeal to arms as an alternative for the trial by ordeal, and the voluntary challenges or defiances resorted to for the purpose of settling disputes supposed to involve the honor of gentlemen. This last custom was first elevated to the dignity of an established institution by Philip le Bel of France (1308).

In England, duelling does not appear to have prevailed until the latter part of the reign of Queen Elizabeth. At this period appeared the famous "Treatise of Honor" by Vincentio Saviolo, a fierce and punctilious Italian. He was a fencing-master by profession. His work, published in 1594—now little known—appears to have been adopted as a standard book of reference in cases of supposed insult. Saviolo resolves all quarrels into the *lie*—that is, he supposes the original insult to be followed by a regular series of replies and retorts, until one of the parties is reduced to give the lie direct; which, like the phrase "stupid youth" in some German universities, was immediately followed by the appeal to arms.

Henry II. of France issued an edict in 1547 prohibiting the public or judicial combat. This decree was caused by the death of his favorite La Chataigneraye from wounds received in the lists. The public duel survived longer in Italy. Its abolition in France was not followed by the good effects which the statesmen of those days probably anticipated from it. Private duels, conducted with a sanguinary spirit before unheard of, became very prevalent. Brantôme gives instances of duellists who prided themselves on advantages which they had taken of their opponents, and were not less esteemed in society for having done so; there were said to be regiments in the same service, the officers of which were bound to fight one another whenever they met. Lord Herbert of Cherbury mentions the honor in which the French ladies held the brave Balagny, a man with neither wit, figure, nor fortune, but whose merit consisted in the fact that he had killed eight or nine of his friends in single combat.

In the reign of Henry III. the custom of the seconds taking part in the quarrels of their principals seems first to have been established—a custom which did not cease till the beginning of the last century. When such practices were rife in all parts of France we can scarcely doubt the extraordinary assertions of writers of those times—that 120 gentlemen were killed in duels in a single province in six months; that in the reign of Henry IV. 4000 fell in two years; and that this mania cost France more gentle blood than thirty years of civil war. Henry IV. issued edicts against duelling; Louis XIII. proceeded against it with such severity that it is said wounded duellists were dragged from the field to the gibbet; but this extreme severity, as usual in such cases, appears to have had no good effect. In the minority of Louis XIV. the duke de Nemours, a prince of the blood, fell, with two of his seconds, in a quarrel with another grandee. Soon after this many noblemen and gentlemen of undoubted courage made a voluntary compact to abstain from duelling. This resolution was seconded by Louis XIV. when of age, in several edicts. It should be remembered to the honor of that monarch that he labored during his whole life to correct this abuse, and with considerable success. One of his expedients was the establishment of a court of chivalry, the members of which were the marshals of France, which was to decide on all questions in which a gentleman might conceive his honor to be involved. Killing in duels in France is now punishable as homicide, and a civil action lies on behalf of the friends of the man who has been slain.

The first attempt made in England to introduce legislative enactments for the suppression of duels is said to have taken place in 1713, when, after the famous duel of Duke Hamilton with Lord Mohun, a bill for that purpose was brought into the Commons, but lost on the third reading. A challenge to fight is now a high misdemeanor. In Scotland as late, it would appear, as the middle of the sixteenth century, licenses for duelling were granted by the Crown, and formed a source of revenue; killing in a duel without license was murder. The new codes of Bavaria and Prussia contain a number of provisions against duels, challenges, etc. In no country were duels more prevalent formerly than in Ireland. In France the period of the restored monarchy (1815–48) was one of those in which duels were most rife, not only among the military, but among civilians; but since 1848 they have greatly diminished. In Great Britain a heavy blow was aimed at duelling in the army by the new article of war of 1844, rendering it an offence punishable by cashiering. For some years duels, either military or civil, have been comparatively rare.

In America the practice of fighting duels was formerly very common. But in more recent times duelling in any part of the U. S. is rarely heard of. It is not only made illegal by statute, but is forbidden in the army and navy by the Articles of War. Revised by J. Thomas.

Duen'na [Sp. *dueña*], the chief lady-in-waiting on the queen of Spain. In a more general sense it is applied to a

woman holding a middle station between a governess and a companion, and appointed to take charge of young ladies.

Du'er (John), LL.D., an able American jurist and legal writer, born at Albany, N. Y., Oct. 7, 1782, was a son of Col. William Duer. He practised law in New York City, whither he removed in 1820, and was elected a judge of the superior court of that city in 1849. Among his works is "The Law and Practice of Marine Insurance" (2 vols. 8vo, 1845–46). He succeeded Oakley as chief-justice of the superior court in 1857. Died Aug. 8, 1858.

Duer (William Alexander), a jurist, born in Dutchess co., N. Y., Sept. 8, 1780, was a brother of the preceding. His mother was a daughter of Lord Stirling. He was admitted to the bar in 1802, and became a partner of Edward Livingston in New Orleans, but returned to the city of New York about 1812. He was a judge of the supreme court of New York from 1822 to 1829. In the latter year he was chosen president of Columbia College. He was the author of a "Treatise on the Constitutional Jurisprudence of the U. S." (1856). Died May 30, 1858.

Duet' [It. *duetto* (from the Lat. *duo*, "two"); Fr. *duo*], a piece of music composed for two performers, either vocal or instrumental.

Due West, a post-village and township in Abbeville co., S. C. It is distinguished chiefly as a seat of learning. Erskine College and Erskine Theological Seminary, under the control of the Associate Reformed Presbyterians, are located here, as well as a female college. There are five public libraries in the town, and one weekly paper. Pop. 400; of Due West township, 1030.

J. I. Bonner, Pub. "Associate Ref. Presbyterian."

Dufau (Pierre Armand), a French author, born at Bordeaux in 1795. He wrote several works on political economy and French history, and was an editor of several liberal journals of Paris, and is the author of several works on the education of the blind.

Dufaure (Jules Armand Stanislas), a French orator and statesman, born at Saujon, in Charente-Inférieure, Dec. 4, 1798. He practised law at Bordeaux, and was elected to the Chamber of Deputies in 1834. He became an influential leader of the liberal party. After the formation of the republic in 1848 he was a moderate republican member of the Assembly, and was minister of the interior for about two months ending in December of that year. He filled the same office from June to Oct., 1849, and was driven from the public service by the *coup-d'état* of Dec., 1851, after which he gained great eminence at the bar. He was appointed minister of justice by Thiers in Feb., 1871.

Dufay (Charles François de Cisternay), a French savant, born in Paris Sept. 14, 1698. He was the author of the theory of two kinds of electricity, vitreous and resinous. He wrote treatises on chemistry and other sciences. Died July 16, 1739.

Duff (Alexander), D. D., LL.D., a Scottish Presbyterian missionary, born in Perthshire in 1806 or 1808. He was educated at St. Andrew's. He went to India in 1830, and labored there with great zeal and success for many years as a missionary. In 1839 he published a work "On India and the Missions." After the disruption of the Scottish Church in 1843 he was the chief agent of the mission which the Free Church maintains at Calcutta. He visited the U. S. in 1854, returned to India in 1855, and remained there until 1863. After his return to Scotland he became professor of evangelistic theology in the theological schools of the Free Church.

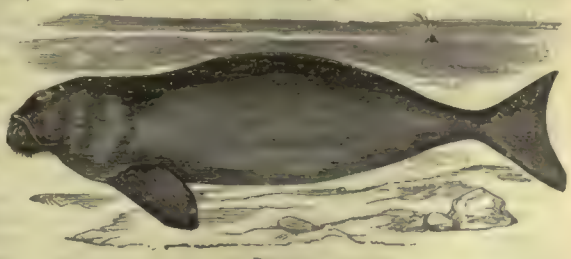
Duf'ferin, Earls of (United Kingdom, 1871), Barons Dufferin and Clanderboye (Ireland, 1800), Viscounts Clanderboye (1871), Barons Clanderboye of Clanderboye (United Kingdom, 1850). — Frederick Temple Blackwood, first earl, K. P., K. C. B., born in June, 1826, was under-secretary of state for India 1864–66, and for war 1866, and succeeded his father in 1841. He became in 1872 governor-general of Canada.

Duf'field, a post-township of Charles co., Md. Pop. 3485.

Duffield (George), D. D., was born at Strasburg, Lancaster co., Pa., July 4, 1794, and was educated at the University of Pennsylvania. He was for many years a pastor of Presbyterian churches in Philadelphia, New York, and Detroit. He was an active leader of the "New School" movement. Died at Detroit, Mich., June 26, 1869.

Duf'fy's, a township of Tallapoosa co., Ala. Pop. 1273.

Dufour (Guillaume Henri), an able Swiss general, born at Constance Sept. 15, 1787. He entered the French army in 1809, and became a captain in the Swiss service about 1815. In 1847 he was chosen commander-in-chief of the federal army raised to defend the integrity of the republic against the Roman Catholic Sonderbund. He quickly quelled the rebellion. In 1864 he was president of the Geneva convention. He published, besides others, a "Memoir upon Ancient and Mediæval Artillery" (1840) and "Permanent Fortification" (1850). D. July 14, 1875.



Duganne (Augustine Joseph Hickey), an American poet and novelist, born in Boston in 1823. He published a volume of poems in 1856, and a prose work entitled a "Class-Book of Governments and Civil Society" (1859). Among his poems are "The Iron Harp" (1847) and "The Mission of Intellect" (1852). Died July 14, 1875.

Dugas (Louis Alexander), M. D., LL.D., was born in Washington, Wilkes co., Ga., Jan. 3, 1806, received his medical education at the University of Maryland and in Europe, and was one of the original founders of the Medical College of Georgia (1832), in which he still is professor of surgery (1874). He has published many contributions in professional periodicals, was many years editor of the "Southern Medical and Surgical Journal" (Athens, Ga.), and is the author of a "New Principle of Diagnosis of Dislocations of the Shoulder-Joint" (1857).

Dug'dale (Sir William), an English antiquary, born in Warwickshire Sept. 12, 1605. He was appointed blanch-lyon pursuivant-extraordinary in 1638, rouge-croix pursuivant-in-ordinary in 1640, became Chester herald in 1644, was a royalist in the civil war, and became Norroy king of arms in 1660, after the restoration of Charles II., and Garter king of arms in 1677. Dugdale and Dodsworth published an important work on English monasteries entitled "Monasticon Anglicanum" (3 vols., 1655–73). Among his other works are "Antiquities of Warwickshire" (1656), which is highly esteemed, and "Origines Juridiciales" (1666). Died Feb. 10, 1686. (See "Life and Diary of Sir W. Dugdale," edited by Hamper, 1827.)

Dughet (Gaspard), called Caspar Poussin, a painter of French extraction, was born at Rome in 1613, and studied under his brother-in-law, Nicolas Poussin, whom he followed as a painter of the heroic landscape, excelling him in the grandeur of his distances, his development of the middle ground, rich foliage masses agitated by the wind, and the bold treatment of landscapes. His chief works are in Rome, where he died in 1675.

Du'gong [a word of Malay origin], a marine animal of the genus *Halicore*, belonging to the Sirenia. The dugong of the Indian seas is generally from eight to twelve feet long, though it is said to attain sometimes the length of twenty-five feet. The upper lip is thick and fleshy, and forms a kind of snout; the upper jaw bends downward almost at a right angle; the eyes are very small, with a nictitating membrane; the skin thick and smooth. In its internal structure it has considerable resemblance to the pachyderms, and it feeds chiefly on algæ. It is also remarkable for the ventricles of the heart being entirely detached from each other. Its flesh is said to resemble beef, and is prized as food. The oil is recommended as a substitute for cod-liver oil. Various species occur in the Indian Ocean, the Red Sea, etc.

Dugong.

Duguay-Trouin (René), a celebrated French admiral, born at Saint Malo June 10, 1673. As captain of a privateer frigate he cruised about the high seas, and took many prizes from the English between 1690 and 1697. In the latter year he entered the royal marine with the rank of captain. He served with distinction in the war of the Spanish succession, which began in 1702. In 1707 he captured three English ships of war and about sixty transports of merchant vessels. Among his famous exploits was the capture of Rio Janeiro in 1711. He was raised to the rank of lieutenant-general in 1728. Died Sept. 27, 1736. (See his autobiographic "Memoirs," 1740, and English translation, 1742.)

Du Guesclin (Bertrand), the greatest French general of his time, was born near Rennes about 1314. He fought against the English, who occupied many places in France, and he defeated the duke of Lancaster at Rennes

in 1356. In 1366 he commanded an army which fought for Henry de Trastamare against Peter the Cruel of Castile. He gained a victory over Peter, but he was defeated and taken prisoner by the English Black Prince in 1367. He paid a large ransom, and was soon released. Having been appointed constable of France in 1369, he defended the country against the English invaders, whom he expelled from nearly every province of France before 1375. Died July 13, 1380. (See FROISSART, "Chronicles;" JAMISON, "Life of Duguesclin," 1864.)

Duhamel du Monceau (HENRI LOUIS), an eminent French botanist and rural economist, born in Paris in 1700. Among his numerous useful works are a "Treatise on the Culture of Land" (1751), a treatise on the structure and physiology of plants entitled "De la Physique des Arbres" (1758), and "Elements of Agriculture" (1762). He was a member of the Academy of Sciences. Died Aug. 23, 1782.

Duil'ius, or **Duil'lius** (CAIUS), a Roman general who became consul in 260 B. C., during the first Punic war. He built ships of war after the model of one taken from the enemy, and was the first Roman who gained a naval victory over the Carthaginians, whom he defeated in the year 260 near the Lipari Islands.

Duil'lian Col'umn, the *Columna Rostrata* which was erected in the forum at Rome (as Quintilian states) to commemorate the naval victory of C. Duillius. (See DUILIUS.) Columns of this kind were called *rostratæ*, from having the beaks of ships (*rostra*) projecting on each side. The restoration of the Duillian column by Michael Angelo is now preserved in the Palazzo de' Conservatori on the Capitoline Hill, retaining in the pedestal a portion of the original inscription in archaic Latin. The inscription has been copied and printed, and may be found at the end of the fourth book of Duker's "Florus."

HENRY DRISLER.

Duis'burg, a town of Rhenish Prussia, on the Ruhr and near the Rhine, 16 miles N. of Düsseldorf. It is an old town, and has a church founded in 1187. Here is a gymnasium, with a realschule and a female high school; and there are also manufactures of cotton and woollen fabrics, hosiery, porcelain, soap, etc. In the thirteenth century it was a city of the Hanseatic League. The railway which connects Cologne with Minden passes through this place, which has been declared a free port. Pop. in 1871, 30,520.

Dujardin (FÉLIX), a French naturalist, born at Tours in 1801. He wrote, besides other works, a "Natural History of Infusoria" (1841) and a "Manual of the Observer with the Microscope" (1843). Died in 1860.

Dujardin, or **De Jardyn** (KAREL), a skilful Dutch painter, born in Amsterdam about 1640, was a pupil of Berghem. He studied in Rome and painted pastoral landscapes. He made also a series of fifty etchings of rural subjects, which are much sought. During a second visit to Italy he died at Venice Nov. 20, 1678.

Duke [from the Lat. *dux* (gen. *ducis*), a "leader" or "general;" Fr. *duc;* It. *duca;* Sp. *duque;* Ger. *Herzog*], a title originally given in the Byzantine empire to military governors of provinces, and previous to the time of Theodosius regarded as inferior to that of count. Dukes in Germany became in course of time the chief princes of the empire. In France and Italy dukes form the second rank in the nobility, being next below princes; in England they are first. The title was introduced in the reign of Edward III., whose eldest son, the Black Prince, was made duke of Cornwall. In 1351, Henry Plantagenet, earl of Lancaster, became duke of Lancaster. The dignity thus created in these instances was not a dukedom by tenure; it has always remained a personal title only, hereditary according to the limitations of the patent. The Austrian archdukes and the Russian grand dukes are princes of the blood. The princes of the royal house of Saxony also have the title of duke. In Bavaria and Würtemberg the side branches of the reigning family are called dukes in Bavaria and dukes of Würtemberg. In Prussia the title was conferred in 1840 upon the Prince Hohenlohe Waldenburg Schillingsfürst (duke of Ratibor), and in 1861 upon Prince Hohenlohe Ochringen (duke of Ujest). Several reigning sovereigns of German states have the title of duke (Anhalt, Brunswick, Saxe-Coburg, Saxe-Meiningen, Saxe-Altenburg) or of grand duke (Baden, Hesse, Oldenburg, Saxe-Weimar, Mecklenburg-Schwerin, and Mecklenburg-Strelitz). Royal dukes in Great Britain are princes of the blood. British dukes have no territorial jurisdiction. The English dukes are next to the peers of the royal blood and the two archbishops of Canterbury and York, the first peers of the realm. There were in 1873 twenty dukes in England (exclusive of the duchess of Inverness, the widow of the duke of Sussex), namely: Norfolk (title created in 1483), Somerset (1547), Richmond (1675), Grafton (1675), Beaufort (1862), St. Alban's (1684), Leeds (1694), Bedford (1694), Devonshire (1694), Marlborough (1702), Rutland (1703), Brandon (duke of Hamilton, 1711), Portland (1716), Manchester (1719), Newcastle (1756), Northumberland (1766), Wellington (1814), Buckingham and Chandos (1822), Sutherland (1833), Cleveland (1833). There are also seven Scotch and one Irish duke, who, however, do not sit in the imperial Parliament as dukes, but as marquesses, earls, viscounts, or barons.

REVISED BY A. J. SCHEM.

Dukes, a county of Massachusetts, consisting of Martha's Vineyard and other smaller islands in the Atlantic Ocean, has an area of about 118 square miles. The largest of these islands is about 5 miles from the mainland. Many of the inhabitants are employed in fisheries. The soil is partly fertile. Some iron ore is found, and salt is made from the sea. Wool is the chief agricultural product. Capital, Edgartown. Pop. 3787.

This county (officially called "the county of Dukes county") was named from the fact that, with the province of New York, it was under the government of the duke of York (King James II.). It became a part of Massachusetts in 1692.

Dulci'gno [anc. *Olcinium;* Turk. *Olgoon*], a town and seaport of European Turkey, lat. 41° 54′ N., lon. 19° 12′ E., is in Albania, on the Adriatic Sea, 14 miles W. S. W. of Scutari. It is the seat of a Catholic bishop, and has a trade in timber and oil. Pop. 7000.

Dul'cimer [Sp. *dulcemele*, from the Lat. *dulcis*, "sweet," and *melos*, "music"], the name of a musical instrument shaped like a triangle, and having brass wire strings, set in motion by rods of wood or iron. The form and nature of the instrument called by this name in the Bible are not known.

Dül'ken, a town in Germany, in the Rhine Province, 8 miles S. S. E. of Kempen. It has manufactures of cotton, silk, thread, ribbons, linens, and wire. Flax is extensively cultivated. Pop. 5816.

Dulong (PIERRE LOUIS), a French chemist and savant, born at Rouen Feb. 12, 1785. He discovered the chloride of nitrogen in 1812, and became an associate of Berzelius in chemical researches. In 1823 he was chosen a member of the Academy of Sciences. He wrote treatises on the theory of heat and on gases. Died at Paris July 19, 1838.

Dulse, the name given to many of the red-spored seaweeds. The *Rhodomenia palmata*, belonging to the Rhodomeniaceæ, grows on rocks on the coasts of Great Britain, the U. S., and other regions. It has sessile fronds of a dark-red or purple color, irregularly notched, and of a leathery texture. It is an important article of food in Iceland, where it is dried and stored in casks. It is abundant on all the British coasts, and is sometimes used as food, either raw or cooked. The *Schyzimenia edulis*, of the order Cryptonemiaceæ, is also called dulse, and is used as food. This also occurs in the U. S. "Pepper dulse," of the genus *Laurentia* and order Laurentiaceæ, is eaten in Scotland. It grows on our Pacific coasts.

Duluth′, a city, capital of St. Louis co., Minn., is situated at the W. extremity of Lake Superior, 155 miles N. N. E. of St. Paul. It is the eastern terminus of the Northern Pacific R. R., now (1874) running 452 miles westward to the Missouri River, and the northern terminus of the Lake Superior and Mississippi R. R., running from St. Paul. It has 12 church-edifices—1 Catholic, 1 Episcopal, 2 Presbyterian, 1 Methodist Episcopal, 1 Congregational, 1 Swedish Methodist, 1 Swedish Lutheran, 1 Norwegian Lutheran, 1 German Evangelical, 1 Union or Universal, and 1 Baptist; two grain elevators, a custom-house, and a weather-signal office. The Northern Pacific R. R. has in construction some of the largest private docks in the U. S. The harbor, entered by a ship-canal 250 feet wide, is landlocked, being formed by Minnesota and Rice's Points; the former is a scythe-shaped natural breakwater running out 7 miles into the lake. The harbor has been improved by the construction of several docks and piers, independent of the railroad company's works. The outer harbor is protected by a partially constructed breakwater, on which has been expended $150,000; two-thirds of this sum by the government. Duluth has a large stove-factory, machine and car-building works, and other manufactories. In May, 1869, the site of the city was a forest—the *old* Duluth, at that time situated on Minnesota Point, consisted of a few cabins. The place is named after Capt. John Duluth, a French traveller, who visited the country and built a hut in 1760. The town has five newspapers, two of them daily. Large quantities of wheat and flour are shipped from here, principally to Buffalo, N. Y. It has one national bank. Pop. in 1869, 38; in 1870, 3131.

R. D'UNGER, ED. "HERALD."

Dul'wich, a suburb of London, England, in Surrey, 5 miles S. of London. It is pleasantly situated near Sydenham, and has numerous handsome villas and mansions. Here is Dulwich College, founded in 1619 by Edward Alleyne, a tragic actor, and a picture-gallery.

Dumangas, a town in Panay, one of the Philippine Islands, is near the sea. Rice abounds here. Pop. about 25,000.

Dumas (Alexandre), a popular French novelist and dramatist, born at Villers-Cotterets (Aisne) July 24, 1803. He was not liberally educated. He went to Paris in 1823 to seek his fortune. In 1828 he produced "Henri III.," a drama, which was very successful. He was a writer of the romantic school, and was remarkable for literary fecundity. Dumas displayed much skill in the construction of plots. Among his novels are "The Three Musketeers" (30 vols., 1844–45) and "The Count of Monte-Christo" (12 vols., 1845). It appears that a large part of the works published in his name were written by other men. Died at Puys, near Dieppe, Dec. 5, 1870.

Dumas (Alexandre), a novelist and comic writer, a son of the preceding, was born in Paris July 28, 1824. Abandoning the imaginative romance of his father, he applied himself to the study of society, and sought by verisimilitude to make good his deficiency in dramatic construction. His works treat mostly of the equivocal aspects of French life. His first novels, "La Dame aux Camélias" (1848), "Diane de Lys" (1851), etc., were attended with great success, as also the plays which afterwards chiefly employed his pen. In 1872, in "L'Homme-Femme," a social tract, he attacked the French marriage system.

Dumas (Alexandre Davy de la Pailleterie), a French general, born in St. Domingo Mar. 25, 1762, was the father of Alexandre Dumas (1803–70). His mother was a negress. He became a general of division in 1793, and defeated the Austrian general Wurmser at Mantua in 1796. He commanded the cavalry in Egypt in 1798. Died in 1807.

Dumas (Jean Baptiste), a French chemist and writer, born at Alais (Gard) in 1800. He became a resident of Paris, and married a daughter of the well-known chemist A. Brongniart. He acquired a European reputation by his discoveries in organic chemistry, isomerism, the law of substitutions, and other parts of chemical philosophy. In 1832 he was admitted into the Institute, and in 1834 he became professor of organic chemistry in the School of Medicine. His chief work is a "Treatise on Chemistry Applied to the Arts" (8 vols., 1828–45). He was minister of agriculture and commerce from Oct., 1849, to Jan., 1851, after which he became a senator.

Dumas (Mathieu), Count, a French general, born at Montpellier Dec. 23, 1753. He fought for the U. S. in 1780–82, and was a moderate member of the Legislative Assembly in 1791. In the Reign of Terror he was condemned to death, but he escaped and went into exile. He became a general of division in 1805, and served at Ulm and Austerlitz. In 1812 he was intendant-general of the grand army in Russia. He wrote a narrative of the French campaigns from 1798 to 1807, entitled "Précis des Evénements Militaires" (19 vols., 1816–26), and "Souvenirs," an account of his career. Died Oct. 16, 1837.

Dumbar'ton, a county of Scotland, has an area of 297 square miles. It consists of two detached parts, one of them bounded on the E. by Loch Lomond, on the S. by the estuary of the Clyde, and on the W. by Loch Long; the other, much smaller, portion lying on both sides of the Forth and Clyde Canal. The surface is mountainous, and presents much picturesque scenery. Here are mines of coal and iron and quarries of limestone and slate. Capital, Dumbarton. Pop. in 1871, 58,839.

Dumbarton, a seaport of Scotland, the capital of the above county, is on the river Leven near its entrance into the Clyde, 13 miles N. W. of Glasgow. Steamboats ply regularly between this port and Glasgow. It has manufactures of glass, machinery, and ropes. Here, on a steep, rugged basaltic rock, rising to the height of 560 feet, stands the famous Dumbarton Castle, which has been a stronghold for many centuries. Pop. of parliamentary borough in 1871, 11,414.

Dumb Cane (*Dieffenbachia Seguina*), a West Indian shrub, so named from its acrid juice causing the tongue to swell. It belongs to the order Araceæ. The root and the juice have medicinal properties, and are used in sugar-refining.

Dumb'ness, when associated with deafness, is usually the result of that deafness; the child being unable to hear, of course is unable to learn to talk; but there are at least two important varieties of dumbness which are the direct results of disease. The first of these is what physicians call aphonia, a loss of voice which may be transient or permanent, functional or structural. Diseases of the larynx or of the nerves supplying it are frequent causes. A much more formidable disease or symptom is aphasia, which is a loss of language rather than of speech. It is a symptom of brain disease, the patient having the power to articulate, and even to think, but not to express his thoughts. (See Deaf and Dumb, revised by Hon. Henry Barnard, LL.D.; also Aphasia and Aphonia.)

Dum'dum, a town of British India, in Bengal, 8 miles N. E. of Calcutta. Here are a cantonment and a cannon-foundry.

Dumfries', a county in the S. of Scotland, is bounded on the S. by Solway Frith, on the E. by Cumberland, on the N. by Roxburgh, Selkirk, Peebles, and Lanark, and on the W. by Ayr and Kirkcudbright. Area, 1129 square miles. It is drained by the Annan, the Esk, and the Nith rivers. The surface is mountainous in the N. and undulating in the S. The valleys of the Annan, Esk, and Nith are fertile. Among the minerals of this county are coal, lead, silver, limestone, and new red sandstone. It is traversed by two railways extending to Edinburgh and Glasgow. The chief towns are Dumfries, Annan, Moffat, and Sanquhar. Pop. in 1871, 74,794.

Dumfries, a seaport of Scotland, the capital of the above county, is on the river Nith 9 miles from its entrance into Solway Firth, and 64 miles S. by W. from Edinburgh; lat. of Solway Frith light, 54° 48′ N., lon. 3° 32′ W. It is well built of red freestone, and is regarded as the capital of the south of Scotland. Two bridges across the river connect it with Maxwelltown. The high tides of Solway Frith bring vessels of sixty tons to the town, and larger vessels to the river quays near Dumfries. Here are manufactures of woollen cloths (tweeds), hosiery, hats, etc. Among the notable objects of the place is the tomb of Burns, who here officiated as exciseman. Pop. in 1871, 15,435.

Dumfries, a post-township of Prince William co., Va. Pop. 844.

Dü'michen (Johannes), a German Egyptologist, born Oct. 15, 1833, studied at Berlin, and passed many years in archæological research in the Valley of the Nile. He has written several treatises on Egyptian inscriptions.

Dum'mer, a township of Coos co., N. H. It has manufactures of lumber, etc. Pop. 317.

Dummer (Dr. Jeremiah) was born at Boston, Mass., and graduated at Harvard in 1699, afterwards studying at Utrecht, where he obtained his doctor's degree. Unsuccessful as a preacher, he became the agent of Massachusetts in England (1710–21). He wrote with great ability in defence of colonial rights, and presented 800 volumes to Yale College. Died in England May 19, 1739.—His brother, Lieutenant-Governor William Dummer (1677–1761), founded Dummer Academy at Newbury, Mass. (opened in 1763).

Dum'merston, a township and post-village of Windham co., Vt., on the Vermont Valley R. R., 5 miles N. of Brattleboro'. Pop. 916.

Dumont' (Ebenezer), an American general and lawyer, born at Vevay, Ind., Nov. 23, 1814. He became a brigadier-general of Union volunteers in Sept., 1861, and defeated the Confederates at Lebanon, Ky., in May, 1862. Having resigned his commission early in 1863, he was a Republican member of Congress for two terms (1863–67). Died April 16, 1871.

Dumont (Pierre Étienne Louis), a Swiss author, born at Geneva July 18, 1759. He was a Protestant minister, and emigrated in 1782 to St. Petersburg, where he preached eighteen months. In 1785 he removed to England, and became tutor to the sons of Lord Shelburne. He was intimate with Sir Samuel Romilly and Jeremy Bentham. He passed the years 1790 and 1791 mostly in Paris, where he associated with Mirabeau, whom he aided in composing his speeches and reports. Having returned to England in 1792, he edited and popularized Bentham's works on legislation—namely, "Traités de Législation" (1802) and "Théories des Peines et Récompenses" (1810). He died at Milan Sept. 29, 1829, leaving "Souvenirs sur Mirabeau" (1832). (See A. P. de Candolle, "Notice sur la Vie et les Écrits de M. Dumont," 1829.)

Dumont d'Urville (Jules Sébastien César), a French navigator, born in Normandy May 23, 1790. He commanded an expedition sent in 1826 to obtain tidings of La Pérouse and to survey the coasts of New Zealand, New Guinea, etc. His discoveries were published in a work called "Voyage of Discovery Around the World" (22 vols., 1832–34). In 1837 he conducted an exploring expedition to the Antarctic regions. He discovered land, which he called Terre Adélie, in lat. 66° 30′ S.; returned in 1840, and became a rear-admiral. Died May 8, 1842.

Dumoulin [Lat. *Molinæus*], (CHARLES), an able French jurist, born in Paris in 1500. He was a Protestant, and was often persecuted for his religion. He wrote several legal works which were highly esteemed, and a book against the acts of the Council of Trent (published in 1564). Died in 1566.

Dumouriez (CHARLES FRANÇOIS), a French general, born at Cambrai Jan. 25, 1739. He served as an officer in the Seven Years' war, was quartermaster-general in Corsica in 1768, and was employed in a secret mission to Poland by the duke of Choiseul in 1770. Between 1776 and 1787 he was commandant at Cherbourg, where he planned and directed great naval works. In the Revolution he acted with the Girondists. He was appointed minister of foreign affairs in Mar., 1792, and acquired the confidence of the king. War having broken out between France and Austria, he resigned office in June, 1792, in order to take command of the army; invaded Flanders in Oct., 1792, and defeated the Austrians at Jemmapes in November, and conquered Belgium. According to Lamartine, he was at this period the virtual dictator of all parties. Instead of prosecuting the war with vigor, he plotted a counter-revolution, and negotiated secretly with the Austrians. The Convention, suspecting his design, sent four commissioners in April, 1793, to summon him to Paris. Dumouriez refused to obey the Convention, and when the commissioners ordered the soldiers to arrest him he sent them as prisoners to the Austrian camp. His army refused to support him in this defection, and he became a fugitive and exile. He died in England Mar. 14, 1823. (See "Mémoires de Dumouriez," by himself, 2 vols., 1794.)

Dumpy Level, a levelling instrument with a short telescope of large aperture, and compass-box beneath.

Dun, a Celtic or Gothic word signifying a "hill" or "height." It is the root of the names of many places (often modified into *Dum* or *Don*), as Dunkirk, Dumbarton, Donegal, etc.

Duna Földvar, a town of Hungary, in the county of Tolna, 28 miles N. of Tolna, on the Danube. Here is a Franciscan cloister and two match-factories. Pop. 12,382.

Dunbar', a royal burgh and seaport of Scotland, in Haddingtonshire, is at the mouth of the Frith of Forth, 27 miles E. N. E. of Edinburgh; lat. 56° N., lon. 2° 29′ W. The harbor will admit vessels of 300 tons. Dunbar is a fine old town, containing the remains of Dunbar Castle, which was the scene of many historical events. Dunbar has valuable herring-fisheries. Cromwell gained near this town a decisive victory over the royalists, Sept. 3, 1650. Pop. in 1871, 3311.

Dunbar, a township of Faribault co., Minn. P. 203.

Dunbar, a township and post-village of Fayette co., Pa., on the Pittsburg Washington and Baltimore R. R., 4 miles S. of Connellsville. Pop. 2972.

Dunbar (JOHN R. W.), M. D. See APPENDIX.

Dunbar (WILLIAM), an eminent Scottish poet, born at Salton about 1460. He was a Franciscan friar and itinerant preacher in his youth. He was employed by James IV. as clerk of embassy. Among his works are "The Thistle and the Rose" (1503), an allegory in honor of the marriage of James IV., and "The Merle and Nightingale," poems showing a rich fancy. Died about 1530.

Dunbar'ton, a post-township of Merrimack co., N. H. It has manufactures of lumber. Pop. 778.

Dunc'an, a post-twp. of Monroe co., Ark. Pop. 1334.

Duncan, a township of Mercer co., Ill. Pop. 974.

Duncan, a township of Cheboygan co., Mich. P. 831.

Duncan, a township of Sullivan co., Mo. Pop. 1064.

Duncan (ADAM), VISCOUNT DUNCAN OF CAMPERDOWN, a British admiral, born at Dundee July 1, 1731. He entered the navy in 1746, and became a post-captain in 1761. In 1789 he obtained the rank of rear-admiral of the blue. With the rank of vice-admiral he was appointed commander of a fleet in the North Sea in 1795, and waged war against the Dutch. Many of his men mutinied and deserted in 1797, but finally returned to their duty. He defeated the Dutch near Camperdown in Oct., 1797, and was raised to the peerage for that service. Died Aug. 4, 1804.

Duncan (JAMES), an American officer, born in Sept., 1810, at Cornwall, N. Y., graduated at West Point 1834, and inspector-general U. S. A. Jan. 26, 1849, to which date he served in the artillery. He served chiefly at seaboard posts 1834–45; as assistant professor at the Military Academy 1855; in Florida war 1855–56, engaged at Camp Izard (wounded) and Olaklikaha; in removing Cherokees to the West 1838; in suppressing Canada border disturbances 1838–41; in the military occupation of Texas 1845–46; in the war with Mexico 1846–48, engaged at Palo Alto (brevet major), Resaca de la Palma (brevet lieutenant-colonel), Monterey (brevet colonel), Vera Cruz, Cerro Gordo, Amazoque, San Antonio, Churubusco, Molino del Rey, Chapultepec, and the city of Mexico; and on inspection duties 1849. Died July 3, 1849, at Mobile, Ala., aged thirty-six.
GEORGE W. CULLUM, *U. S. Army.*

Duncan (JAMES HENRY), LL.D., born at Haverhill, Mass., Dec. 5, 1793, graduated at Phillips (Exeter) Academy and Harvard College 1812, admitted to Essex bar 1815, and entered upon the practice of law in Haverhill, Mass., where he resided till his death, Feb. 8, 1868. He was a member of the Massachusetts general court 1827–28, 1837–38, and 1857; member of governor's council 1839–40; from 1848 to 1852 member of Congress from the Essex district, Mass.; for many years chairman of the board of managers of the American Baptist Missionary Union, a trustee of Newton Theological Institution, and a fellow of Brown University. He was active and influential in all that concerned the welfare of his town, his Church, and the general interests of humanity.

Duncan (JOHNSON K.), a general, born in Pennsylvania in 1826, graduated at West Point in 1849. He entered the service of the Confederate States in 1861, and took command of Forts Jackson and St. Philip, on the Mississippi below New Orleans. After the fleet of Farragut had passed these forts Duncan surrendered them, April 29, 1862. Died in Jan., 1863.

Duncan (JOSEPH), an American legislator, born in Kentucky about 1790. He served in the war of 1812, after which he removed to Illinois. As a member of the senate of Illinois he originated a law establishing common schools. He was chosen a member of Congress in 1827, and governor of Illinois in 1834. Died Jan. 15, 1844.

Duncan (THOMAS), A. R. A., a Scottish painter, born in Perthshire in 1807. He painted portraits and historical and fancy subjects with success. He was elected an associate of the Royal Academy of London in 1843. His works are mostly illustrative of Scottish history, life, and character. Died in 1845.

Duncan (WILLIAM CECIL), D. D., was born in New York City Jan. 24, 1824, graduated at Columbia College in 1843, and studied at Hamilton Theological Seminary. He was ordained to the Baptist ministry in 1848. He was for some time editor of the "South-western Baptist Chronicle," and for three years professor of Greek and Latin in the University of Louisiana. During his pastorate over the Coliseum place Baptist church, New Orleans, he was compelled (1861) to leave the South for a considerable time. He was the author of several volumes of religious and denominational literature. Died May 1, 1864.

Duncan and Hinton Creek, a township of Cleaveland co., N. C. Pop. 1242.

Duncan'non, a post-village of Penn township, Perry co., Pa., on the W. bank of the Susquehanna, and on the Pennsylvania R. R., 16 miles N. by W. of Harrisburg. It has important iron-works and one weekly newspaper.

Dun'cansby Head (anc. *Berubium*), a promontory forming the N. E. extremity of Scotland and of Caithness, is 1½ miles E. of John o' Groat's House; lat. 58° 40′ N., lon. 3° 8′ W.

Dun'can's Creek, a post-township of Rutherford co., N. C. Pop. 999.

Dun'ciad, The, a keen poetical satire, written by Alexander Pope, and published complete in four books (1742). It is a fierce onslaught on his numerous detractors, who have thereby obtained an unenviable immortality.

Dunck'er (MAXIMILIAN WOLFGANG), a German historian, born in Berlin in 1812. He became professor of history at Halle in 1842, a member of the German national assembly in 1848, professor at Tübingen in 1857, and received an appointment in the Prussian ministry in 1861. Among his works are "Origines Germanicæ" (1840) and a "History of Antiquity" (1852).

Dun'combe (THOMAS SLINGSBY), an English radical, born in 1797, was elected to Parliament in 1826. He represented Finsbury from 1834 to 1861, advocated the vote by ballot, extension of suffrage, and other reforms. He was a witty, fluent, and popular speaker. He made in 1858 a motion which resulted in the relief of the Jews from political disabilities. Died Nov. 13, 1861.

Dun'daff, a post-borough of Clifford township, Susquehanna co., Pa. Pop. 187.

Dundalk', a seaport-town of Ireland, the capital of the county of Louth, is at the mouth of Castleton River and on Dundalk Bay, 50 miles N. of Dublin, with which it is connected by railway. It has a safe harbor, which admits vessels drawing sixteen feet of water. The chief articles of export are linen, timber, iron, dairy products,

and live-stock. Here are manufactures of soap, pins, leather, starch, etc. Edward Bruce took Dundalk in 1315, and held his court here until he was killed in 1318. Pop. in 1871, 10,893.

Dundas', a county in Ontario, Dominion of Canada, is bounded on the S. E. by the river St. Lawrence, and intersected by the Grand Trunk R. R. Pop. in 1871, 18,777.

Dundas, a post-town of Wentworth co., Ontario, Dominion of Canada, is at the W. end of Lake Ontario, and at the head of the Desjardins Canal, on the Great Western R. R., 7 miles W. of Hamilton. It has one weekly newspaper, and manufactures of machinery, axes, combs, woollens, castings, soap, etc. It has many fine buildings. Pop. in 1871, 3135.

Dundas (Henry), Viscount Melville, a Scottish lawyer and statesman, born about 1741 of a family distinguished for forensic ability through several generations, the son of Robert Dundas, Lord Arniston (1685–1753), who was lord advocate of Scotland (1720–25), was admitted to the bar in 1763. He became lord advocate of Scotland in 1775, and a member of Parliament, in which he promoted the war against the U. S. He joined the party of Pitt, who appointed him president of the board of control in 1784, after which he was a constant supporter of that minister. In 1791 he was appointed secretary of state for the home department, and in 1794 he became secretary at war. He resigned in 1801, received the title of Viscount Melville in 1802, and was appointed first lord of the admiralty in 1804. In 1805 he was impeached for malversation, but he was acquitted by the Peers. Died May 27, 1811.—His son, Admiral Richard Saunders Dundas, born April 11, 1802, commanded a fleet in the Baltic in Feb., 1855, which bombarded Sweaborg. Died June 3, 1861.

Dundas (Sir James Whitley Deans), a British admiral, born Dec. 4, 1785. He commanded a fleet in the Black Sea in 1854, during the war against Russia. Died Oct. 3, 1862.

Dundas' Strait, Northern Australia, separates Melville Island from Coburg Peninsula, and is 18 miles wide.

Dundee' [Lat. *Taodunum*], a royal burgh and seaport of Scotland, in the county of Forfar, is finely situated on the N. side of the wide estuary of the Tay, 10 miles from the sea and 50 miles by water N. N. E. of Edinburgh; lat. 56° 27′ 36″ N., lon. 2° 57′ 45″ W. The principal public edifices are the royal exchange, opened in 1856; the corn exchange; St. Paul's church, with a tower and spire 217 feet high; the infirmary and town-hall. Here is a remarkable tower 156 feet high, built in the twelfth century, to which three parochial churches under one roof have been annexed. Dundee has a theatre, a public library, and an asylum for the insane. It is the chief seat in Great Britain of the manufacture of coarse linen fabrics—namely, osnaburgs, sheetings, ducks, dowlas, drills, and canvas. It has also manufactures of jute, confectionery, and machinery. The annual value of the flax, hemp, and jute manufactures of Dundee is about £3,000,000. Dundee has an excellent harbor, and extensive docks which cost £600,000. It is connected with Edinburgh by a railway, the passengers of which cross the Friths of Tay and Forth by large steamboats. Here are a number of shipbuilding yards. Pop. in 1871, 118,974.

Dundee, a post-village of Kane co., Ill., on Fox River, 48 miles by railroad W. N. W. of Chicago. Pop. of Dundee township, 2079.

Dundee, a post-township of Monroe co., Mich. It has four churches, two schools, and one newspaper, a bank, one paper and two planing mills. Pop. 2384.

John Cheever, Pub. "Enterprise."

Dundee, a post-village of Starkey township, Yates co., N. Y., about 12 miles from Watkins and 32 miles N. by W. from Elmira. It has one weekly newspaper, four churches, a bank, an academy, two furnaces, mills, etc. Pop. 730.

J. M. Wescott, Ed. "Record."

Dundon'ald, Earls of (1669), Barons Cochrane (Scotland, 1647).—Thomas Barnes Cochrane, eleventh earl, born April 18, 1814, succeeded his father in 1860.

Dundonald (Thomas **Cochrane**), tenth earl of, an able British admiral, born Dec. 14, 1775, was a son of the ninth earl. He entered the navy in 1793, captured many prizes from the French, and became a post-captain in 1801. In April, 1809, he was selected for the daring and perilous service of burning the French fleet in Basque Roads, and he successfully performed that exploit. Before this date he had been elected to Parliament by the Whig voters of Westminster. In 1814 he was accused of complicity in fraudulent stock-jobbing transactions, and of spreading a false rumor of the fall of Napoleon to raise the price of stocks. He was unjustly convicted, fined £1000, dismissed from the service, and imprisoned. His constituents re-elected him to Parliament, and he escaped from jail to reappear in the House. He commanded the fleet of Chili (1818–22), and fought for the Greeks against Turkey in 1827. He succeeded to the earldom in 1831, was restored to his rank in the navy in 1833, and was appointed a vice-admiral in 1841. He died Oct. 30, 1860.

Dune [from Ang.-Sax. *dûn*, a "hill"], the name given to low mounds of movable sand found on sea-coasts. They are formed by deposits of fine sand borne forward by the wind till it is obstructed by large stones or other obstacles, around which it accumulates. Dunes often cause great damage by their inroads upon the country, the department of Landes in France having been nearly overwhelmed by them. The annual inland progress of the sand is estimated at seventy-two feet. Trees and shrubs planted close together have been found to be the best protection against the encroachments of the dunes. Dunes absorb and retain much water from precipitation. The water from the dunes on the North Sea coast is brought by aqueducts into the interior, and the best water used at Amsterdam comes from this source. (See Down.)

Duned'in, a seaport-town of New Zealand, the capital of the province of Otago, is on the S. E. coast of the Middle Isle; lat. 45° 50′ S., lon. 170° 36′ E. It was founded in 1848, since when it has increased rapidly. It is the seat of an Anglican bishop. The chief export is wool. Pop. 14,857.

Dunel'len, a post-village of Piscataway township, Middlesex co., N. J., on the Central R. R. of New Jersey, 14 miles S. W. of Elizabeth.

Dunferm'line, a handsome royal burgh of Scotland, in Fifeshire, is on a long ridge 3 miles from the Frith of Forth and 15 miles N. W. of Edinburgh. It derives its prosperity chiefly from manufactures of linen, cotton, worsted, iron, etc., and is said to be unrivalled by any British town in the manufacture of damask linen. Here are also several iron-foundries, collieries, dye-works, and bleaching-works. Dunfermline was a town as early as 1100 A. D. Malcolm Canmore founded here about 1080 a Benedictine abbey, of which some ruins are still visible. Here was also a regal palace of the Stuarts, now ruined. Robert Bruce was buried at Dunfermline. Pop. in 1871, 14,958.

Dun'fish, in the U. S. a name given to codfish cured in such a manner as to give them a "dun" color. Fish for "dunning" are caught in February or in early spring. The fish are taken in deep water, are split and incompletely salted, then laid in a pile for two or three months in a dark place, and covered with salt hay, eel-grass, etc., and pressed by some weight. They are then uncovered and closely packed for several months, when they are ready for use. They acquire a peculiar flavor, which is greatly liked by many. The Isles of Shoals (Me. and N. H.) are a principal seat of this method of curing.

Dungar'van, a seaport and bathing-place of Ireland, in the county of Waterford, is on Dungarvan Bay, 40 miles E. N. E. of Cork. Its harbor admits only small vessels. It has three convents, and an old castle now used as a barrack. Pop. in 1871, 7700.

Dung Beetle, a name given to many coleopterous insects of the family Scarabæidæ and of the genera *Copris*, *Phaneus*, *Aphodius*, *Geotrupes*, *Bolbocerus*, *Trox*, and others. Some of these insects enclose their eggs in pellets or globes of manure. There are many species in America, Europe, Asia, and Africa. The sacred scarabæus of the Egyptians was a true dung beetle, the *Ateuchus sacer* of the Old World.

Dun'geon (originally Donjon, which see), a prison; a dark and subterraneous cell or place of confinement.

Dung'lison (Robley), M. D., LL.D., was born at Keswick, England, Jan. 4, 1798, received his medical education at London and Erlangen, was professor of medicine in the University of Virginia (1824–33), of therapeutics in the University of Maryland (1833–36), and of the institutes of medicine (1836–68) in the Jefferson Medical College, Philadelphia. He published about twenty volumes, among which are "Human Physiology" (1832), a "Medical Dictionary" (1833), a work of vast erudition and great value, "Therapeutics and Materia Medica" (1836), and a dictionary for the blind. Died April 1, 1869.

Dun'ham, a township of McHenry co., Ill. Pop. 999.

Dunham, a post-township of Washington co., O. P. 755.

Dun'kard, a post-township of Greene co., Pa. P. 1520.

Dunkeld', a small town of Scotland, in Perthshire, is on the Tay, 15 miles N. N. W. of Perth. It is in a vale enclosed by mountains. A cathedral was built here in 1330, several centuries after the foundation of Dunkeld, which became the seat of a bishop in 1127. Here is the mansion of the duke of Athole, with the largest and finest park in Scotland, including twenty square miles of larch woods.

Dunk'ers, Dunk'ards, or **Tunk'ers** [from the Ger.

tunken, to "dip"], a sect of German American Baptists, called by themselves **Brethren,** said to have been founded at Schwarzenau in Westphalia by one Alexander Mack in 1708, and named from their manner of baptism by trine immersion of believers. Having been driven from Germany by persecution between 1719 and 1729, they settled in Pennsylvania, and subsequently in Ohio, Indiana, Maryland, Virginia, and several other States. Their doctrines are similar to those of the Mennonites, and in the simplicity of their dress and speech they somewhat resemble the Society of Friends. They use the kiss of charity, love-feasts, feet-washing, laying on of hands, anointing with oil, etc. They have bishops, elders, teachers, and deacons. They condemn war and will not engage in lawsuits. They hold an annual meeting about Whitsuntide, which is attended by the bishops, teachers, and representatives chosen by the congregations. The belief in universal redemption, though not an article of faith, is commonly held by them. They are opposed to statistics, which they believe to savor of pride, and trustworthy statements of their number can, therefore, not be given. The entire population connected with the denomination is estimated at about 100,000. They have a monthly publication called the "Gospel Visitor." From the Dunkers as a sect must be distinguished the Seventh-Day Dunkers, commonly called GERMAN SEVENTH-DAY BAPTISTS (which see), who are sometimes confounded with them.

Dun'kirk [Fr. *Dunkerque*], a fortified seaport-town in the extreme northern part of France, is in the department of Nord, and on the Strait of Dover, about 40 miles N. W. of Lille and 46 miles E. of Dover; lat. 51° 3′ N., lon. 2° 22′ E. It is the northern terminus of the Railway du Nord. It is well built, with wide and well-paved streets, and is defended by a citadel and ramparts. The harbor is shallow, but the roadstead is large and safe. Dunkirk has several fine churches, a college, a theatre, a public library, and a town-hall; also manufactures of soap, starch, cordage, and leather, with metal-foundries and shipbuilding yards. It became a free port in 1826, since which it has an active trade in wines, liqueurs, etc. A church is said to have been built here in the seventh century among the sandhills or dunes, and hence its name, which signifies "church of the dunes." Dunkirk was taken by the English in 1658, but was sold to the French king by Charles II. in 1662. Pop. 33,083.

Dunkirk, a post-village and port of entry of Chautauqua co., N. Y., is on Lake Erie and on the Lake Shore and Michigan Southern R. R., 40 miles S. W. of Buffalo. It is the western terminus of the Erie R. R., which connects it with New York City, 459 miles distant, and the northern terminus of the Dunkirk Alleghany Valley and Pittsburg R. R. It has a good harbor and an advantageous position for trade. It has two banks, locomotive-works employing 600 men, a foundry, a coal and grain elevator, and various mills and factories. The village is lighted by gas, and supplied with water from Lake Erie by the Holly system, and has nine churches, a horse railroad, an orphan asylum, an opera-house, a library and free reading-room, etc. Two weekly newspapers are published here. Pop. 5231; of Dunkirk township, 6912.

MONROE T. CUSHING, ED. "ADVERTISER AND UNION."

Dunkirk, a post-village of Blanchard township, Hardin co., O., on the Pittsburg Fort Wayne and Chicago R. R., 84 miles E. by S. of Fort Wayne, Ind.

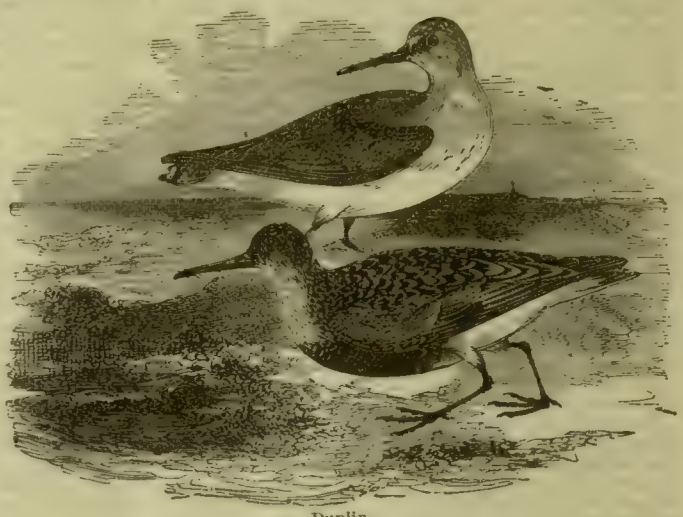
Dunkirk, a post-township of Dane co., Wis. P. 2179.

Dunk'lin, a county in the S. E. of Missouri. Area, 525 square miles. It is bounded on the W. by the St. Francis River. The surface is nearly level; the soil is fertile, but partly subject to inundation. Grain, tobacco, and wool are raised. Capital, Kennett. Pop. 5982.

Dunklin, a township of Greenville co., S. C. P. 1457.

Dunlap, a post-village of Harrison co., Ia., on the Chicago and North-western R. R. It has one weekly newspaper. It is a flourishing place, with an active trade.

L. F. COOK, ED. AND PROP. "REPORTER."



Dunlap, a post-village, capital of Sequatchie co., Tenn., on the Sequatchie River, about 94 miles S. E. of Nashville.

Dunlap (WILLIAM), an American painter and writer, born at Perth Amboy, N. J., Feb. 19, 1766. Among his paintings are "Christ Rejected" (1821) and "Calvary" (1828). He wrote, besides other works, a "Life of Charles Brockden Brown" (1827), "History of the Rise and Progress of the Arts of Design in the U. S." (1834), and a "History of the American Theatre" (1833). Died Sept. 28, 1839.

Dunleith', a city of Jo Daviess co., Ill., on the Mississippi River opposite Dubuque, and 16 miles N. W. of Galena, at the N. W. corner of the State. It is on the Illinois Central R. R., which here crosses the Mississippi by a noble bridge. The town has manufactures of machinery, castings, agricultural implements, beer, etc., and has a trade in grain. Pop. including Dunleith township, 1352.

Dun-le-Roi, a town of France, department of Cher, 16 miles S. E. of Bourges. It is an iron-mining district. Pop. 5454.

Dun'lin, called also **Sea Snipe** and **Oxbird** (*Tringa variabilis*), is a species of sandpiper found in most parts of North America and Europe. It is eight inches long, of

Dunlin.

a black, rufous, and gray color on the back, and black and white beneath. Audubon calls it the red-backed sandpiper (*Tringa alpina*).

Dun'more, a post-borough of Luzerne co., Pa., 2 miles N. E. of Scranton. It derives its prosperity chiefly from coal-mines which are worked in the vicinity. Pop. 4311.

Dunmore, EARLS OF (1686), Viscounts Fincastle and Lords Murray (Scotland, 1686), Barons Dunmore (United Kingdom, 1831).—CHARLES ADOLPHUS MURRAY, seventh earl, born Mar. 24, 1841, succeeded his father in 1845.

Dunn, a county in the W. of Wisconsin. Area, 864 square miles. It is intersected by the Red Cedar River, which enters the Chippewa River in the southern part of the county. The surface is diversified by forests and prairies; the soil is productive. Lumber, dairy products, grain, wool, and hay are the staples. It is traversed by the West Wisconsin R. R. Capital, Menomonee. Pop. 9488.

Dunn, a township of Dane co., Wis. Pop. 1172.

Dunn, a township of Dunn co., Wis. Pop. 990.

Dun'nage [etymology uncertain], on shipboard, the name given to the loose wood, fagots, and rubbish placed on the bottom of the hold to raise the cargo, either to keep it dry or to keep the ship in trim.

Dun'net Head, a rocky peninsula of Scotland, 100 to 600 feet high, in Caithness, is the most northern point of Great Britain. Here is a lighthouse 340 feet above the sea.

Dun'ning (JOHN), LORD ASHBURTON, an eminent English lawyer, born at Ashburton Oct. 18, 1731. He was called to the bar in 1756, was appointed solicitor-general in 1767, and became a Whig member of Parliament in 1768. He was a witty and sarcastic speaker, and stood in the foremost rank among English advocates. He married Elizabeth Baring in 1780, and received the title of Baron Ashburton in 1782. Died Aug. 18, 1783.

Dunn's, a township of Tuscaloosa co., Ala. Pop. 556.

Dunn's, a township of Franklin co., N. C. Pop. 838.

Dunn's Rock, a post-township of Transylvania co., N. C. Pop. 420.

Dunn'ville, a post-village of Monck co., Ontario, Can-

ada, is on Grand River and the Grand Trunk R. R., 38 miles W. of Buffalo. One weekly newspaper is published here. Steamboats can ascend the river from Lake Erie to this place, which has a large trade, a fine water-power, and considerable manufactures. Pop. 1452.

Dunra'ven and Mount Earl, EARLS OF (1822), Viscounts Mount Earl (1816), Viscounts Adare (1822), Barons Adare (Ireland, 1800), Barons Kenry (United Kingdom, 1866), and baronets (1781).—WINDHAM THOMAS WINDHAM QUIN, fourth earl, born Feb. 12, 1841, succeeded his father in 1871.

Duns Sco'tus (JOHN), surnamed THE SUBTLE DOCTOR, a celebrated theologian and scholastic philosopher, was born about 1265. He is claimed as their countryman by the Scots, the English, and the Irish. He was of gentle blood, studied at Oxford, became a Franciscan friar, and in 1301 professor of theology at that place. In 1304 he removed to Paris, where he taught theology with great distinction. He wrote many works on theology and metaphysics, and was a realist in philosophy. He opposed the teachings of Thomas Aquinas, and tried to identify their consequences with Averroism, which denied individual immortality and the freedom of the will. He held that the faculties of the soul are not subjectively distinct from each other. In theology he favored the doctrine of the immaculate conception of the Virgin Mary. He was the founder of a school called Scotists, who maintained for several centuries a controversy with the Thomists (*i. e.* the disciples of Aquinas). He died at Cologne in 1308.

Dun'stable, a township and post-village of Middlesex co., Mass. Dunstable Station is on the Boston Lowell and Nashua R. R., 33 miles N. W. of Boston. Pop. 471.

Dunstable, a township of Clinton co., Pa. Pop. 515.

Dun'stan, SAINT, an English prelate, born at Glastonbury in 925 A. D. He was a man of extraordinary abilities, and gained renown by his ascetic piety. He acquired the favor of Edred, who began to reign in 946 A. D., and he took a prominent part in the government during his reign. He was banished by Edwy, but obtained the chief power under Edgar, who became king in 959, and appointed Dunstan archbishop of Canterbury. Dunstan promoted the papal supremacy, enriched and exalted the monks, and compelled the clergy to practise celibacy. He was deprived of power on the accession of Ethelred in 978. Died May 19, 988 A. D.

Dun'ster (HENRY), the first president of Harvard College, was born in Lancashire, England, and educated at Magdalen College, Cambridge. He came to New England in 1640, and entered upon his presidency Aug. 27th of that year. In 1654 he was compelled to resign, in consequence of having borne public testimony against the baptism of infants, for which offence he was afterwards tried by a jury and placed under bonds. Still later, he was again presented by the grand jury for neglect to have one of his children baptized. He was esteemed for learning and piety. He assisted in the preparation of the "New England Psalm-book" (1640). Died at Scituate, Mass., Feb. 27, 1659. (See "Life of Dunster," by J. CHAPLIN, D. D., 1872.)

Dun'ton (JOHN), an eccentric English writer and dissenter, born at Graffham May 4, 1659. He opened a bookstore in London about 1685, but failed in business. He wrote, besides other works, "The Athenian Mercury" (20 vols., 1690–96), the "Dublin Scuffle" (1699), and "The Life and Errors of John Dunton, with the Lives and Characters of a Thousand Persons," containing an account of a visit to Boston and Salem, and sketches of ministers and prominent citizens of New England in 1685 (1705; new ed. 1818). Died in 1733.

Dunwody (SAMUEL), a minister of the Methodist Episcopal Church South, born in Pennsylvania Aug. 3, 1780. He was forty-eight years a minister in the South Carolina Conference, which extended into North Carolina and Georgia. He was a bold pioneer of Methodism, a powerful controvertist, an original thinker, and a successful preacher. He organized the first Methodist church in Savannah, Ga., in 1807. He died in South Carolina July 8, 1854. T. O. SUMMERS.

Duodeç'imals [from the Lat. *duodecim*, "twelve"], called also **Cross-Multiplication,** is the name given to a method by which the area of a rectangular surface is calculated when the length and breadth are stated in feet, inches, and lines. It is principally used by artificers in finding the contents of their work. The operation is performed by substituting the duodecimal scale of notation for the decimal.

The DUODECIMAL SCALE is the scale of notation obtained by the division of unity into twelve equal parts. Computation in this manner has some advantages, as 12 may be divided into so many equal parts—viz. 2, 3, 4, and 6; but the decimal scale, which coincides with our system of notation, is now universally preferred.

Duodeç'imo [from the Lat. *duodecim*, "twelve"], a term signifying "twelfth," is applied to a book when every sheet being six times folded forms twelve leaves. It is usually abbreviated into 12mo.

Duode'num [from the Lat. *duodeni*, "twelve," because it is about twelve finger-breadths long in man], that part of the small intestine which is nearest the stomach. In man it is eight or ten inches in length. It is the widest, shortest, and most fixed part of the small intestine, having no mesentery. It is somewhat horseshoe-like in form, the convexity to the right. It receives the secretions of the liver and the pancreas. Its muscular fibres are more numerous than in the rest of the small intestine.

Du Page, a county in the N. E. of Illinois. Area, 340 square miles. It is drained by the branches of the Du Page River. The surface is nearly level; the soil is fertile. Cattle, grain, wool, hay, and dairy products are the staples. The most numerous manufactories are those of carriages. It is intersected by the Chicago Burlington and Quincy R. R. and the Chicago and North-western R. R. Capital, Wheaton. Pop. 16,685.

Du Page, a post-township of Will co., Ill. Pop. 1118.

Dupanloup (FÉLIX ANTOINE PHILIBERT), a French bishop, born at Saint-Félix, in Savoy, Jan. 3, 1802. He became bishop of Orleans in 1849, and was admitted into the French Academy in 1854. He wrote, besides other works, a popular treatise on education (3 vols., 1855–57). In 1871 he was elected a member of the National Assembly. He was nominated archbishop of Paris in 1871, but declined that office.

Duperré (VICTOR GUY), BARON, a French admiral, born at La Rochelle Feb. 20, 1775. He gained the rank of vice-admiral in 1826, and commanded the fleet which aided the army to conquer Algiers in 1830, and was made admiral. Died Nov. 2, 1846.

Duperrey (LOUIS ISIDORE), a French navigator and hydrographer, born in Paris in 1786. He conducted an exploring expedition in 1822 to the islands of the Pacific. He surveyed the coasts of New Zealand and parts of Australia, returned in 1825, and published a "Voyage Round the World in the Corvette La Coquille" (1826–30).

Dupetit-Thouars (ABEL AUBERT), a French admiral, born Aug. 3, 1793, was the son of ABEL AUBERT DUPETIT-THOUARS, captain of the ship Le Tonnant, destroyed in the battle of Aboukir, and nephew of LOUIS MARIE AUBERT DUPETIT-THOUARS, botanist (born Nov. 11, 1758, died in 1831), who explored the botany of Africa, Madagascar, etc. He was appointed commander of the naval forces in the Pacific Ocean, and seized the island of Tahiti in 1842, but this act was disavowed by his government. He published a "Voyage Round the World" (10 vols., 1841–49). Died Mar. 17, 1864.

Dupin (ANDRÉ MARIE JEAN JACQUES), a French lawyer and statesman, born at Varzy, in Nièvre, Feb. 1, 1783. He gained distinction as the advocate of Marshal Ney, Béranger, and other persons tried for political offences. In 1826 he was elected a member of the Chamber of Deputies, in which he acted with the liberals. He promoted the revolution of 1830 and the accession of Louis Philippe. He was chosen president of the Chamber of Deputies eight times between 1832 and 1848, and was admitted into the French Academy in 1832. In Feb., 1848, he supported the count of Paris as the successor to Louis Philippe, but he recognized the republic which was then formed. He was a prominent member of the Constituent Assembly, and was president of the Legislative Assembly in 1849. In 1857 he was appointed procureur-général of France. He published, besides other works, "Mémoires et Plaidoyers" (20 vols., 1806–30). Died Nov. 10, 1865.

Dupin (FRANÇOIS PIERRE CHARLES), BARON, a French geometer, a brother of the preceding, was born at Varzy Oct. 6, 1784. He visited England in 1816, and published "Travels in Great Britain" (6 vols., 1820–24). He became professor of mechanics at the Conservatoire des Arts et Métiers in 1810. He wrote on geometry and mechanics, and did much to advance the useful arts and improve the condition of the laboring people. In the legislature his labors were extensive. He was an Orleanist. Died Jan. 18, 1873.

Duplain', a post-township of Clinton co., Mich. Pop. 1493.

Dupleix (JOSEPH), MARQUIS, a French governor, born about 1695. He amassed a fortune by commercial operations in India, and in 1742 was appointed governor of Pondicherry and all the French possessions in India. He formed the project of founding a European empire in that

country, and soon made himself master of the Carnatic, partly by fighting and partly by political intrigues. He was opposed by the English general Clive, who defeated the French in several battles. Dupleix was removed from the command in 1754, and returned to France, where he died in 1763.

Duplicate Ratio, the ratio of squares. Thus, the simple ratio of 2 to 4 is $\frac{2}{4}=\frac{1}{2}$; the duplicate ratio is $2^2:4^2 = \frac{4}{16}=\frac{1}{4}$.

Du'plin, a county in the S. E. of North Carolina. Area, 660 square miles. It is intersected by the North Branch of Cape Fear River. The surface is level; the soil is mostly sandy, and is partly covered with forests of pine. Cotton, corn, rice, wool, and cattle are raised. It is traversed by the Wilmington and Weldon R. R. Capital, Kenansville. Pop. 15,542.

Dupon'ceau (Peter S.), LL.D., a French lawyer and scholar, born in the island of Rhé June 3, 1760. He emigrated to the U. S. in 1777, and served in the army as aide-de-camp to Baron Steuben. He practised law in Philadelphia with distinction, and was president of the American Philosophical Society. He wrote on philosophy and other subjects. In 1838 he published a work on Indian languages. Died April 1, 1844.

Dupont', a post-twp. of Waupaca co., Wis. Pop. 150.

Dupont (Henry). See Appendix.

Dupont (Henry A.). See Appendix.

Dupont (Pierre), a popular French song-writer, born at Lyons April 23, 1821. He composed the words and airs to his poems at the same time. Among his works are "The Two Angels," a poem (1842), "Song of Bread," and "Song of the Workers." Died at Lyons July 25, 1870.

Du Pont (Samuel Francis), U. S. N., born of French descent Sept. 27, 1803, at Bergen Point, N. J., entered the navy as a midshipman Dec. 19, 1815, became a lieutenant in 1826, a commander in 1842, a captain in 1855, and a rear-admiral in 1862. To attempt to give, within the limits assigned in this volume to biography, even a brief outline of the services of one whose naval life of fifty years was but a record of constant and continuous devotion to the navy and the country, would indeed be vain. The writer must therefore restrict himself to saying that while in command of the Cyane on the W. coast of Mexico during our war with that republic, Du Pont added to a name already distinguished a reputation for ability, sound judgment, discreetness, and daring which all his after service tended greatly to strengthen; so that when the first act of the drama of the civil war opened with the fall of Fort Sumter, Du Pont stood prominently forward, by the side of Farragut and Foote, as one to whom might safely be entrusted the honor and welfare of his country in this her hour of need. As soon, therefore, as the government had decided "to seize and occupy one or more important points on our Southern coast," it confided to his care that part of the joint army and navy expedition organized for this purpose, upon which the success of the whole depended; and when he unfurled his flag from the masthead of the Wabash, the desk of the secretary of the navy was filled with applications from officers asking to serve under him; for all were anxious to *follow* whithersoever Du Pont might choose to *lead*. How well founded their confidence the result shows; for on the evening of the ninth day after sailing from Hampton Roads, Du Pont, with his fleet of fifteen vessels, was in possession of Port Royal Bay, one of the finest and largest harbors of the South, after a brilliant and successful engagement of four hours with two strong forts splendidly garrisoned and mounting forty-three guns, all but four of which were of heavy calibre. He now established a rigid blockade of the coast, pushed his vessels into almost every bay, inlet, and river of South Carolina, Georgia, and Florida, and took possession of several strong places which served as *points d'appui* for the army.

On the 7th of April, 1863, at 3 P. M., he engaged Fort Sumter with eight iron-clads, and, not having silenced the fort at 4.30 P. M., made signal then "to withdraw from action," intending to renew the engagement on the following morning; but, finding that many of his vessels were injured, and one, the Keokuk, sunk, he became convinced that to do so would be "to convert failure into disaster," and abandoned his design, expressing to the department his opinion that Charleston could not be taken "by a purely naval attack"—a judgment that the events of the next two years amply vindicated and sustained. In July, 1863, being relieved from the command of the South Atlantic fleet, he returned to his home, where he died on the 23d of June, 1865, sincerely regretted by the whole navy.

A thorough seaman, an accomplished officer, a Christian gentleman, he was beloved by all who came in contact with him, and best by those who knew him best. His mind, like his stature, was above that of ordinary men, his person graceful and commanding, his countenance handsome, thoughtful, and interesting; and "in looking upon him," as Tacitus says of the wise and virtuous Agricola, "you would have been easily convinced that he was a good man, and you would have been willing to believe him a great one." Foxhall A. Parker, U. S. N.

Dupont de l'Étang (Pierre), a French general, born at Chabannais July 14, 1765. He served with distinction at Jena (1806) and Friedland (1807). Having obtained the command of an army in Spain, he was defeated at Baylen in June, 1808, by De Castaños, who took from him 18,000 prisoners. For this ill-success he was disgraced and imprisoned. Died Feb. 16, 1838.

Dupont de l'Eure (Jacques Charles), a French judge and legislator, born in 1767. He was liberal in politics, and represented his native department (L'Eure) in the Chamber of Deputies (1817–48). He was chosen president of the provisional government in Feb., 1848. Died in 1855.

Dupont de Nemours (Pierre Samuel), a French economist, born in Paris Dec. 14, 1739. He became a member of the National Assembly in 1790, and of the Council of Ancients in 1795. In 1795 he was admitted into the Institute. He refused to take office under Napoleon, and emigrated to Delaware in 1815. He wrote several treatises on political economy and natural history, and "Philosophie de l'Univers" (1796). Died Aug. 6, 1817.

Dupré (Giovanni), an Italian sculptor, born at Sienna Mar. 1, 1817, first practised his father's trade of wood-carving. His works treat mostly of religious subjects; among them are "Abel" and a "Pietà." Died Sept., 1869.

Dupré (Jules), a French landscape-painter of the realistic school, born at Nantes in 1812, was the son of a maker of porcelain, in which occupation he first engaged. He first exhibited in 1831.

Dupuis (Charles François), a French philosopher, born at Trie-le-Château (Oise) Oct. 16, 1742. He became professor of rhetoric in the College of Lisieux in 1766, and was a friend and pupil of Lalande the astronomer. His "Origine de tous les Cultes, ou la Religion Universelle" (12 vols., 1794), contained bold speculations on religion. Died Sept. 29, 1809.

Dupuytren (Guillaume), Baron, a French surgeon and anatomist, born Oct. 6, 1777, became professor of surgery in Paris in 1811. He was reputed the most skilful French surgeon of his time, made important discoveries in morbid anatomy, and invented several useful instruments. Died Feb. 8, 1835. (See Cruveilhier, "Vie de Dupuytren," 1841.)

Duquesne, du-kain', a former borough of Alleghany co., Pa., on the right bank of the Alleghany River. It has been annexed to Allegheny City, of which it forms the eighth ward.

Duquesne (Abraham), Marquis, a famous French naval commander, born at Dieppe in 1610. He served with distinction against the Spaniards at Tarragona in 1641. In 1643 he defeated the Danes near Gothenburg, and compelled them to make peace. He defeated the Spanish and Dutch fleet under De Ruyter in the Mediterranean, near Catania, in April, 1676. Died at Paris Feb. 2, 1688. (See André Richer, "Vie du Marquis Duquesne," 1783.)

Duquesnoy (François), called Il Fiammingo, a sculptor, born at Brussels in 1594, was a friend of N. Poussin, and a rival of Bernini at Rome. Died in 1646.

Duquoin, a city of Perry co., Ill., on the Illinois Central R. R., 76 miles N. of Cairo, at its junction with the St. Louis and Southern Illinois R. R. It has four churches, one graded school, a park and public library, a foundry and machine-shops, salt-works, two flouring-mills, stave-factory, and twelve coal-mines. It has one weekly newspaper. Pop. 2212. R. Berrey & Co., Props. "Tribune."

Du'ra Ma'ter [the Lat. for "hard" or "unyielding mother," so named because it is more unyielding than the "pia mater"], the outermost of the three meninges or membranes enveloping the brain and spinal cord in vertebrate animals. Within the skull it is so completely joined to the bones that it may be regarded as their endosteum. Its inner surface is covered with pavement epithelium, and perhaps by the parietal layer of the arachnoid membrane, but this is denied by Kölliker. The dura mater sends out sheaths for the nerves as they go through their foramina. It is usually studded, except in infancy, by numerous small whitish masses called the Pacchionian bodies, whose use is not understood. The tentorium and the falces (*falx cerebri* and *falx cerebelli*) are induplications of the dura mater sent into the cavity of the skull. Within the spinal canal the dura mater becomes a fibrous tube, separated from the vertebræ (which have an endosteum) by a loose areolar

fatty tissue and a plexus of veins. It is much larger than the spinal cord, the space between being filled by the other meninges and by the cerebro-spinal fluid.

Dura'men [from *duro*, to "harden"], a Latin word signifying a "hardening," is a term applied in botany to the hardened and matured central layers of exogenous trees, commonly called "heart-wood." It is more dense, compact, and durable than the alburnum or sap-wood, and its tubes are filled with the peculiar secretions of the tree, so that the sap no longer circulates freely through them. In many species it is of a darker color than the alburnum. The duramen is the most valuable part of the tree for timber and for the use of the cabinet-maker.

Durance [Lat. *Druentia*], a river in the S. E. part of France, rises among the Cottian Alps in the department of Hautes-Alpes. Its general direction is nearly southwestward. It flows through the department of Basses-Alpes, forms the south-western boundary of Vaucluse, and enters the Rhone 3 miles below Avignon. Its total length is nearly 200 miles. Marseilles is supplied with water from this river by an aqueduct 51 miles long.

Durand', a township and village of Winnebago co., Ill., on the Western Union R. R. Pop. 1578.

Durand, a post-village, capital of Pepin co., Wis., is in Durand township and on the Chippewa River, about 20 miles N. of Wabashaw (Minn.). It has one weekly newspaper. Pop. of township, 917.

S. A. Foster, Ed. "Times."

Durand (Asher Brown), an eminent American painter and engraver, born at Jefferson, N. J., Aug. 21, 1796. He engraved several portraits for the "National Portrait Gallery," also Trumbull's "Declaration of Independence." After 1835 he devoted himself almost exclusively to painting, and gained brilliant fame as a landscape-painter. Among his paintings are "The Capture of Major André," "The Wrath of Peter Stuyvesant," "A Primeval Forest," "Franconia Mountains," and "The Rainbow."

Durand (Guillaume) **de Saint-Pourçain,** known as the "Most Resolute Doctor," a scholastic divine, born at St.-Pourçain, Auvergne, about 1280. He was a Dominican friar in his youth. In 1318 he became bishop of Puy, and bishop of Meaux in 1326. He died about 1332. He was a decided nominalist, and by his independent thinking is believed to have contributed to the rise of the Reformation. His best-known writings are commentaries on Peter Lombard, and a work on the canon law ("De Origine Jurisdictionum"). In his treatise "On the State of the Pious Dead" he attacked the opinions of Pope John XXII.

Duran'do (Giacomo), an Italian general, born at Mondovi in 1807. He printed in 1847 a brochure in favor of Italian unity under a constitutional government, which had an extensive influence. He was minister of war at Turin in 1854–55, and became a senator in 1860. In 1862–63 he was minister of foreign affairs in the cabinet of Ratazzi.

Duran'go, a state of Mexico, bounded on the N. by Chihuahua, on the E. by Cohahuila, on the S. by Xalisco, and on the W. by Cinaloa. The surface is mostly mountainous. It belongs to the N. part of the table-land of Anahuac. Area, 42,645 square miles. Gold and silver are found here. Capital, Durango. Pop. in 1871, 185,077.

Durango, or **Guadiana,** a town of Mexico, capital of the above state, is about 150 miles N. W. of Zacatecas; lat. 24° 2′ N., lon. 103° 34′ W. It is nearly 7000 feet above the level of the sea. It is the seat of a bishop, and has a cathedral, a college, a mint, several convents, and a theatre; also manufactures of tobacco and iron. Pop. in 1868, 12,449.

Durant', a post-village of Farmington township, Cedar co., Ia., on the Chicago Rock Island and Pacific R. R. Pop. 373.

Durant, a post-village of Holmes co., Miss., on the Mississippi Central R. R., 59 miles N. by E. of Jackson. Pop. 375.

Duran'te (Francesco), an Italian composer, born Mar. 15, 1684, studied music at Naples under Gaetano Greco and under Scarlatti, and in 1742 became director of the conservatory of Sta. Maria di Loreto at Naples. His compositions consist solely of church music, and are marked by loftiness and purity of style. Died Aug. 13, 1755.

Dura'zzo [Turkish *Drasch*; anc. *Epidamnus*, afterwards *Dyrrhachium*], a fortified maritime town of European Turkey, in Albania, is on the Adriatic; lat. 41° 18′ N., lon. 19° 28′ E. It is the seat of a Roman Catholic archbishop. It has a safe harbor and an active trade. Grain, tobacco, and olive oil are exported from it. The ancient *Epidamnus* was a populous city. The expulsion of its aristocracy in 436 B. C. was the origin of the Peloponnesian war. The Romans changed the name to Dyrrhachium (which see). It was captured by the Norman chief Robert Guiscard in 1082, and by the Venetians in 1205. Pop. about 8000.

Dur'bin (John Price), D. D., an American Methodist preacher, born in Bourbon co., Ky., in 1800, was educated at Miami University and Cincinnati College, and entered the ministry in 1819. He became president of Dickinson College in Pennsylvania in 1834. Having visited Europe and the Levant, he published "Observations in Europe, principally in France and Great Britain" (2 vols., 1844), and "Observations in Egypt, Palestine, etc." (2 vols., 1845). For many years he was missionary-secretary of the Methodist Episcopal Church, and displayed great eloquence and administrative ability in its affairs. He resigned the presidency of Dickinson College in 1845. He has furnished many contributions to periodicals, etc.

Dü'ren, or **Mark Düren** (anc. *Marcodurum*), a town of Rhenish Prussia, on the river Roer and on the Cologne and Aix-la-Chapelle Railway, 18 miles E. of Aix-la-Chapelle. It has a Catholic gymnasium, a high-school, a female high-school, an asylum for the blind, several fine churches, and manufactures of woollen cloth, carpets, cotton goods, etc. It was besieged and taken by Charles V. in 1543. Charlemagne held diets here in 775 and 779 A. D. Pop. in 1871, 12,850.

Dü'rer (Albrecht), a celebrated German painter and engraver, born at Nuremberg in 1471. The day of his birth is uncertain, owing to the way in which it is inserted in his father's diary, but it was probably May 21st. He was a pupil of Michael Wohlgemuth, with whom he studied and worked three years (1486–89). He afterwards passed four years in travel, visiting various parts of Germany, and returned to Nuremberg in 1494. In the same year he married Agnes Frey, with whom he is said to have lived unhappily, though there is no good authority for the widespread belief. He visited Venice in 1505, and while there painted a picture for the Tedeschi, or guild of German merchants, which was probably "The Feast of the Rose Garlands," now in the monastery of Strahow at Prague. This was his first picture of importance. In 1520 he went to the Netherlands, accompanied by his wife; and during his journey, the object of which is not known, he kept a minute diary, which was first published in Von Murr's "Journal zur Kunstgeschichte" (1775–88). This curious and interesting record of early travel has been several times translated into English. Dürer returned home in 1521, and continued to live in his native town until his death, April 6, 1528. Dürer's works consist of paintings in oil and engravings on wood and copper. He has also left a number of etchings; and over 500 of his drawings in pen and ink, water-color, chalk, charcoal, India-ink, and with the silver point, exist in public and private collections. These drawings and sketches are remarkable for their precision, delicacy, and firmness of touch, and for the power of observation and patient study they reveal in the master. The finest collections are in the British Museum, the Albertina Gallery at Vienna, and the Uffizi at Florence. His most celebrated paintings are "The Four Apostles," originally presented by him to the city of Nuremberg, but now in Munich; his own portrait in the Uffizi Gallery at Florence; and an "Adoration of the Magi," a most beautiful picture, well worthy of the place it occupies in the tribune. His best wood-cuts are the four series "The Apocalypse," "The Great Passion," "The Little Passion," and "The Life of the Virgin," but there are many fine single cuts. Dürer is not believed to have engraved all the wood-cuts that bear his monogram, but only to have made the designs. Perhaps the works by which Dürer is most widely known are his engravings on copper. Of these the most famous are the "Adam and Eve," the "Melancholia," the "Knight, Death, and the Devil," the "Saint Eustache," "Saint Jerome in his Study," and "The Great Fortune." These are all large, but many among the smaller engravings are equal miracles of execution. Dürer was much beloved by the emperor Maximilian I. and by many of the most distinguished men of his time—by Luther, by Melanchthon, by Erasmus, as well as by lesser men, such as Camerarius and Pirkheimer. When in Venice he received much kindness from Bellini, and Raphael and he exchanged specimens of their work. Dürer has left us valuable portraits of Melanchthon, Erasmus, Pirkheimer, and many other notables of his time. He was the author of several treatises—"The Art of Fortification," "Instruction in the Art of Mensuration with the Rule and Compass," with one on "The Proportions of the Human Body," published after his death. A work on the "Proportions of the Horse" is now lost, as is also one on "The Art of Fencing," with perhaps some others whose names are not known. (See J. Heller, "Das Leben und die Werke A. Dürers," 1827–31; only the second volume of this valuable work ever appeared. See also lives of

Dürer by Roth, Nagler, Von Eye, in German, Charles Narrey in French, and in English by Mrs. C. Heaton, 1869, and W. B. Scott, 1869.) Of late years a great interest has been felt in Dürer, and many important publications relating to him have appeared in Germany. A photo-lithographic imitation of his "Little Passion," in thirty-seven sheets, was published by J. W. Bouton in 1868, and copies of his copper-plates by J. R. Osgood, Boston, in 1872. Clarence Cook.

Du'ress [Lat. *duritia*, "hardship"], in law, is either of the person or of goods. 1. *Of the Person.*—This is exercised in two modes, either by threats or by imprisonment. Duress by threats (*per minas*), according to the older authorities, occurred where a person entered into a contract or performed some other act through fear of loss of life or limbs, or grievous bodily harm. It was even an excuse for some crimes, but not for those of the graver class, such as the killing of an innocent person. The modern cases do not take quite so technical a view of the subject, and the tendency is to make the presence of duress turn on positive inquiry whether the threat was of a kind calculated to overcome the will of a person of ordinary firmness and prudence. In equity jurisprudence the word is used in a broader sense than in the courts of common law, and includes cases where a party is in extreme necessity and distress; and duress may be exercised not only towards the person who makes a contract, but in certain cases towards one standing in confidential relations with him. Thus, a threat to prosecute criminally a son, whereby a father is induced to execute a deed in order to save him from arrest, is sufficient duress in equity to furnish a basis to set the conveyance aside. A contract executed under duress is not void, but only voidable at the election of the injured party. Duress of imprisonment can only be affirmed of the case of unlawful restraint.

2. *Duress of Goods.*—This phrase refers to a case where a person having goods illegally detained pays money to obtain their release. If such payment is made under protest, the money may be recovered back, as being paid under compulsion. An instance is an exaction of unauthorized duties upon goods by the collector of a port. The mode of making the protest in this special case is regulated in the U. S. by act of Congress.

The question has been raised whether the doctrine of duress can be applied in international law to relieve a nation from the obligations of a treaty of peace. The answer must in general be in the negative, as the terms of peace, however humiliating, are the chances of war to which the parties have appealed. T. W. Dwight.

Duret (Francisque Joseph), a French sculptor, born Oct. 19, 1804, studied with his father, with Bosio, and at Rome. His works, among them "Fisher-boy Dancing" (1833), "Vintager" (1839), and statues of Molière and Chateaubriand, are noble compositions of great spirit and correctness. Died in May, 1865.

Dur'fee (Job), LL.D., an American jurist, born at Tiverton, R. I., Sept. 20, 1790, graduated at Brown University in 1813, became a member of Congress in 1820, and chief-justice of Rhode Island in 1835. He wrote, besides other works, "What Cheer?" a poem on the adventures of Roger Williams (1832). His life and writings were published by his son (1849). Died July 26, 1847.

D'Ur'fey (Thomas), an English dramatist, born at Exeter, gained the favor of Charles II. He wrote successful comedies, popular songs, and odes. Died in 1723.

Durgâ, or **Dourga,** a Sanscrit word signifying "difficult of access," and forming one of the many names of Pârvatî (which see).

Dur'ham, a county in the N. part of England, is bounded on the N. by the river Tyne, on the E. by the German Ocean, and on the S. by the river Tees. Area, 973 square miles. The surface is hilly, but the greater part of the land is arable. The rocks which underlie it are new red sandstone, carboniferous limestone, and magnesian limestone. Among its mineral resources are coal, iron, lead, and marble. The collieries of Durham are the most extensive and valuable in England. Durham produces a celebrated breed of short-horned cattle. The chief towns are Durham, Sunderland, Darlington, South Shields, and Gateshead. Durham is one of the three counties palatine of England. Pop. in 1871, 685,045.

Durham [Sax. *Dunholme*, from *dun*, a "hill," and *holme*, a "river"], an episcopal city of England, the capital of the above county, is on the river Wear, 14 miles S. of Newcastle. It is built around a steep rocky hill, the top of which is occupied by a castle and cathedral. It is connected by railways with Newcastle and other towns. It sends two members to Parliament. Here is a castle founded by William the Conqueror about 1072. The magnificent cathedral of Durham was founded in 1093, and is a Norman structure 507 feet long by 200 wide, with a central tower 214 feet high. This cathedral contains the tombs of Saints Cuthbert and Bede. The see of Durham was long the richest bishopric in England. This city is the seat of the University of Durham, which was opened in 1833. Pop. in 1871, 14,406.

Durham, a county of Ontario, Dominion of Canada. Area, 620 square miles. It is bounded on the S. by Lake Ontario, and intersected by the Grand Trunk R. R. and the Midland Railway of Canada. Capital, Port Hope. Pop. in 1871, 37,381.

Durham, a post-village of Gray co., Ontario. It has a weekly newspaper and important manufactures. Pop. about 2500.

Durham, a post-township of Middlesex co., Conn. It is the seat of an academy. Pop. 1086.

Durham, a post-township of Hancock co., Ill. Pop. 1019.

Durham, a post-township of Androscoggin co., Me. It has manufactures of carriages and cooperage. Pop. 1350.

Durham, a township and post-village of Strafford co., N. H., on the Boston and Maine R. R., 6 miles S. of Dover. It has manufactures of brick, wall-paper, etc. Pop. 1298.

Durham, a post-township of Greene co., N. Y. It has several tanneries and mills. Pop. 2257.

Durham, a township and post-village of Orange co., N. C., on the North Carolina R. R., 25 miles N. W. of Raleigh. It has manufactures of tobacco. One weekly newspaper is published here. The surrender of Gen. J. E. Johnston, April 25, 1865, took place near by. Pop. 2323.

Durham, a post-township of Bucks co., Pa. P. 1209.

Durham, Earls of, and Viscounts Lambton (1833), Barons Durham (United Kingdom, 1828).—George Frederick D'Arcy Lambton, second earl, born Sept. 5, 1828, succeeded his father in 1840.

Durham (John George **Lambton**), Earl of, an English statesman, born in the county of Durham April 12, 1792. He was elected to Parliament by the Whigs in 1813, and was an advanced liberal. He was created Baron Durham in 1828, became lord privy seal in the cabinet of Earl Grey in Nov., 1830, and was one of the four persons who prepared the Reform bill of 1831, which he supported in the House of Lords. In 1833 he resigned the office of lord privy seal and received the title of earl. He was sent as ambassador to Russia in 1835, and was appointed governor-general of Canada in 1838, but returned suddenly in Dec., 1839. Died July 28, 1840.

Durham Breed of Cattle. See Short Horns.

Dur'hamville, a post-village of Verona township, Oneida co., and of Lenox township, Madison co., N. Y., is on the New York and Oswego Midland R. R., 55 miles S. E. of Oswego, and on the Erie Canal. It has manufactures of glass, leather, and castings. Pop. 859.

Du'rian, or **Durion** (*Durio Zibethinus*), a tree of the order Sterculiaceæ, a native of the Malay peninsula, cultivated by the Malays for its delicious fruit, which forms a great part of their food. It is a lofty tree, with simple leaves and large clusters of pale yellow flowers. The fruit is globular or oval, about ten inches in diameter, and has a hard, thick, prickly rind enclosing a creamy pulp and about ten seeds, which are eaten roasted. It combines the most delicious flavor with a very offensive odor, and brings a higher price than any other fruit.

Durivage (Francis Alexander), was born in Boston, Mass., in 1814. He published a "Cyclopædia of History," "Stray Subjects," and other works, including popular tales, poems, and plays.

Dur'kee (Charles), a politician, was born at Royalton, Vt., Dec. 5, 1807, removed to Wisconsin Territory in 1830, was a Free-Soil member of Congress (1849–55), U. S. Senator (1855–61), and governor of Utah (1865–70). Died Jan. 14, 1870.

Durk'heim, a town of Bavaria, on the Isenach, 20 miles N. of Landau. It has a castle, a hospital, and manufactures of paper and glass. It is surrounded by beautiful scenery, and is a resort of invalids. It has an active trade in wine. Pop. in 1871, 5572.

Dur'lach, a town of Germany, in Baden, on the river Pfinz, and on a railway, 3 miles E. of Carlsruhe. It is at the base of the Thurmberg, a hill the top of which is occupied by a ruined castle. Pop. in 1871, 6327.

Duroc (Gérard Christophe Michel), duke of Friuli, a French general and diplomatist, born at Pont-à-Mousson Oct. 25, 1772. He became in 1796 aide-de-camp to Bonaparte, whom he accompanied to Egypt in 1798. During

the consulate and empire he was sent on diplomatic missions to Berlin, Vienna, and other courts. He was a favorite officer of Napoleon. He was killed at Markersdorf May 23, 1813.

Duruy (Victor), a French historian, born in Paris Sept. 11, 1811. He published many popular and excellent historical and geographical works, some of which were designed for schools. He was minister of public instruction from June, 1863, to July, 1869, and made important changes in the educational system of France.

Duryea (Joseph T.), D. D. See Appendix.

Dushore, a post-borough of Sullivan co., Pa., on the Sullivan and Erie R. R., about 35 miles N. W. of Wilkesbarre. It has one weekly newspaper. Pop. 376.

Dusky Bay, of New Zealand, is a large inlet on the S. W. coast of the Middle Island. It affords good anchorage. Lat. 45° 40′ S., lon. 166° 20′ E.

Düs'seldorf, a town of Rhenish Prussia, the former capital of the duchy of Berg, is finely situated on the right bank of the Rhine, at the mouth of the river Düssel, 17 miles N. N. W. of Cologne; lat. 51° 13′ N., lon. 6° 45′ E. It is connected by railways with Cologne, Elberfeld, and other towns. The Rhine is here crossed by a bridge of boats. Düsseldorf is mostly built of brick, and has wide and regular streets. It contains an old electoral palace, a gymnasium, a realschule, a town-hall, a public library, a theatre, an observatory, and several fine churches. Here are manufactures of woollen and cotton fabrics, jewelry, hats, leather, carpets, etc. Its prosperity is derived partly from trade and the navigation of the Rhine. Here is a fine public garden called the Hofgarten, and a celebrated academy of art. This town became a free port in 1829. It has increased rapidly in recent times. Pop. in 1871, 69,351.

Düsseldorf School of Painting. The Düsseldorf Academy, founded in 1767 by Prince Charles Theodore, led a languishing life until, under the patronage of Frederick William III., Cornelius was appointed director, which position he continued to fill until his removal to Munich in 1826. A man of such ability and force naturally quickened the growth of art, and the academy soon became the centre of a new life. On the departure of Cornelius, William von Schadow was made director, and his great skill as a teacher, added to his proficiency in his art, increased the reputation of the academy as a school, and drew to it more and more of the rising, undeveloped talent of Young Germany. The names that make this period in the history of German art, in the eyes of Germans at least, a modern Renaissance — Koch, Overbeck, Veit, Schnorr, Von Schwind—are most widely known by the frescoes with which they adorned so many palaces, villas, churches, and public buildings in Rome, Munich, and Berlin; but the artists of the Düsseldorf School have spread the name of their Alma Mater far and wide by means of their easel-pictures. Their chief influence outside of Germany has been in America, where many of their best works have been exhibited and sold, and whither several artists, mostly of American birth, have brought the doctrines they learned at Düsseldorf, either in the academy or in the studios of German artists residing there, and have gained much influence and a widespread reputation at home and abroad by putting them in practice. In 1853 an exhibition of Düsseldorf pictures, belonging to Mr. Boker, was opened in the city of New York, and long continued one of the principal attractions of the town. It made Americans familiar with the names of Lessing, Hübner, Karl Sohn, Hildebrand, Steinbrück, Andreas Achenbach, Hasenclever, and Preyer; and as the specimens of their work contained in this gallery were of the best, there came nearer to being a real enthusiasm on the subject of art awakened in our Eastern States than was ever before, or than has since, been possible. A group of Americans, Eastman Johnson, George H. Hall, W. Whittredge, were somewhat influenced by their studies at Düsseldorf, but fortunately for his country other and larger influences saved the first of these from being spoiled by the teachings of the academy, and preserved to us one of the best of our painters. But we were not so fortunate in the cases of Leutze and Bierstadt, two artists of considerable native ability, who were fatally overmastered by the Düsseldorf Academy, and whose influence in this country has set art back for fifty years. While it would not be fair to compare their works with those of the more famous members of the school in Europe, it cannot be denied that their pictures were the direct outcome of the system taught at Düsseldorf, though it must be admitted that the system was unfortunate in its representatives—men of small culture, and working in a community where art was necessarily little understood.

The school at Düsseldorf was early divided into two parties—the Catholic and the Protestant, the former seeking to restore the ancient exclusive devotion of art, as in the Old Cologne School, to religious, chiefly Roman Catholic, subjects: the other, of which Lessing was the acknowledged head, refusing to be shut up in such narrow limits, and painting all subjects—landscape, genre, historical, and religious—having, however, a strong leaning to the Protestant side. The harm the Düsseldorf School has done is not perhaps greater than has been done by the schools of Berlin and Munich: it seems greater to an American, because we have suffered so much from it. It inculcates the fatal doctrines that art can be taught, and that its ministry is that of a preacher of doctrines or a narrator of anecdotes, religious, historical, domestic. It confounds art with science, and dissects where it ought to create. But in their own narrow, pedantic field here were men of sense, talent, learning, industry—everything but genius; the men of genius in Germany, as everywhere, have grown up and worked outside of all schools—and they have had the reward that always awaits the commonplace and the practical. They have been extremely popular, they have stimulated a great number of kindred minds, and they have more than supplied the demand for works of art that everybody can understand. Clarence Cook.

Duston (Hannah). See Appendix.

Dutch Creek, a post-twp. of Yell co., Ark. Pop. 466.

Dutch Creek, a post-township of Washington co., Ia. Pop. 1228.

Dutch'ess, a county in the E. S. E. of New York. Area, 810 square miles. It is bounded on the W. by the Hudson River, and is drained by Fishkill River. The surface is hilly; the soil is generally fertile. Cattle, grain, tobacco, wool, potatoes, hay, butter, and milk are largely produced. The manufacturing interests are varied and quite extensive, embracing iron, metallic wares, clothing, flour, cooperage, sash, doors, and blinds, carriages, etc. Limestone, marble, iron, and lead are found here. It is intersected by the Hudson River R. R., the Harlem R. R., and the Dutchess and Columbia R. R. Capital, Poughkeepsie. Pop. 74,041.

Dutch Flat, a mountain-village of Placer co., Cal., on the Central Pacific R. R., 67 miles from Sacramento. It has productive hydraulic gold-mines. Pop. about 2000.

Dutch Fork, a township of Lexington co., S. C. Pop. 1352.

Dutch Gap Canal, a cut through the narrow isthmus of a peninsula known as Farrar's Island, in the James River, about 5 miles below Richmond, Va., designed to afford the national vessels a nearer approach to the Confederate works, to avoid the great obstructions which had been placed in the curve of the river, and to outflank the heavy Howlett House batteries. It was executed under Major P. S. Michie, by order of Gen. B. F. Butler. The work was undertaken Aug. 15, 1864, and finished Jan. 1, 1865; but a large part of the bulkhead of clay which was blown out by powder on that occasion fell back, so as to obstruct navigation for the time. It was of no service to either side during the war, but has since shortened the navigation of the river to Richmond some seven miles.

Dutch Gold, an alloy of copper and zinc, closely resembling common brass, but having rather less zinc in its composition than brass generally has. It is used for beating into thin plates, resembling gold-leaf in appearance when new, and used for ornamentation instead of gold-leaf. It tarnishes readily, and may be tested by the application of strong nitric acid, which will not injure gold-leaf, but which readily dissolves the imitation.

Dutch Guiana. See Guiana.

Dutch Language and Literature. The Dutch is the language spoken by the inhabitants of the Netherlands. It is so closely allied to the Flemish that in their earlier forms, at least, the two may be considered as one and the same tongue. The Dutch belongs to the Aryan (otherwise called the Indo-European) family of languages, and to the Teutonic subdivision of that great family. The study of the Dutch language is of especial interest to the student of English, as well as to the general philologist, as presenting one of the most important links that connect our tongue with the German, and also as bearing a very close relationship to the Lowland Scotch.

The Dutch alphabet consists of the same letters as our own. The vowels *a*, *e*, *i*, *o*, *u* are essentially the same in sound as in French; but *u*, followed by a consonant in the same syllable, is pronounced nearly like short *u* in English. *Y* (now mostly replaced by *ij*) has the sound of the long *i* (*ī*) in English. A long vowel sound before a consonant in the same syllable is usually indicated by doubling the vowel, as *laat* ("late"), *been* ("bone"), *zoon* ("son"), *duur* ("duration"). *Ae* is equivalent to long *a*; it is now replaced in spelling by *aa*. *Ei* or *ey* sounds like long *i* in Eng-

lish; *eu* is like *eu* in French: *ie* like our *ee*. *Ij*, as already intimated, is pronounced like our long *i*. *Oe* sounds like our *oo; ui* or *uy* like *oi*. The consonants *b, c, f, h, k, l, m, n, p, r, s, t, x*, and *z* are essentially the same in sound as in English. *D* at the beginning or in the middle of a word is pronounced like the English *d*, but at the end of a word sounds like *t; g* has nearly the sound of the German *ch* in *ach; v* at the beginning of a word has a sound intermediate between our *f* and *v; w* sounds almost as in English; *ch* is pronounced like *ch* in German; *sch*, however, has not, as in German, the sound of our *sh*, but preserves that of the guttural *ch*, with the pure sound of *s*, being pronounced somewhat like *sk*.

The Dutch nearly resembles the German in the inflections of the nouns and verbs, and in the construction of the sentences, as well as in many of its words, as may be seen from the following examples:

SINGULAR.

	Dutch.	(*German.*)
Nominative,	*de koning*	(*der König*), the king.
Genitive,	*des konings**	(*des Königes* or *Königs*), of the king.
Dative,	*den koning*	(*dem Könige*), to the king.
Accusative,	*den koning*	(*den König*), the king.

PLURAL.

Nom.	*de koningen*	(*die Könige*), the kings.
Gen.	*der koningen**	(*der Könige*), of the kings.
Dat.	*den koningen*	(*den Königen*), to the kings.
Acc.	*de koningen*	(*die Könige*), the kings.

The following is an example of the article with an adjective and substantive:

SINGULAR.

	Dutch.	(*German.*)
Nom.	*de goede vriend*	(*der gute Freund*), the good friend.
Gen.	*des goeden vriends**	(*des guten Freundes*), of the good friend.
Dat.	*den goeden vriend*	(*dem guten Freunde*), to the good friend.
Acc.	*den goeden vriend*	(*den guten Freund*), the good friend.

PLURAL.

Nom.	*de goede vrienden*	(*die guten Freunde*), the good friends.
Gen.	*der goede vrienden**	(*der guten Freunde*), of the good friends.
Dat.	*den goeden vrienden*	(*den guten Freunden*), to the good friends.
Acc.	*de goede vrienden*	(*die guten Freunde*), the good friends.

The plural of the nouns is generally formed by adding *en* or *n* to the singular, as *een boom* (masc.), "a tree," *boomen*, "trees;" *eene kerk* (fem.), "a church," *kerken*, "churches;" *een hofd* (neut.), "a head," *hofden*, "heads;" *bede*, a "prayer," *beden*, "prayers." *Kind*, a "child," is an exception; it takes the addition of *eren* to form the plural, like our word child, which originally made the plural in the same way, *child-eren*, afterwards contracted into *children*. Many nouns change the final consonant of the singular into another of the same class, as *dief*, "thief," *dieven*, "thieves;" *huis*, "house," *huizen*, "houses," etc.: often a double vowel in the singular is changed to a single one in the plural, as *maan*, "moon," *manen*, "moons;" *zoon*, "son," *zonen*, "sons," etc.; not unfrequently both vowels and consonants are changed, as *baas*, "master," *bazen*, "masters;" *graaf*, "count," *graven*, "counts," etc. Nouns ending in *r, l, en*, and *em* frequently form the plural by simply adding *s*, as *broeder*, "brother," *broeders*, "brothers" (also formed by adding *en*, as *broederen*); *moeder*, "mother," *moeders*, "mothers;" *appel*, "apple," *appels*, "apples;" *bessem*, "broom" or "besom," *bessems*, "brooms;" *kindeken*, a "little child," *kinderkens*, "little children."

The Dutch numerals are as follow:

1, een.	18, achttien.
2, twee.	19, negentien.
3, drij.	20, twintig.
4, vier.	21, een en twintig.
5, vijf.	22, twee en twintig.
6, zes.	23, drij en twintig, and so on.
7, zeven.	30, dertig.
8, acht.	40, veertig.
9, negen.	50, vijftig.
10, tien.	60, zestig.
11, elf.	70, zeventig.
12, twaalf.	80, tachtig.
13, dertien.	90, negentig.
14, veertien.	100, honderd.
15, vijftien.	200, twee honderd.
16, zestien.	1,000, duizend.
17, zeventien.	1,000,000, millioen.

ORDINAL NUMBERS.

de eerste, the first.	de dertiende, the thirteenth.
de tweede, the second.	de veertiende, the fourteenth.
de derde, the third.	de twintigste, the twentieth.
de vierde, the fourth.	de een en twintigste, the twenty-first.
de vijfde, the fifth.	de dertigste, the thirtieth.
de zesde, the sixth.	de veertigste, the fortieth.
de zevende, the seventh.	de vijftigste, the fiftieth.
de achtste, the eighth.	de zestigste, the sixtieth.
de negende, the ninth.	de zeventigste, the seventieth.
de tiende, the tenth.	de tachtigste, the eightieth.
de elfde, the eleventh.	de negentigste, the ninetieth.
de twaalfde, the twelfth.	de honderdste, the one hundredth.

*It is proper to observe that instead of the forms *des konings, der koningen, des goeden vriends*, we may also use *van den koning, van de koningen, van den goeden vriend*, etc.

The principal Dutch pronouns are declined as follows:

	SINGULAR. (*German.*)		PLURAL. (*German.*)	
Nom.	*ik*	(*ich*),	*wij*	(*wir*), we.
Gen.	*mijner*	(*meiner*),	*onzer*	(*unser* or *onser*), our.
Dat.	*mij*	(*mir*),	*ons*	(*uns*), to us.
Acc.	*mij*	(*mich*),	*ons*	(*uns*), us.

PLURAL.*

(*German.*)

Nom.	*gij* (or *gijlieden*)	(*ihr*), ye, you.
Gen.	*van u* (or *uwer*)	(*euer*), your.
Dat.	*u* (or *ulieden*)	(*euch*), to you.
Acc.	*u* (or *ulieden*)	(*euch*), you.

SINGULAR.

Nom.	*hij*	(*er*), he.
Gen.	*van hem*, or *zijns*	(*seiner*), his, or of him.
Dat.	*hem*	(*ihm*), to him.
Acc.	*hem*	(*ihn*), him.

PLURAL.

Nom.	*zij*	(*sie*), they.
Gen.	*hunner* (or *van hen*)	(*ihrer*), them.
Dat.	*hun* (or *aan hen*)	(*ihnen*), to them.
Acc.	*hen* (or *ze*)	(*sie*), them.

	SINGULAR. (*German.*)		PLURAL. (*German.*)	
Nom.	*zij*	(*sie*), she.	*zij*	(*sie*).
Gen.	*harer*	(*ihrer*), her or hers.	*harer*	(*ihrer*).
Dat.	*haar*	(*ihr*), to her.	*haar*	(*ihnen*).
Acc.	*haar* and *ze*	(*sie*), her.	*haar* and *ze*	(*sie*).

Het, "it," has no inflections, the cases being formed by prefixing prepositions, as *van het*, "of it," *aan het*, "to hit," etc. The plural is like the plural of *zij*, except that it does not take *ze* in the accusative. *Zich* (like the German *sich*, to which it corresponds exactly in pronunciation as well as signification) signifies "himself," "herself," "itself," "themselves;" it is only found in the oblique cases, never in the nominative.

The Dutch pronominal adjectives are—

SINGULAR.

	Masculine.	*Feminine.*	*Neuter.*
Nom.	*de mijne*,	*de mijne*,	*het mijne*, mine.
Gen.	*des mijnen*,	*der mijne*,	*des mijnen*, of mine.
Dat.	*den mijnen*,	*der mijne*,	*den mijnen*, to mine.
Acc.	*den mijnen*,	*de mijne*,	*het mijne*, mine.

PLURAL.

	Masculine.	*Feminine.*	*Neuter.*
Nom.	*de mijnen*,	*de mijnen*,	*de mijnen.*
Gen.	*der mijnen*,	*der mijnen*,	*der mijnen.*
Dat.	*den mijnen*,	*der mijnen*,	*den mijnen.*
Acc.	*de mijnen*,	*de mijnen*,	*de mijnen.*

De onze, "ours," *de uwe*, "yours," *de zijne*, "his," *de hare*, "hers," etc., are declined in a similar manner.

The demonstrative adjectives (otherwise called demonstrative pronouns) are *deze* (masc. and fem.), and *dit* (neut.), "this;" in the plural *deze* ("these") for all three genders: and *gene*† (masc. and fem.) and *geen* (neut.), "that." The latter is often compounded with the definite article, as *degene* (masc. and fem.), *hetgene* (neut.), "that;" *degene*, "those," forming the plural for all three genders; and with *die, dat*, as *diegene* (masc. and fem.), *datgene* (neut.), "that;" plural, for the three genders, *diegene*, "those."

The relatives are—

SINGULAR.

	Masculine.	*Feminine.*	*Neuter.*
Nom.	*die*, who;	*die*, who;	*dat*, which.
Gen.	*diens*, whose;	*dier*, whose;	*diens*, of which.
Dat.	*dien*, to whom;	*dier*, to whom;	*dien*, to which.
Acc.	*dien*, whom;	*die*, whom;	*dat*, which.

PLURAL.

Nom.	*die*,	*die*,	*die.*
Gen.	*dier*,	*dier*,	*dier.*
Dat.	*dien*,	*dier*,	*dien.*
Acc.	*die*,	*die*,	*die.*

Welke (masc. and fem.), "who," and *welk* (neut.), "which," are also used as relatives, especially in elevated discourse.

The interrogative *wie* (masc. and fem.), "who," and *wat* (neut.), "what," are declined like *die, dat*, as given above.

The following are the principal tenses, etc. of the verb *zijn*, to "be:"

INDICATIVE MOOD.

Present Tense.

Dutch.	(*German.*)
ik ben	(*ich bin*), I am.
gij zijt	(*ihr seid*), you are (or thou art).
hij is	(*er ist*), he is.
wij zijn	(*wir sind*), we are.
gij (or *gijlieden*) *zijt*	(*ihr seyd*), you are.
zij zijn	(*sie sind*), they are.

*The Dutch may be said to have, properly speaking, no second person singular; but *gij* is always used, even in Scripture, for the singular as well as the plural.

†Cognate with the German *jener, jene*, etc., which in a similar manner is compounded with the article, as *derjenige, dasjenige*, etc.

Imperfect.

ik was	(*ich war*), I was, etc.
gij waart	(*ihr waret*).
hij was	(*er war*).
wij waren	(*wir waren*).
gij waart	(*ihr waret*).
zij waren	(*sie waren*).

Perfect.

ik ben geweest	(*ich bin gewesen*), I have been, etc.
gij zijt geweest	(*ihr seyd gewesen*).
hij is geweest	(*er ist gewesen*), etc.

In the future the Dutch use the auxiliary *zal, zult, zal, zullen, zult, zullen*, as *ik zal zijn* ("I shall be"), *gij zult zijn*, etc. (the Germans use *werde, wirst, wird, werden*, etc.).

Zoude ("should"), *zoudst, zoude, zouden, zoudt, zouden*, is used to form the conditional (instead of which the Germans use *würde*, etc.).

PARTICIPLES.

	(*German.*)
Present, *zynde*	(*seyend*).
Past, *geweest*	(*gewesen*).

The regular active verb *hooren*, to "hear," is conjugated as follows:

Indicative Present.	*Imperfect.*	*Perfect.*
ik hoor, I hear.	*ik hoorde.*	*ik heb gehoord*, I have heard, etc.
gij hoort, you hear.	*gij hoordet.*	*gij hebt gehoord.*
hij hoort, he hears.	*hij hoorde.*	*hij heeft gehoord.*
wij hooren, we hear.	*wij hoorden.*	*wij hebben gehoord.*
gij hoort, you hear.	*gij hoordet.*	*gij hebt gehoord.*
zij hooren, they hear.	*zij hoorden.*	*zij hebben gehoord.*

Pluperfect.	*Future.*	*Conditional.*
ik had gehoord.	*ik zal hooren.*	*ik zoude hooren.*
gij hadt gehoord.		
hij had gehoord.		
wij hadden gehoord.		
gij hadt gehoord.		
zij hadden gehoord.		

IMPERATIVE MOOD.

hoor, hear thou.
laat hem (or *hij*) *hooren*, let him hear.
laat ons (or *laten wij*) *hooren*, let us hear.
hooret, hear ye.
laat hen (or *laten zij*) *hooren*, let them hear.

The subjunctive mood is omitted here, as presenting nothing especially remarkable.

The present participle is *hoorende*, "hearing;" the future, *zullende hooren*, "going to hear," literally, equivalent to "shalling to hear," or, as the Greek neatly expresses it, μέλλων ἀκούειν.

The passive voice of verbs is formed with the auxiliary *worden* (imperfect, *werd* or *wierd*), to "be" or "become," thus:

Indicative Present.

	(*German.*)
ik word gehoord	(*ich werde gehört*), I am heard,
gij wordt gehoord	(*du wirst gehört*) [etc.
hij wordt gehoord	(*er wird gehört*).
wij worden gehoord	(*wir werden gehört*).
gij wordt gehoord	(*ihr werdet gehört*).
zij worden gehoord	(*sie werden gehört*).

Imperfect.

ik werd (or *wierd*) *gehoord*	(*ich wurde* (or *ward*) *gehört*), I was
gij werdt (or *wierdt*) *gehoord*	(*du wurdest gehört*). [heard, etc.
hij werd (or *wierd*) *gehoord*	(*er wurde gehört*).
wij werden (or *wierden*) *gehoord*	(*wir wurden gehört*).
gij werdt (or *wierdt*) *gehoord*	(*ihr wurdet gehört*).
zij werden (or *wierden*) *gehoord*	(*sie wurden gehört*).

Perfect.

ik ben gehoord worden (*ich bin gehört worden*), I have been heard, etc.

Pluperfect.

ik was gehoord worden (*ich war gehört worden*), I had been heard, etc.

First Future.

ik zal gehoord worden (*ich werde gehört werden*), I shall be heard, etc.

Second Future.

ik zal gehoord worden zijn (*ich werde gehört worden seyn*), I shall have been heard, etc.

Essential Resemblance between Dutch and German Words.—This resemblance is often much greater in reality than appears to the eye. Thus, the Dutch *zijn* and the German *seyn* (to "be"), so different in appearance, have not only the same meaning, but precisely the same pronunciation. The same is also true of several other parts of the above-named verb; for example, in the subjunctive mood the Dutch *zij, zijt*, and *zijn*, and the German *sey, seyd*, and *sey'n* (for *seyen*), are pronounced exactly alike. So *buigen* and *beugen* (to "bend"), *lezen* and *lezen* (to "read"), *meel* and *Mehl* ("meal"), *meer* and *mehr* ("more"), *mijn* and *mein* ("my" or "mine"), *nemen* and *nehmen* (to "take"), *prijzen* and *preisen* (to "praise"), *zijn* and *sein* ("his"), *bloed* and *Blut* ("blood"), *bloem* and *Blum'* (for *Blume*, "flower"), *broeder* and *Bruder* ("brother"), *hoed* and *Hut* ("hat"), *hoef* and *Huf* ("hoof"), *hoen* and *Huhn* ("fowl," "hen"), *koe* and *Kuh* ("cow"), *moed* and *Muth* ("spirit," "courage"), *moes* and *Mus* ("pap," "sauce"), *roem* and *Ruhm* ("fame," "glory"), *brood* and *Brōd* ("bread"), *hoon* and *Hohn* ("insult"), *nood* and *Noth* ("need," "necessity"), *rood* and *roth* ("red"), *stroo* and *Stroh* ("straw"), *troon* and *Thron* ("throne"), *troost* and *Trōst* ("comfort"), *zaad* and *Saat* ("seed"), *zacht* and *sacht* ("soft," "gentle"), *zand* and *Sand* ("sand"), *zeer* and *sehr* ("very"), *zegen* and *Segen* ("blessing"), *zijde* and *Seide* ("silk"), *zin* and *Sinn* ("sense"), *zo* and *so* ("thus," "also," "as"), *zoon* and *Sohn* ("son"), etc.

A great multitude of instances might be cited in which the meaning is the same, and the pronunciation nearly the same, or the difference, at most, is between letters of the same class, as *d* and *t*, *b* and *v*, *p* and *f*, or *v* and *f*, *ch* and *k*, etc.; as *blijven* and *bleiben* (to "remain"), *doen* and *thun* (to "do"), *dood* and *Tōd* ("death"), *dood* and *tōdt* ("dead"), *dragen* and *tragen* (to "bear"), and the past tense of the same, *droeg* and *trug* ("bore"), *rijden* and *reiten* (to "ride"), *roepen* and *rufen* (to "call"), *strijden* and *streiten* (to "fight," to "strive"), *treden* and *treten* (to "tread"), *vallen* and *fallen* (to "fall"), *vechten* and *fechten* (to "fight"), *vinden* and *finden* (to "find"), *voor* and *vōr* ("before"), *vraag* and *Frag'* (for *Frage*, a "question"), *werpen* and *werfen* (to "throw"), *wijken* and *weichen* (to "retire," to "yield"), *wijzen* and *weisen* (to "show"), *zoeken* and *suchen* (to "seek"), *zwijgen* and *schweigen* (to "be silent"), etc.

There are, in regard to certain letters, changes that very frequently if not invariably take place when a word passes, so to speak, from the German to the Dutch. The following changes take place in diphthongs and vowels: (1.) The German *au* usually becomes *o* or *oo* in Dutch; for example, *auf* ("on," "up") is changed to *op* (for the change of *f* to *p*, and that of other consonants, see below); *Baum* ("tree") to *boom; Haufe* ("heap") to *hoop; Haupt* ("head") to *hoofd; kaufen* (to "buy") to *koopen; Lauf* (a "running") and *laufen* (to "run") to *loop* and *loopen; Raub** ("prey," "plunder"), *Rauber* (a "robber") and *Rauben* (to "rob") to *roof, roover*, and *rooven; Rauch* ("smoke") and *rauchen* (to "smoke") to *rook* and *rooken; Saum* (a "hem," "seam") to *zoom; taub* ("deaf") to *toof; tauf'* or *taufe* ("dipping," "baptism") to *doop; Traum* ("dream") to *droom*. **(2.) The German *au* also not unfrequently becomes *ui* in Dutch, as** *aus* ("out") to *uit; Bauch* ("belly"), *buik; braun* ("brown"), *bruin; Braut* ("bride"), *bruid; Daum* ("thumb"), *duim; faul* ("foul"), *vuil; Faust* ("fist") *vuist; Haus* ("house"), *huis; Laus* ("louse"), *luis; Maus* ("mouse"), *muis; Raum* ("space," "room"), *ruim; rauschen* (to "rush," to "roar"), *ruischen; sauber* ("clean," "pure"), *zuiver; saufen* (to "drink," to "tipple"), *zuipen; Staub* ("dust"), *stuif; Strauch* ("shrub"), *struik; Strauss* ("ostrich"), *struis; Taube* ("dove," "pigeon"), *duif; Traube* ("grape"), *druif; Zaun* ("hedge" or "fence"), *tuin*. **(3.) *Ei* in German frequently becomes *ee* in Dutch, as** *allein* ("alone"), *alleen; Bein* ("leg," "bone"), *been; Eich* (an "oak"), *eek; ein* ("one"), *een; kein* ("no," as an adjective), *geen; Stein* (a "stone"), *steen*, etc. **(4.) But *ei*, as well as *ey*, is often changed to *ij*, as *preisen* (to "praise") to *prijzen; sein* ("his") and *seyn* (to "be") to *zijn*, etc., etc. (5.) *Eu* and its equivalent *äu*, commonly become *ui*, having essentially the same sound, as *beugen* (to "bend"), *buigen; Beule* (a "boil"), *buil; keusch* ("chaste"), *kuisch; säugen* (to "suckle"), *zuigen; säumen* (to "delay"), *zuimen; Zeug* ("stuff," "materials," "tools"), *tuig*, etc., etc. (6.) *Oe* or *ö* in German often becomes *oo* in Dutch, as *böse, boos* ("bad," "evil"); *blöde, bloo* or *bloode* ("bashful"); *hören, hooren* (to "hear"); *schön, schoon* ("beautiful"); *schönheit, schoonheid* ("beauty"), etc. (7.) *Ue* or *ü* in German often becomes *u* in Dutch, the latter being the natural equivalent of the former;** as *Brücke, brug* ("bridge"); *bücken, bukken* (to "stoop," to "bow"); *Bürger, burger* ("citizen"); *dünken, dunken* (to "seem"). The German *mich dünkt*, and Dutch *mij dunkt*, explains the origin of our phrase *methinks* (*i. e.* "it seems to me").

In the first paragraph treating of the resemblance between Dutch and German, the reader will see numerous examples of the correspondence of the German long *o* with the Dutch *oo* (as *Sohn* and *zoon*, etc.), and the German *u* with the Dutch *oe* (as *gut* and *goed*, etc.), precisely the same sound being represented by the corresponding words. The German *u*, however, often becomes *o* in Dutch, as *Bund, bond* (a "covenant"); *Bundel, bondel* ("bundle"); *bunt, bont* ("variegated"); *Grund, grond* ("bottom," "ground"); *Hund, hond* ("dog"); *Krumm, krom* ("crooked"), etc., etc.

Of the consonants (1.), *f* in German commonly becomes *p* in Dutch,* as may be seen in the following verbs: *helfen* (to "help"), *helpen; hoffen* (to "hope"), *hopen; reifen* (to "ripen"), *rijpen; rufen* (to "call"), *roepen; werfen* (to "throw"), *werpen*. **In like manner from the German** *Dorf* ("village"), *Harfe* ("harp"), *reif* ("ripe"), *Schiff*

* In a few instances the reverse occurs; that is, the sound of *p* in German is changed to *f* in Dutch; as *Haupt, hoofd* ("head"); *Dieb* (pronounced as if written *dieps, dief* "thief"); *Raub* (pronounced as if written *raup*), *roof* ("plunder"), etc.

("ship"), *Waffe* ("weapon"), etc., we have in Dutch, *dorp, harp, rijp, schip, wapen*, etc. (2.) *B* is usually changed to *v*, as shown in the following examples: *bleiben, blijven* (to "remain"); *schreiben, schrijven* (to "write"); *sterben, sterven* (to "die"). (3.) *S* initial or medial in German becomes *z* in Dutch; for example, *seyn, zijn* (to "be"); *lesen, lezen* (to "read"), etc. (4.) The German *s* terminal generally becomes *t* in Dutch, as *blōss, bloot* ("mere," "naked"); *Füss, voet* ("foot"); *grōss, groot* ("great"); *Maas, maat* ("measure"); *Schloss, slot* ("lock," "castle"). To which may be added *es, het* ("it"); *das, dat* ("that"); *was, wat* ("what"). (5.) *Z* initial is usually changed to *t*, as *Zahl, tal* ("number"); *zählen, tellen* (to "tell"); *bezahlen, betalen* (to "pay"); *Zaum, toom* ("bridle"); *Zeichen, teeken* ("sign," "token"); *Zeit, tijd* ("time"); *Ziegel, tegel* (a "tile"); *Zimmer, timmer* (a "room," also "timber"); *Zinne, tinne* ("pinnacle"); *Zins, tins* ("rent"); *zu, toe* ("to"); *zwei, twee* ("two"); *Zweifel, twijfel* ("doubt"); *Zweig, twijg* (a "branch" or "twig"); *zwelf, twaalf* ("twelve"); *Zunge, tong* ("tongue"); *zwanzig, twintig* ("twenty"); *Zwist, twist* ("strife," "discord"). (6.) *Ch* in German is often changed to *k* in Dutch, as *Būch, boek* ("book"); *fluchen, vloeken* (to "curse"), and *Fluch, vloek* (a "curse"); *suchen, zoeken* (to "seek"), etc.; but this is very far from being always the case. The most numerous class of exceptions consists of words beginning with *sch*—*e. g.* German *Schaf*, Dutch *schaap* ("sheep"); German *Schiff*, Dutch *schip* ("ship"), etc.

It will be observed from the foregoing examples that almost invariably where the Dutch consonant differs from the German it corresponds to the English whenever there is any English word at all resembling either; compare, for example, the German *Zeit*, the Dutch *tijd*, and the Old English *tide*, in the sense of "time"; German *Zeichen*, Dutch *teeken*, English *token*, etc.

It has seemed proper to explain somewhat fully the principles of such changes from the one tongue to the other as would be likely to escape the notice of those who should make only a cursory examination of the two languages. But it has not been deemed necessary to dwell at length upon the more obvious correspondences between them. It may not, however, be without interest to present some examples of such correspondences: *Band, band* (a "band"); *Berg, berg* ("mountain"); *bersten, bersten* (to "burst"); *bergen, bergen* (to "conceal;") *Bescheid, bescheid* ("information"); *bescheiden, bescheiden* ("modest," "discreet"); *bescheiden, bescheiden* (to "appoint"); *Brand, brand* (a "burning"); *branden, branden* (to "rage"); *Hand, hand* ("hand"); *Handel, handel* ("trade"); *hangen, hangen* (to "hang"); *Helm, helm* ("helm" or "helmet"); *Hemd, hemd* ("shirt"); *Kind, kind* ("child"); *klein, klein* ("small"); *krank, krank* ("sick"); *Kunst, kunst* ("art"); *Land, land* ("land"); *lang, lang* ("long"); *Last, last* (a "burden"); *leider, leider* ("alas!"); *Leder, leder* ("leather"); *licht, licht* ("light"); *lichten, lichten* (to "lighten," to "illuminate"); *Linde, linde* (a "linden tree"); *List, list* ("cunning," "craft"); *listig, listig* ("crafty," "cunning"); *Lust, lust* ("pleasure"); *Markt, markt* ("market"); *Mast, mast* ("mast"); *Merk, merk* ("mark"); *merken, merken* (to "mark"); *Minne, minne* ("love"); *Morgen, morgen* ("morning"); *Nacht, nacht* ("night"); *Nagel, nagel* (a "nail"); *nimmer, nimmer* ("never"); *Rad, rad* (a "wheel"); *Rand, rand* ("margin," "border"); *Rede, rede* ("speech"); *Regen, regen* ("rain"); *rein, rein* ("clear," "pure"); *Rente, rente* ("rent"); *Spiegel, spiegel* (a "mirror"); *Vogel, vogel* ("bird," "fowl"); *Wacht, wacht* ("watch"); *Wagen, wagen* ("wagon," "carriage"); *wegen, wegen* (to "weigh"); *Werk, werk* ("work"); *Winter, winter* ("winter").

The character of Dutch literature may be said to correspond, to a great extent, to the national character, which has been formed in a constant conflict with the most formidable and most unconquerable of all the elements. "The Dutch have taken their possessions from the dominion of the deep; and the exercise of the perpetual thought, care, and industry necessary first to raise and then to keep up such mighty embankments as defend them from their constant assailant, the raging sea, has educated a people adventurous, brave, and cautious." (*Bosworth's Anglo-Saxon Dictionary*, p. xcii.) The spirit of industry and energy thus acquired may be said to pervade their literature, which is characterized rather by solid strength than by a versatile fancy or soaring imagination. Much of the Dutch poetry, however, is not without the charm of unaffected simplicity and great expressiveness of language. In fact, the distinguishing characteristics of the Dutch language may be said to be directness of expression and descriptive energy. In simplicity and directness indeed it bears a near resemblance to the English, over which its greater fulness of inflections gives it some decided advantages, especially on the score of variety and flexibility. In another respect, also, it is on some accounts superior to our tongue. We allude to the facilities it possesses for forming compound words. Many technical terms which the English borrow from the Latin or Greek are formed by the Dutch from their own indigenous roots. In this respect the Dutch even surpasses the German. Thus, for astronomy they have *sterrekunde* ("star-knowledge"), a word which explains itself without the necessity of having recourse to a Greek etymology. Such Dutch terms are usually much more euphonious than their literal English equivalents, because they generally employ connecting vowels, thus rendering the sound much softer, instead of running the terminal and initial consonants together, as is continually done in English in the formation of compound words; thus, we say *endless*, but the Dutch say *eindeloos;* the same may be seen in the above-cited *sterrekunde*, and in numerous other compound words.

It may be proper to remark here that the Dutch having been pre-eminently a commercial and maritime nation long before England could boast of being the mistress of the sea, from them have been derived many of our nautical terms and phrases, such as *boom*, literally, "tree or beam;" *skipper* (Dutch *schipper*, the *ch* being hard), literally, a "shipper;" *schooner*, etc.

Some of the oldest extant specimens of the Dutch language are supposed to date as far back as the ninth century. They bear a near resemblance to the Low German. All the earlier specimens, indeed, of the Teutonic dialects prove, by the remarkable affinities which they bear to each other, that they originated from a common source. We have already spoken of the essential identity of the Dutch and Flemish, the difference between these two languages being scarcely more than a difference of pronunciation and orthography. The celebrated poem called "Reinaert de Vos" ("Reynard the Fox"), the first part of which was written originally in the old Flemish dialect about 1150, affords one of the finest of the early specimens of the Flemish or Dutch language. From it was made a free translation into Low Saxon, "Reineke Vos," under which form it became widely known and very popular.

Jacob van Maerlant is regarded as the father of Dutch poetry. He was born at Damme, in Flanders, in 1235, and died in 1300. He made various translations into Dutch poetry, of which the following may suffice as a specimen:

"Diese bloemen hebben wi besocht,
En uten Latine in Dietche brocht,
Ute Aristotiles boeken."

Translated literally:

"These flowers (beauties) have we sought,
And out of Latin into Dutch brought,
From Aristotle's books."

Perhaps his most celebrated work is his "Spiegel Historiael" ("Historic Mirror"). The "Rijmkronik" ("Chronicle" in verse) of Melis Stoke was written about 1290. The following is an interesting sample of that early rhyme:

"Dese pine ende dit ghepens
send ic u Heer Grave Florens
Dat ghi moget sien ende horen
Wanen dat ghi sijt geboren,
Ende bi wat redenen ghi in hant
Hebbet Zeelant ende Hollant;
Ende bi wat redenen dat ghi soect
Vrieslant dat u so sere vloect."

Literally translated:

"These labors (pains) and these thoughts
send I to you, Sir Count Florens,
that you may see and hear (learn)
whence [it is] that you are born
(descended), and by what right
(reasons) you have Zealand and
Holland in hand (in your possession),
and by what right you seek
Friesland, that curses you so sorely."

Jan van Heelu, the contemporary of Stoke, also wrote chronicles in verse ("Rijmkronik"), which display considerable poetic spirit.

The culture and development of what may be strictly termed Dutch literature, as distinguished from the Flemish, may be said to date from the establishment at Amsterdam (about 1570) of a sort of literary academy called *Rederijkskamer* ("Chamber of Rhetoric"), under the auspices of Coornhert, Spiegel, and Visscher. Somewhat later appeared Peter Kornelius Hooft, whom Vondel calls, playing upon his name (signifying "head"), "Dat doorluchtig Hooft der Hollandsche poeten"—"That illustrious head of the Dutch poets." The merits of Hooft are so great that he has been styled the creator of Dutch literature. He imparted a sweetness and harmony to the poetry of his native language unknown before his time, and not surpassed by any later author. He also excelled as a writer of history. Jacob Cats (1577–1660), or Father Cats, as his countrymen in their affection delighted to call him, was emphatically the poet of the people, and his productions are still admired and loved by all classes. Joost van den Vondel (1587–

1679) is one of the greatest names in Dutch literature. He excelled in satirical and lyric poetry, and also in tragedy. About the end of the seventeenth century there was a decline in Dutch poetry, caused in part by the influence of the French school of criticism, but a new poetical era commenced in the latter half of the next century, introduced by J. Bellamy (about 1770), whose ballad of "Rosje" is regarded as the most beautiful in the language. In touching simplicity it reminds us of some of the finest of the Scottish ballads. Bilderdijk (1756–1831) was not only one of the greatest of Dutch poets, but was distinguished in almost every department of literature. Tollens (1780–1856) is perhaps the most popular of recent Dutch poets. Among his most celebrated productions are "De Overwintering op Nova Zembla" ("The Wintering on Nova Zembla"), a narrative poem giving an account of the famous expedition of Barentz (1594–96), and his splendid war-lyric entitled "Wapenkreet" ("Call to Arms").

In classical learning the Dutch have taken a high place among the nations of Europe. Among the most distinguished of their scholars are Erasmus, Lipsius, Daniel and Nicholas Heinsius, Grotius, Gronovius, Vossius (Gerard de Vos), Hemsterhuis, etc. In science they have had Huygens, Leewenhoek, Ruysch, and Swammerdam. In theology they can boast of Arminius, besides many others. In philosophy there is perhaps no greater name in modern times than Spinoza; and in medicine few, if any, more illustrious than those of Boerhaave and Van der Kolk.

J. THOMAS.

Dutch Liquid, or **Eth'ene Chlo'ride,** received its first name because it was first discovered by Dutch chemists in 1795. It is a combination of ethene (olefiant gas, C_2H_4) with chlorine, and its formula is $C_2H_4Cl_2$. It is a thin, inflammable, colorless liquid of an agreeable fragrance and pleasant taste, somewhat resembling chloroform. Like chloroform, it has great anæsthetic powers when its vapor is inhaled, but the medical profession are not satisfied of its safety. Modifications of this compound (such as C_2H_3Cl, $C_2H_3Cl_3$, and $C_2H_2Cl_2$) are also sometimes called Dutch liquids, and the whole are known as the "Dutch liquid series."

Dutch Reformed Church. See REFORMED CHURCH IN AMERICA.

Dutch'ville, a post-township of Granville co., N. C. Pop. 1752.

Dutens (JOSEPH MICHEL), a French political economist, born at Tours Oct. 16, 1765. He published "The Philosophy of Political Economy" (2 vols., 1835) and other works. Died Aug. 6, 1848.—His uncle, LOUIS DUTENS, F. R. S., born at Tours Oct. 15, 1765, removed to England, where he obtained from the duke of Northumberland the lucrative living of Elsdon. He wrote a treatise maintaining the antiquity of many discoveries, numismatical treatises, and "Mémoires d'un Voyageur qui se repose" (Paris, 1806). Died May 23, 1812.

Du'ties [from *due, i. e.* "something owed:" Fr. *douane*], in their general sense, are those things which a man is, by any natural, moral, or legal obligation, bound to do or to refrain from doing. The word is also used commercially, and then, in its most enlarged sense, is nearly equivalent to taxes, embracing all impositions or charges levied on persons or things; but in its more restricted sense it is often used as equivalent to customs or imposts, being those taxes which are payable upon goods and merchandise imported or exported. (See the Constitution of the U. S., Art. I., s. 8, n. 1, and Art. I., s. 10, n. 2.) The import duty is held to be a personal debt, chargeable upon the importer, as well as a lien on the goods themselves.

As used in the U. S., the term duties does not include the taxes on property, real or personal, nor the poll-tax; nor, in its popular sense, does it include the excise. In the U. S. there is no duty on exportation, nor is any State allowed to collect duties or imposts.

Dutrochet (RENÉ JOACHIM HENRI), M. D., a French physiologist, born in Poitou Nov. 14, 1776. He graduated as M. D. in 1806, and devoted his time chiefly to the study of natural history and physiology. He published "Researches in Endosmosis and Exosmosis" (1828), and "Mémoires pour servir à l'Histoire anatomique et physiologique des Végétaux et Animaux" (1837). Died Feb. 4, 1847.

Dut'ton (ARTHUR H.), an American officer, born at Wallingford, Conn., in 1839, graduated at West Point, and was appointed brevet second lieutenant in the corps of engineers June 24, 1861; promoted to be first lieutenant of engineers Mar., 1863, and captain Oct., 1863. During the civil war he served on staff and engineer duty from July, 1861, to July, 1862, being assistant engineer on the defences of Washington and in the Florida expedition with Gen. H. G. Wright. He was appointed Sept., 1862, colonel of the Twenty-first Connecticut Volunteers, which regiment he led at Antietam and Fredericksburg; commanded a brigade in the Ninth army corps at Newport News and about Suffolk, Va., Feb. to Aug., 1863; was chief of staff to Major-General Peck, in command of the district of North Carolina; during the operations of the Army of the James at Bermuda Hundred, Va., 1864, he commanded his regiment, distinguishing himself at the battle of Drury's Bluff, May 16; and while reconnoitering the Confederate works May 26 was mortally wounded. Died at Baltimore, Md., June 5, 1864. Brevet major Dec., 1862, lieutenant-colonel May, 1863, colonel and brigadier-general May, 1864, for gallant and meritorious services.

Dutton (HENRY), LL.D., a jurist, was born at Plymouth, Conn., Feb. 12, 1796, and graduated at Yale in 1818, was professor of law in Yale (1847–55), became governor of Connecticut in 1854, and was a judge of the superior court and court of errors (1861–66). He prepared several digests, compilations of State statutes, etc. Died April 26, 1869.

Du'ty, a township in Lawrence co., Ark. Pop. 573.

Duum'viri, or **Duo'viri** [Lat., the plural of *duumvir*, from *duo*, "two," and *vir* (plu. *viri*), a "man" (*i. e.* the "two men")], the title of various magistrates of ancient Rome and her colonies. Two men jointly held the office, whence the name. The duumviri, "*juri dicundo*" ("for pronouncing judgment"), were chief magistrates in municipal towns. Naval duumviri were occasionally appointed to equip fleets. Duumviri "*perduellionis*" were appointed to try cases of treason (*perduellio*) and parricide. Quinquennial duumviri were the censors of municipal towns, and were chosen every five years, hence called *quinquennales* (from *quinque*, *annus*), but the duties of the office occupied only one year. The position was one of great dignity. Sacred duumviri were sometimes appointed to erect temples. There were also duumviri for performing other minor duties.

Duval', a county in the N. E. of Florida. Area, 860 square miles. It is bounded on the E. by the Atlantic Ocean, and is intersected by the St. John's River. The surface is low and nearly level. Lumber, market vegetables, and rice are the most important products. It is traversed by the Florida R. R. and the Jacksonville Pensacola and Mobile R.R. Capital, Jacksonville. Pop. 11,921.

Duval, a county in the S. of Texas, partly drained by the Nueces River. Area, 1650 square miles. Wood and water are scarce, but the pasturage is good. Cattle and wool are the chief products. Pop. 1083.

Duval, a township of Lincoln co., W. Va. Pop. 604.

Duval (ALEXANDRE), born April 6, 1767, served in the American Revolution on a French vessel, was then engineer, architect, and, after 1792, devoted himself to dramatic composition. He succeeded in mingling comic traits with serious action, and many of his pieces have kept the stage. Died Jan. 10, 1842.—His brother, AMAURY DUVAL, born Jan. 28, 1760, acquired note by treatises upon antiquities. Died Nov. 12, 1838.

Duvaucel (ALFRED), a French naturalist, born in Paris in 1792, was a stepson and pupil of the celebrated Cuvier. He passed nearly six years in the exploration of the natural history of India, to which he went in 1818. He died near Madras in Aug., 1824.

Duvergier de Hauranne (PROSPER), a French statesman, born at Rouen in 1798. He was elected to the Chamber of Deputies in 1831, acted with the Doctrinaires, and advocated electoral reform. He was a conservative member of the National Assembly in 1848. He wrote a "History of Parliamentary Government in France" (2 vols., 1857), and "On the Principles of Representative Government, and on their Application" (1838), which is full of admiration of English institutions.

Duvernoy (GEORGES LOUIS), M. D., a French zoologist and anatomist, born at Montbéliard Aug. 6, 1777. He edited Cuvier's "Lectures on Comparative Anatomy" (1805) at his request. He succeeded Cuvier in 1837 as professor in the College of France, and became in 1850 professor of comparative anatomy. Among his important works is "Lectures on Organic Bodies" (1842). Died Mar. 1, 1855.

Duveyrier (HENRI), a French traveller, born Feb. 28, 1840, was the son of Charles Duveyrier, a political and dramatic writer, and nephew of Anne Joseph Duveyrier, who, under the pseudonym of Mélesville, wrote a great number of theatrical pieces in collaboration with Scribe and others. He has published "Exploration of Sahara" (vol. i., 1864), and numerous papers in geographical periodicals which contribute much to a knowledge of Northern Africa and the Great Desert. He travelled two years in

the interior, and under the protection of the Tuarick chiefs penetrated to the centre of Soodan.

Dux'bury, a township and post-village of Plymouth co., Mass., on the South Shore R. R., 5 miles N. of Plymouth. It is the seat of an academy. Here the French Atlantic telegraph terminates. Duxbury has an iron lighthouse; lat. 41° 59′ N., lon. 70° 38′ W. It has also four churches, a soldiers' monument, and a monument to Miles Standish. Pop. 2341.

Duxbury, a township of Washington co., Vt. It contains the Camel's Rump Mountain, and has manufactures of lumber. Pop. 893.

Duy'ckinck (Evert Augustus), an American editor and essayist, born in the city of New York Nov. 23, 1816, and graduated at Columbia College in 1835. He was the founder and editor of the "Literary World." With the aid of his brother George he published a "Cyclopædia of American Literature" (2 vols., 1856), which is highly esteemed. Among his works is a "History of the War for the Union" (3 vols., 1861–65).

Duyckinck (George Long), a brother of the preceding, was born in New York Oct. 17, 1823, graduated at the University of New York in 1843. He was joint-author of the "Cyclopædia of American Literature" (1856), and published several biographies, among which was a "Life of George Herbert" (1858). Died Mar. 30, 1863.

Dwara'ca, or **Dwarka,** a maritime town of India, in Guzerat, is on the Arabian Sea a few miles S. of the Gulf of Cutch, 95 miles N. W. of Joonaghur. Here is a temple of Krishna, which is annually visited by multitudes of pilgrims. The great temple is an ancient sculptured stone structure, with a massy gate and a long flight of steps. In front is a sacred stream.

Dwarf [Ang.-Sax. *dveorg;* Ger. *Zwerg;* Swedish and Dutch, *dwerg*], the name given to any animal or plant greatly below the usual size of its kind, particularly a human being of small dimensions. In ancient times dwarfs were kept by persons of rank for their amusement, and the Roman ladies employed them as domestics. In Europe the passion for dwarfs reached its height under the reigns of Francis I. and Henry II. of France. Among the most celebrated dwarfs were the following: Philetus of Cos, a philosopher and poet, who lived about 330–285 B. C.; Geoffrey Hudson, born in 1619, who was three feet nine inches high; Joseph Borowlawski, born in 1739, who attained the height of thirty-nine inches, and was remarkable for acute intellect; and Nicolas Ferry or Bébé (thirty-three inches high), who was a favorite of Stanislas, king of Poland. In recent times Tom Thumb (Charles S. Stratton), born at Bridgeport, Conn., in 1837, is the most celebrated, and his performances as an actor have been received with applause both in Europe and America.

The dwarfs of Scandinavian mythology are represented as deformed and crafty elves, distinguished for their skill in magic and the working of metals.

Dwarfed Trees may be produced in three different ways—by grafting on dwarf slow-growing stocks, as, for example, the pear on the quince; by planting in small pots filled with poor soil, by which the plant is starved and stunted; and by causing a portion of the extremity of a branch to produce roots, and then cutting it off and planting it in a pot with poor soil. The last is the Chinese method, and is thus performed: The extremity of a branch two or three feet long in a fruit- or flower-bearing state is selected, and a ring of bark is taken off at the point where it is desired that roots should be produced. The part thus denuded of bark is covered with a ball of clay, kept moist with the frequent application of water. After the roots have grown out the branch is cut off, planted in a pot of poor soil, and sparingly supplied with water. The dwarf tree will remain nearly of the same size for years. The pear tree especially is often dwarfed, because in this condition it will produce fruit while still very young. Some varieties of pear may remain unfruitful for many years unless dwarfed.

Dwight, a post-village of Livingston co., Ill., on the Chicago and Alton R. R., 72 miles S. W. of Chicago. It has one weekly newspaper. It is a terminus of the western division of the same railroad. Pop. 1044; of Dwight township, 1804. Ed. "Star."

Dwight, a township of Huron co., Mich. Pop. 335.

Dwight (Benjamin Woodbridge), Ph. D., born at New Haven, Conn., April 5, 1816, and graduated at Hamilton College, N. Y., in 1835, was principal and proprietor of a high school for boys in Brooklyn and New York City for many years. He is the author of "The Higher Christian Education," "Modern Philology, First and Second Series," "The History of the Strong Family," 2 vols., and also of "The History of the Dwight Family in America," 2 vols., "Woman's Higher Culture," and "The True Doctrine of Divine Providence." He resides now (1874) at Clinton, Oneida co., N. Y., where he is engaged in literary labor.

Dwight (Edmund), a merchant, born at Springfield, Mass., Nov. 28, 1780. He graduated at Yale in 1799. He was a member of business firms which established cotton-mills at Chicopee and Holyoke. He gave $10,000 to support normal schools in Massachusetts. Died April 1, 1849.

Dwight (Francis), born at Springfield, Mass., Mar. 14, 1808, graduated at Harvard College in 1827, and at the Law School in 1830, travelled extensively in Europe, and afterwards practised law for a few years (1834–38), but in 1838 turned the whole force of his strong nature towards the promotion of common-school education in our country, and established at Albany, N. Y., in 1840, "The District School Journal," under State patronage. Here he had full scope for his fine, highly-cultured faculties of mind and his glowing zeal in behalf of the most improved style of popular education. His name stands, for honor, by the side of that of Horace Mann in the thoughts of those who know how the present superior style of public instruction has been reached in those parts of the land where it is highest in its form. He died in the fulness of his influence for good, Dec. 15, 1845.

Dwight (Rev. Harrison Gray Otis), D. D., born at Conway, Mass., Nov. 22, 1803, graduated at Hamilton College, N. Y., in 1825, and became a missionary of the A. B. C. F. M. in 1830 to the Armenians, making Constantinople the centre of his field of operations. He was abundant in his labors with tongue and pen, and is one of the most noted of all American missionaries hitherto for his great skill and success in his work. He published in America and England several volumes at different times, as "Researches of Smith and Dwight in Armenia," "Memoir of Mrs. Elizabeth B. Dwight," "Christianity Revived in the East," "A Complete Catalogue of Literature in Armenia," etc. He composed also several books and tracts in the native languages of the East. He was killed suddenly, when on a brief visit to his native land, by an accident on the Troy and Bennington R. R., Jan. 25, 1862.

Dwight (John) graduated at Oxford University, England, in 1682, was secretary to three successive bishops of Chester, England (Walton, Ferne, and Hall). He established in 1684, at Fulham, "a manufactory of white gorges, marbled porcelain ware, statues, and vessels never before made in England, and also of China and Persian wares, and the Cologne and Hessian wares." He invented moulds and models and processes of his own, and manufactured the only porcelain that was made in England in his day. His inventive talents are described in leading English works on pottery and porcelain ware as having been of the very highest order. The great potteries at Fulham, Chelsea, etc. are ascribed to him as their real founder.

Dwight (John Sullivan), a musical critic, born in Boston May 13, 1813, graduated at Harvard in 1832. He studied divinity, entered the Unitarian ministry, and preached about six years. In 1842 he joined the Brook Farm enterprise at West Roxbury, Mass., where he remained until the institution was broken up. In 1852 he established "Dwight's Musical Journal," an excellent periodical, of which he is still the editor. Mr. Dwight has also published many admirable reviews, lectures, etc., and is the author of the song "God Save the State" (1844).

Dwight (Joseph), Brigadier-General, born at Hatfield, Mass., Oct. 16, 1703, graduated at Harvard University in 1722, was judge of the court of common pleas of Hampshire co., Mass., and afterwards of Berkshire county, and judge of probate. He was eminent both as a judge and a soldier. He commanded the Massachusetts artillery at the reduction of Louisburg in 1745 with distinction, and led a brigade at Lake Champlain in the second French war in 1756. He was also for eleven years member of the general council of Massachusetts. Died in 1765.

Dwight (Rev. Nathaniel), M. D., brother to Dr. Timothy Dwight of Yale College, born Jan. 31, 1770, at Northampton, Mass., prepared and published the first school geography ever issued in this country. It was in the form of questions and answers, and was extensively used. He was also the author of "The Great Question Answered," and of "A Compendious History of the Signers of the Declaration of Independence." He resided chiefly at Wethersfield, Conn. Died June 11, 1831, at Oswego, N. Y.

Dwight (Samuel), M. D., of Fulham, England, graduated at Oxford University (son of John Dwight of Fulham, the great inventor and first manufacturer of porcelain ware in England), was the author of three different medical works—viz. "De Vomitione" (London, 1722), "De Hydropibus" (1725), and "De Febribus" (1731).

Dwight (Sereno Edwards), D. D., an American divine, born at Greenfield Hill, Conn., May 18, 1786, was a son of Timothy Dwight, noticed below. He graduated at Yale in 1803, and practised law with success (1810–16). He was afterwards pastor of Park street church, Boston (1817–26), and was president of Hamilton College (1833–35). He wrote, besides other works, "The Hebrew Wife" and a "Life of Jonathan Edwards," and edited the works of the same author (10 vols. 8vo). Died Nov. 30, 1850.

Dwight (Theodore), an able journalist, an uncle of the preceding, was born at Northampton, Mass., Dec. 15, 1764. He was a member of Congress (1806–07). He practised law with distinction, and was a leader of the Federalist party. He was secretary of the Hartford Convention in 1814. His mother was a daughter of Jonathan Edwards. In 1817 he founded the "New York Daily Advertiser," which he edited until 1835. He published "The Life and Character of Thomas Jefferson" and "The History of the Hartford Convention." He was a brilliant political writer. Died July 12, 1846.

Dwight (Theodore), an author, a son of the preceding, was born at Hartford, Conn., Mar. 3, 1796, and graduated at Yale in 1814. He wrote, besides other works, a "Tour of Italy" (1824), a "History of Connecticut" (1841), a "Life of Garibaldi" (1859), "A School Dictionary of Roots and Derivatives," "The Northern Traveller," "The Tour of New England," "The Father's Book," "First Lessons in Modern Greek," "The Roman Republic of 1849," and "The Kansas War." Died Oct. 16, 1866.

Dwight (Theodore William), LL.D., an American jurist, professor, and editor, born July 18, 1822, at Catskill, N. Y., graduated at Hamilton College, N. Y., in 1840, and studied his profession at Yale Law School, under the late distinguished Judge Hitchcock. In 1846 he was elected Maynard professor of law in Hamilton College, and there established a law school. In 1858 he was chosen professor of municipal law in Columbia College, N. Y. His inaugural address was published. He was soon made warden of the law school, a department of the college organized under his direction, and now (1874) numbering 425 students, drawn from all parts of the U. S. He received the degree of doctor of laws from Rutgers College, N. J. (1859), and from Columbia College (1860). He published an "Argument in Rose Will and Charity Cases" (1863), and other arguments in leading law cases. In association with Dr. E. C. Wines he published "Prisons and Reformatories in the U. S." He edited "Maine's Ancient Law." As associate editor of the "American Law Register" he has written articles which have been separately published, as "Trial by Impeachment," etc. He was elected non-resident professor of constitutional law in Cornell University, N. Y. (1868), and lecturer in Amherst College, Mass., on the same subject (1869). He was a member of the New York constitutional convention of 1867, and early in 1873 was vice-president of the New York board of State commissioners of public charities, president of the New York prison association, and an active member of the well-known "committee of seventy" of the city of New York. In Jan., 1874, he was appointed by Governor Dix of New York a judge of the commission of appeals, a court sharing the duties of the court of appeals.

Dwight (Timothy), D. D., LL.D., an eminent American divine and scholar, born at Northampton, Mass., on the 14th of May, 1752. His mother was Mary, daughter of Jonathan Edwards. He graduated at Yale College in 1769, after which he was a tutor in that institution for six years. In 1777 he married Mary Woolsey. Between 1778 and 1782 he was a chaplain in the army, or lived with his mother at Northampton; in 1783 he became minister of a church at Greenfield, Conn., where also he was principal of a flourishing academy. In 1795 he was elected president of Yale College, in which he also became professor of theology at the same time. He was an able preacher, and was eminently qualified as an instructor of young men. He continued to be president of Yale College until his death. His chief works are "The Conquest of Canaan," an epic poem (1785), "Theology Explained and Defended in a Series of 173 Sermons" (5 vols., 1818), often reprinted, and "Travels in New England and New York" (4 vols., 1821). Died at New Haven Jan. 11, 1817. (See W. B. Sprague, "Life of T. Dwight," in Sparks's "American Biography," vol. iv., second series; also Sprague's "Annals of the American Pulpit," vol. ii., pp. 152–165.)

Dwight (Wilder), an American officer, born in Springfield, Mass., in 1833, graduated at Harvard College in 1853, entered the army as major of the Second Massachusetts regiment of volunteers, and served in the Shenandoah campaign under Gen. Banks, displaying great bravery during the famous retreat. He was engaged at the battle of Antietam Sept. 17, 1862, where he was mortally wounded, but survived till the 19th, when he expired in hospital at Boonesville. At the time of his death he was lieutenant-colonel of his regiment. G. C. Simmons, *Clerk Board of Eng'rs.*

Dwight (Rev. William Theodore), D. D., son of President Timothy Dwight of Yale College, Conn., born June 15, 1795, at Greenfield Hill, Conn., graduated at Yale in 1813, practised law in Philadelphia for ten years (1821–31), when he entered the ministry, and was settled as a Congregational clergyman at Portland, Me., where he remained for thirty-two years (1832–64), when he resigned his pastorate on account of poor health. His ministry was one of great success, and his influence as a thinker, preacher, superior platform-speaker, and presiding officer in ecclesiastical councils and conventions was very great, not only throughout his adopted State, but also throughout the Congregational denomination at large. He was several times invited and urged to accept of other positions of honor and influence, and was solicited in vain by three different theological seminaries to take the chair of doctrinal theology in them. He excelled alike in the art of fine rhetorical composition and of easy and effective extempore speaking. His personal appearance was—like that of his father and of his brother, Dr. Sereno E. Dwight—fine and commanding. He died at Andover, Mass., Oct. 22, 1865.

Dwi'na, or **Duna** (anc. *Turunthus*), a river of Russia, rises in the government of Tver, near the source of the Volga. Its general direction is nearly north-westward. It forms the boundary between Livonia and Courland, and enters the Gulf of Riga 7 miles below the town of Riga. Length, about 600 miles. The navigation is obstructed by rocks and sandbanks, but during the floods of spring and autumn it is easily navigated.

Dwina, or **Northern Dwina,** a large river of Russia, is formed by the confluence of the Sookhona and Vitchegda, which unite in the government of Vologda. It flows nearly north-westward through Archangel, and enters the White Sea 20 miles below Archangel. Its length, excluding the branches above named, is estimated at 450 miles. It is navigable, and is an important channel of trade, but there are shoals at its mouth which obstruct the entrance of vessels drawing more than fourteen feet of water.

Dyaks, the aborigines of Borneo (which see, revised by Prof. A. J. Schem).

Dy'berry, a post-township of Wayne co., Pa. P. 1196.

Dyce (Rev. Alexander), a critic and divine, born in Edinburgh June 30, 1797, was educated at Edinburgh and Oxford. He removed to London in 1827, and edited several old English dramatists and other writers, including Beaumont, Fletcher, and Marlowe. In 1858 he published a good edition of Shakspeare (6 vols.), which displays much critical ability. Died May 15, 1869.

Dyce (William), a painter of eminence, was born in 1806 at Aberdeen, Scotland. He studied at Rome, and practised his art in Scotland and in London, where he was head-master of the school of design, 1838–43, and was employed upon works for Buckingham Palace. In 1845 he painted the "Baptism of Ethelbert" for the House of Lords. He painted various scriptural and ecclesiastical scenes, and gained distinction by his frescoes. Died Sept. 14, 1864.

Dyck, van (Anthony). See Vandyke.

Dyeing [Lat. *tinctura;* Fr. *teinture;* Ger. *Färben* or *Färbekunst*], the art of coloring yarn or cloth, has been practised from the most remote antiquity. The fibres and fabrics usually dyed are either cotton, linen, silk, or wool. (See Textile Fabrics.) The coloring-matters employed are either the natural products of animals or plants, or are the results of chemical processes. (See Dyestuffs.) Thorough cleansing of the fibres is an almost indispensable preliminary to dyeing. Resinous and oily matters must be removed to give the dye liquors free access to the fabrics, and natural coloring-matters must be destroyed in order to secure the brightest and clearest tints of the dyes. Cotton is successively boiled with lime, soda-ash, and rosin; it is then soured with dilute sulphuric acid, and finally treated with hypochlorite of lime (bleaching-powder). Linen is subjected to repeated treatment with water, alkalies, acids, and hypochlorite of lime, alternating with exposure on the grass to air and sunlight. Silk is boiled in a solution of fine soap to remove the gelatinous, resinous, and fatty matters which make up a large proportion of its weight. Wool is thoroughly cleansed by washing in weak soap or soda-lye, putrid urine, or weak ammonia. (For the details of these operations see Bleaching.)

The dyeing is usually effected while the fibres are in the yarn, although the woven cloth is dyed in some cases. The special operations of dyeing vary with the fabric and the coloring-matters employed. Some colors combine with the fibres very readily as soon as they are immersed in their solutions; such colors have been called *substantive.* Silk and wool take colors much more readily than cotton and

linen; many dyes are therefore substantive for these animal fibres. Nearly all the aniline colors belong to this class. With such colors the operations of dyeing are very simple. They consist in the mere immersion of the yarn or cloth in cold or hot solutions of the dye, with sufficient handling to secure the even distribution of the color. Agents are often added to fix or set the color, such as acids, alkalies, tin salt, alum, etc. A few colors are substantive for cotton and linen, as the safflower pink.

For dyes which will not unite directly with the fibres, called *adjective*, the aid of *mordants* is necessary. Mordants are bodies which possess an affinity for the colors, and which can be fixed in an insoluble condition on or within the fibres. Some are metallic oxides or salts, as alumina, oxide of iron, oxide of tin, tannate of tin, soap, etc.; others, as albumen, gluten, caseine, tannin, acids, etc., are of a different character. The mode of applying the mordant depends on the fabric, as well as on the character of the mordant itself. Silk and wool, when immersed in a solution of alum, take up a considerable quantity of the salt without decomposing it. The acetates of alumina and iron are easily decomposed, with the liberation of a portion of the acetic acid and the formation of an insoluble basic acetate. By boiling cotton in their solutions the fibres become thoroughly impregnated with the insoluble compounds, and when the yarn is transferred to the solution of the dyestuff, the color unites with the mordant, forming insoluble colored bodies in or upon the fibres which are called LAKES (which see). The goods thus become permanently dyed. The same decomposition of the aluminous or ferrous salt occurs if the goods are simply immersed and then hung up in the air. Chloride of tin is decomposed by boiling its dilute solution, with the liberation of hydrochloric acid and the formation of insoluble oxide of tin. Sometimes the insoluble oxide or salt is produced by first immersing the goods in a soluble salt, and then passing them through a second solution of another agent. Exposing fabrics to an iron salt, and then to an alkaline lye, fixes oxide of iron. A lead salt and an alkaline lye fix oxide of lead. Stannate of soda, followed by a solution of nutgalls, sumach, etc., fixes tannate of tin in the fibres.

In some cases the mordant is mixed with the color, and both are applied simultaneously, to be subsequently fixed. Thus, aniline colors are mixed with albumen, applied to the cloth, and fixed by steaming, which coagulates the albumen, rendering it insoluble. Mixtures of the acetates of alumina and iron, of the chloride of tin, etc. with colors, are also fixed by steaming. This method of fixing colors is extensively practised in CALICO-PRINTING (which see), as it renders it possible to produce patterns by applying the colors to certain portions of the cloth, or by applying different colors to different portions. Mordants often affect the natural tints of the dyes, thus enabling the dyer to produce a variety of shades with the same dye. Oxide of iron is most remarkable in this respect; it changes the red color of madder, logwood, Brazil-wood, etc. to shades of purple, lilac, chocolate, and even black, according to the proportions in which it is employed. The most durable blacks are obtained with oxide of iron, combined with logwood, sumach, catechu, etc. The oxide of tin tends to brighten the shades, while alumina fixes them in their natural tints. This is a very important circumstance in calico-printing, as it enables the dyer to produce several colors on the same cloth by one operation of dyeing; the mordants, acetate of alumina, acetate of iron, and mixtures of the two salts in varying proportions, being printed on the cloth. The oxides are rendered insoluble by hanging the cloth in the air (*ageing*), and by washing in alkaline solutions of silicate, arseniate, or phosphate of soda (*dunging*). On passing the mordanted cloth through a mixture of madder-root, Brazil-wood, etc. in warm water, patterns in pink, red, purple, lilac, chocolate, and black are produced. Metallic pigments are often produced in the yarn or cloth by the successive application of the agents necessary for their production. Thus, when cloth mordanted with oxide of iron is passed into an acidulated solution of ferrocyanide of potassium, an insoluble Prussian blue is at once produced. Goods impregnated with oxide of lead by immersion in acetate of lead become bright yellow in a solution of bichromate of potash, owing to the formation in the fibres of insoluble chromate of lead. By subsequently boiling with lime-water the yellow is changed to orange basic chromate. Pigments are also fixed upon the cloth by albumen; this is specially the case in the application of the chromates of lead, ultramarine, and Guignet's green in calico-printing. Indigo blue is produced in cotton by immersion in a solution of colorless reduced indigo (the indigo vat) and exposure to the air, when the indigo blue is regenerated by oxidation in an insoluble form. The following are a few of the principal methods of dyeing; more detailed statements are given under the different dyestuffs:

REDS.

On Cotton.—(1) Mordant with sumach, then with red spirits (a solution of 2 oz. of tin in 3 oz. hydrochloric acid, 1 oz. nitric acid, and 1 oz. water); then dye in a mixture of Lima-wood and fustic. (2) The most beautiful red on cotton, Turkey red, is produced by boiling the cloth in a mixture of oil and a little carbonate of soda. It is then dried, freed from the excess of oil by pearlash, passed through a bath of nutgalls and alum; then through hot water holding chalk in suspension. It is then ready to be dyed in a boiling bath of madder. It is then washed, and the treatment with galls and alum, chalk and madder repeated. It is then cleared or brightened by boiling in soap and pearlash, then in soap and protochloride of tin; finally, it is immersed in a bath of sour bran. (3) Aniline reds and pinks on cotton mordanted in nutgalls or sumach, followed by perchloride of tin.

On Wool.—(4) Mordant with alum and bichromate of potash, and dye with peach and Lima-wood, with alum. (5) *Scarlet.* Cochineal, with cream of tartar, sumach, and fustic. (6) *Crimson.* Cochineal, with cream of tartar and protochloride of tin. (7) *Pink.* Cochineal, tartar, alum, and red spirits. (8) Aniline shades are fixed on wool without mordants.

On Silk.—(9) Peach-wood and fustic, followed by red spirits, with annatto for scarlets, cochineal and safflower for finer tints. (10) *Pink.* Safflower, with sulphuric acid and cream of tartar. (11) Beautiful tints have been obtained from lac-dye. (12) Anilines are applied to silk in a warm bath, slightly acidulated with acetic, tartaric, or sulphuric acid.

BLUES.

On Cotton.—(13) Prussian blue produced by an iron mordant, followed by ferrocyanide of potassium. (14) Indigo vat, a solution of reduced indigo. (15) *Aniline blues.* Mordant with soap, then sumach, the protochloride of tin; dye in warm bath.

On Wool.—(16) Prussian blue, as for cotton. (17) Indigo extract, with argol and alum. (18) Aniline blue, with starch, sulphuric acid, and gum-arabic.

On Silk.—(19) Prussian blue, as for cotton. (20) Indigo extract and alum. (21) Anilines, with soap and sulphuric acid.

YELLOWS AND ORANGES.

On Cotton.—(22) Chromate of lead, produced by bath of acetate of lead, followed by bichromate of potassa, deepened by the addition of annatto. (23) The chrome yellow is deepened to orange by boiling in lime-water. (24) Mordant in acetate of alumina and dye in yellow weed (weld). (25) Mordant in weak protochloride of tin; dye in quercitron bark, fix with protochloride of tin. (26) *Coralline orange.* Mordant with stannate of soda, then with sumach.

On Wool.—(27) Mordant in tartar and alum; dye in mixture of quercitron, sumach, fustic, and red spirits. (28) Weld, with alum and tartar. (29) Picric acid. (30) Aniline yellow. (31) Naphthaline yellow. (32) *Orange.* Sumach, with cochineal, fustic, tartar, and red spirits. (33) Aniline orange.

On Silk.—(34) *Yellow to orange.* Annatto, with alum and white soap. (35) Weld, with alum and tartar. (36) Picric acid. (37) Aniline yellow or orange. (38) Naphthaline yellow.

GREENS.

On Cotton.—(39) Dye blue, then yellow with fustic or quercitron bark. (40) Aniline green, on cotton mordanted with sumach; brighten the tint with picric acid.

On Wool.—(41) Dye yellow with fustic and alum, then blue with indigo. (42) For olive, use fustic with logwood, madder and peach-wood; following with copperas. (43) Aniline green. (44) Picric acid and indigo carmine.

On Silk.—(45) Fustic, with sulphate of indigo and alum, using logwood and copperas to darken shades. (46) Lakao, or Chinese green, gives beautiful shades. (47) Aniline green, with sulphuric acid or cream of tartar. (48) Picric acid and indigo carmine.

PURPLES, VIOLETS, AND LILACS.

On Cotton.—(49) Mordant with red spirits, and dye with logwood, to which a little red spirits and acetate of alumina have been added. (50) Dye light blue, then redden in logwood with alum. (51) Mordant in sumach, then in red spirits, and dye in logwood. (52) *Safflower lavender.* Dye light blue, then cover with safflower pink. (53) Dye madder on a mordant of alumina and oxide of iron. (54) *Aniline colors.* Mordant with perchloride of tin or with sumach, followed by perchloride of tin or tartar emetic; fix with gelatine or albumen.

On Wool.—(55) Cudbear, logwood, barwood, camwood, or peach-wood, with alum. (56) Murexide, fixed by corrosive sublimate, acetate of soda, and acetic acid. (57) Anilines.

On Silk.—(58) Archil or cudbear. (59) Murexide, as for wool. (60) Anilines.

BLACKS.

On Cotton.—(61) Sumach, followed by copperas, then by logwood, then by weak copperas; the color is improved by adding fustic and replacing the second copperas bath by acetate of iron. (62) For blue-black precede 61 by the indigo vat. (63) Aniline black is not available for dyeing, although the best black for many styles of calico-printing.

On Wool.—(64) Camwood, followed by copperas, then logwood, finally copperas. (65) Mordant in bichromate of potassa, with alum and fustic; hang in the air; dye in logwood, barwood, and fustic; finish in copperas.

On Silk.—(66) Copperas and logwood, repeated; the addition of nitrate of iron and fustic improves. (67) For blue-black, dye in Prussian blue and follow with 66.

DRABS.

On Cotton.—(68) Sumach, followed by weak copperas, then fustic, Lima-wood, and logwood; raised with alum.

On Wool.—(69) Madder, peach-wood, logwood, fustic, with alum and copperas.

On Silk.—(70) Sumach, fustic, and logwood, with copperas.

BROWNS.

On Cotton.—(71) Dye yellow, then with Lima and logwood, and fix with alum. (72) *Catechu brown.* Boil in catechu, pass through hot bichromate of potassa, wash in hot water containing a little soap. (73) *Chocolate or French brown.* Dye in spirit yellow, 25, then in logwood, and raise with acetate of alumina.

On Wool.—(74) Pass through a bath of fustic, madder, peach, and logwood; then through dilute copperas. (75) Bath of bichromate of potassa, argol, and alum; then of maddor, peach, and logwood. (76) Aniline brown.

On Silk.—(77) First orange, with annatto, then pass through copperas, then bath of fustic, logwood, archil, and alum; modify with fustic for yellowish, peach for reddish, logwood for bluish brown. (78) Aniline brown.

(For special works on dyeing, see article on CALICO-PRINTING.) C. F. CHANDLER.

Dy'er, a county in the W. of Tennessee. Area, 650 square miles. It is bounded on the W. by the Mississippi River and intersected by the Obion River. The surface is level, the soil fertile. Lumber (mostly of the poplar or tulip tree) is exported from this county. Cattle, grain, wool, cotton, and tobacco are raised. Capital, Dyersburg. Pop. 13,706.

Dyer, a township of Saline co., Ark. Pop. 512.

Dyer, a township of Washington co., Me. Pop. 24.

Dyer (ALEXANDER B.), an American officer, born in 1817 in Virginia, graduated at West Point in 1837, and Sept. 12, 1864, chief of ordnance with the rank of brigadier-general. He served in the artillery at Fortress Monroe, Va., and in the Florida war 1837–38, and in the ordnance at various arsenals 1838–46; as chief of ordnance of the army invading New Mexico 1846–48, engaged at Canada, Taos (brevet first lieutenant), and Santa Cruz de Rosales, Mexico (brevet captain); on ordnance duty and in command of various arsenals 1848–61; and member of ordnance board 1859. He served in the civil war in command of Springfield Armory 1861–64, largely extending the manufacture of small-arms; as member of ordnance board 1860–63; and as chief of ordnance and in charge of ordnance bureau at Washington, D. C., since 1864. Brevet major-general Mar. 13, 1865. Died at Washington, D. C., May 20, 1874. GEORGE W. CULLUM, *U. S. Army.*

Dyer (Rev. GEORGE), an English antiquary and scholar, born in London Mar. 15, 1755. He was educated at Cambridge, became a Baptist minister, and preached for some years at Oxford, from which he removed to London in 1792. He edited Valpy's Classics, and wrote, besides other works, a "History of the University of Cambridge" (2 vols., 1814). Died Mar. 2, 1841.

Dyer (Rev. JOHN), an English poet, born in Carmarthenshire in 1700. He was originally a painter, and studied art in Italy. He published in 1728 a poem entitled "Grongar Hill." Having taken holy orders, he obtained the livings of Calthorpe, Coningsby, and Bedford. Among his works are the "Ruins of Rome" (1740), and "The Fleece," a didactic poem (1754). Died July 24, 1758.

Dyer, or **Dyre** (Mrs. MARY), a member of the Society of Friends who suffered death for her religion. She was hanged on Boston Common, a willing martyr, June 1, 1660. (See HILDRETH, "History of the U. S.," vol. i.)

Dyer (N. MAYO), U. S. N., born Feb. 19, 1839, in Massachusetts, appointed a master's mate in the volunteer navy May 2, 1862, became an acting ensign in 1863, an acting master in 1864, and an acting lieutenant in 1865. He received a commission as lieutenant-commander in the regular navy Dec. 18, 1868. On the night of May 18, 1862, Master's Mate Dyer, in charge of the second cutter of the steamer R. R. Cuyler, off Mobile, boarded a blockade-runner which had accidentally grounded within 200 yards of Fort Morgan, and captured her officers and crew. Then, observing that a gunboat was coming towards him, Dyer set fire to the vessel, which, being filled with cotton, was soon destroyed, and made his way in safety with his prisoners to the Cuyler. He served on board the Metacomet at the battle of Mobile Bay, Aug. 5, 1864, and is thus honorably mentioned by his commanding officer, Lieutenant-Commander James E. Jowett, in his official report to Rear-Admiral Farragut of the part taken by the Metacomet in the action: "For the efficient handling of the vessel I am much indebted to Acting Master N. M. Dyer, who had permission to go North on leave, but volunteered to remain to assist in the attack upon the forts."

FOXHALL A. PARKER, U. S. N.

Dyer (Rev. SIDNEY), a Baptist minister and author, was born at White Creek, Washington co., N. Y., in 1814. He became a soldier of the U. S. army in 1831, and remained in the service nearly ten years. In 1842, after laborious study, he was ordained, and afterwards was a missionary to the Choctaws. In 1852 he became pastor of a church in Indianapolis, and in 1859 one of the secretaries of the Baptist Publication Society in Philadelphia. He has published "Voices of Nature," "Songs and Ballads," many of them very popular, "Winter's Evening Entertainment," "Great Wonders in Little Things," and other works.

Dyers' Broom, called also **Woadwaxen, Dyers' Green-Weed,** and **Whin,** a low shrub with yellow flowers and simple leaves. It is the *Genista tinctoria,* a European leguminous plant now thoroughly naturalized in New England. It is said to be the *genêt,* the bush which gave its name to the Plantagenet family. It was introduced into this country for garden cultivation, for its tops were formerly used to make a yellow dye for domestic purposes. It is used in Russia as a preventive to hydrophobia, but it appears to be simply a hydragogue cathartic of no great value.

Dy'ersburg, a post-village, capital of Dyer co., Tenn., on Forked Deer River, about 160 miles W. of Nashville. Two weekly newspapers are issued here. Pop. 683.

Dyersville, a city of Dubuque co., Ia., on the Illinois Central R. R., 29 miles W. of Dubuque. It has four churches, a flour-mill, two breweries, two schools, and one weekly newspaper. ROSE & SON, PUBS. "COMMERCIAL."

Dyers' Weed or **Weld,** also called **Woold** and **Rocket,** the *Reseda Luteola,* a European herb of the order Resedaceæ, naturalized about New York. It considerably resembles its congener, the mignonette. It is extensively cultivated in Holland and France, and to some extent in England, and is a valuable yellow dyestuff. Its quality is much improved by cultivation. It was formerly used in medicine as a sedative, diaphoretic, and diuretic.

Dyestuffs. The bodies used to impart color to textile fibres and fabrics are either derived from the animal or vegetable kingdom, or are prepared artificially, either from mineral or vegetable products. Many colors exist already formed in plants; others are produced from colorless bodies by oxidation or other processes. Lakes are compounds of coloring-matters with metallic oxides, such as alumina, the oxides of tin, lead, antimony, and barium. They are generally prepared from cochineal, madder, weld, Brazil-wood, coralline, aniline colors, etc. (See LAKES.) The following are some of the most important dyestuffs:

I. ANIMAL DYES.—*Cochineal,* the female insect of the species *Coccus cacti,* is by far the most important. Its coloring principle is carminic acid. It produces scarlets and crimsons of great brilliancy on silk and wool. Carmine is nearly pure carminic acid. *Kermes, kermes grains, alkermes* is the insect *Coccus ilicis,* one of the most ancient dyes for red shades on silk. *Lac* is the *Coccus laccæ,* a similar insect. The *Tyrian purple* was obtained from mollusks: it is no longer used. *Galls* are excrescences produced on the leaves and leaf-stalks of the oak by punctures of the gall-wasp, made for the purpose of depositing her eggs. Their characteristic constituent is tannic acid, which produces drabs and blacks with iron salts. They also serve as a mordant for some aniline colors, and are the basis of most writing inks. *Sepia* is the fluid of cuttle-fish; it is not used as a dye, but as a water-color by artists. *Murexide* is a purple compound produced by the action of nitric acid and ammonia on uric acid from guano; it is no longer used.

II. VEGETABLE DYES.—These are extremely numerous, although only a few are in general use. They are derived from different parts of plants: (1) From roots the most important is *madder* (*Rubia tinctorum*), which contains two

principles, alizarine and purpurine. These bodies produce on cotton the most permanent reds, purples, and chocolates, which makes them specially applicable for calico-printing. Madder appears in commerce in the form of ground root; flowers of madder, the ground root washed and fermented; garancine, the ground root boiled with sulphuric acid and washed; and extract, a tolerably pure alizarine. Recently the alizarine has been manufactured artificially from the anthracene of coal-tar, and there is reason to believe that the artificial product will almost entirely supersede the natural root. *Munjeet* is the Indian madder. *Alkanet* is the *Anchusa tinctoria*, formerly used for lilac, lavender, and purple on silk. Its colors were always fugitive. *Barberry* produces a yellow of little importance. *Turmeric*, or Indian saffron, produces a fugitive yellow. It is now chiefly used for yellow lacquers, as a test for alkalies, for mixing with curry-powder and with mustard. *Soorangee* is a yellow much used in India. (2) Among the more important woods are *logwood*, containing hæmatoxylin, extensively used for reds, purples, violets, blues, and blacks; *Brazil-wood*, comprising several species of *Cæsalpinia*, found in Central and South America and in Japan, known as "Lima," "Pernambuco," "Santa Martha," "Peach," "Nicaragua," "Sapan" or "Japan," etc. It yields a coloring-matter known as brazilin, which produces rich reds. *Sandal-wood* from Ceylon, and *cam* and *bar wood* from Africa, contain santalin, which gives reds, violets, and scarlets. *Fustic*, or "yellow wood," is the *Morus tinctoria* from the West Indies. *Fustet*, "young fustic," or "Hungarian yellow wood," is the *Rhus Cotinus*. (3) The only bark of special importance is the *quercitron*, which produces a rich yellow, and greens when combined with blue. *Lo-kao*, or *Chinese green*, is a green lake prepared by the Chinese from the bark of a species of *Rhamnus*, or buckthorn. (4) Leaves of the *Rhus Cotinus* are known as *sumach;* they produce a yellow, but are generally used, on account of the tannic acid they contain, either as a mordant or to produce blacks, etc. with iron salts. *Chica*, which gives an orange on cotton, consists of the leaves of *Bignonia Chica*. (5) *Flowers.* The petals of *Carthamus tinctorius* constitute "safflower." They contain a useless yellow coloring-matter, soluble in water, and a beautiful pink (*carthamin*), soluble in alkalies, which is used for red on silk and cotton. This is the material used for dyeing *red tape* and for preparing *red saucers*. *Saffron*, a beautiful yellow dye, consists of the stigmas of *Crocus sativus*. (6) *Fruit.* "Persian," "French," "Turkey," etc. berries are derived from several species of *Rhamnus*. They contain a beautiful yellow dye (*chrysorhamnine*) and olive-yellow (*xanthorhamnine*). They are used in calico-printing, for paper pulp, and for lakes. *Annatto* or *annotto* is an extract of the seed-pellicles of *Bixa Orellana*. It is used for yellows, oranges, and with reds for scarlet. It is also employed for coloring butter and cheese. *Divi-divi* is the pod of the *Cæsalpinia Coriaria*. It contains tannic acid. *Catechu, terra japonica*, and *gambir* are the extracts prepared from the fruit, wood, twigs, and unripe pods of several plants growing in India. Their active principle, as well as that of *divi-divi*, is tannic acid. They are used as mordants, with iron salts for drabs and blacks, and in tanning skins. (7) *Entire plants. Indigo* from various species of the *Indigofera*, and *woad* from the *Isatis tinctoria*, contain a glucoside (*indican*) which by fermentation yields indigo blue (*indigotine*). This color has long been used as one of the most permanent blue dyes. Several preparations are employed by the dyer: (*a*) solution of colorless or reduced indigo, with which the cloth or yarn is impregnated, and from which the insoluble blue indigotine is precipitated on exposure to the air; (*b*) in solution in sulphuric acid as sulpho-purpuric acid, purple blue, or as sulpho-indigotic acid, deep blue; (*c*) as carmine of indigo, the soda compounds of the above-mentioned acids. It is used for cotton, silk, and wool, and in calico-printing. *Lichens.* A variety of lichens yield, by a kind of fermentation, a series of products known as *archil* or *orseille, cudbear* or *persio*, and *litmus*. The weeds (from the Canaries, the Pyrenees, etc.) are pulverized and moistened with urine, when certain acids they contain are changed to the coloring-matter *orcein*. Archil appears in commerce as a purple paste, cudbear as a red powder, litmus as a blue lake. Before the introduction of the aniline colors the most beautiful purples for silk were obtained from archil. *Weld*, the *Reseda Luteola*, contains lutioline, which yields a rich but fugitive yellow.

III. Artificial or Chemical Colors.—(1) Pigments are insoluble metallic compounds, either produced in the yarn or cloth by successively applying the necessary reagents, or attached mechanically to the surface by albumen or other adhesive substances. *Prussian blue* is a ferrocyanide of iron; *chrome yellow* and *orange* are chromates of lead; *Schweinfurt green* is the aceto-arsenite of copper; *Guignet's green* is a hydrated oxide of chromium; *ultramarine* is a compound of alumina, silica, soda, and sulphur. (2) *Coal-tar colors.* Within the past few years a revolution has taken place in silk and wool dyeing, and even cotton-dyeing and calico-printing have been very considerably involved. An entirely new class of dyestuffs has been created by modern chemistry, all of which are derived from the refuse tar produced in gas-works from bituminous coal. These colors belong to four distinct series: (*a*) The aniline series, including the red rosaniline salts, the purple, violet, and blue substitution products derived from them, the greens, yellows, browns, black, and pinks, all of which are described under Aniline Colors (which see). (*b*) The phenol or carbolic acid series, including picric acid (yellow), pheniciene, coralline (red and orange), and azuline or phenyl blue. (See Phenol Colors.) (*c*) The naphthaline series; Martin's yellow, dinitronaphthol yellow, Magdala red, and violet and blue substitution products derived from it. (See Naphthaline Colors.) (*d*) Anthracene series, of which artificial alizarine and anthrapurpurine are the representatives. (See Anthracene, Alizarine, and Madder.)

All the important animal and vegetable dyestuffs above mentioned are described more fully under their respective titles. (For fuller information consult the works on dyeing mentioned in the article Calico-Printing.)

C. F. Chandler.

Dy'ing Declara'tion, in law, is a statement made by a person in the prospect of impending death with regard to the method of his death. In most countries such statements cannot be received in civil cases as evidence, and in criminal cases only when the manner of death of the deceased is the subject of the charge. They must be made with full knowledge of approaching death, must relate to facts only, must be complete and unqualified, and must be freely made. They are further subject to the ordinary rules of evidence. The theory is, that the knowledge of the approach of death creates an obligation at least equal to that of a judicial oath.

Dyke, or **Dike** [from the Dutch *dijk*, a "dike" or "wall;" Fr. *digue*], a term applied by geologists to the molten material filling a wide fissure or rent in rocks, such as often occurs in volcanic formations. This molten matter on cooling was solidified, so as to form a wall separating the edges of the disjointed strata. Such walls of intruded matter occur in stratified rocks of all ages, are usually nearly vertical, and are supposed to have been caused by volcanic eruptions. A dyke differs from a *fault* in not involving a shifting of the opposite sides of the fissure. The material with which the fissure is filled is often crystalline and porphyritic. In many cases the dyke is composed of lava, greenstone, or trap. Trap-dykes often project above the surface of the ground in consequence of the abrasion or denudation of the softer rock which was contiguous, and they form prominent objects in the landscape.

Dyke, a rampart against the encroachments of the sea. (See Dike, revised by Gen. J. G. Barnard, U. S. Army.)

Dy'mond (Jonathan), an English moralist and writer, born at Exeter in 1796, was a member of the Society of Friends and a linen-draper. He wrote an able work entitled an "Inquiry into the Accordancy of War with the Principles of Christianity" (1823), and "Essays on the Principles of Morality, and on the Private and Political Rights and Obligations of Mankind" (1829), which are highly esteemed and have often been reprinted. Died May 6, 1828.

Dynam'eter [from the Gr. δύναμις, "power," and μέτρον, a "measure"] is an instrument for determining the magnifying power of a telescope. This power is the ratio of the solar focal distance of the object-glass to the focal distance of the eye-piece, considered as a single lens; and this ratio being the same as the ratio of the effective diameter of the object-glass of the telescope to the diameter of the image of the same formed at the solar focus and seen through the eye-piece, the object of the instrument is to measure the exact diameter of this image, which can be either projected on mother-of-pearl or measured by optical means. Ramsden proposed for this purpose the double-image dynameter, or micrometer, which is formed by dividing the eye-lens of a positive eye-piece into two equal parts, and mounting them so that the divided edges are made to slide along each other by means of a fine screw apparatus. Each semilens gives a separate image; and the distance of the two centres, measured by the revolutions of the screw when the borders of the two images are brought into contact, gives the distance of the centres of the images or the diameter of one of them.

Dynam'ics. The term *dynamics*, in its literal signification, as well as in its more modern acceptation, relates to or designates the science which has for its object the in-

vestigation of the laws and principles which govern the action of forces. The science of dynamics may be divided into various branches, each embracing the principles applicable to some special conditions of the action of forces or of the bodies acted on, such as the subject of *statics*, or the equilibrium of forces; the subject of *kinetics*, the action of forces in connection with the motions and changes which they produce; and the special applications of both these subjects to bodies in the *solid* and *fluid* states.

The abstract idea of force is derived from our knowledge and experience in regard to the forces of nature—gravitation, inertia, friction, molecular force, muscular force, etc. These forces are so far similar and identical in their effects as to admit of a common measure, and of being subjected to the same laws and principles. In general they arise from the action of one body on another, in such a manner that this action is distributed among all the particles or is exerted through a surface. But it is nearly always possible to assume a single force acting through a definite point and in a particular direction, which shall be equivalent, in its effects, to such combined or distributed forces. The force of gravity, for instance, is an attractive influence exerted between two bodies, which can only be supposed to be exerted by the separate particles or molecules of each, and yet a single force equivalent to the sum of the attraction of all the particles of a body, and acting through its centre of gravity, is usually assumed to represent this attraction. A force may thus be regarded as an influence or action which requires three elements for its determination—its *line of action*, its *point of application*, and its *magnitude*.

This abstract idea is applicable to all forces, and furnishes the starting-point or basis of the system of principles which constitutes the science of force. These principles depend also on certain axioms of physical science derived from a consideration of the nature of forces and their effects; and also upon certain geometrical laws involving the relation between the magnitudes of forces and motions, and their equivalent components. To compare the magnitudes of forces a standard unit or measure must be adopted which is applicable to all forces under all ordinary conditions. As all standards of measure are arbitrary, such a unit of measure may be found in the effects which a given force will produce under conditions which permit of the effect being measured by some other known standard of measure.

To explain the standard or unit of force adopted in dynamical science, it will be necessary to explain just what is understood by the mass of a body. If we suppose (*for the purpose of this explanation only*) that the ultimate particles or molecules of all substances are the same, and that we may designate by the term *density* the degree of proximity of the particles of any body to each other, then the number of particles in a given *volume* may be taken to denote the mass of the body; *i. e.* this number would represent the *quantity of matter in the body*. This quantity of matter or mass has important properties as regards force. First, the action of the force of gravity upon the body is directly proportional to the mass; and this mass possesses a peculiar power of resistance to any force which acts to change its condition in respect to motion. It is inert as regards any power in itself to change, but a force of resistance is developed with the action of an impressed force. The truth of this principle is so well established that the following relation between an impressed force, the mass of a body free to move without resistance (other than its inertia), and the velocity which is produced in a unit of time, has the force of a scientific axiom. This relation may be stated as follows: *The velocity produced in a body free to move without resistance in a unit of time will be directly proportional to the intensity or amount of the impressed force, and inversely proportional to the mass of the body.* In algebraic symbols, if v be the velocity, F the force, and M the mass, the relation will be expressed by the equation $v = \frac{F}{M}$. From this is determined the value of the force $F = Mv$. If the mass M be that of a given volume of some substance assumed as a standard, the unit of force may be assumed to be that force which will produce a given velocity—the unit of velocity, for instance—in a unit of time. This is an *absolute unit of force*, and serves as a universal measure. Another measure adopted is more specific, but not an invariable standard. It is, however, that in most common use, and is perhaps the most universally understood as the standard of measure for forces. If the force F, instead of being any force, be taken as the force of gravitation, the total attraction of the earth at a given place on the mass M will be what is commonly called the weight of the body; representing this by W, we shall have $W = Mv$. If the same standard mass be chosen as before, the weight of this mass may be taken as the unit of force. Such a unit has been generally adopted for different national standards. For English measures the mass M is that of a piece of platinum carefully preserved, the weight of which is called 1, or one pound. This weight will differ for different latitudes, because the force of attraction of the earth varies with the latitude, and hence this measure is not absolute in its character, but it is convenient for use, and is universally employed. If any mass be allowed to fall under the influence of gravity, the velocity generated in one second may be determined experimentally, and the equation $W = Mv$ will give the relation between the weight, mass, and velocity under these circumstances. In the latitude of London this velocity is 32.2 feet, approximately; so that $\frac{W}{32.2} = M$. The mass of a body is thus found by dividing the weight by 32.2. The unit of force, for British measures, may therefore be said to be *one pound avoirdupois*, and the mass of a body may be found by dividing the weight by the number 32.2; these quantities representing British measures referred to the latitude of London. The corresponding French unit of force is 1 kilogramme, equivalent to about 2.2 British units.

A force being fully represented by its *magnitude*, *direction*, and *point of application*, the first problems in order in the action of impressed force, relate to the laws of equilibrium, or the rules for finding the resultant of any number of forces acting on a body. If the lines of direction of the forces all pass through the same point, the resultant may be found by the application of the geometrical theorem called the parallelogram of forces. If two forces act upon one point, and portions of their lines of direction be taken to represent the magnitude of the forces, their resultant, or a single force equivalent to the action of the two, will be represented by the diagonal of the parallelogram constructed on the lines of the other two. By counting the forces which act on a point two and two, and repeating the process, a single resultant for all may be found. Or, to determine graphically the resultant, from the extremity of the line representing one of the forces draw a line parallel to the direction of any other force, of a length representing the magnitude of this force; then from the extremity of this last line draw another, parallel to and equivalent to another force, and so on; the final resultant will be a line drawn from the extremity of the last line to the origin, or point of application; if this line is zero, then the forces are in equilibrium. If the forces do not all act on one point in the body, the conditions of equilibrium require that the action of the forces shall be such that they not only produce no motion of the body in a straight line, but there must be no unbalanced effort to turn the body about any line as an axis.

The *moment of a force* in reference to an axis is the product of the intensity of the force into the perpendicular distance of its line of action from that axis.

Several special cases may be considered as leading to the most general case of the equilibrium of any number of forces acting upon a rigid body in any direction.

1st. To find the resultant of two parallel forces acting in the same direction, divide any line across their common direction into parts inversely proportional to the magnitudes of the forces; the point of application of the resultant may thus be found, and its magnitude will be equal to the sum of the magnitudes of the two forces. A third force equal and opposed to this resultant will produce equilibrium.

2d. The resultant of any number of parallel forces acting in one plane and in the same direction may be found by first finding the resultant of two, then the resultant of this with a third, and so on.

3d. For any number of parallel forces not in one plane, the conditions of equilibrium require that the algebraic sum of the forces shall be equal to zero, and the algebraic sum of the moments of the forces in reference to any two rectangular axes in the plane; that is, the combined action of the forces must produce neither a motion of translation nor of rotation. The resultant of such a system, if there be a resultant, may be a single force, or two forces forming what is called a couple.

4th. Two equal parallel and contrary forces not acting on the same point produce a couple which has no single resultant.

5th. When a system of forces act in various directions and on various points of a rigid body, if their axes be assumed at right angles to each other, each of the forces may be replaced by three component forces in the direction of these axes. The components of each force being found by multiplying the magnitude of the force by the cosine of the angle which its line of action makes with the direction of the component (a process which depends on the theorem of the parallelogram of forces), then the conditions of equi-

librium of the system are that the algebraic sums of the components in the directions of the three axes shall be zero, and also the algebraic sums of the moments of the forces in reference to these axes must be zero.

The application of these principles to find the centres of gravity of various lines, surfaces, and solids is made by supposing the body to be divided into small elementary portions, and these portions to be acted on by the parallel forces of gravity acting on each. In a corresponding manner the centre of pressure of fluids resting upon surfaces may be found.

The various cases of equilibrium when no other forces act on a body than the force of gravity, and the pressure between the body and fixed supports, constitute a large class of problems which occur in the applications of dynamics to engineering; the stresses and strains which are produced in the pieces of a structure being the principal objects for calculation. In the action of forces where motion is produced, the elements of time, space, and velocity enter into the discussion, as well as the mass of the body acted on.

The three fundamental axioms or truths on which the science of dynamics principally rests are—

1st. Every body continues in its state of rest or of uniform motion until compelled by impressed forces to change its state.

2d. Change of motion is proportional to the resultant of the impressed forces, and takes place in the direction of the straight line in which that force acts.

3d. There can be no action of a force without a contrary and equal reaction.

The *work* of a force is the product obtained by multiplying the intensity of the force by the space passed over by its point of application.

According to the above axioms or fundamental principles, the effort of any force must be opposed by an equal and contrary effort from some other force. In cases of bodies free to move under the influence of any force, a portion of the resistance to the external force is always supplied by the inertia of the body. If no other force acts upon the body than the force which produces the motion, the whole of the resistance will be supplied by inertia, and the expression which has been employed, $F = Mv$, gives the relation between the force and the resistance in terms of the mass and velocity. The quantity Mv, called by some writers quantity of motion, and by others momentum, may be interpreted as implying that this is *the measure of a force* which, acting for a unit of time, generates the velocity v. If the force continue to act on the body so as to accelerate the velocity, the *work* of the impressed force must be equivalent to the work of the resistance during any given time or through any given space. A body moving, for instance, with a velocity v, and having by the action of an impressed force its velocity changed to v', the change of momentum will be $M.(v-v')$. The force necessary to produce this change in the time t will be $F = M.\frac{v-v'}{t}$. If during this time we suppose the body to have passed with a uniformly accelerated velocity over the space s, the *work* of the force F will be Fs. But the space s is equal to the mean velocity multiplied by the time, or equal to $\frac{v+v'}{2}t$, and we have

$$F \times s = M\frac{v-v'}{t}.\times\frac{v+v'}{2}.t = M.\left(\frac{v^2-v'^2}{2}\right).$$

If the body start from rest, the initial velocity will be 0, and we shall have

$$F \times s. = \frac{Mv'^2}{2}.$$

The same may be proved whether the impressed force is constant or variable; and the important principle is thus established that the product of the mass of a body multiplied by half the square of the velocity with which the body is moving, is equivalent to the *work* of the *impressed force* which produces this velocity in the body. And generally a change in the value of $\frac{Mv^2}{2}$ is always equivalent to the *work* of the force which produces the change. The quantity $\frac{Mv^2}{2}$ is called *living force*, and sometimes *actual energy* of the body, because a body moving with the velocity v will always require the expenditure of the work represented by $\frac{Mv^2}{2}$ to bring it to rest.

In cases where external resistances act on the body in opposition to the impressed force, the work of the resistance, added to the work of inertia, will be equivalent to the work of the impressed force. This gives rise to a very simple enumeration of the laws of all machines—viz. the work of the effort or prime mover must always, during any interval of time, be equal to the total work of the resistances added to the actual energy or living force accumulated in the moving pieces. If during a given period the living force of any piece is alternately increased and diminished, the quantities of energy stored and re-stored may just equalize each other; and such a piece may be employed simply for the purpose of storing up and restoring work, as a regulator. The common fly-wheel is such a piece in machinery.

If a body has a rotary motion about any axis, the actual energy or living force due to the rotation is expressed in terms of the angular velocity and the moment of inertia of the body with reference to the axis. If the angular velocity be represented by a, the actual energy due to rotation will be $\frac{a^2}{2g}I$; the moment of inertia I being found by means of what is called the radius of gyration, which is that radius or distance in a rotating body the square of which is the mean of the squares of the distances of the particles of the body from the axes. It is found by geometrical solution. For the fly-wheel this radius is approximately equal to the mean radius of the rim.

When a body in motion is constrained to move in a curve, the force which causes it to deviate at each instant from the tangent is found by multiplying the mass by the square of the velocity, and dividing by the radius of curvature. The deviating force is equal and opposite to the influence which tends to draw the body away from the axis, the centrifugal force, and hence the *centrifugal* force is always proportional to the square of the velocity, and inversely as the radius of curvature.

In the application of the laws of dynamics to fluids the principle of living force holds true as for solids. Every fluid mass in motion has a living force proportional to the mass, multiplied by the square of the velocity.

The force of heat is derived from the same general dynamical law. It has been demonstrated that the molecules of all bodies have a constant vibratory motion, and these molecules having weight, the energy exerted when a body is cooled is equivalent to the expenditure or change of living force; and when a body is heated, the vibratory motion of the particles being increased in velocity, living force or actual energy is stored.

The property of matter which is called inertia, by virtue of which masses in motion possess a force which is appropriately called *living* force, is of great importance in the economy of machines, and of special importance also to living beings. In nearly all motions of animals this principle acts to aid the muscles in the execution of particular movements, which would otherwise be accomplished by fatiguing exertions, and would often be otherwise impracticable.

The demonstrations and applications of the various principles which have been enunciated, with their secondary consequences, usually occupy entire volumes. Works of this character have generally been entitled works on mechanics, and are often divided into two subjects or parts, *statics* and *dynamics*, but the tendency of modern writers is to exclude the word *mechanics* from definitions connected with *abstract* science, and to employ the term *dynamics* to designate the whole science of force. W. P. Trowbridge.

Dynamic Units are units for measuring forces and their effects. The simple *unit of force* has been defined under Dynamics. A *unit of work* combines two elements—viz., force acting, and space through which it acts; and is the product of a unit of force and a unit of distance. Such is the foot-pound, which is the work done in raising one pound one foot; or the kilogrammètre, the work done in raising one kilogramme one mètre. A *unit of power*, or of *rate of working*, involves the additional consideration of time. It is a definite amount of work conventionally fixed upon for purposes of comparison as the work of a unit of time. Thus, the horse-power, the unit of rate commonly used in this country in estimating the performance of machines, is 550 foot-pounds per second, or 33,000 per minute. The *cheval-vapeur* (French horse-power) is 75 kilogrammètres per second, or 4500 per minute; equal to 542½ foot-pounds per second, or 32,550 per minute, nearly —a little less than the former. W. P. Trowbridge.

Dynamite. See Explosives, by Gen. H. L. Abbot, U. S. Army.

Dynamom'eter [from the Gr. δύναμις, "force," and μέτρον, a "measure"], an instrument or apparatus for measuring energy exerted or work performed. Any contrivance may be so called which indicates the intensity of a force used to produce motion. The work done is found by multiplying the *mean* effort thus indicated into the space passed over by the point where the force is applied. A dynamometer may record only the intensities of the force, space being ascertained independently; or it may

record both force and distance traversed. A spring attached to a plough-beam may, by suitable mechanism, be made to record the varying force of traction, and thus become a dynamometer. The mean force shown by it, multiplied into the length of the furrow, will give the work of the animals drawing the plough. Prony's friction dynamometer is the form most easily applied to revolving shafts. A flexible band, enveloping either the shaft or a drum turning with it, resists the driving force by its friction. The resistance is measured by the weight required to keep the band from turning with the shaft; and this weight, multiplied by the distance it would have been carried in a given time if it had revolved with the shaft, gives the work of the prime-mover. Hirn's torsion dynamometer measures the force applied to a shaft, by the torsion caused by such force in the shaft itself. The torsion dynamometer and the spring dynamometer are best suited to measure variable forces; but there are instruments of this class in which force is measured by the resistance of fluids driven through small apertures. For measuring the work of fluid pressure, the steam-engine indicator is the dynamometer in common use. In this, the pressure of the fluid upon a small piston is resisted by a spiral spring. A pencil which moves with the piston traces upon a moving slip of paper a curve, of which the ordinates give the pressure, while a straight line perpendicular to these shows the distance passed by the surface pressed. The mean pressure multiplied by this distance gives the work done. (For Brewster's chromatic dynamometer see POLARIZATION OF LIGHT.)

W. P. TROWBRIDGE.

Dy'nasty [Gr. *δυναστεία*, from *δυνάστης*, a "lord;" Fr. *dynastie*], a family of sovereigns or rulers reigning by hereditary succession; a series of kings of the same family.

Dyrrha'chium. See DURAZZO.

Dy'sart, a royal burgh and seaport of Scotland, in Fifeshire, on the Frith of Forth, 12 miles N. N. E. of Edinburgh. The High street is lined with many antique houses. Dysart has manufactures of damasks and ticking; also shipbuilding yards. Coal-mines are worked in the vicinity. Pop. in 1871, 8920.

Dy'sartsville, a township of McDowell co., N.C. P. 767.

Dyscra'sia [from the Gr. *δυς*, "evil," and *κρᾶσις*, a "composition," a "mixture"], in medical terminology, a diathesis, a tendency towards a particular disease, a constitutional peculiarity which gives character to all attacks of disease from which a patient may suffer. The word is also used to designate a depraved and dangerous condition of the system, not constitutional, but accidental. The term is a vague one, and is not much employed.

Dys'entery [Gr. *δυσεντερία*, from *δυς*, "ill," "painful," and *ἔντερα*, "intestines"], a febrile disease, characterized by paroxysms of pain in the bowels, and by scanty though often frequent bloody, mucous stools. The glands and tissue of the large intestine are inflamed, and sometimes, though rarely, the small intestine shares the disorder. It may be acute or chronic, and is a frequent and formidable disease, especially in hot climates. It is sometimes epidemic, and then is peculiarly fatal among children. Many times it attacks and decimates armies. Sporadic cases in civil practice usually recover with little treatment. Pain is relieved by opium or Dover's powder. Gentle purgatives are extremely useful. Enemata of warm water will often relieve tenesmus. Astringents, copaiba, opiated starch injections, etc., are useful adjuvants in some cases.

Niemeyer regards epidemic dysentery as a disease distinct from the common or sporadic disease. He considers it truly infectious. The severer cases of this disease are not much benefited by treatment. Even the mild cases are apt to assume a chronic form, which may prove fatal. This disease is akin to cholera, and perhaps to intermittent fever. It is endemic in Southern Europe. The endemic dysentery of Egypt is a distinct disease, caused by the presence of a trematode worm (the *Bilharzia hæmatobia*) in the walls of the intestine.

REVISED BY WILLARD PARKER.

Dysmenorrhœ'a [from the Gr. *δυς*, "ill," *μήν*, a "month," and *ῥέω*, to "flow"], painful and difficult menstruation, is sometimes caused (1) by flexion or displacement of the uterus, in which case the proper treatment is the restitution of that organ to its normal position; (2) by an excessively or morbidly excitable nervous condition, best relieved by sedatives at the time of attack, and by supporting treatment and correct hygienic regimen; (3) it is said to be caused by uterine rheumatism, in which case it may require the treatment appropriate to rheumatism; (4) when associated with endocervicitis or endometritis it is often benefited by local treatment with caustics, etc.; (5) a variety of other local troubles may cause it, and may require special treatment.

Dyspep'sia [Gr. *δυσπεψία*, from *δυς*, "difficult," and *πέπτω*, to "digest"], a disordered functional state of the stomach without appreciable organic disease; indigestion of food, with the resulting symptoms, such as flatulence, pyrosis, pain, etc. Dyspepsia may be the forerunner or concomitant of consumption or of Bright's disease, but it is much more frequently the result of improper habits with regard to food, exercise, etc. Its treatment is important and difficult. In cases where the coats of the stomach are irritable, bismuth is a standard, safe, and useful remedy. The mineral acids, as the nitro-muriatic, are believed to correct depraved secretions. The hyposulphites are sometimes useful where microscopic plants (*Sarcina* and *Torula*) exist in the stomach. Rhubarb with alkalies, followed by sulphate of quinia, is frequently beneficial. The bitter tonics tend to correct gastric atony. In all cases the patient should have the best hygienic conditions.

When there is no gastric catarrh or ulceration there is great, and often complete, relief obtained by sea-bathing, nutritious food, and the administration of iron. Dyspepsia with depression of spirits and a red uric-acid deposit in the urine is often cured by water-treatment, with visits to saline mineral springs. In short, there is no disease with a greater variety of causes and symptoms, or which requires more judgment and skill in treatment. Neglected dyspepsia must be placed in the numerous class of causes which tend, by impairing nutrition and depressing the tone of the system, to prepare the way for pulmonary consumption.

REVISED BY WILLARD PARKER.

Dyspha'gia [from the Gr. *δυς*, "difficult," and *φαγεῖν*, "to eat"], a difficulty in swallowing, caused by paralysis, disease of the muscles of the throat, quinsy, œsophagitis, carcinoma, stricture, or spasm of the œsophagus; or it may be a symptom of hysteria, tetanus, or hydrophobia. Its treatment is various, according to the disease of which it is a symptom.

Dyspho'nia [from the Gr. *δυς*, "difficult," and *φωνέω*, to "speak"], a difficulty in speaking. The most common variety is the *dysphonia clericorum*, or "clergyman's sore throat," a follicular inflammation of the pharynx, accompanied by huskiness of the voice, with more or less coughing, hawking, and expectoration. The follicles of the fauces and the pharynx are larger or more apparent than in health. The follicles occasionally discharge hard or elastic lumps of mucus, greatly to the alarm of the patient. Ulceration may supervene, and the patient may be constantly inclined to swallow. Time, rest, muscular exercise, tonics, travelling by sea or land, are all useful in the treatment.

Dyspnœ'a [Gr. *δύσπνοια*, from *δυς*, "difficult," and *πνέω*, to "breathe"], a difficulty in breathing, a common symptom in most diseases of the heart or lungs. If the difficulty is increased by lying down, so that the patient can only breathe with any comfort when erect, it is called *orthopnœa*. Dyspnœa is sometimes the result of some functional or organic nervous disease, as hysteria. It is then relieved in most cases by diffusible stimulants. In other cases the character of the dyspnœa is remarkably varied, and the treatment is as various; belladonna, stramonium, cannabis, chloral, ipecac, and many other remedies are often useful. Strict temperance in eating and drinking should always be observed.

Dytis'cidæ [from *Dytiscus* (the diminutive of the Gr. *δύτης*, a "diver"), one of the genera], a family of aquatic coleopterous insects formed from the Linnæan genus *Dytiscus*, now divided into several genera. There are many species, of which the largest attain a length of nearly two inches. The general form is oval and the surface smooth. They are pentamerous—that is, have all the tarsi five-jointed. They are remarkable for the oar-like shape of their swimming-legs. All the species are found in marshes, lakes, and the still parts of rivers. When they come to the surface to breathe, they rest with the back downward and the extremity of the abdomen exposed to the air, the organs of respiration being in the last segment. They feed voraciously upon all kinds of animal food. They fly well, and often leave the water by night. Before changing into pupæ the larvæ secrete themselves in the earth. The larvæ are called "water-tigers," from their habit of attacking and devouring insects, tadpoles, and even fishes.

Dziggetai, or **Koulan** (*Asinus Onager*), a species of wild ass abounding in Eastern Turkey, Persia, Afghanistan, and the Punjâb. It is one of the swiftest of quadrupeds, and cannot ordinarily be overtaken, even by the Arabian horse, and the greyhound can follow it successfully only on the open plains. These animals live in troops, under a leader who rules them despotically. They are extremely wild, for they are much hunted, not only for their excellent flesh, but for the great difficulty and excitement of the chase. They are pursued by falconry, but are more frequently shot with the rifle. They are of a brown color, with a black stripe along the back.

E.

E (pron. *ee*), the fifth letter and second vowel of the Roman and of most modern alphabets. The Greeks had two vowels represented by the Latin *e*—the one short (ε, *epsilon*), the other long (η, *eta*); *e* stood for the number 5, η usually represented 8. The Sanscrit has only one *e;* this is always long (see SANSCRIT), and is usually represented in the Western languages by *e* circumflexed (*ê*). In the Arabic and Persian the vowel *fatha* (see ARABIAN LANGUAGE), being a somewhat obscure sound, is often represented in the European languages by *e* (short), though it properly corresponds to short *ă;* thus we may write *el-Korân* or *al-Korân* for "the Koran," *er-rasheed* (rashid) or *arrasheed*, the surname of Haroon (Haroun), the celebrated caliph of Bagdad. In like manner, the Arabian prophet's name may be written either Mohammed or Mohammad. The Arabs have no vowel sound corresponding to long *e* (*ê*), although this frequently occurs in the Persian.

In most of the modern European languages *e* occurs more frequently than any other letter. This remark is especially true of the French and English. One reason of this is that *e* (mute) in these languages usually replaces the terminal letter or letters of Latin or Greek words, as in the following nouns: *fame*, from the Latin *fama;* *muse* (Lat. *musa;* Gr. μοῦσα); *plume* (Lat. *pluma*); *bile* (Lat. *bilis*); *cone* (Lat. *conus;* Gr. κῶνος); *face* (Lat. *facies*); so also in adjectives, as *prone* (Lat. *pronus*); *pure* (Lat. *purus*); *vile* (Lat. *vilis*), etc. All the foregoing derivative words are French as well as English. In a few instances the final *e*, though found in English, is omitted in French; as *pine* (Lat. *pinus;* Fr. *pin*); *wine* (Lat. *vinum;* Fr. *vin*), etc.; but more frequently the reverse occurs, particularly in adjectives; thus we have *arid* (Lat. *aridus;* Fr. *aride*); *avid* (Lat. *avidus;* Fr. *avide*); *livid* (Lat. *lividus;* Fr. *livide*), etc., etc. (For the different sounds of our *e*, see PRONUNCIATION OF THE ENGLISH LANGUAGE.)

E in music is the third note in the diatonic natural scale. As a Latin preposition, *e* is put for *ex* by way of euphony, both as a separate word and in composition.

Each'ard (JOHN), D. D., an English clergyman, born in Suffolk in 1636. He became a fellow of Catherine Hall, Cambridge, in 1658. He wrote "The Ground and Occasions of the Contempt of the Clergy and Religion inquired into" (1670), and a "Dialogue on Hobbes' State of Nature" (1672). He was a writer of considerable humor, but of no great ability. Died July 7, 1697.

Ea'die (JOHN), D.D., LL.D., a divine of the Scottish United Presbyterian Church, was born at Alva, Stirlingshire, May 9, 1814, and was educated at Glasgow University. He published a "Biblical Cyclopædia," "Life of Kitto," a "Condensed Concordance to the Scriptures," etc.

Ead'mer, or **Edmer,** an English historian and monk. He entered in his youth the Benedictine monastery at Canterbury, and became a friend of Saint Anselm. He was elected bishop of St. Andrew's in 1120, but the Scottish king would not allow him to be consecrated by the archbishop of Canterbury, and he soon returned to his monastery. He wrote in Latin a "Life of St. Anselm," and a "History of [his own] Times," from 1066 to 1122, printed by Selden in 1623. These, and other writings of his, are published with the works of Anselm. Died Jan., 1124.

Eads (JAMES B.). See APPENDIX.

Eagle [Lat. *aquila;* Fr. *aigle;* Ger. *Adler*], the name of several species of rapacious birds of the order Raptores and family Falconidæ. They belong to the genera *Aquila*, *Haliaëtus*, etc., and are characterized by hooked beaks and sharp, powerful claws. About seventy species are known. They have great powers of flight and of vision, are diurnal and solitary in their habits, and use their claws in killing their prey. The eagle was regarded by the ancients as a symbol of royalty, and has the proverbial distinction of being the king of birds. Large specimens of the eagle measure three and a half feet in length, and nine feet from tip to tip of the expanded wings. These birds usually breed in mountainous districts or forests, remote from human habitations. They are all monogamous, and it is said that a pair will live together in perfect harmony until death separates them. They build their nests on a high tree, a ledge of rock, or on some inaccessible cliff. The nest is inartistically constructed of sticks, which are rudely arranged. The eagle is supposed to live to a great age, more than one hundred years.

The golden eagle (*Aquila chrysaëtos*) is a magnificent bird found in Europe, Asia, and North America, deriving its name from the golden-red color of the feathers which cover its head and neck. The plumage of the body is a rich dark-brown. This species is the largest of the European eagles. It feeds on hares, lambs, pigs, fish, etc., which it carries to its nest. When in pursuit of its prey it is very audacious, and has been seen to carry off a hare before the noses of a pack of hounds.

It is stated that the golden eagle can be tamed, and has been trained to catch game for its master. The flight of this bird is very graceful, and presents an interesting spectacle. It sweeps through the air in a series of spiral curves, rising with every spire, and making no perceptible effort or motion with its wings. According to Ruskin, "the projection of the brow is the essential point in an eagle's head. To keep the sunshine above from teasing it, the eye is put under a triangular pent-house, which is precisely the most characteristic thing in the bird's whole aspect." The imperial eagle (*Aquila imperialis*), which inhabits Asia and Southern Europe, is nearly as large as the golden eagle, and is similar in appearance. It may be distinguished from the other species by the white patch on its scapularies. Its head and neck are covered with feathers of a deep fawn-color. It generally builds on lofty trees.

The national bird of the U. S. is the bald eagle (*Haliaëtus leucocephalus*), which has a white head, neck, and tail. It is said to lay its eggs in the same nest year after year. It is fond of fish, which it generally steals from the osprey. Its habit is to watch near a river or other water until an osprey has caught a fish, which the eagle snatches in the air or catches as it falls from the claws of the osprey. The bald eagle is widely distributed through different regions of North America, and frequents the sea-coasts, lakes, and large rivers. It measures from thirty-five to forty inches in length. (See BALD EAGLE.)

Harpy Eagle.

The genus *Harpyia* includes a single species, the harpy eagle (*Harpyia thrasaëtos*), a fierce and powerful bird of Mexico and of Central and South America. A single stroke of its bill has been known to break a man's skull.

Eagle, a gold coin of the U. S., is equivalent to ten dollars, and bears the figure of an eagle. The largest gold-piece coined in the U. S. is a double-eagle = $20. The eagle weighs 258 grains Troy, and being nine-tenths fine, contains $232\frac{2}{10}$ grains pure gold.

Eagle is also the name of an ancient coin of Ireland, current in the thirteenth century.

Eagle, in heraldry, a bearing of frequent occurrence, and often assumed by sovereigns as the emblem of empire, from having been borne on the legionary standard of the ancient Romans. The eagle of Russia is *or*, with two heads displayed, sable, each ducally crowned of the field; the whole imperially crowned, beaked, and membered gules. The eagle of Austria is also displayed with two heads. The Prussian eagle has only one head. The U. S. adopted (1785) the bald eagle, his wings displayed, proper, as the national emblem.

The eagle was also one of the most ancient Roman military standards. In 104 B. C. it became the distinctive ensign of the Roman legions. It was made of bronze or silver, and was carried upon a short staff. An eagle of gold was the royal emblem of ancient Persia.

Ea'gle, a township of Bradley co., Ark. Pop. 255.

Eagle, a township of Pulaski co., Ark. Pop. 889.

Eagle, a township of La Salle co., Ill. Pop. 870.

Eagle, a township of Monroe co., Ill. Pop. 2388.

Eagle, a township of Boone co., Ind. Pop. 2327.

Eagle, a township of Black Hawk co., Ia. Pop. 507.

Eagle, a township and post-village of Clinton co., Mich. Pop. 1008.

Eagle, a post-township of Wyoming co., N. Y. It has three cheese-factories. Pop. of village, 110; of twp., 1040.

Eagle, a township of Brown co., Ohio. Pop. 1166.

Eagle, a township of Hancock co., Ohio. Pop. 1330.

Eagle, a township of Vinton co., Ohio. Pop. 681.

Eagle, a township of Harrison co., W. Va. Pop. 1560.

Eagle, a township of Richland co., Wis. Pop. 1083.

Eagle, a post-village and township of Waukesha co., Wis., at the junction of the Western Union and the Prairie du Chien division of the Chicago Milwaukee and St. Paul R. Rs. Pop. of township, 1256.

Eagle (Henry), U. S. N., born April 7, 1801, in the city of New York, entered the navy as a midshipman Jan. 1, 1818, became a lieutenant in 1827, a commander in 1844, a captain in 1855, and a commodore in 1862. He commanded the bomb-vessel Ætna at the siege of Vera Cruz, and was civil and military governor of the province of Tobasco, Mexico (1847–48). He commanded the Monticello at the attack on Sewell's Point Battery, Va., May 19, 1861, and from June, 1861, to July, 1862, commanded the frigate Santee of the Gulf blockading squadron, during which service a boat-expedition from the Santee captured and destroyed the privateer Royal Yacht in the harbor of Galveston, Texas. Foxhall A. Parker, U. S. N.

Eagle, Bald. See Bald Eagle.

Eagle Bridge, a post-village of Hoosick township, Rensselaer co., N. Y., on the Hoosick River and on the line of White Creek township, Washington co. It is at the junction of the Troy and Boston R. R. with a branch of the Rensselaer and Saratoga R. R., 24 miles N. E. of Troy.

Eagle Creek, a township of Lake co., Ind. Pop. 737.

Eagle Creek, a township of Scott co., Minn. Pop. 1120.

Eagle Grove, a post-township of Wright co., Ia. Pop. 195.

Eagle Harbor, a post-township of Keweenaw co., Mich. It contains the port of Eagle Harbor, whence copper is shipped. Pop. of village, 233; of township, 778.

Eagle Harbor, a post-village of Gaines and Barre townships, Orleans co., N. Y., on the Erie Canal, has a number of manufacturing establishments. Pop. 315.

Eagle Hawk (*Morphnus*), a name given to several species of birds of prey of the family Falconidæ, similar in form to the eagle, but inferior in size. They are natives of South America, the East Indies, and Africa. They have short wings and long legs. Some of them are beautiful.

Eagle Isle, a township of Hancock co., Me. Pop. 30.

Eagle Lake, a township of Otter Tail co., Minn. Pop. 80.

Eagle Lake Plantation, a township of Aroostook co., Me. Pop. 143.

Eagle Mills, a post-township of Iredell co., N. C. Pop. 1090.

Eagle Pass, a post-village, capital of Maverick co., Tex., on the Rio Grande, about 450 miles S. W. of Austin City. During the civil war it had a large trade with Mexico.

Eagle Point, a post-township of Ogle co., Ill. Pop. 777.

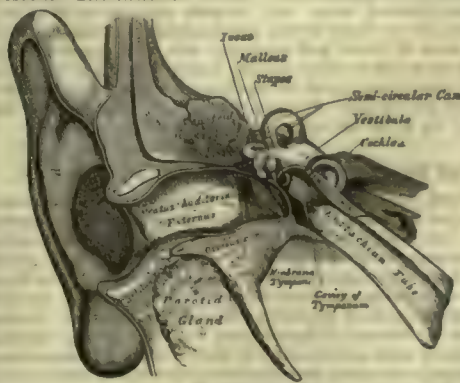
Eagle Point, a township of Chippewa co., Wis. Pop. 1667.

Eagle River, a post-village, capital of Keweenaw co., Mich., on Lake Superior, about 195 miles E. N. E. of Duluth. Copper is mined in the vicinity and shipped here.

Eagle Wood, the fragrant wood of *Aloexylon Agallochum* or *Aquilaria ovata*, a tree of the order Aquilariaceæ, indigenous in the tropical parts of Asia. It is used for burning as incense.

Ea'gre [probably from the sea-jotun Ægir (which see)], a Norse word used to express the sudden rise of the tide in the mouth or estuary of a river. It is often called the Bore (which see, by Prof. Arnold Guyot, Ph. D., LL.D.).

Eames (Charles), an eminent lawyer and journalist, born at New Braintree, Mass., Mar. 20, 1812, graduated at Harvard in 1831 and studied law. In 1845 he took a situation in the navy department at Washington, and soon became an editor of the Washington "Union." He was sent by President Polk as commissioner to the Sandwich Islands, whence he returned in 1850. After several years of journalism he became U. S. minister to Venezuela under President Pierce. After his return, in 1858, he attained high reputation as an admiralty lawyer. Died at Washington, D. C., Mar. 16, 1867.



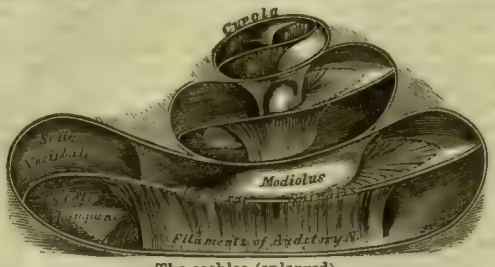
Ear, Anatomy of the. For the perception of sound the essential structure is a nerve capable of receiving and transmitting sonorous vibrations. Some animals (as spiders), possessing no special organ of hearing, nevertheless show a distinct recognition of sounds. The lowest animals, Protozoa, have no specialized organs of sensation. In some of the Acalephæ (belonging to the Radiata of Cuvier), as *Medusa*, small sacs arranged around the margin of the disk appear to represent the ear in a rudimentary form. Many of the Mollusca have auditory organs. In Gasteropoda (*e. g.* snails) these are connected with the pedal ganglia, seeming thus to aid directly in the guidance of locomotion. Cephalopoda, the highest of the Mollusca, have the organs of hearing connected with the head, as they are in Vertebrata. Worms also often have auditory vesicles in the head, connected with the œsophageal nervous ring. Grasshoppers and locusts have similar organs, either at the sides of the first abdominal segment or on the main segments of the anterior legs. In the lobster and other large Crustacea they are placed in the basal joints of the first pair of antennæ. Probably they have a similar situation in some insects, which appear to find each other by hearing sounds, made especially by those of the male sex.

All vertebrate animals, except *Amphioxus*, have distinct organs of hearing. They differ much, however, in the different classes. Fishes have no external or middle ear, and no cochlea in the internal ear. Amphibia also are without a cochlea; some have a tympanum, others none. Reptiles, except the crocodile, are quite destitute of external ears. All of them except serpents have a tympanum, and several an externally visible membrana tympani. The columella in them is either one small bone or a row of bones in the tympanic cavity. It is homologous with the stapes or stirrup-bone of mammals. Comparative anatomists generally consider the other tympanic bones (incus and malleus) to be homologous with the "quadrate" and "jugal" bones, which support the jaws in birds, reptiles, and fishes; being thus, in all of these animals, outside of the ear. Some anatomists, however, assert the existence within the tympanum of reptiles of a rudimentary incus and a cartilaginous malleus. No *external* ear exists in any fish or reptile. Birds, especially owls, present it in the form of a circular arrangement of feathers. In birds the middle ear (tympanum) contains only a single bone, the columella, with processes of cartilage representing the other bones. The cochlea of the internal ear is, in birds, a conical, slightly twisted double canal; the semicircular canals in them are large.

Mammals always have the internal and middle ear complete; and mostly also an external ear. This is slight, however, in diving quadrupeds, as the otter and beaver, and wanting altogether in the whale, seal, mole, ornithorhynchus, and armadillo. Several aquatic animals have a valve near the entrance of the external meatus or canal of the outer ear, which closes when they are under water, protecting the membrana tympani against excessive pressure. The elephant also is provided with a sort of valve or ear-flap. Bats are endowed with very large and sensitive external ears. Many quadrupeds (*e. g.* the horse and dog) have considerable muscular power over their ears, by which they can turn them so as to receive sound from different directions. Man has three *rudimentary* muscles of the same kind, but they are commonly powerless and without use.

The Human Ear.—This consists of three distinct, though connected, parts—the *external ear*, the *middle ear* or tympanum, and the *internal ear* or labyrinth.

Of the *outer ear*, the expanded part is the pinna; its prominent rim or margin is the helix. The ridge next within this is called the anti-helix; it divides above. Its lower and front part encircles a cavity, the concha, below which are two opposite prominences, tragus and anti-tragus. The lowest, soft, flexible part is the lobule. The whole external ear, except the lobule (which is formed of fat and connective tissue), is composed of cartilage covered with skin, well supplied, however, with nerves as well as blood-vessels. The entrance to the ear is the meatus auditorius



The Human Ear.

externus. It is about an inch and a quarter long, directed forward and inward, slightly curved. Near its orifice are

the ceruminous glands, secreting the ear-wax. At the bottom of the meatus is the membrana tympani.

The *middle ear*, or tympanum, is a sort of drum or hollow organ, containing air, and through its middle a small chain of bones—the malleus, or hammer-bone, the incus, or anvil, and the stapes, or stirrup. The tympanum communicates with the throat (pharynx) by means of the Eustachian tube. The fenestra ovalis, or round window of the tympanum, is a membranous partition between the internal part of the tympanic cavity and the vestibule of the labyrinth or internal ear. The fenestra rotunda is a round membranous "window" between the tympanum and the cochlea of the labyrinth. Three muscles are asserted by most anatomists to exist in the tympanum—the tensor tympani, luxator tympani, and stapedius. The second of these is considered by some to be only a ligament.

The *internal ear* is composed of the vestibule, cochlea, and three semicircular canals. The vestibule is the middle portion, the cochlea is anterior, and the three canals are above and behind the vestibule. Within the latter are two small bodies, the otoliths, or ear-stones, composed of carbonate and phosphate of lime. The semicircular canals always differ definitely in their direction, two being vertical and

The cochlea (enlarged).

one horizontal. The cochlea is shaped somewhat like a snail-shell. In its centre is a conical bony axis, the modiolus. Around this is a spiral canal, within which is the lamina spiralis, partly composed of bone and partly membranous. This divides the canal into two passages or scalæ—the upper, communicating with the vestibule, scala vestibuli, and the lower, communicating through the fenestra rotunda with the tympanum, scala tympani. The bony part of the lamina spiralis has a grooved margin, the uppermost edge of which, towards the scala vestibuli, supports a finely-toothed membrane, lamina denticulata. From each of these margins of the lamina spiralis is given off a fine periosteal layer—the upper one the membrane of Corti, the lower the basilar layer. Between these is a space called by Kölliker the scala media. Within this space are arranged two sets of minute rod-like bodies, parallel to each other, radiating from the axis of the cochlea, those of the two sets being inclined towards each other above. These are the rods of Corti. Looked at in a certain direction with the aid of a lens, they resemble somewhat the keys of a piano.

The whole inner surface of the bony labyrinth is lined by a fibro-serous periosteal tissue. This secretes a thin fluid, the perilymph. The membranous inner labyrinth, which duplicates, as it were, the osseous wall of the vestibule and semicircular canals, secretes a similar liquid, the endolymph. The auditory nerve (portio mollis of the "seventh pair" of cephalic nerves, according to anatomists) is subdivided into branches which are distributed to all the parts of the internal ear. Those filaments which enter the cochlea form a sort of ganglionic plexus in the scala tympani; thence proceed some very delicate nervous extremities, which, in the scala media, are brought into relation with the rods of Corti, and probably also with certain large nucleated cells in their vicinity called the cells of Claudius. (For the *physiology* of the auditory apparatus, see the article on Acoustics.) See also "Treatise on Diseases of the Ear," by D. B. St. John Roosa, New York, 1873.

Henry Hartshorne.

Ear'bus, a township of Sumter co., Ala. Pop. 520.

Earl [from the Ang.-Sax. *eorl*, "hero," "chief;" Norse, *Jarl*], a British title of nobility, next in rank to a marquis, and one degree higher than a viscount. It was formerly the highest rank of hereditary nobility of England. After the Norman Conquest the title of earl was used by the English to express the French *comte*, "count" (Lat. *comes*). Hence the wife of an earl is still styled a countess. In the reign of Edward III. earldoms were granted by letters-patent to earls and the heirs of their bodies. Earldoms were gradually converted from territorial into merely titular honors. The earl's coronet is a circle of gold rising at intervals into eight pyramidal points or spikes, each tipped with a pearl. The style of an earl is "right honorable."

Earl, a post-township of La Salle co., Ill. Pop. 2129.

Earl, a township of Berks co., Pa. Pop. 1622.

Earl, a township of Lancaster co., Pa. Pop. 2975.

Earle (Pliny), an American inventor, born at Leicester, Mass., Dec. 17, 1762. He invented a machine for making cards for carding cotton and wool. Died Nov. 29, 1832.

Earle (Pliny), M. D., was born at Leicester, Mass., Dec. 31, 1809. He was a son of Pliny Earle, the inventor. He was educated at the Friends' school at Providence, R. I., and graduated as M. D. in 1837. He was resident physician of the insane asylum at Frankford near Philadelphia (1840–42), physician in the Bloomingdale asylum, N. Y. (1844–49), and has long been superintendent of the insane asylum at Northampton, Mass. He has published many valuable reports and papers on the treatment of the insane.

Earle (Thomas), a lawyer, a brother of the preceding, was born at Leicester, Mass., April 21, 1796. He practised law in Philadelphia, was distinguished as an opponent of slavery, and was a member of the constitutional convention of 1837. In 1840 he was nominated for the office of Vice-President of the U. S. by the Liberty party. Died July 14, 1849. He published several legal and other works.

Ear'ley, a post-village of Fox township, Elk co., Pa., is the southern terminus of the Daguscahonda R. R. There are coal-mines in the vicinity.

Earl'ham, a post-village of Madison township, Madison co., Ia., on the Chicago Rock Island and Pacific R. R., 30 miles W. by S. of Des Moines. Pop. 222.

Earlham College was chartered in 1859. The president's chair was not filled for a few years at the first. The first president was Prof. Barnabas C. Hobbs, A. M. The chair for five years past has been occupied by Joseph Moore, A. M. Both sexes are admitted. There is a preparatory department, with a two years' course of study, two college courses, a classical and a scientific, of four years each. In the department of instruction there are six professors and three preparatory teachers. Number of students the past year, 220; number in the collegiate department, 70. The government is designed to be as nearly as possible that of a well-ordered family. A majority of the students board at a general dining-hall, where a superintendent and matron preside. An endowment fund of $50,000, together with the proceeds of a farm of 160 acres, very materially lessens the general expenses of the students. The libraries contain 3500 volumes. A large reading-room is furnished with the best magazines and periodicals of the times. The college is healthfully located about 1 mile W. of Richmond, Ind. The play-grounds, walks, groves, and lawns are ample.

Joseph Moore.

Earl Marshal, of England, one of the great officers of state who regulates ceremonies, is the head of the college of arms, takes cognizance of all matters relating to honor, arms, and pedigrees, and superintends the proclamation of war or peace. This office is at present hereditary in the family of Howard, and is enjoyed by its head, the duke of Norfolk.

Earl'ville, an incorporated town in La Salle co., Ill., on the Chicago Burlington and Quincy R. R., 73 miles W. S. W. of Chicago. It has two manufactories, a steam-mill, and two newspapers.

Ed. "Gazette."

Earlville, a post-village of Oneida township, Delaware co., Ia., on the Dubuque and Sioux City R. R., 37 miles W. of Dubuque.

Earlville, a post-village of Hamilton township, Madison co., and of Sherburne township, Chenango co., N. Y., on the Midland R. R. at the junction of the Syracuse and Chenango Valley R. R., and very near the Delaware Lackawanna and Western R. R. Pop. 399.

Ear'ly, a county in the S. W. of Georgia. Area, 500 square miles. It is bounded on the W. by the Chattahoochee River. The surface is level; the soil is fertile. It is partly covered with forests of pine. Rice, cotton, corn, and wool are raised. Capital, Blakely. Pop. 6998.

Early (John), D. D., bishop of the Methodist Episcopal Church South, was born in Bedford co., Va., in 1786, joined the Virginia Methodist conference in 1807, was one of the chief founders of Randolph-Macon College, Va., and was a laborious and eminently successful preacher of Methodism in his native and adjacent States. He took a prominent part in the proceedings which in 1844 divided his denomination into Northern and Southern sections, was elected first book-agent of the Southern division, and in 1854 was ordained as one of its bishops. He was distinguished by long public services, administrative ability, and great energy of character. Died Nov. 5, 1873.

Early (Jubal A.), an American general and lawyer, born in Virginia about 1818, graduated at West Point in 1837. He afterwards studied law, and served in the Mexican war as a major. He joined the Confederate army, was

a major-general at Gettysburg in July, 1863, and commanded an army which invaded Maryland in July, 1864. He was defeated by Gen. Sheridan near Winchester, and at Fisher's Hill in Virginia, on the 19th and 20th of September. On the 19th of Oct., 1864, he attacked the Union army at Cedar Creek, Va., in the absence of Gen. Sheridan, who arrived in time to rally his retreating army and to gain a decisive victory. After the war he returned to the practice of law in Richmond, Va.

Ear'nest, the payment of money, the delivery of a part of any goods sold, or the performance of a simple ceremony to "bind a bargain." The performance of ancient and now meaningless ceremonies as a pledge of good faith is lawful earnest in Scotland and some other countries, but money or goods only are held to constitute earnest in England and the U. S. The seller cannot sell to a third party that for which earnest has been paid. A party who has paid earnest can demand the goods, but the seller is not obliged to deliver them till the whole price is paid. If the buyer fail to demand and pay for his goods, the seller, after due notice, can sell again and keep his earnest. In some countries a party who fails to keep a contract loses his earnest, and may be compelled to fulfil his contract besides.

Earring. See JEWELRY.

Ear-shell, the shell of various gasteropods of the

Ear-shell.

Haliotidæ family. Of these, the *Haliotis tuberculata*, a mollusk of Europe and the tropics, is edible. The genera and species, living and fossil, of this family are numerous and widely distributed. Some of the shells are used in inlaying, and resemble MOTHER-OF-PEARL (which see).

Earth, The, is the dwelling-place of man; the noble garden given him by his Creator to cultivate and to enjoy; the scene of his activity, the means of his development, and the theatre of his history. As such it cannot fail to become one of the most prominent objects of his study.

I. *The Earth in the Universe and the Solar System.*—The earth is a star among the innumerable stars which float in the boundless space of the heavens. Unlike those bright bodies, however, the existence of which is revealed to us only by the rays of light which they send to our eyes, it is not self-luminous; it possesses no other light than the feeble reflected rays which it borrows from the splendor of a mighty neighbor. The earth is one of the more modest members of a small family of similar stars, clustered and revolving around the central luminous orb of the sun, with which they form the SOLAR SYSTEM (which see).

The arrangement of the members of the solar system shows law and order everywhere, and strongly favors the idea, suggested by the celebrated astronomer Laplace, of a common origin, which makes it really a *family* of stars, whose parent is the sun.

The planets, in their order of distance from the sun, are Mercury, Venus, the Earth, and Mars, all of small size, which form a first group; then comes the cluster of the asteroids, followed by another group of four large planets—Jupiter, Saturn, Uranus, and Neptune—whose orbit forms the extreme boundary of the solar system.

In the first group, that of the small planets nearer the sun, no satellites are found except one, the moon, which graces the earth. In the second, that of the large planets, they are numerous. Jupiter has four. Saturn's heaven presents the glorious spectacle of eight moons, accompanied by the phenomenon, unique in the solar system, of a broad, flat, luminous double ring, revolving, like its satellites, around the body of the planet. Uranus has four, and perhaps more; Neptune, as yet, is known to have but one.

The distances of the planets from the sun are not equal. They gradually increase from Mercury to Neptune, so that the distance from the orbit of Mercury to that of each following planet is nearly double the distance from Mercury to the preceding one. That ratio fails, however, in the case of Neptune. For each planet one revolution around the sun is a year; one rotation on its axis, marked by a succession of light and darkness, is a day.

The velocity of these motions is also subject to law. The rapidity of revolution around the sun is greatest in Mercury, and gradually diminishes in the other planets, as their distance from the sun increases, to Neptune, in which it is slowest. The velocity of rotation, on the contrary, is greatest in the large planets more distant from the sun, Jupiter and Saturn turning upon themselves in about ten hours, while the four smaller planets have, like the earth, a day of about twenty-four hours.

The density of the planets, again, varies with their distance from the sun. Mercury is the most dense, and has a specific gravity of about eight times that of water, which is a little more than that of iron; the earth five and a half, and the other small planets nearly the same; while the specific weight of Jupiter is one and a third, or little more than that of water; and that of Saturn, the lightest of all the planets, is only seven-tenths, or less than water, which makes it comparable to a similar volume of cork or light wood.

Thus, in all respects, the earth occupies a happy intermediate position. By its size it belongs to the group of the small planets, but it is the largest of them. Its distance from the sun makes it equally free from the intense glare and the burning heat which prevail on Mercury, and from the dimness of light and the cold which probably are the share of the mighty sister planets, Jupiter and Saturn. The relative length of its day, seasons, and year establishes harmonious relations between them, such as cannot exist in the outer planets, owing to the great disproportion between the excessive shortness of their days compared with the great length of their year.

The earth thus seems to be better fitted than any other member of the solar system for sustaining that noble world of living forms, vegetable, animal, and human, which adorn its surface and give to our globe its highest value. Nay, whatever be the past or future destinies of the other planets in this respect, it may be doubted whether any of them possesses, at present, the physical conditions without which a life-system at all similar to our own cannot be conceived as possible.

II. *The Earth considered in itself*, as a great individual organization, can be studied under two aspects—either in its past or its present condition. A close examination of the earth's crust and its organic contents shows that the terrestrial globe, like every individual body in nature, large or small, had its period of gradual growth before its present perfect state. The very structure of the rocks proves a gradual formation. The continents emerged by successive steps from the bosom of the ocean; their surface was wrinkled by mountain-chains rising one after the other; tribes of plants and minerals, different from the existing ones, succeeded each other during untold ages. These great phases of the existence of the earth, geology studies and describes. (See GEOLOGY.) Physical geography considers the globe in its present condition, as the full-grown earth, with man upon it, in its state of highest perfection.

III. *General Form and Dimensions.*—The general form of the earth, like that of most of the heavenly bodies floating in space, is a sphere, on which, for the sake of convenience, we may distinguish the *poles*, or the two extremities of the axis of its rotation; and the *equator*, which is a great circle traced midway between the two poles, the plane of which passes through the centre of the sphere, cutting its axis into two equal parts. The mean diameter of the earth, given by the great geodetic measurements, by which the true form and dimensions of the globe have been ascertained, is about 7916 English statute miles. The equatorial diameter, however, which measures 7925½ miles, exceeds the length of the polar diameter, or the length of the axis, which is only 7899, by about twenty-six and a half miles, so that a point on the surface of the polar region is over thirteen miles nearer the centre of the globe than a point on the surface of the equatorial regions. This proves that the earth is not a perfect sphere, but a sphere-like body, or spheroid, slightly compressed about the poles and bulging about the equator. That form is accounted for by the effect of the rotation of the earth, which causes a tendency of the matter to fly off and to recede from the poles, where the velocity of rotation is but slight, towards the equator, where the velocity is greatest. That small deviation from the regular spherical form is in itself of little importance, but it teaches us that at some former period the earth must have been in a semi-fluid state, after which it was consolidated in its present shape.

The most recent and accurate measurements seem to indicate some other irregularities in the figure of various

parts of the globe, which, however, are not yet sufficiently determined to be mentioned here.

The following table gives the principal dimensions of the earth in English statute miles:

Dimensions of the Earth.

Equatorial diameter	7925.65	Radius	3962.82 miles.
Polar diameter	7899.17	Radius	3949.58 "
Difference	26.48	Difference	13.24 "
Mean diameter	7916.17	Radius	3958 "
Circumference at the equator	24,899 miles.		
Surface of the globe	196,900,278 square miles.		
Contents or bulk	260,000 millions of cubic miles.		

In round numbers easily remembered: diameter, 8000; radius, 4000; circumference, 25,000 miles; surface, 197,000,000 square miles.

IV. *The Globe and its Circles.*—The representation of the earth most true to nature is the artificial globe, which, however, looks like a perfect sphere, for the polar compression is too small to be visible to the eye. On a globe of twelve inches the difference between the polar and equatorial diameters would amount only to a twenty-fifth of an inch. The outlines of the continents and oceans, the course of rivers, and other geographical features of the surface can be drawn correctly on the globe, while on flat maps there can be only an approximation to their true form.

On the globe are seen several sets of circles not belonging to the natural features of the surface, the object of which will be easily understood.

Parallels and Meridians.—In order to find out the precise location of a place or of any point on the face of the earth, two sets of circles are traced—one in the same direction as the equator, the other at right angles, passing through both poles. The first are called *parallels*, because they are parallel to the equator and to one another. The last are called *meridians* (from the Latin *meridies*, "noon"), because all places situated on such a circle have mid-day at the same time.

All the parallels except the equator are small circles—that is, smaller than the greatest circumference. All the meridians are great circles which intersect each other at the poles, and the planes of which pass through the axis of the earth.

All these circles, great or small, are divided into 360 equal parts, or degrees, each degree into sixty minutes, and each minute into sixty seconds; further subdivisions are given in decimal parts of a second. The mode of expressing these divisions in writing is seen in the following figures: 20° 32′ 5″.9$_{m}$, which mean twenty degrees, thirty-two minutes, five seconds, and nine-tenths of a second. (See Degrees of Latitude and Longitude.)

Climatic Zones.—There are four parallels, usually made prominent in globes and maps, which are peculiar limits in the distribution of light on the surface of the earth. Two are traced at the distance of about 23½° on each side of the equator, and are called on the north the *Tropic of Cancer*, and on the south the *Tropic of Capricorn*. The other two, 23½° from either pole, are the *North Polar* and the *South Polar Circles*, also called the *Arctic* and *Antarctic Circles*. The two tropics mark the extreme limits of the central region where the sun, in its yearly course, can be seen vertical, the sun being vertical on these parallels on the longest days of the year—viz., the 21st of June in the northern, and the 21st of December in the southern hemisphere. The polar circles are the parallels on which the longest day is twenty-four hours, and mark the limits of the circular area around the poles within which the summer sun does not set every day. The globe is thus divided into six bands, or *zones*, in three groups, which, from the general character of their temperature, are termed the warm or *torrid*, the *temperate*, and the *frigid* zones. The portion of the earth's surface occupied by each of the zones is very unequal. Their comparative area, in English square miles, is as follows:

North tropical zone	39,109,628	Warm regions	78,219,256
South tropical "	39,109,628		
North temperate zone	51,110,763	Temperate regions	102,221,526
South temperate "	51,110,763		
North polar "	8,229,748	Cold regions	16,459,496
South polar "	8,229,748		
The whole globe	196,900,278 English square miles.		

It is thus seen that, by a wise arrangement of Providence, the temperate regions, most favorable to man's development, are the most extensive; next are the warm regions; while the frigid zones, unfit for man's progress, cover but an inconsiderable portion of the earth's surface.

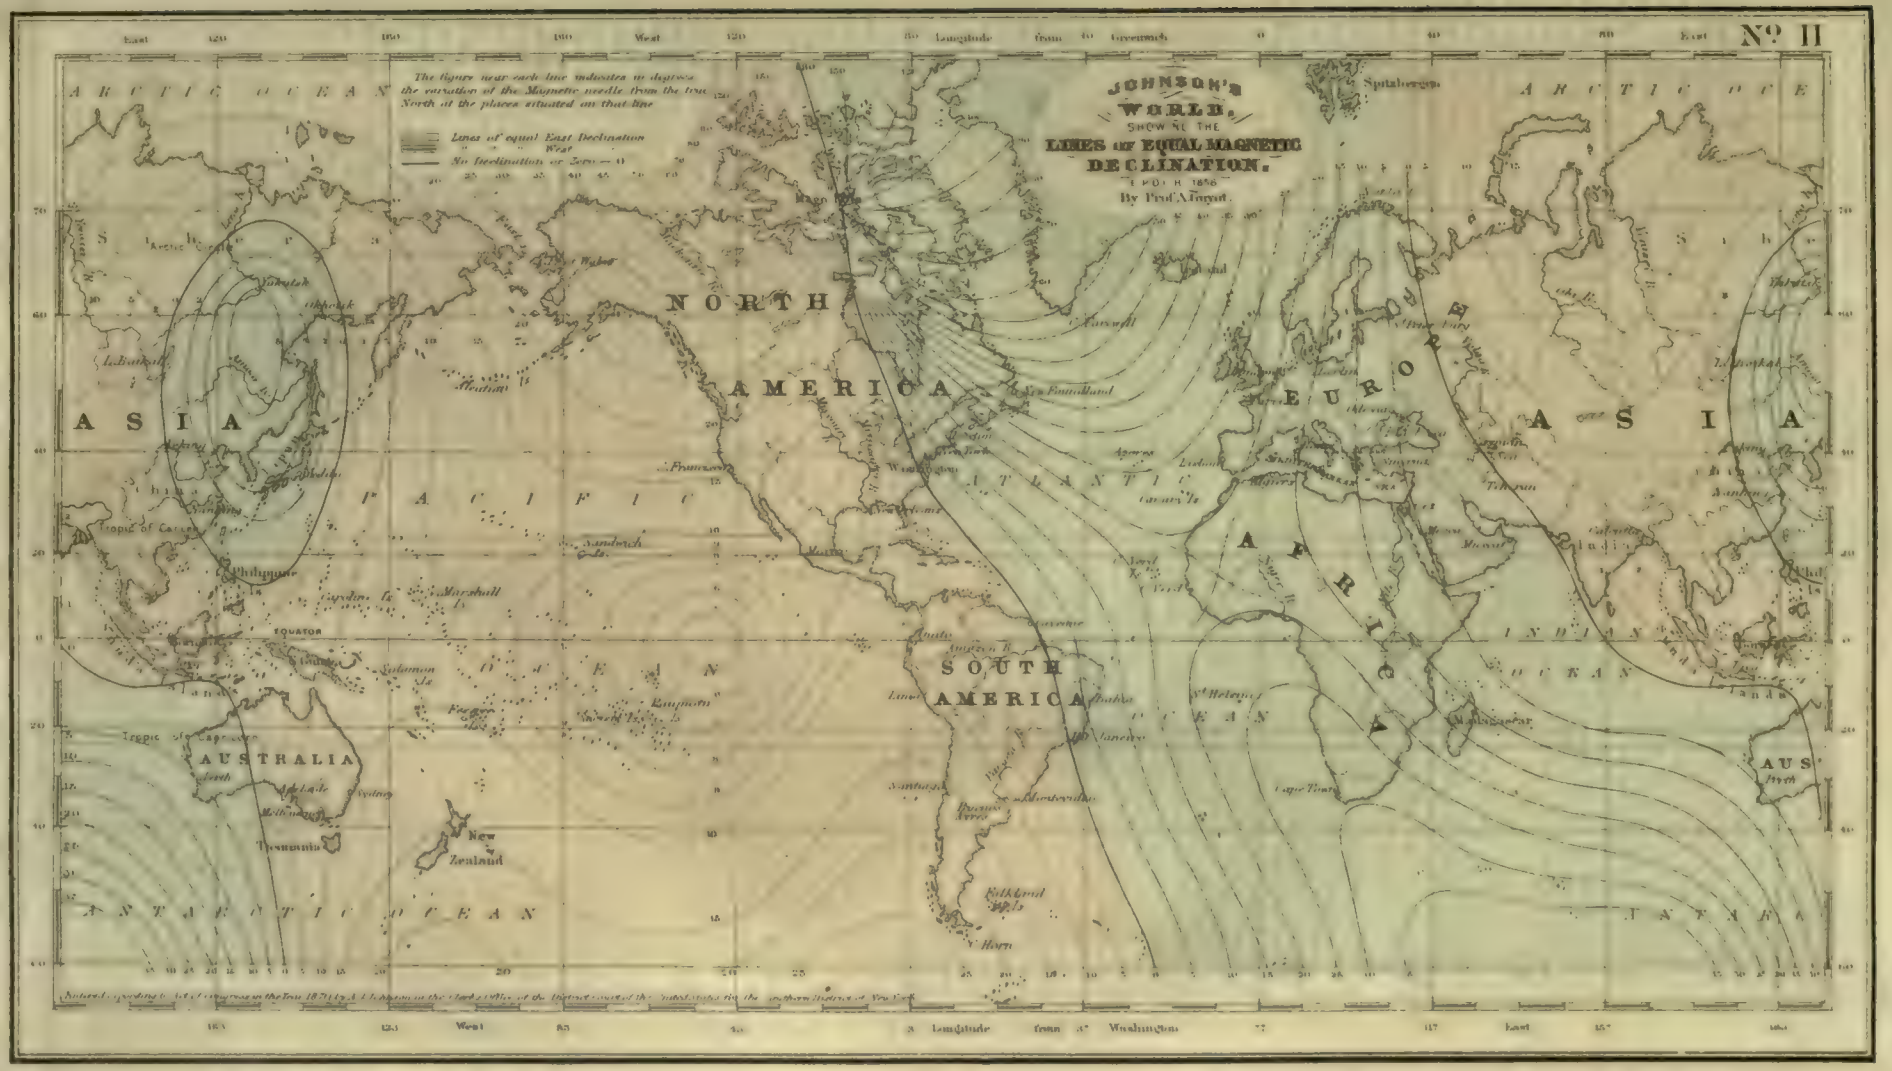
Ecliptic.—A last great circle is to be noted, which intersects the equator at an angle of about 23½°, and touches the two tropics. When the axis is inclined 23½° from the perpendicular position, the plane of this circle is horizontal, representing the plane of the orbit in which the earth moves around the sun. This circle is the line through which the plane of the orbit cuts the surface of the earth, and marks the apparent course of the sun from one tropic to the other during the seasons. It is called *ecliptic* because eclipses happen only when the moon is in the same plane, or very near it.

V. *Density and Weight of the Earth.*—To find out the absolute and specific weight of the enormous mass of the earth, and by it that of all the bodies of the solar system and of the sun itself, seems so bold an undertaking for man's littleness as to savor of rashness. Still, it has been done quite satisfactorily by physicists and astronomers.

If we weigh equal volumes of pure water, stone, iron, lead, gold, and other substances, their weights are found greatly to differ. A cubic foot of stone weighs as much as two cubic feet and a half of water; one of iron, as much as seven and a half; of lead, as eleven and a half; of gold, as nineteen. That is to say, that, under the same volume, the last substances contain as many times more matter than water, and their *density*, or *specific weight*, is greater in the same proportion. By three different methods, the results of which very nearly agree, the average density of the earth has been found to be five and two-thirds times as great as that of water. In other words, it would require five and two-thirds globes of water of equal bulk to balance the globe of the earth. The volume of the earth being known, as well as its density, its absolute weight may be computed, which is about 5852 trillions of tons—a number which we can write down, but of the magnitude of which we can scarcely form any conception. (See Density of the Earth.)

Considering that the materials composing the surface—water and rocks—have a density so much smaller than the average, we must surmise that in the interior of the globe either the metallic substances greatly prevail, or that matter is in a state of very great compression.

VI. *The Earth's Internal Temperature.*—We are so much accustomed, at the surface which we inhabit, to look to the sun—that is, to an outside source—for all the heat we enjoy, that we almost forget to ask whether the earth has a temperature of its own, independent of that which it receives from that great common reservoir. But when we remember that the warm springs around which so many gather for health or pleasure rise from beneath the surface; when we observe the greater heat of the waters of the Artesian wells, the even and warm temperatures of the deep mines, and especially the torrents of hot steam, of molten rocks, which ascend from unknown depths to the mouths of volcanoes and flow along their slopes,—we must recognize that the interior mass of the globe has a higher temperature than that of its surface, the source of which is in itself. The earth, like the sun, is a warm body in the midst of the cold space of the heavens.



But if so, can we form an idea of the amount of that proper heat? To do this, we must try to establish the law of its increase from the surface downward.

Warm or Thermal Springs.—The temperature of the innumerable springs which bring back to the surface the rain-waters absorbed by the earth-crust, feed the brooks and rivers, and minister to the wants of life, vegetable and animal, is generally about equal to the mean annual temperature of the air and the ground at the places where they issue. It is nearly the same in all seasons, so that spring-water appears cold in summer and warm in winter. But while spring-water is scarcely ever cooler than the mean temperature of the surface-ground, it is often found to possess a much higher temperature, ranging even to that of boiling water. These springs, warmer than the average, are termed *thermal* springs, even though their temperature be but a little superior to that of ordinary springs.

It is believed that this higher temperature is imparted to the spring-water by the deep-seated layers of rock among which it circulates. The deeper the rain-water penetrates into the earth's strata the warmer it becomes. This view is sustained by the fact that the thermal springs most abound in the mountains and in all the regions where the earth's strata are most disturbed, broken, and creviced, as in the volcanic districts. (See Thermal Springs.)

The famous Geysers (or spouting springs) of Iceland, which, volcano-like, throw out at intervals, with tremendous force, from a vertical chimney, a column of boiling water sometimes ten feet in diameter, and reaching often over 100 feet in height, give us a magnificent as well as instructive exhibition of the power of steam generated and gradually accumulated in a heated volcanic soil. Similar spouting springs, on a still grander scale, are found at the head-waters of the Yellowstone, Madison, and Snake rivers in the Rocky Mountains. (See Yellowstone Valley.) The temperature of the water in the Geysers is fully 212° F., and even higher a few feet down in the shaft. Thermal springs of all grades of temperature are abundant in all parts of the globe.

The phenomenon of the warm springs is thus too general to be attributed to local or accidental causes. It proves that at no great depth below the surface a temperature exists which is not inferior to that of boiling water; but as

we do not know from what depth these warm waters come, they do not afford the means of ascertaining the law of its distribution. This we have to learn from observations made at known depths in Artesian wells and in mines.

Careful observations, made by sending down self-registering thermometers to different depths in Artesian wells, give us a clue as to the temperature of the strata in which the water is contained, and the law of its distribution. In order, however, to obtain the true rate of increase, we must start from the mean annual temperature of the ground, which is not always found at the surface. The surface layers are affected by the heat of the seasons, and are warmer in summer and colder in winter. But these variations gradually diminish downward to a depth at which they become insensible, and where the degree of heat is constant, and equal to the average annual temperature of the air above. It is evident that the greater the extremes of heat and cold, the deeper will they be felt below the surface. In our latitude the layer of invariable temperature reaches the depth of from sixty to eighty feet; while in the equatorial regions, where the temperature is nearly the same the whole year, it is found at a few feet, and grows gradually deeper towards the colder and more variable latitudes. From this invariable layer the increase downward has to be reckoned.

Among the most remarkable of the Artesian wells in which such observations have been made are those named in the following table, which gives the temperature observed in these wells at these various depths:

	Depth in feet.	Temperature, Fahr.	Number of feet for increase of 1° Fahr.
Grenelle	1798	82.4	58
Neu Salzwerk	2288	92.5	55
Mouillelonge	2677	101.0	51
St. Louis, Mo.	2199	79.2	88
Louisville, Ky.	2086	82.5	67
Columbus, Ohio	2775	88.0	73

This shows that the temperature invariably increases from the surface downward, but also that temperature at the same depth is different in different wells, and therefore the rate of increase greater in some places than in others.

Temperature in Mines.—Observations of temperature made in deep mines, first in France in the middle of the last century, and since in all parts of Europe, give similar results. The increase of heat downward is constant, but the rate of increase often differs widely, even in mines situated at no great distance from each other, according to the nature of rocks and their power to transmit heat. In the Prussian mines, where a long series of investigations have been made with the greatest care, the most rapid rate is 1° Fahrenheit for every 27 feet; the slowest, 1° for every 197 feet—the average 1° for 92 feet. In the mines of Saxony the average is 1° for 72 feet. Six of the largest mines in England give 1° for 44 feet; Dalcoath mine, in Cornwall, 1° for 75 feet. In America, the Virginia coal-mines show an increase of 1° for 60 feet. Even the frozen soil of the middle Siberian plains, which has a thickness of nearly 600 feet, and near the surface a temperature of only 10° Fahrenheit, shows a steady increase down to the depth at which the temperature reaches the melting-point.

The average of all known observations, made in various parts of the globe, both in Artesian wells and mines, gives an increase of heat towards the interior of about one degree of Fahrenheit for every fifty-five feet—a very rapid rate indeed, which leads to an important conclusion.

Conclusion.—If this universally increasing temperature in the interior of our earth continues in a regular progression downward, the temperature of boiling water will be reached at 9000 feet, or less than two miles from the surface—a distance only equivalent to a moderate-sized mountain. At thirty miles the heat would be sufficient to melt all the rocks and metals contained in the earth's crust. But as we have some reason to believe that the progression becomes gradually slower, we may admit as probable that the solid, unmelted crust has a greater thickness, reaching, perhaps, if not exceeding, 100 miles.

Startling as this result may be, it is the hypothesis which best accounts for the facts just mentioned, and for the phenomena of geology.

Volcanoes.—Artesian wells and thermal springs prove an internal temperature reaching the boiling-point of water; but volcanoes, and the torrents of melted, fiery lava, which escape from their open mouths, demonstrate the existence in the bowels of our planet of extreme temperatures, which tell us that the above conclusion is not a mere fancy, for the volcanic phenomena are too general, and too much connected with the great fractures of the earth's surface, to be accounted for, as has been tried, by mere local chemical causes. (See VOLCANOES.)

Arrangement of Volcanoes on the Earth's Surface.—While the reader is referred to the article VOLCANOES for a particular description of them, it seems proper to offer here some remarks on their general distribution, as forming one of the most remarkable features of the earth's surface. Though volcanoes are but local and apparently independent accumulations of ejected materials, they are mostly arranged in long, straight lines, more or less interrupted. Humboldt was the first to show that the six volcanoes of Mexico, among which the noble Orizaba and Popocatepetl are kings, are on a straight line which stretches across the continent, and, when prolonged beyond in the Pacific, strikes the volcanic islands of Revillagigedo. He draws from that fact the plausible inference that they have all issued from one long fissure extending across the body of the table-land. The volcanoes of South America are all on the long line of the Andes; those of North America on the line of the Sierra Nevada and Cascade ranges. On a similar line are also the numerous volcanoes of Sumatra, those of Java, and many others along the coast of the Asiatic continent.

Other volcanoes seem more isolated, or form groups composed of a central volcano surrounded by secondary ones. Vesuvius and Etna in Europe; the Canary Islands, the Azores, and Iceland in the Atlantic; the Sandwich Islands and the numerous groups of Polynesia in the Pacific, and many more in the Indian Ocean, are usually considered as examples of this class.

Linear and Central Volcanoes.—The celebrated geologist L. von Buch first called attention to this difference, and accordingly divided volcanoes into linear and central. The first class he conceived as raised on a single fissure; the second, on a number of crevices radiating from a centre, as if the result of a violent vertical upheaval. This classification, however, has hardly the importance which has been attached to it, for the groups of the so-called central volcanoes are mostly arranged on a line or zone; and even in many groups, as in Iceland and the Sandwich Islands, the disposition of the single volcanoes in parallel lines is unmistakable.

Distribution of Volcanoes.—Though volcanoes are found in every continent and ocean, and in all latitudes, they are not equally distributed on the surface of the globe. They follow certain lines and cluster in distinct groups. The most important feature of their distribution is, that nearly all are situated along the mountain-chains and rows of islands which border the shores of the continents, while the interior of these great land-masses is nearly free from them. Leaving out a few extinct volcanoes, the only well authenticated exception to that rule is the existence of a few volcanic centres around the Thian-Shan Mountains, in the very heart of the continent of Asia, midway between the Arctic and Indian oceans, nearly two thousand miles from the sea in every direction—the volcano Bo-Shan, with lava streams; that of Turfan; the Solfatara of Ourumtsi, which sometimes emits ashes.

The number of volcanoes, extinct and active, is variously estimated. Humboldt, in "Cosmos," counted 407. More recently, Dr. Fuchs enumerates 672, of which 270 are still in a state of undoubted activity. Of these 270, 175 are on islands, and 95 on the continents, but again mostly on the sea-shore. This uniform proximity of volcanoes to the sea has caused a prevalent belief that sea-water is a necessary condition of their existence. It will be seen, however, that this may perhaps be a hasty conclusion.

Two Great Volcanic Zones.—There are two great terrestrial zones in which are found, arranged in long lines or isolated groups, nearly all the volcanoes of the globe.

The first zone is the vast circle of mountain-chains, peninsulas, and rows of islands which surround the Pacific Ocean and girdle it with a belt of burning mountains. Beginning at the extreme point of South America, in Terra del Fuego, with the somewhat doubtful volcano of Sarmiento, it extends along the Andes, in which are found three of the most remarkable series of volcanoes, separated by intervals of hundreds of miles, those of Chili, Bolivia, and Ecuador counting together sixty-seven volcanoes, twenty-seven of which are still active. Then follows the rich group of Central America, with fifty-seven volcanoes, twenty-two being active. The series of Mexico has six active volcanoes, besides full as many extinct ones. In North America, the series of the Sierra Nevada and Cascade Mountains, the group of Alaska, and the long series of the Aleutian Islands, have together over eighty volcanoes, half of which are active, mostly in the Aleutian Islands. Passing to the Asiatic continent, we find the series of Kamtchatka peninsula, with not less than thirty-eight volcanoes, twelve of which are active; the line of the Koorile Islands with twenty volcanoes, half of which are now extinct; the group of the Japan Islands, which numbers forty-six volcanoes, with only seven active. Between Japan and the Philippine Isles twenty-three volcanoes may be counted, of which seven are active; in the Philippine and Moluccs Isles, thirty-one, most of which are in a state of activity. At last the Australian

line: New Guinea, with three active; New Britain, with two active and one extinct; New Hebrides, with two; New Zealand, with seven extinct and two active volcanic cones, terminate that brilliant girdle of fiery beacons around the Great Ocean. Including those which are extinct, the number of volcanoes in that zone reaches 392.

The second volcanic zone, though less continuous, is hardly less remarkable. It is a belt of broken lands, islands, peninsulas, and inland seas, which runs in a slanting direction around the globe, separating the northern from the southern continents. Starting from Central America, with its isthmus full of volcanoes, its landlocked seas, its peninsulas and islands, and the volcanic series of the Lesser Antilles, it passes through the volcanic groups of the Azores and Canary Islands to the Mediterranean and its peninsulas, including the active volcanoes of Europe—Vesuvius, Etna, the Lipari Islands, and Santorin. Entering Asia Minor, with its numerous extinct volcanoes, it passes through Arabia, the Red Sea, the Persian Gulf, and the two peninsulas of India, all rich in traces of the activity of the internal fires. Thence crossing the East Indian Archipelago and its hundreds of burning mountains, it reaches those of the Friendly Isles, and running through all the Polynesian volcanic groups, meets again the great isthmus of Central America. Including those of the latter region, we find in this zone 168 volcanoes.

The two zones just described contain therefore, together, no less than 560, or five-sixths of all the existing volcanoes.

Where the two zones intersect each other, in Central America and in the East Indian Archipelago, the volcanic forces also display their greatest intensity. Central America, with Mexico and the Antilles, has eighty-five volcanoes. In the East Indian Archipelago, the long line of the Sunda Islands alone possesses eighty, and those of the Philippine Islands with the Moluccas, and of New Guinea with New Britain, swell the number to 117. Thus in these two regions are crowded over 200, or nearly one-third of all which are known.

The remaining volcanoes not included in these two great belts are either scattered in the midst of the oceans, as the Sandwich Islands group in the Pacific; Bourbon and Mauritius in the Indian; Cape Verde Islands, Ascension, St. Helena, Tristan da Cunha in the Atlantic Ocean; or in the broken polar lands, like Iceland and Jan Mayen Island in the Arctic; Erebus and Terror in the Antarctic Ocean.

Height of Volcanoes.—Volcanoes are of all heights, from the submarine cones which do not reach the surface of the ocean to that of Sahama in Bolivia, the highest of the known volcanoes, which rises to 23,000 feet above it. Nay, if we accept as probable the idea that such volcanoes as Mauna Loa, nearly 14,000 feet high, have their base at the bottom of the deep ocean which surrounds them, the total elevation of such a structure may even reach that of the highest mountains of the globe.

The peculiar distribution of volcanoes on the surface of the globe, described above, may help us to understand the nature and the causes of volcanic action, which are not to be confounded with the more general force which has upheaved the continents and sunk the basins of the oceans. Three facts are here prominent and significant: 1st. Nearly all volcanoes are either along the highest edge of the continents, or in the great central zone of fracture. 2d. Most of them affect a linear arrangement. 3d. The agent at work in these mighty engines is mainly vapor of water, or steam-power.

If we admit, as we have every reason to do, that the interior of the earth is a fiery mass, this must be considered the primary source of volcanic action. Its effect will be most intense in the deep fissures which establish a ready communication with the surface. Nowhere are the earth's strata more deeply broken than on the very edge of the continents; and geology demonstrates that it is on the mighty chasms caused by the upheaval of these vast bodies of land that mountain-chains like the Andes, the Sierra Nevada, and the other mountains encircling the basin of the Pacific Ocean have been raised. There also the volcanic vents abound in long lines, following either the top or the foot of the mountain-chains. The same may be said of the central zone of fracture.

It is not, however, to the heat of this fiery interior mass, but to its slow cooling, and the contraction which is the consequence, that we must ascribe the wrinkling and breaking up of the solid exterior crust, and the formation of those grand features of the surface of our planet which add so much to its beauty and usefulness.

In this view, volcanic action is not the cause, but a consequence, of the upheaval of mountain-chains and continents, and the frequent proximity of volcanoes to the sea does not imply the necessity of sea-water for their formation. Rain-water and Artesian waters also, which, instead of reappearing on the surface in the form of springs, penetrate a few miles deep in these subterranean cavities, may become so overheated, under high pressure, as to explain the usual volcanic phenomena. If so, the lavas flowing from a volcanic chimney may not necessarily be connected with the great reservoir of the melted interior. There can be no doubt that a close connection exists between the phenomena of volcanoes and those of earthquakes. (See EARTHQUAKES.)

VII. *Terrestrial Magnetism.*—The earth exerts a directing force upon the magnetic needle, acting like a magnet. (See MAGNETISM.) In whatever portion of the globe—on the ocean or on land, on mountains or deep valleys—a magnetic needle, freely suspended so as to move easily in every direction, no matter how it is placed, will always turn in a definite direction, one pole pointing towards the north, and the other towards the south pole of the earth. The pole of the needle directed by the north pole of the earth, being of contrary magnetism, is the south pole of the needle, but for convenience is marked *north* on the compass, because it points towards the geographical north.

The magnetic poles, however, do not coincide with the geographical poles, but are found to be more than 20° from them; nor do the magnetic meridians passing through the poles of the needle, and the magnetic poles of the earth, coincide with the geographical meridians. The needle, therefore, seldom points to the true north, but usually to the east or west of it. The difference between the magnetic and the true north is called *magnetic variation* or *declination*. This declination may be either east or west of the true north; but there will be also a line where the needle points to the true north, and which is the line of no declination, from which the variation has to be counted. By connecting together all points which have equal declination we obtain a system of lines which show at a glance, as in Map No. II., the direction of the needle in all parts of the world. On the map the eastern declination is distinguished by dotted lines and a light-brown color, and the western by full lines and blue color, the line of no declination between being heavier.

Secular Variation.—It is found that the declination does not remain the same at any one place, but the magnetic poles with their system of meridians are gradually travelling from west to east and from east to west; and as these oscillations take centuries to complete their course, this is called *secular variation*. A map of the lines of declination must therefore refer to a particular date. The one here given shows the declinations as observed in the year 1858. It will be seen that the line of no declination in the Western World passes through Rio de Janeiro, the mouth of the Amazon, somewhat west of Washington, through Lake Huron, and the magnetic pole as found by Sir James Ross in Boothia Felix, under the 70th degree of N. lat. In the Eastern World it passes through the western part of Australia, west of the peninsula of India, and through the Caspian and White seas. A region of abnormal declinations in Central Siberia seems to indicate the existence of a secondary magnetic pole in that part of the world.

The map shows that when crossing the Atlantic from Liverpool to New York the voyager will find the variation of the compass, which in Liverpool is about 25° west, increasing to 30° in mid-ocean, and then rapidly diminishing from Newfoundland to New York, where it is only about 7°. Beyond the line of no variation, passing near Washington and the great lakes, the needle points east of the true north, and continues so across all the continent and the Pacific Ocean, where it again begins to point west before reaching the islands and the coast of Asia. It is evident that both the traveller on land and the mariner have to correct the indications of the needle for variation to get the true points of the compass. The amount of declination can easily be found by comparing the direction of the needle with the north star.

The following table of the declinations observed in Paris since 1580 will show the course of the secular variation in the northern hemisphere:

Declinations observed in Paris.

Year.	Declination.	Year.	Declination.
1580	11° 30′ east.	1816	22° 25′ west.
1618	8 "	1817	22 19 "
1663	0 "	1823	22 23 "
1678	1 30 west.	1827	22 20 "
1700	8 10 "	1828	22 5 "
1780	19 55 "	1829	22 12 "
1805	22 5 "	1835	22 4 "
1814	22 34 "	1854	22 10 "

This table shows that—

1st. The extent of the variation was over 31°.

2d. In 1663 the declination was zero, the needle pointing due north.

3d. From 1580 until 1814 the needle moved towards the west.

4th. Since 1814 it has moved backward towards the east.

5th. The rate of this movement is not uniform, but is greater near the minimum, and least near the maximum point of declination.

There are minor variations in the declination which follow the periods of the day and of the year, and seem to be in close connection with the temperature of the atmosphere and the position of the sun.

The mariner's compass is but a needle attached to a circular sheet of talc moving freely on a pivot, on which is marked the direction of the winds according to thirty-two points of the compass. The whole is placed in a box with double suspension, so as to keep it horizontal even amid the motion of the waves.

Magnetic Inclination.—A magnetic needle so suspended as to move freely in a vertical direction will adjust itself in the magnetic meridian, and in each hemisphere one of its poles will *dip* towards the pole of the earth. This is called the *Magnetic Inclination*, and the needle itself is called a *dipping needle*. (See DIPPING NEEDLE.) At the magnetic pole the needle stands vertical; at the magnetic equator, horizontal; between these extremes it takes all intermediate positions. The inclination, like the declination, is subject to periodic and secular variation. In Paris, as will be seen in the table below, it was 75° in 1671, while in 1853 it was only 66° 28′.

Sir James Ross in 1832 saw the dipping needle stand within one minute of a degree of the vertical position near Baffin's Bay. When tracing the lines of equal dip on a Mercator's map, we find that they coincide in a remarkable manner with the isothermals or lines of equal mean temperature, indicating a close connection of the distribution of heat with that of magnetism, and seemingly a common cause for both.

The inclination, like the declination, is subject to periodic and secular variations. The last is shown in the following table:

Inclinations observed in Paris.

Year.	Inclination.	Year.	Inclination.
1671	75° 00′	1820	68° 20′
1780	71 48	1825	68 00
1798	69 51	1831	67 40
1814	68 36	1853	66 28

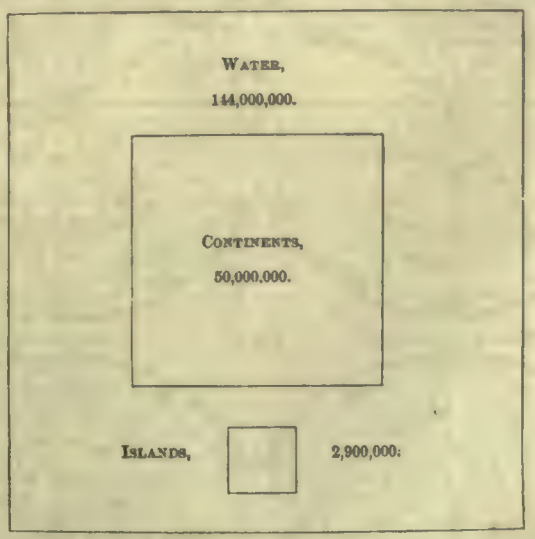
It appears from the table that since the year 1671 the inclination has steadily diminished at the rate of about three to five minutes a year.

Magnetic Intensity.—The intensity of magnetic force can be measured by causing a dipping needle to oscillate, and counting the number of its oscillations in a given time. The greater the number of oscillations in a minute of time, the more intense is the attractive force. The lines of equal magnetic force, though not identical with, are very similar to, those of equal inclination.

Modern science is inclined more and more to consider magnetism as but a form of electric activity, for every electrical current causes a magnetic current moving at right angles to it. If we admit, with the learned Ampère, that electrical currents caused by the action of the sun on the revolving earth are constantly moving from east to west around the globe, we must expect a magnetic current at right angles which will make our earth a magnet.

If the earth is a magnet, so are, no doubt, all the other planets, and the sun itself; and our globe is but a link in a great chain of heavenly magnets bound together by mutual attraction and comprising the whole solar system.

VIII. *The Surface of the Earth.*—The surface of the earth, as stated before, measures 197,000,000 of English square miles. Nearly three-quarters of it are covered by the waters of the sea, one-quarter only of the solid crust rising above them. Both dry land and water are surrounded by the atmosphere as by a common garment.



The solid land, the liquid surface, and their gaseous envelope are the three geographical elements which, under the influence of the sun, support life, vegetable and animal, and the mutual play of which it is the province of physical geography to consider. As the extent and forms of the land-masses and oceans, and their relative situation, deeply modify the nature of the climate and regulate the distribution of life, the study of their general arrangement is of primary importance.

General Arrangement of Land and Water.—The principal facts in this respect are the following:

1. The solid land is not gathered together in a single large mass, nor is it uniformly scattered over the sea in fragments of about equal size, but forms a few large bodies, called continents, and a multitude of much smaller fragments, called islands, which surround the coasts of the continents and dot the broad expanse of the oceans. This peculiar division into individual bodies favors diversity of climate and richness of development in the domain of life.

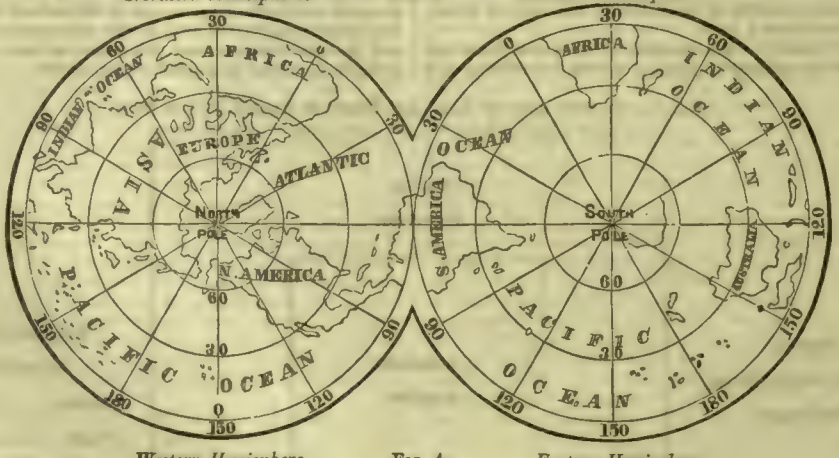
The relative amount of land and water on the surface of the globe is made clear to the eye in the following diagram, in which the large square is the surface of the globe; the inner squares, the area of the continents and islands; and the surrounding area, the water-surface. The figures indicate the areas in English square miles:

FIG. 1.—*Relative Area of Land and Water, in English Square Miles.*

2. Looking on the artificial globe from above, we see the masses of land crowded around the North Pole to about the 70th degree of latitude, and from there extending towards the South Pole in three directions, dividing into three bands of land, which taper as they advance, and terminate in three points—South America, Africa, and Australia, far away from the Antarctic Pole. Looking on the globe from the opposite side, we see the broad sea surrounding the South Pole, and sending three great arms between the bands of land, the Pacific, Atlantic, and Indian oceans. The North Pole might be called the *Continental;* the South Pole, the *Oceanic Pole.*

3. We observe, further, that each of these main bands of land is cut transversely in two by a region of inland seas and broken lands, isthmuses, peninsulas, and islands; the Gulf of Mexico and the Caribbean Sea, with the great isthmus of Central America and the Antilles, separating as well as uniting North and South America; the Mediterranean Sea, with its peninsulas and islands, lying between Europe and Africa; and the Malayan Archipelago, with its lines of islands and landlocked seas, between Asia and Australia.

These regions are parts of a broad transverse band, whose position can be traced from Behring Straits as a centre, with



a meridian arc of 80° as a radius, and which we would call the *central zone of fracture*. This disposition is shown in the accompanying map on a polar projection, in which the zone of fracture is marked by a circle passing through the middle of it.

4. As the lands are nearer the North Pole, and expand to the north while they taper to the south, the northern hemisphere contains nearly three times as much land as the southern hemisphere, in which water correspondingly predominates, as shown in fig. 3.

FIG. 2.—*Radiating Arrangement of the Land Masses.*

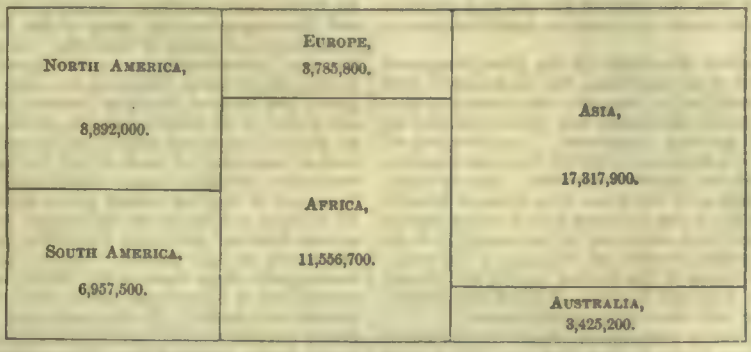
Northern Hemisphere. FIG. 3. *Southern Hemisphere.*

Western Hemisphere. FIG. 4. *Eastern Hemisphere.*

The New World. *The Old World.*

5. As the lands are crowded on the north and east sides of our planet, the north-eastern hemisphere contains more land and the south-western hemisphere more water than any other we can devise. They are therefore contrasted by the celebrated Carl Ritter as the Land and Water Hemispheres. In the land hemisphere are gathered together the largest parts of all the great continents, making over six-sevenths of all the land, and occupying only a little less than one-half of the surface. In the water hemisphere, Australia, the smallest of the continents, stands alone, with only the southern points of Asia and South America, making less than one-seventh of the land, and leaving twelve-thirteenths of the surface to the water. The centre of the land hemisphere is about London; that of the water hemisphere at some point in the ocean south of New Zealand.

Land Hemisphere. FIG. 5. *Water Hemisphere.*



6. The central zone of fracture divides the land masses into three northern and three southern continents, which form two groups of a very different nature, the northern continents being mostly situated in the temperate and the southern in the tropical regions.

The relative extent of the various groups just mentioned are here tabulated for convenient reference, and the areas given in English square miles:

Land and Water.

	Land.	Water.	Total.
The earth	52,900,000	144,000,000	196,900,000
North hemisphere	38,780,000	59,670,000	98,450,000
Southern hemisphere	13,955,000	84,485,000	98,450,000
Eastern hemisphere	36,100,000	62,350,000	98,450,000
Western hemisphere	15,900,000	82,550,000	98,450,000
Land hemisphere	45,000,000	53,450,000	98,450,000
Water hemisphere	7,000,000	91,450,000	98,450,000

FIG. 6.—*The Areas of Continents compared in English Square Miles.*

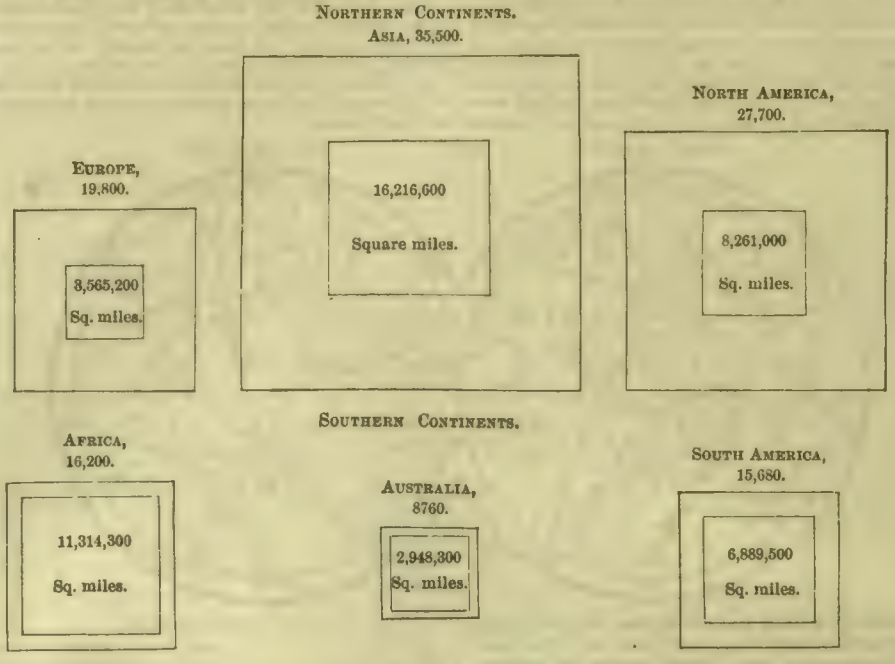
The general distribution of land and water, just considered, and the extent and relative position of the great land masses among themselves, are of the utmost importance. The action and reaction of land and water upon each other greatly modify the distribution of heat and moisture, due to the general laws arising, as we shall see, from the spherical form of the globe. Land absorbs and radiates heat more readily than water, and thus causes extreme temperatures, which never occur on the surface of the ocean. Similar extremes of moisture and dryness are found only on the continents. As heat and moisture essentially regulate the development of organic life, the final character and value of each part of the globe, in this respect, are determined by the size, form, and grouping of the bodies of land in the midst of the oceans. We have now, therefore, to turn our attention to the specific forms of the continents and oceans, on which so much depends.

Land and its Configuration.—The portion of the solid crust of the earth rising above the surface of the ocean is divided, as we have seen, into six great bodies, the *continents*, besides innumerable smaller ones, the *islands*. In both we must notice the *horizontal forms*, or the line of contact of land and water as shown in the maps, and the *vertical forms*, the elevations and depressions, the mountains and plains, or the forms of relief. (See CONTINENT.)

The amount of indentation in each continent is shown in the following diagram (fig. 7), in which the inner square represents the line enclosing the unindented area, without the islands; the outer line, the actual length of the coast with its windings. The difference between the two gives the true measure of the indentation. It is easy to perceive at a glance how much the northern continents differ from the southern in this respect:

It is a fact full of meaning that the indented, well articulated continents are also, and have always been, the abode of the most civilized nations. The unindented ones, shut up in themselves, and less accessible from without, have played no important part in the drama of history. We must remember, however, that the variety of contours is but the expression of a more complicated inner structure, which, together with the climatic situation of the northern continents in the temperate regions of our globe, has a large share in this remarkable result.

The following table gives the length of the coast lines of the six continents compared with their area, without the islands, in English miles:



Area and Length of the Real Coast Line of each Continent.

	Area.	Length of coast line.
Europe	3,565,200 sq. miles	19,800 miles.
Asia	16,216,600 "	35,500 "
North America	8,261,000 "	27,700 "
Africa	11,314,300 "	16,200 "
Australia	2,948,300 "	8,760 "
South America	6,889,300 "	15,700 "

The table shows that Europe has 4000 miles of coast more than Africa, which is three times larger; and that North America, which is only little larger than South America, has 12,000 miles more of coast.

We have thus far taken a view of the outward forms of the masses of land as bounded by the waters of the ocean.

FIG. 7.—*Length of the Coast Line in each Continent, compared with the Line Enclosing its Area.*

To complete our view we must consider them as solid bodies, and study their vertical forms.

Vertical Forms, or Relief.—The configuration of their surface, as diversified by plains, highlands, mountains, and valleys, constitutes the *relief* of the continents, the characteristic features of which reveal their internal structure.

The elevation of a place above the level of the sea is usually reckoned from the level of the sea as a common base, and its height above the ocean is called its *absolute height* or *altitude*.

Though the loftiest mountains of the globe, compared with the diameter of the earth, are but as grains of sand on a globe of several feet in diameter, this element of altitude acts so powerfully on climate and organic life that its knowledge is of primary importance. An elevation of level of 350 feet is sufficient to diminish the mean temperature of a place by one degree Fahrenheit; that is to say, the effect is the same as if the place were situated seventy miles farther north. A few thousand feet of height change entirely the aspect and usefulness of a country. It is, again, the relief which controls the drainage of the continents, directs the course of the flowing waters, and shapes the river-basins. Although the forms of relief are infinitely varied, we may refer them to two great classes:

1st. The elevations in mass and by great surfaces, which are called plains or lowlands when they are only a little elevated above the level of the ocean, and plateaus or tablelands when their elevation is more considerable and presents a solid platform, a basis of great thickness.

2d. The linear elevations or chains of mountains, which are distributed on the borders of the plains and tablelands, or, more rarely, scattered in isolated groups. To the mountain-chains the valleys correspond, as the low plains to the plateaus.

Plains and Lowlands.—The lowlands and plains occupy nearly one-half of the surface of the continents. They are most extensive and unbroken on the Arctic slopes of the three continents of the north, and on the eastern or Atlantic side of the New World. The great Siberian plains extend from the north-eastern part of Asia to the Ural Mountains and the Caspian Sea, and continue through Russia and Northern Germany to the low land of Holland. In North America we find extensive lowlands marked by the valley of the Mackenzie River and the plains of the Mississippi Valley. In South America, the Llanos or plains of the Orinoco, the Selvas or plains of the Amazon, the Pampas or plains of the La Plata basin, form an uninterrupted series of lowlands which continue through the Patagonian plains to the extremity of the continent, along a line of 3500 miles. We may mention, again, among the large plains of the world, the interior of the Australian continent. The historical plains of China, Hindostan, and the Euphrates in Asia, celebrated and useful as they always have been, are smaller and of a more local character.

The nature of the surface in the lowlands is extremely variable. The vast alluvial plains, almost perfectly level, which are the work of the present rivers, and are formed along the great streams and in the deltas formed at their mouths, correspond best with the idea of a low plain. Such are the plains of the delta of the Mississippi, including the flat bottom, from thirty to eighty miles, comprised between the bluffs of the river; the plains of the Amazon; those of the Orinoco and La Plata; the plains of the lower Ganges and Brahmapootra; the delta of the Nile; the plain of Lombardy, and others of less note. In all these the view stretches unobstructed, as on the broad ocean, without meeting an elevation deserving the name of a hill. Other plains, like those of Northern Germany, the Caspian Sea, and a part of the Siberian plains, are the sandy bottom of an ancient ocean, and offer slight inequalities incident to local accumulation of sand drifted by the currents, or to some other accidental cause. Others, again, are undulating, like many of the vast treeless plains which cover most of the western portion of the Mississippi basin, or, like the eastern Siberian plain, are diversified by numerous hills. The nature of their surface is not less varied. In the Siberian plains large tracts called Tundra are endless frozen swamps full of mosses and lichens, while the hilly parts are covered with forests. To the south-west stretch immense grassy steppes, in which roam the nomadic Kirgheez. Salt sandy plains surround the Caspian Sea. Dense forests cover Central Russia, open treeless but fertile prairies its more southern plains. In North America, the wet, alluvial plain of the Mississippi delta, the open and fertile prairies of the upper Mississippi, the barren and, in part, salt plains of the far West, are very distinct types, with a value to man not less different. In South America, the Llanos of the Orinoco, a burnt waste one half the year, a rich pasturage the other half; the plains of the Amazon, covered with a luxuriant forest of over a million of square miles; and the treeless Pampas, with their tall grass and forests of thistles, are all forms which exhibit the endless variety of nature.

The low plains may be counted among the most valuable portions of our globe. There the waters, rushing down the slopes of the continents, meet, and bringing with them the spoils of the uplands, accumulate the rich alluvial soil on which at all times men have gathered by millions. There civilization began and developed, and an inexhaustible fertility supplied all the wants of the full-grown nations. China, India, Babylonia, and Egypt had their heart and centre in the alluvial plains, fertilized by the mighty rivers which traverse them.

The altitude of these useful basins is remarkably small. The central part of each of those just mentioned does not average 500 feet above the sea-level. The Mississippi at St. Louis, 1000 miles from the sea, is hardly 400 feet above it. The Amazon, at a similar distance inland, does not reach 250 feet of altitude. The Siberian plains, those of the Ganges, Euphrates, and the valley of the Nile, have all

altitudes of the same order. It would require, therefore, but a slight depression of the continents to cover all these rich countries with the waters of the ocean.

The following table shows the approximate area covered by the lowlands in each continent, in English square miles, with the proportion to the whole surface:

	Lowlands.		Proportion.
Asia	7,116,000	square miles	$\frac{3}{7}$
Europe	2,541,000	"	$\frac{2}{3}$
Africa	3,614,000	"	$\frac{3}{10}$
North America	3,840,000	"	$\frac{2}{5}$
South America	5,417,000	"	$\frac{4}{5}$
Australia	2,551,000	"	$\frac{6}{7}$

Plateaus and Highlands.—The name of plateau is usually applied to elevations in mass, or surface elevations, the absolute height of which exceeds a thousand feet. Plateaus, or table-lands, are swelled portions of the continents, often raised to a great height between two chains of mountains, which form their margin, as the plateau of the Great American Basin between the chains of the Rocky Mountains and the Sierra Nevada, and that of Thibet between the snowy chains of the Himalaya and Kuen-Lun. Or they descend by a series of terraces to the sea, as the plateau of Mexico, or, again, slope gradually into the lowlands, as the great plains of the far West in North America, which from an altitude of five or six thousand feet at the foot of the Rocky Mountains, pass by imperceptible steps into the centre of the Mississippi Basin.

Though the name plateau rather implies a flat surface, it may also be hilly, or even mountainous, but in all cases the lowest part of it still remains thousands of feet above the ocean. If no well defined limit can be given at which a rising surface begins to deserve the name of plateau, striking differences in the climate and the vegetable and animal life distinguish the table-lands as one of the main types of geographical forms.

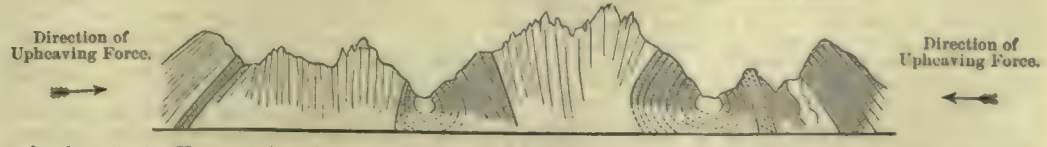
The plateaus most remarkable for their elevation are the elongated, valley-like highlands situated between the two chains of the Andes in South America, which have an altitude of from 10,000 to 13,000 feet, and those of Thibet between the Himalaya and the Kuen-Lun, which average from 10,000 to 16,000 feet. These may be called plateaus of the first order. The plateaus of a second order, though less elevated, averaging from 4000 to 7000 feet, are the most extensive, such as those of East Toorkestan and Mongolia in Central Asia; of Iran in Western Asia; the vast plateau which extends over all the southern half of Africa and Abyssinia; the long and broad swell which fills the western half of North America with a continuous mass of highlands from Alaska to Mexico. Plateaus of a third order, with from 2000 to 3000 feet altitude, occupy the large peninsulas of Deccan in India, of Arabia, Asia Minor, and Spain. The central part of France, Switzerland, and Bavaria, at the north foot of the Alps, and Transylvania, are plateaus of the same order.

The plateaus, together with accompanying mountain-chains, form the backbone, or kernel, of almost every continent, determining its general shape, and to a great extent its drainage and water-courses. But they are in nearly all the least fertile and useful portions of the surface.

Mountains and Valleys.—Unlike the broad, elevated surfaces just described, the mountains rise in long and comparatively narrow lines or ridges, the tops of which are often deeply indented, offering to the eye a series of peaks apparently detached from each other. Each of these peaks or distinct elevations being often called a mountain, and receiving a special name, the appearance suggests for such a structure the usual name of a *chain* of mountains.

A mountain-chain, therefore, is not to be considered as a necklace of isolated mountains, touching each other only by their base, but rather as a solid prism, with a broad base and two opposite slopes, of which the upper edge is either nearly even, as in the middle Appalachian chains in Pennsylvania, or indented, as in the Rocky Mountains and the Alps. These indentations, however, even in extreme cases, as in the Alps, do not reach lower than half the height, leaving the larger part an unbroken, continuous mass.

The top of the chain from which the waters flow on opposite sides is the *crest*, and the notches between the peaks are the *passes*, from which usually descend transverse valleys, like deep furrows along the slopes. The mountain-ridges are seldom isolated, but usually united into *systems of mountains*, composed of a large number of more or less parallel chains with their intervening valleys. The Alleghanies, the Alps, and the Andes are such systems, and not simple chains.



Formation of Mountains.—Geology demonstrates that the mountain-chains are mostly formed by the uplifting of the layers of rock which compose the earth's crust. (See Geology.) These rocks having been deposited at the bottom of the ocean, as is proved by their texture and the abundant marine shells which they contain, were originally in a horizontal position, and are still so in the plains at the foot of the mountains. In the mountain-chains, however, the same are found in all degrees of inclination, up to a vertical position, the marine shells and pebbles in them standing on their edges, thus testifying that they have been disturbed since their materials were deposited. Indeed, most of the mountain-chains seem to have been produced by tremendous lateral compressions in the crust of the earth, which caused either a series of long folds, as in the Appalachians, or, when the action was more violent, deep fissures, whose upturned edges rose into high ridges, as in the Rocky and Sierra Nevada Mountains, the broken strata forming ragged peaks. There are, accordingly, two main types of mountain-chains, very distinct from each other. One we call *mountains by folds*, which are generally of moderate elevation; and the other, *mountains by fracture*, to which belong the highest of the globe. The Appalachian system in North America and the Jura Mountains in Switzerland are examples of the first; the Rocky Mountains, the Alps, and the Himalaya, of the second.

Fig. 8.—*Chain of Mountains by Folds.*

In the Appalachian and the Jura the mountains are curved into arches, either entire or broken on the top, forming a system of long, straight parallel ridges of about equal height, with intervening trough-like valleys, justifying a comparison to the folds of a garment. The crest of the ridges, seen at the horizon, appears like a uniform unindented line without sharp peaks or deep passes. The main valleys are longitudinal, the transverse valleys being few and unimportant. Here and there, however, deep gaps cut the chains transversely to their base, allowing the rivers to escape from one valley to the other. In systems by fracture, like the Rocky Mountains and the Alps, there is one main central with lower subordinate chains. The parallel chains and the longitudinal valleys which separate them have not the same regularity. The crests are deeply indented, and cut down, to one-third or one-half of their height, into isolated mountain-peaks and passes, presenting to the eye the appearance of a saw, or in Spanish *sierra*, in Portuguese *serra*, which names are applied to mountain-chains of this description. The longitudinal valleys, though sometimes of considerable size, are few, the transverse valleys numerous, with bald picturesque outlines and a series of fertile basins united by deep gorges and defiles. These systems of mountains are not to be conceived as one single chain; they are large mountainous zones, several hundred miles broad, whose general slopes, therefore, average but a few degrees. It is the peculiar combination of mountain-systems with plateaus and plains which constitutes the distinctive forms of relief of each continent, and also determines its general contours.

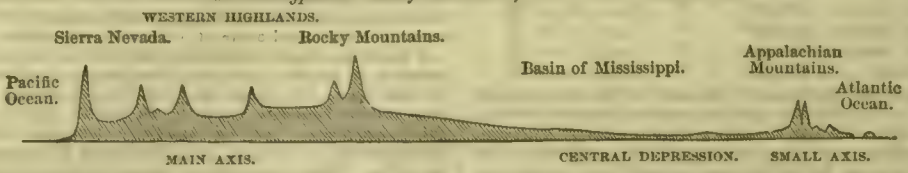


Fig. 9.—*Chain of Mountains by Fracture.*

General Laws of Relief.—The examination of the general vertical forms of the masses of dry land leads to a recognition of certain great laws of relief which apply to every continent, or to certain groups of continents, or to the whole earth.

1st. Each continent has on one side a large system of highlands, plateaus, and mountain-chains which constitutes the principal feature of its structure, and may be called its main axis. On the other side, along the opposite shore, is found a similar system, but diminutive in all its dimensions, extending over only a part of the continent, and forming a secondary axis. Between the two a general depression or low plain fills the interior. The direction of these two fundamental lines of highlands is not parallel, but converging, which gives to all continents the triangular form mentioned in the article CONTINENT (which see).

FIG. 10.—*Typical Form of Continents, shown in North America.*

A large swell on one side, a smaller converging one on the other, and a depression between the two, is the *typical* form of a continent. An island, however large, is never more than a part of it.

This typical structure can be traced in all continents, but in none more clearly than in North America. Here the main axis is formed by the large swell of the western highlands, stretching from the north-west to the south-east, without interruption, for 4500 miles, steadily growing in height from the shores of Alaska to the south end of Mexico, and filling from one-third to one-half of the width of the continent. The plateaus contained between the border chains of the Sierra Nevada and the Rocky Mountains average full 4000 feet, and reach in Mexico double that altitude, the high peaks of the mountain-ranges reaching from 12,000 to 15,000 feet. The secondary axis is the Appalachian system, extending from Nova Scotia to Alabama, in a south-westerly direction, for 1500 miles. Its average width is hardly one-fifth, and its elevation, plateaus, and peaks not one-half, that of the western highlands; but still it determines the trend of the Atlantic coast. Between the two axes the lowlands of British America and the vast plains of the Mississippi Basin stretch for 3000 miles from the Arctic shores to the Gulf of Mexico, hardly interrupted by a slight central swell of 1000 or 1600 feet in the region of the sources of the Mississippi.

In the sister continent of South America the same normal structure is evident. On the extreme western margin the high and massive swell which bears the peaks of the Andes, the highest of the New World, rises from the Pacific shores as a continuous wall of 4500 miles from the Isthmus of Panamá to Cape Horn. Opposite this main axis, on the Atlantic side, the Brazilian plateau, with its border chains 2000 miles long and from 3500 to 9000 feet high, forms the secondary axis. In the interior, 4000 miles of low plains extend without interruption along the eastern foot of the Andes, from the Llanos of Venezuela to the southern extremity of Patagonia.

In Asia and Europe, which together form one great continental mass, the typical structure, owing to the complication of their forms of relief, is not so easily traced, but it is none the less real. Here, instead of a continuous body of highlands, as in North and South America, we meet with a series of separated systems. The highest and most prominent chains of mountains, forming the main axis, are all nearer the southern edge—the Himalaya, the Caucasus, the Alps, and the Pyrenees. The low and extensive plains are all on the north, and about the centre lines of lower mountains mark the smaller axis. Asia-Europe, however, is divided into three distinct parts, each of which is almost a continent, Eastern and Western Asia and Europe, which have to be considered separately.

In Eastern Asia the main axis is clearly marked at the south by the gigantic swell of land contained between the border chains of the Himalaya and the Kuen-Lun, in which are found the highest plateaus and mountains of the world. On the north side we recognize the secondary axis in the chains of the Thian-shan and the Altai. Between these two zones of highlands extend, in a vast depression, the plains of East Toorkestan and of the so-called plateau of Mongolia, which, though having an altitude of from 2000 to 4000 feet, lie full 10,000 feet lower than the neighboring plateaus of Thibet. In Western Asia the plateau of Iran has its main swell on the south border, in the high mountains of Koordistan and the Taurus, and in the eastern half the river Ilmend marks the direction of a central depression which sinks from 4000 to 5000 feet below the surrounding plains.

In Europe, the highest chains, the Pyrenees, the Alps, and the Balkans, which form the main axis, are all on the southern edge of the continental triangle, separating the three Mediterranean peninsulas from the main body. In the centre, a slanting line of lower chains, the Carpathian and the Sudetic Mountains, the Riesengebirge, and the chains bordering the low plains of Northern Germany, form the minor axis. Between the two lie the low plains of Wallachia and Hungary and the numerous basins of Central Germany.

Africa has a double structure. The northern half conforms to Asia-Europe, its mountain-chains and plateaus running east and west, which explains its projection far into the Atlantic. The highlands of the Atlas along the Mediterranean, and the Kong Mountains on the Sea of Guinea, are two border swells, between which stretch the vast plains of the Sahara, whose average altitude does not much exceed 1500 feet. The southern half, as ascertained by Dr. Livingstone, is an unbroken plateau with two border swells running from north to south, as in North and South America, the higher one on the east, the smaller one, hardly less elevated, on the west, and a depression two or three thousand feet lower in the centre.

Australia has also a main swell on the east, with plateaus of 3000 feet and mountains of over 7000 feet; and a lower one in the west, extensive plains filling the centre between the two. It has, therefore, the real continental structure, and cannot be counted, as it sometimes erroneously is, among the islands.

2d. From this peculiar structure of the continents results the fact that in all the line of greatest elevation is placed out of the centre, on one of the sides, at an unequal distance from the shores of the seas. Hence arise two slopes, unequal in length and inclination. In North America, for example, the Rocky Mountains, which divide the Pacific and Atlantic slopes, are 800 miles from the Pacific shore, and over 2000 miles from the Atlantic, the western slope being less than one-third of the eastern. In South America the inequality is still greater. The Amazon takes its rise hardly more than a hundred miles from the Pacific, and its waters reach the Atlantic 2000 miles farther east, making the eastern slope twenty times longer than the western. This peculiarity has, as we shall see, the greatest influence upon the character of the drainage and the arrangement of the river-systems in each continent.

3d. All the prominent plateaus and mountain-systems of the globe are found to stretch chiefly in two principal directions. They extend either from east to west, with a slight deviation towards the north, on a line nearly parallel to the ecliptic, or else from north to south, slightly deviating to the east or west, and thus on a line at right angles with the first. The direction east and west predominates in the Old World, and controls the high ranges and plateaus which form the main body of the continents of Asia, Europe, and North Africa. The direction north and south predominates in the American continents, and gives them the great elongation towards the south which is characteristic of the New World. It is also found in South Africa and Australia. Distinguished geographers in the last century had already noticed these prevalent directions in mountain-chains, and called one class *parallel* and the other *meridian* mountains.

4th. The mountain-ranges and plateaus in the New World all belong to the north-and-south system, the transverse being almost absent; hence the great simplicity of structure and of outlines which characterizes the American continent. In Asia and Europe the two intersect each other. Though the main body is due to the chains and plateaus of the east-and-west system, it is crossed at right angles by numerous chains of the second system, which greatly diversify the surface and divide it into distinct regions, and, projecting far into the sea, form the beautiful peninsulas which so much vary their contours and enrich these continents. The high Bolor and the Ural Mountains in the interior of Asia, the chains which fill the peninsulas

of Kamtchatka, Corea, and of Indo-China, the Ghauts of India, the mountains of the Hellenic peninsula, the Apennines, the Scandinavian Alps, all belong to the north-and-south system. The same can be said of the southern half of Africa and Australia.

5th. The altitude of both the surface elevations and the mountain-peaks gradually increases along the axes of the continents to a maximum which is placed beyond the centre, towards one end, from which the heights rapidly decrease. Here also, as in the transverse sections of the continents, there is a long and a short slope. The following table of altitudes will exhibit this law, and also show that the two Americas form together one system of increasing heights from north to south, interrupted only by the zone of broken and sunken lands in Central America, and that Europe and Asia form another, increasing from west to east. Volcanoes, being but exceptions in the general relief, are omitted, unless they owe their altitude to the elevation of the base on which they stand. (See profile in Map I.)

New World.

North America — Western Highlands.

Surface Elevations.	Eng. feet.	Mountains.	Eng. feet.
Plains of Alaska	800	Northern Rocky M'tns	4,000
Pelly Banks, Upper Yukon	1400	Mt. Murchison, Brit. Col.	14,831
Central Plateau of British Columbia	2000	Mt. Hood, Oregon	11,225
Great Plains of the Columbia	2000	Mt. Shasta, California	14,440
Great Basin, Utah, average	4500	Fremont Peak, Wyoming Territory	13,576
Great Salt Lake, "	4236	Gray's Peak, Col. Terr.	14,290
Colorado Plateau, "	6000	Pike's Peak, Col. Terr.	14,000
Plateau of Mexico, "	8000	Mt. Whitney, Sierra Nevada	15,000
City of Mexico, "	7473	Popocatepetl, Mexico	17,784
City of Toluca, "	8818	Orizaba	17,879

South America—Andes.

Surface Elevations.	Eng. feet.	Mountains.	Eng. feet.
City of Bogotá, New Gran.	8,655	Tolima, New Granada	18,360
City of Quito, Ecuador	9,520	Cayambe, Ecuador	19,386
City of Cuzco, Peru.	11,500	Chimborazo, "	21,414
Lake Titicaca, Bolivia	12,800	Ilhampu, or Nevada de Sorata, Bolivia	25,000
City of La Paz, "	12,230	Illimani, "	24,155
City of Potosi, "	13,330	Aconcagua, Chili	22,422
Plateau of Catamarca, Argentine Republic	12,000	Yanteles, Patagonia	8,030
Valley of Tenuyan, Andes of Chili	7,500	Sarmiento, Terra del Fuego	6,910

Thus the highest lands of the New World, surface elevations, and mountains are found in the plateau of Bolivia, around Lake Titicaca, and the heights steadily increase from the shores of the Arctic Ocean to that point for 7500 miles, while the line of descent to the Southern Ocean is only 2500 miles.

The same law is shown in the smaller axes, along the Atlantic in both continents, with some modification in the Appalachian system. Here the lowest part is a little above the middle point, about New York and New Jersey. Thence the heights increase towards the north and the south, but more gradually and to a greater altitude in the southern half, as shown in the following table:

Appalachian Mountains—Northern half, from South to North.

Eastern Chain.	Eng. feet.	Green Mountains.	Eng. feet.
Mt Wachusett, Mass.	2018	North Beacon, Highlands	1471
Grand Monadnock, N. H.	3718	Greylock, Mass.	3505
Moosehillock, N. H.	4790	Killington Peak, Vt.	4221
Mt. Lafayette, W. Mts., N. H.	5200	Mansfield Mt.	4389
Mt. Washington, " "	6288	Mt. Marcy, Adirond'k Mts.	5370

Southern half, from North to South.

The Great Central Valley.	Eng. feet.	Mountains.	Eng. feet.
Easton, Pa.	165	Blue Ridge, N. J.	1500
Harrisburg, Pa.	328	Peaks of Otter, Va.	3993
Salem, Upper Roanoke	1014	White Top, Va.	5530
Mt. Airy, Va.	2595	Black Dome, or Mitchell's High Peak, N. C.	6707
Bristol, Va.	1678	Clingman Mt., N. C.	6660
Knoxville, Tenn.	900	Great Frog Mount'n, Tenn.	4226

In South America the Atlantic border of the Brazilian highlands rises to an altitude of about 8000 feet in the north, 4000 in the centre, and culminates with 9500 in the Serra Mantiqueira, south-west of Rio de Janeiro.

Old World.

Europe and Asia, from West to East.

Surface Elevations.	Eng. feet.	Mountains.	Eng. feet.
Plateau of Spain	2,300	Pyrenees, Pic Anethou	11,168
" " Bavaria	1,800	Alps, Mt. Blanc	15,781
" " Asia Minor	3,000	Caucasus, Mt. Elboorz	18,572
" " Armenia	4,500	Hindoo-Koosh Chain	20,000
" " West Iran, Persia	4,000	Karakorum Chain, Mt. Dapsang	28,278
" " East Iran, Afghanistan	6,000	Dhawalagiri, Himalaya	26,826
" " West'n Thibet	15,000	Gaurisankar, or Mt. Everest	29,002
" " East'n Thibet	11,000	Chamalari, Bhootan	23,944

In the smaller axis in Europe also the heights are steadily increasing from north-west to south-east. The Weser Mountains only average 1500 feet; the Thuringian Forest, 3000; the highest peak in the Riesengebirge rises to 5254; the culminating point in the Tatra, or High Carpathian Mountains, has an altitude of 8685 feet.

In the smaller Asiatic axis the Altai Mountains, which average about 5000 feet, culminate in the Bielucha, 11,000 feet, and the Sajan Mountains, 11,452 feet, in the west, and decrease towards the north-east.

In the New World, therefore, the highest lands are piled up in the south-west; in the Old World, in the south-east. In Africa, also, the land-masses increase in altitude from west to east and from north to south. The western systems, the Kong Mountains and the Atlas, are plateaus of from 2000 to 3000 feet in altitude, with mountain-chains in the latter of from 7000 to 11,000 feet. The volcanic group of the Cameroons, near the Gulf of Guinea, reaches 13,000 feet. The eastern swell rises to plateaus of 6000 to 8000 feet in Abyssinia, with mountain-peaks of 16,000 feet. The course of the Nile marks a long slope running up from the Mediterranean to the highlands of Abyssinia; and far beyond, on the same line, under the equatorial sun, the snowy peaks of Kenia and Kilimandjaro rise to 20,000 feet, and mark the culminating points of the whole continent. In the southern half also the two border swells unite into the high plateau of 5000 feet which fills the broad and massive point of the continent in the territory of the Cape Colony.

In Australia the same tendency is observed; the lands rise towards the south-east corner, and culminate there in the Australian Alps, where Mt. Hotham exceeds 7000 feet.

6th. On the whole, the reliefs begin with the vast low plains around the polar circle, and go on increasing from the shores of the Arctic Ocean towards the tropical regions. The highest elevations, however, are not found at the equator, but north of the Tropic of Cancer in the Old World, in the Himalayas, 28° N. lat.; and north of the Tropic of Capricorn in the New World, in the Andes of Bolivia, 16° S. lat. The effect of this law is to temper the burning heat of the tropical regions, and give them a variety of climate which seems not to belong to these countries. If this order were reversed, and the elevation of land went on increasing towards the north, the now most civilized part of the globe would become a frozen and uninhabited desert.

7th. The distribution of low plains, plateaus, and mountains is far from being uniform. Not only has each continent a different share, but also one or the other form of relief so predominates as to give it a special character, which has the greatest influence upon its climate and functions, both in nature and in man's history. The large, fertile basins of the Mississippi and Amazon are the most valuable and characteristic parts of the American continents; they are the continents of low plains. Africa has no low plain of any great extent, but is filled with vast table-lands; it is the continent of plateaus. Europe in its western and most important half is but a network of mountain-chains without high plateaus, and is the continent of mountains. Asia, as the common root of all, has all the forms of relief on the grandest scale and in equal proportion; the most extensive plains in the north, the largest plateaus in its centre, the highest mountains on its border, with the greatest variety in their combination. It is the master continent, the full type of all the others.

8th. All that has just been said of the general reliefs of the globe is summed up in a single great fact which can be thus expressed:

All the long, gentle slopes descend towards the Atlantic and its prolongation, the Arctic Ocean, while all short and rapid slopes are directed towards the Pacific and its dependant, the Indian Ocean.

Formation of the Relief.—These general laws which regulate the inequalities of our globe seem to point to a common geological cause, which may perhaps be found in the gradual cooling of our planet. We may conceive that owing to the contraction of the interior the hard crust, having become too large for its contents, shrunk and shriveled. Vast portions of its surface subsided, and formed the oceans where the waters are gathered together. Between these sinking areas the other portions of the crust were forced up in large swells, wrinkled into folds, or broken into high mountain-ranges, and formed between the Pacific and the Atlantic the American continents on one side, Europe and Asia on the other; between the Indian Ocean and the Atlantic, South Africa; between the same and the Pacific, Australia. This view is confirmed by the fact, pertinently pointed out by Prof. Dana, that the height of the border mountains and plateaus is in proportion to the width of the oceans which bathe their feet. The Pacific, which is the larger ocean, has on its border the high chains of the Andes and Sierra Nevada, and the short slopes;

while the Atlantic has the Brazilian and the Appalachian Mountains, and the long slopes; and a similar arrangement is found in the other continents. The interior, more remote from the seat of the upheaving force, remains depressed. The cause of the typical structure of all continents above described therefore becomes evident. Thus the almost infinite variety of the inequalities of the earth's surface is actually subject to a general law. Here, as elsewhere, everything has been made with order and measure, and no doubt with regard to a final aim, which it is for science to discover by patient and intelligent research.

Islands.—The innumerable smaller bodies of land called islands form only one-seventeenth of the total surface of the dry land. They are of two classes—the *Continental* and the *Pelagic* (or oceanic) islands.

The continental islands are mere fragments of the continental structures, situated by the side of them or not far away, as the British Isles; or in lines parallel to their coasts, as the Japanese and Australian islands and the West Indies; or forming a continuation into the ocean of their chains of mountains, only partially submerged, as the long line of the Sunda Islands. They have the same kind of rocks and of mountain forms, the same variety of plants and large animals, as the neighboring coasts of the continents to which they belong. They vary in size, from a mere isolated rock to such large bodies as the British Isles, the Japanese Islands, Madagascar, Sumatra, and the most extensive of all (if we exclude Greenland), Papua and Borneo, whose area exceeds 2,000,000 square miles.

The pelagic (or oceanic) islands are scattered, far away from the continents, in the midst of the oceans to which they belong. Their size is always small. Though sometimes found in lines, they are oftener arranged in groups. Navigators distinguish among them two classes, the *high* and the *low* islands, which are found actually to correspond to two natural groups, distinct in their forms, geological nature, and mode of growth. The high islands are volcanic cones with craters, many of them still active. The low islands are all of a coralline nature, and are the tops of submarine coral reefs.

Volcanic Islands.—It is a remarkable geological fact that the rocks which make up the body of the continents, such as sandstones, slate, granite, and the various metamorphic rocks, are entirely absent in the oceanic islands. We cannot therefore expect here the variety of mountain forms, hills, and valleys which diversifies the surface of the continents. The volcanic islands being the tops of volcanic cones rising above the surface of the ocean, the more or less circular form of their outlines, their elevation and rapid slopes, and their moderate size are easily understood. Some hardly reach the surface, their crater being filled by the water of the sea, as in Barren Island; others rise to alpine heights, as the peaks of Hawaii in the Sandwich Islands, reaching nearly 14,000 feet, the Pico de Teyde, over 12,000 feet, in the Canary Islands, and Tahiti, over 7000. Sometimes two or more volcanoes clustered together form a single island, which may then have a larger size and more irregular outlines.

Coral Islands and their Formation.—The coral islands are among the most striking phenomena of the tropical seas. (For description, see CORAL ISLANDS.)

IX. *Water.*—Water is the second great geographical element to be considered. It is the universal solvent which, by disintegrating and rearranging the materials of the earth's crust, was in geological times the principal agent in forming what is now the solid land. It is equally indispensable in fertilizing the soil and carrying on the process of animal and vegetable life.

The common reservoir of water is the sea, which, as we have seen, covers nearly three-quarters of the surface of the globe. By slow but constant evaporation it is carried into the atmosphere in the shape of invisible vapors, which, borne by the winds over the continents, are condensed and fall in beneficent rains. A portion of the rain-water evaporates again in the atmosphere, another sinks into the ground, through which it percolates, and reappears at the surface in the form of springs, or fills the quiet sheets of water which feed the Artesian wells. The remainder flows over the surface in rivulets and brooks, which unite, and, receiving new accessions at every step, form the mighty rivers which carry the surplus water back to the ocean from whence it came.

Thus is produced the vast network of streams which, like the arteries of the human system, convey the life-giving element to all parts of the globe.

Surface depressions filled by streams or springs form the numerous lakes spread over the continents.

In this ceaseless circulation we have to consider the oceanic, the atmospheric, and the inland waters (for which see OCEAN, RIVER, LAKE, RAINS). ARNOLD GUYOT.

Earth-closet, a form of close-stool, designed to take the place, to some extent, of the water-closet, and frequently made portable for convenience. It is well known that dry soils have wonderful disinfecting powers, owing to their property of absorbing ammonia and other gases. It is upon this absorbent quality that the usefulness of manures, when applied to soil, depends. Advantage is taken of this absorption in the construction of the earth-closet. The fæces are covered by a small quantity of thoroughly dried soil or peat, which completely absorbs all unpleasant and injurious vapors, and after a time the mass becomes perfectly inodorous. It is found that the same earth may, if necessary, be used over and over again, and that finally, when it has become thoroughly charged with excrementitious principles, it is one of the best forms of concentrated fertilizing material known. Considering the increasing value of commercial manures, and the serious prevalence in country as well as city, and in winter as well as in summer, of diseases caused by defective sewerage, it may be readily seen that the earth-closet question may become one of much importance. (See WARING, "Earth-Closets and Earth-Sewage.")

Earth Currents. See MAGNETISM, TERRESTRIAL.

Earth'enware, a general term for all wares made of earth, and afterwards baked. (See POTTERY, by PROF. C. F. CHANDLER, PH. D., LL.D.)

Earth House, or **Eird House,** the name given in Ireland and Scotland to a building under ground anciently used as a place of retreat for the people in time of war. It consisted generally of one chamber from twenty to sixty feet long, from four to ten in width, and from four to seven in height. It was built of unhewn stones, and entered from the top by an opening admitting only one at a time. They are sometimes called Picts' houses. They were mostly built on hillsides and other dry places. In the moor of Clova, in Aberdeenshire, more than forty of these houses are found near together. Bronze swords, earthen vessels, and implements of various kinds have been found in them.

Earth Nut, a popular name given to the tubers or subterranean stems of several plants—viz. the *Bunium flexuosum*, an umbelliferous plant which grows in Europe; the *Cyperus rotundus*, a native of Egypt; and the *Arachis hypogæa*, a leguminous plant often called *peanut*. The tubers of the *Bunium*, which resemble chestnuts, and are sometimes called *earth chestnuts*, are extensively used for food.

Earthquakes. We are accustomed to consider the ground on which we live as *terra firma*, a solid foundation for our heaviest structures. The earthquakes teach us, however, to our dismay, that it is by no means absolutely so.

These movements of the earth's crust are of all degrees of intensity, from the almost imperceptible vibration to the most violent convulsions, which change the face of the ground, and reduce the most substantial works of human handicraft to a mass of ruins.

The appalling nature of these commotions, and the phenomena attending them, were fully exhibited in the remarkable and oft-described earthquake at Lisbon, Portugal, on the morning of Nov. 1, 1755, the great festival of All Saints. The churches of the city were full to overflowing, when at forty minutes after nine a rumbling noise was heard like distant thunder, which gradually increased until it resembled the sound of heavy artillery. A faint shock was followed by a more terrific one, which levelled to the ground a greater part of the city, and in the space of six minutes 30,000 persons were buried under the ruins of the churches and other edifices, and 30,000 more perished before the end of the catastrophe. The ground seemed to undulate like the waves of the sea, the surrounding mountains of Arrabida and Estrella were seen rocking violently on their base, and broad chasms were opened in the earth and shut again. More than 3000 persons had taken refuge on a broad marble quay just constructed on the banks of the Tagus, when the sea, which had before retreated, came back with fury in a wave forty feet high, and swallowed up that unfortunate multitude, of which not one was ever seen again; then, rushing against the doomed city, continued its work of devastation. These oscillations of the sea were repeated several times, and on the spot occupied by that massive structure several hundred feet of water were found. Fires, kindled in the fallen dwellings, soon spread their flames over this scene of desolation, and the mass of burning ruins presented at night the spectacle of a vast conflagration, which finished the work of destruction. After this catastrophe the commotion of the ground continued for several weeks, and a very severe shock was experienced in December.

One of the notable features of the earthquake of Lisbon is the great extent of country over which it was felt. On land it was not confined to the Spanish Peninsula, but shook all Western Europe, pervading France, Northern

Italy, Switzerland, Germany, the British Isles, reaching as far as Scandinavia. The northern coast of Africa suffered considerably; nearly all the cities in Morocco were destroyed; the earth was rent asunder, letting out streams of water. The ocean was hardly less disturbed. An English ship, the Nancy, when 100 miles west of Cape St. Vincent, in Portugal, experienced a shock from below so violent that the men on the deck were thrown over a foot from the floor. It was supposed that the ship had run against a rock and touched bottom, while the sounding-lead indicated deep water all around, proving that the solid floor of the ocean had been shaken and the commotion transmitted through the water. Huge waves, raised by these oscillations of the earth's crust above and below the level of the sea, were hurled on the shores of the continents. In Cadiz a monstrous wave sixty feet high was seen to come from the high sea and dash against the city. In Tangier, on the African coast, the sea rose and fell eighteen times, and fifteen times in Funchal on the island of Madeira. These commotions of the sea crossed even the Atlantic. In some of the Lesser Antilles the sea rose to twenty feet, and similar waves were observed in the harbors of New York and Boston.

The immediate area of concussion, including the portion of the Atlantic affected by it, comprised a surface as large as the continent of Europe. If we add the extensive area covered by the earthquake waves which brought to the American shores the tidings of these convulsions, and that of the American coast which experienced slight shocks during the same period, the surface disturbed by the earthquake of Lisbon amounts, according to Humboldt, to four times that of the European continent. The propagation of the movement seems to have been such that Lisbon was the centre of a system of undulations or earthquake waves, decreasing in violence with their distance from that centre.

Another earthquake, not less celebrated in the annals of science on account of the thoroughness with which its phenomena were studied and recorded, is that which occurred in Calabria in the year 1783. Like that of Lisbon, it was a central earthquake, but its area did not much exceed 500 square miles. The violence of the convulsions, however, and the variety of their effects, were perhaps still more remarkable. On the 5th of Feb., 1783, the first shock threw down, in two minutes, most of the houses of the numerous cities and villages in a radius of fourteen miles around the city of Oppido, which seems to have been the centre of the earthquake. The undulations were so great that tall trees, bent to the earth, were seen touching the ground with their tops alternately on each side of the wave. The surrounding mountains were all in motion. Some of them seemed to jump up and down, and the shape of their summits was permanently changed. Houses were thrown up bodily, as by the power of an exploding mine, and placed on higher ground. Deep chasms opened and shut again; others remained gaping; land-slides obstructed the rivers, the courses of which were altered; and the surface of the country changed its aspect.

Three Kinds of Motions.—The Italians long ago distinguished three kinds of earthquake motions. The first is the *undulatory* or *wave-like* motion, which is the most common and the least destructive. The waves travel either in one direction, like the waves of the sea, or from a centre in somewhat concentric lines.

The second kind of motion is the *vertical*, acting from beneath, as the explosion of a subterranean mine. When violent, no human structure can resist its action. This kind, as well as the first, was repeatedly exhibited in the earthquake of Calabria. In the catastrophe which in 1797 destroyed the city of Riobamba in the Andes of Quito, says Humboldt, many corpses of the inhabitants were thrown several hundred feet high, on a hill beyond the brook Lican. A similar occurrence is recorded in the terrific earthquake of 1868. In the cemetery of Arica, on the coast of Peru, a large number of skeletons were disinterred and spread on the surface of the earth. The earthquake of the 18th of Sept., 1828, in Calcutta, owed its destructiveness to the fact that the main shock was a vertical one. Another one in Murcia, Spain, in 1829, destroyed or severely injured more than 3500 houses.

The third kind of motion is what is termed the *whirling* motion, the most dangerous, but also the rarest of all. It is thought to be proved by facts observed in the earthquake of Calabria, such as the twisted position of the several stones composing the two obelisks placed in the façade of the convent of St. Bruno in the small town of Stefano del Bosco. In the formidable earthquake of 1692 in Jamaica the surface of the ground was so agitated and broken up that some fields planted in different crops changed places, and were found as if twisted into each other.

The normal motion, however, is the wave-like, and it is possible that the other kinds are but the effect of various systems of waves intersecting each other.

The *propagation* of these undulations takes place either in a linear direction, along the mountain-chains, the undulations being then at a right angle with them, as in most of the earthquakes of the Andes; or from a centre, forming a series of concentric waves diminishing in intensity and gradually dying out, as in the earthquakes of Lisbon and Calabria. The first are *linear*, the second *central* earthquakes.

Velocity of the Earthquake Waves.—The velocity with which the earthquake waves move is variable, according to circumstances. Humboldt seems to assume, as an average between extreme cases, a velocity of twenty-three to thirty-two English miles in a minute, and this estimate does not seem far from the truth.

Duration of Earthquakes.—Though slight concussions or single vibrations of the ground often occur isolated, the great earthquakes hardly ever consist of one single shock, but of a series of successive shocks, some of which are of exceptional violence. These convulsions of the ground may be repeated at longer or shorter intervals during a period of several days and weeks, or even of several months and years, before the earthquake is at an end. The earthquake of Calabria was in this respect also remarkable. A careful and intelligent local observer, Dr. Pignataro, counted 949 shocks in the year 1783, 501 of which were of the first magnitude; and 151 in 1784, of which 90 were classified by him as of the first degree of force. Nearly four years elapsed before these oscillations ceased entirely and the earth came again to a state of complete rest. During the terrific earthquake of Cumana on the coast of Venezuela, which began on the 21st of Oct., 1766, destroying the city in a few minutes, the earth continued to be shaken almost every hour during fourteen months, and it was only when the commotions occurred once a month that the unhappy inhabitants dared to begin rebuilding their houses. After the earthquake which laid the beautiful city of Messina in ruins, the ground continued to be convulsed almost daily for ten years, which caused a feeling of insecurity of life which had the worst effect on the moral condition of the inhabitants. In the appalling catastrophe which destroyed the city of Lima and its harbor, Callao, in Peru, in Oct., 1746, the shocks were repeated every seven or eight minutes, and over 200 of the most violent kind were counted within twenty-four hours. In the great earthquake of Caraccas on the 26th of Mar., 1812, fifteen shocks were felt on the first day, and they continued numerous every day until the 5th of April.

The general character of earthquakes seems to have been the same in all times. The descriptions of the most ancient on record and the most recent offer a striking coincidence. All the phenomena above described have been repeated in the latest of the great earthquakes, that which shook the western coast of South America and the mountain region of the Andes from Chili to Ecuador, on a line of over 1000 miles, in Aug., 1868. The flourishing city of Arica in Peru, the main harbor of commerce for Bolivia, was obliterated in a few moments. The beautiful city of Arequipa, in the Andes of Peru, was levelled to the ground, and its 50,000 inhabitants left houseless, and soon starving in the midst of its ruins. In the Andes of Ecuador the city of Catocachy disappeared, and a lake covers the spot where it once stood. The cities of Ibarra, Ottavalla, and others were swallowed up, and not one of their 10,000 inhabitants was ever seen again. Over 300,000 people were left houseless, and the whole number of victims of that awful catastrophe is yet to be counted. The movements of the sea were not less striking. In Arica the sea retreated from the shore, carrying with it five ships which were in the harbor, and returning in a high and furious wave dashed to pieces four of them, and carried the fifth, the U. S. steamer Watorec, two miles inland. Similar motions were observed on the coast of Chili and of Peru, and an immense earthquake wave is said to have crossed the Pacific Ocean, striking in its course the Polynesian Islands, and reaching the Australian shores.

None of the natural phenomena are so immediately destructive of human life as earthquakes, as the recent examples just quoted suffice to show. These are equalled, and even surpassed, by some of older times. In the earthquake of Sicily in 1693 over 60,000 people perished. History has recorded an earthquake in the year 19 after Christ, at the time of the emperor Tiberius, which destroyed 120,000 lives. Another in 526, in the reign of the emperor Justin, which destroyed a number of large cities in Syria, among which was Antioch, cost the lives of over 200,000 human beings. Considering the greatness of the danger, the suddenness of action, the sense of perfect helplessness and insecurity it engenders, and all the appalling circumstances connected with an earthquake, no one can wonder that the feeling of terror which it inspires is one which increases with every new experience.

The number of earthquakes is much greater than is generally supposed. Carefully prepared catalogues of all recorded cases, such as those of Perrey, Kluge, and others, swell their number to several thousands. Indeed, the record of the last century, which, owing to the increased attention bestowed on natural events, is certainly more complete, shows that we may place earthquakes among the regular and continuous terrestrial phenomena; for though the great catastrophes may be rare, a week scarcely elapses without a commotion of the ground worthy of notice taking place somewhere on the surface of the globe.

Connection with Volcanic Eruptions.—The immediate connection of earthquakes with volcanic eruptions is evident in many instances, but these are of a special kind. On the other hand, volcanic eruptions take place without earthquakes, as in the Sandwich Islands; and even in volcanic districts the most extensive earthquakes bear apparently no relation to the surrounding volcanoes, while a considerable number of severe and extensive ones occur in regions far removed from any active volcano, or even deprived of all volcanic rocks. Though the two phenomena may have a common cause or condition, they cannot be confounded in the same class.

Connection with the State of the Atmosphere.—The common belief is that earthquakes are accompanied by some extraordinary condition of the atmosphere, such as a very low or high barometric pressure, profound calm or high wind, sultry and damp weather, a prolonged drought, or peculiar electrical or magnetic disturbances; all of which have been considered as warnings of the coming event. But a careful scrutiny of the cases leaves this matter at present doubtful.

Influence of the Seasons and the Hour of the Day.—The dependence of earthquakes upon the seasons is more decided. Their number seems to be greater about the time of the equinoxes, especially the September equinox, than at any other. In the Molucca Islands during these periods, which are marked by the tempests accompanying the change of monsoon, the inhabitants do not dare to remain in their houses, but spend the season under tents. According to the records, a greater number of earthquakes occur in winter than in summer, which is the reverse of what is observed in volcanic eruptions. They seem also to be more frequent at night than in the daytime.

Astronomical Influences.—By comparing 7000 observations, Perrey found that the number of earthquakes is greater at the time of the syzygies, when the attractions of the sun and moon are combined and the moon is nearest to the earth, than at the time of the quadratures, when the moon is more distant; and also that the shocks are more frequent at the places where the moon is in the meridian. Wolf finds a coincidence with the periodicity of the sun's spots, the years in which the spots are most numerous being also those in which the earthquakes more frequently occur.

Distribution of Earthquakes.—The law of the distribution of earthquakes on the surface of the globe is of paramount importance for the explanation of these mysterious phenomena. The most general facts in this respect are the following:

1. There is no part of the globe absolutely free from earthquakes; the phenomenon is general.

2. There are circumscribed regions in which the surface is liable to be shaken simultaneously; such a region is an earthquake area.

3. A very significant fact, however, is that the most extensive of these areas of concussion, and those in which the earthquakes are the most numerous and violent, are situated within the two great zones of broken lands described above—the border zone around the Pacific Ocean, and the central zone separating the northern from the southern continents. In the first are found the celebrated earthquake areas of the Andes, that of the western coast of North America, and those of Kamtchatka, Japan, and New Zealand. In the second we meet with the great Mediterranean area from Spain to Syria, with Italy, Greece, Asia Minor, and North Africa. The Arabian and Indian areas are in the same zone; and the two regions of the earth most convulsed by these terrific shocks, the earthquake areas of Central America with the Antilles, and that of the East Indian Archipelago, the really classic soil of earthquakes, are situated at the intersection of the two zones. Outside of these two zones only a few more large areas are found like that of which Iceland is the centre, and which extends to Scotland and Scandinavia, and another in Central Asia.

The analogy of this distribution with that of volcanoes is evident, but the domain of earthquakes, as remarked above, extends far beyond that of volcanoes. Both are most intense in their action along the great fractures of our planet, but it would be rash to infer from this fact that one is the cause of the other; they only require similar conditions for their manifestation.

Theory of Earthquakes.—Many explanations of the phenomenon of earthquakes have been proposed, but science must confess its inability to give, at present, a satisfactory one. Earthquakes are obviously due to various causes. Those preceding or accompanying a volcanic eruption must be, no doubt, referred to the action of the volcano; but the extensive earthquakes disturbing areas of hundreds of thousands of miles, and those which take place outside of volcanic districts, require a more general cause. Perhaps this may be found, which is also the opinion of Prof. Dana, in the increasing tension produced in the earth strata by the steady contraction of our cooling planet. To this cause geology refers the rising of mountain-chains on long fissures in the hard terrestrial crust, in the form of prisms with inclined planes, or of a succession of folds with large internal cavities. The settling under their own weight of these vast structures, and the lateral tensions thus engendered, coming from time to time to a paroxysm, might perhaps explain these crackings of the ground and convulsions along the mountain-chains and in the broken parts of the earth. In this view every difference of pressure, atmospheric or astronomical, from lunar and solar attraction, may have a share of influence in the phenomenon.

As to the influence of the seasons, the time of the day, of electricity, magnetism, and the solar spots, they show once more, if finally proved, how intimate are the relations of all physical agencies with each other, and how close an analysis is required to understand so complex a phenomenon. ARNOLD GUYOT.

Earths, in chemistry, a term applied to compounds consisting each of a metal combined with oxygen. The earths proper are the dyad-oxides, glucina, thoria, didymia, lanthana, yttria, and erbia. They and their carbonates are insoluble in water. Alumina, zirconia, and ceria (tetrads) are of the same general character, and are properly called earths. Magnesia, baryta, lime, and strontia are called alkaline earths, because they are less soluble in water than true alkalies, though they exhibit alkaline reactions.

Earth-shine, a reflection of the sun's light from the earth to the moon, and back to the earth again. This phenomenon is often seen when the moon is very old or very new, the outlines of the full moon being rendered visible by the reflection.

Earth'works, a military term applied to fortifications or constructions, whether for attack or defence, in which earth is the principal material employed. (See FORTIFICATIONS, by CAPT. O. H. ERNST, U. S. Army.)

Earth'worm (*Lumbricus*), the popular name of a genus of Annelida of the order Terricolæ. The species are numerous, and they are found wherever the soil contains sufficient moisture to sustain their life. The earthworm has no head distinct from its body. It is composed of a succession of rings, sometimes amounting to 120 in number; it is without eyes or other external organs, excepting that on each ring it has eight short bristles pointing backward, which it uses in locomotion as the snake uses its scales. The mouth consists of two lips, the upper one being elongated; it has no teeth, and subsists by swallowing particles of earth, which, after the digestible matter has been extracted, is voided often on the surface of the ground in small intestine-shaped masses called *worm-casts*. It respires through pores which communicate with little sacs. It is hermaphrodite, but mutual fecundation takes place. The eggs often contain two embryos. The earthworm is covered with mucus, which enables it to glide through the ground without retaining a particle of the soil. Large specimens attain a length of nearly a foot.

Eart'mon, a post-village, capital of Dodge co., Ga., on the Macon and Brunswick R. R. (See EASTMAN.)

Ear Trumpet, an instrument for the relief of defective hearing. Ear trumpets are of a great variety of forms, but they all depend upon the same principle—that of collecting and condensing the sound waves, and thereby intensifying the impression made upon the ear. It is found in practice that a nice adjustment of parts is not necessary; sound being readily reflected along conical tubes, either straight or coiled, with great facility. Cases of comparatively slight deafness are aided by the wearing of "cornets," or small ear trumpets attached by a spring to the ear, and concealed by the hair of the wearer.

Ear Wax. See CERUMEN.

Ear'wig [Ang.-Sax. *eor-wicga*, literally, "ear-beetle;" Fr. *perce-oreille;* Ger. *Ohrwurm*], (Forficulariæ), a family of insects, so named from the popular delusion that they have a propensity to creep into the ear. They form a connecting link between the Coleoptera and the true Orthoptera. They have a narrow body, strong and horny mandibles, long antennæ, and a pair of forceps at the extremity of the abdomen.

Easely, a township of Pickens co., S. C. Pop. 1089.

Easement, a legal term denoting, in its most comprehensive sense, the right which the public or an individual has in the lands of another, not inconsistent with a general property in the latter. It is in the nature of a charge or burden upon land. It is called a *dominant right*, while the land burdened is termed the *servient estate*. Easements may be mere personal rights, when they are said to be *in gross*, or they may be connected with the ownership of land. The latter only will be considered. 1. They are incorporeal. 2. They are imposed on corporeal property. 3. They confer no right to the substance of the land. 4. There must be two distinct estates—the dominant, to which the right belongs; and the servient, upon which the obligation rests. They are affirmative or negative. Affirmative, when the owner of the dominant estate may do some act on the servient; and negative, when the owner of the servient estate must refrain from doing some act, otherwise lawful, on his land. The most important instances are the right of way (the right of the owner of one piece of land to pass over the land of another), of water (the right of the owner of the dominant estate to receive water from or discharge it across the servient estate), of support of the soil or of the buildings of the dominant estate by the adjacent soil or buildings of the servient estate.

Easements exist at common law, and may be created by statute. Common-law easements may arise in various modes. 1. By nature. This is a brief form of expression of a legal rule, that the owners of adjoining parcels of land may have a burden imposed upon them not to disturb the natural state of things. Thus, where a natural stream of water flows from the land of one owner through the land of another, the former cannot divert or diminish the quantity of water which would otherwise descend to the proprietor below, nor can the latter prevent the stream from discharging its water across his land. Each has an easement "by nature" in the land of the other. 2. By dedication. This means an appropriation of land by its owner to a public use; *e. g.* as a street or park or public landing-place. The legal title to the land dedicated is not changed, but the public acquires a right to use it for the special purpose to which it is dedicated. These easements are sustained in law on the doctrine of estoppel, although there is no specific grantee. No particular form or ceremony is necessary to constitute a dedication. It is sufficient if the intention to dedicate appear, either by positive acts of the owner or long-continued acquiescence, and the public act accordingly. 3. By actual grant. In this case the nature and extent of the easement are determined by the words of the instrument creating it, which must be sealed. 4. By implied grant. An easement is created by implied grant when it is necessary for the enjoyment of that which is expressly granted or reserved. Thus, if A is the owner of two lots, the first of which can be approached only over the second, and conveys either to B, the owner of the back lot has by implication a right of way across the front lot. 5. By prescription. This is the enjoyment of the right or privilege for so long a time as to raise the presumption of a grant. The length of time necessary to raise this presumption varies in different States, but, after the analogy of the statute barring disputed claims to land, it is usually twenty years. To obtain by prescription an easement in the land of another its enjoyment must have been uninterrupted for the required number of years, adverse to the owner of such land, and exercised under a claim of right. It must be open, so that the owner may be presumed to know of it. In England it is held to be a rule of the common law that the right to light may be obtained by prescription. This is called the doctrine of "ancient lights." It would take place where the owner of one lot of land had windows opening on the vacant lot of another for twenty years. He would acquire such a right that buildings could not be constructed on the vacant lot so as to shut out the light from his windows. But in the U. S. this rule has frequently been repudiated by the courts as inapplicable to our rapidly growing and rapidly changing condition; and in a number of States an easement of light can be acquired only by express or implied grant.

Easements may be extinguished by a release given by the owner of the dominant to the owner of the servient estate, or by abandonment. The failure to make use of an easement (technically called non-user) for twenty years is strong evidence of abandonment if the easement was acquired by prescription, although the presumption may be rebutted; but if the easement were acquired by actual grant, no length of mere non-user would operate as an abandonment. In that case there must be acts inconsistent with the existence of the easement. An easement may also be extinguished by a union of the two estates in the same person. This is technically called "merger."

T. W. Dwight.

East, a township of Monroe co., Ala. Pop. 859.

East, a township of Carroll co., O. Pop. 827.

East Ab'ington, a post-village and the principal division of Abington township, Plymouth co., Mass., 20 miles S. by E. of Boston, on the Old Colony R. R. It has a savings bank, a newspaper, three churches, and is well supplied with stores. It has large manufactures of boots and shoes. Pop. about 4500. (See new town of Rockland.)

J. S. Smith, Ed. "Standard."

Eastaboga, a post-twp. of Talladega co., Ala. P. 973.

East Al'bany is the N. part of Greenbush village, Rensselaer co., N. Y. It is on the Hudson River, directly opposite Albany, with which it is connected by bridges. It has extensive freight-houses and machine-shops.

East Al'len, a twp. of Northampton co., Pa. P. 1180.

East Alli'ance, a post-village of Smith township, Mahoning co., O., is a suburb of Alliance (which see).

Eastaloe, a post-twp. of Pickens co., S. C. P. 1099.

East Am'well, a twp. of Hunterdon co., N. J. P. 1802.

East An'dover, a post-village of Andover township, Merrimack co., N. H., 25 miles N. W. of Concord, on the Northern R. R. It has manufactures of hosiery, lasts, lumber, and woollens.

East Ar'lington, a post-village of Arlington township, Bennington co., Vt. It has manufactures of wooden ware.

Eastatoee, a twp. of Transylvania co., N. C. P. 351.

East Auro'ra, a post-village of Aurora township, Erie co., N. Y., is beautifully situated on the Buffalo New York and Philadelphia R. R., 17 miles S. E. of Buffalo. It has a weekly newspaper, an academy, six churches, five hotels, a foundry, numerous stores and shops, and is the business centre of a wealthy farming region. The above description includes the neighboring village of Willink. East Aurora was once the residence of ex-President Fillmore.

C. C. Bowsfield, Ed. and Prop. "Erie co. Advertiser."

East Baton Rouge, a parish in the S. E. of Louisiana. Area, 500 sq. m. It is bounded on the E. by the Amite, and on the W. by the Mississippi. The surface is level; the soil fertile. Corn, cotton, sugar, and molasses are produced. Pop. 17,816. Capital, Baton Rouge.

East Bay, a twp. of Grand Traverse co., Mich. P. 466.

East Bear River, a twp. of Yuba co., Cal. Pop. 603.

East Bend, a twp. of Champaign co., Ill. Pop. 643.

East Bend, a post-township of Yadkin co., N. C. Has an academy. Pop. 1353.

East Beth'lehem, a post-township of Washington co., Pa. Pop. 1621.

East Bir'mingham, a borough of Alleghany co., Pa., on the Monongahela River, about 2 miles S. E. of Pittsburg. Has one weekly newspaper. Pop. 9488.

East Bloom'field, a post-twp. and village of Ontario co., N. Y., has an academy. Pop. 2250; of village, 320.

East'bourne, a watering-place of Sussex, England, 3 miles N. N. E. of Beachy Head, in a chasm between two cliffs, has a martello tower, a fort, and a chalybeate spring. P. 5795.

East Boy'er, a township of Crawford co., Ia. P. 231.

East Brad'ford, a twp. of Chester co., Pa. P. 1033.

East Bra'dy, a post-borough of Clarion co., Pa., is situated about 70 miles N. of Pittsburg, on the Alleghany River. It has had a remarkably rapid growth, having attained its present population (about 3000) in four years. The iron-works of the Brady's Bend Iron Company are located on the opposite bank of the river, and give employment to 1500 persons. East Brady is but 7 miles distant from the Butler county oil-regions, and to this place much of the oil produced is run in pipe-lines, whence it is shipped to Pittsburg and other markets. It contains the usual number of schools, churches, business houses, etc., and one weekly newspaper. Pop. in 1870, 728.

Samuel Young, Ed. and Prop. of "Independent."

East Bran'dywine, a twp. of Chester co., Pa. P. 1011.

East Bridgewater, a post-township of Plymouth co., Mass., on the Old Colony and Newport R. R., 25 miles S. E. of Boston. It has valuable water-power, and large manufactures of brick, lumber, cotton-gins, iron, chains, nails, boots, shoes, and other goods. There are five churches, a savings bank, good schools, and one weekly newspaper. Pop. 3017.

Ed. of "News."

East Brook, a twp. of Hancock co., Me. Pop. 187.

East Brook'field, a thriving post-village of Brookfield township, Worcester co., Mass.

East Bruns'wick, a township of Middlesex co., N. J. Its inhabitants are extensively engaged in fruit-culture for the New York market. Pop. 2861.

East Brunswick, a twp. of Schuylkill co., Pa. P. 1661.

East Buf'falo, a twp. of Union co., Pa. Pop. 1011.

East'burn (JAMES WALLIS) was born in London, England, Sept. 26, 1797, and graduated at Columbia College in 1816. He was ordained deacon Oct. 20, 1818, by Bishop Hobart in Trinity church, New York, and soon after became rector of St. George's, Accomac, Va. He wrote an admirable Trinity hymn, besides versions of some of the Psalms. In 1817–18 he and his friend Robert C. Sands produced a poem called "Yamoyden." He died at sea Dec. 2, 1819.

Eastburn (MANTON), D. D., a Protestant Episcopal bishop, a brother of the preceding, was born in England Feb. 9, 1801. He came to New York, graduated at Columbia College in 1816, was ordained in 1822, became rector of the church of the Ascension in New York in 1827, and bishop of Mass. in 1843. He published lectures and addresses, "Lectures on the Epistle to the Philippians" (1833), and other works. Died Sept. 12, 1872.

East Caln, a township of Chester co., Pa. Pop. 1309.

East Canaan, a post-village of Grafton co., N. H., on the Northern R. R., 52 miles N. of Concord. It has five churches, one newspaper, two steam-mills, and numerous stores and shops. Principal business, farming and the manufacture of lumber. C. O. BARNEY, ED. "REPORTER."

East Chatham, a post-village of Chatham township, Columbia co., N. Y., on the Boston and Albany R. R., 29 miles S. E. from Albany, has a number of manufactories.

East Chester, a post-township of Westchester co., N. Y. It contains Mt. Vernon and numerous other suburban villages near New York City. Pop. 7491.

East Chester, a twp. of Chester co., S. C. Pop. 732.

East Chi'na, a twp. of St. Clair co., Mich. Pop. 297.

East Cleveland, a p.-twp. of Cuyahoga co., O. P. 5050.

East Cocal'ico, a twp. of Lancaster co., Pa. P. 1992.

East Conemaugh, borough, Cambria co., Pa. P. 381.

East Cov'entry, a p.-twp. of Chester co., Pa. P. 1318.

East Deer, a township of Alleghany co., Pa. P. 1390.

East Don'egal, a twp. of Lancaster co., Pa. P. 3254.

East Dorset, a post-village of Dorset township, Bennington co., Vt., on the Harlem Extension R. R., 25 miles S. of Rutland. It has marble-quarries of great value.

East Douglas, a post-village of Douglas township, Worcester co., Mass., on the Boston Hartford and Erie R. R., 16 miles S. S. E. of Worcester and 46 miles S. W. of Boston. The extensive works of the Douglas Axe Co. are here. Pop. about 1500. SPENCER BROTHERS,
PUBS. OF THE "WORCESTER SOUTH COMPENDIUM."

East Earl, a township of Lancaster co., Pa. Pop. 2310.

East Eden, Me. See EDEN.

East Elma, a post-village of Elma township, Erie co., N. Y. Pop. 112.

Eas'ter [Ger. *Oster;* Gr. πάσχα; Lat. *pas'cha;* Fr. *pâques;* etymology doubtful], the principal festival of the Christian year, observed in commemoration of the resurrection of our blessed Lord. The returns of this anniversary were originally regulated, and in imitation of this early usage have always continued to be, by the calendar of Judea, in which the months were conterminous with the revolutions of the moon. A mean lunation being, roughly, twenty-nine and a half days long, twelve lunar months, or a lunar year, fall short of a solar year by about eleven days. The beginning of the Jewish year therefore goes backward on the natural year eleven days annually, requiring an intercalary month to be introduced in the third year, and again in the sixth, ninth, eleventh, fourteenth, and so on. Any anniversary regulated by such a calendar as this is consequently *movable* in reference to a calendar regulated by the sun. The Resurrection took place just after the Jewish feast of the Passover, which was held on the fourteenth day of Nisan, the first month of the year—that is to say, the fourteenth day of the moon, or not far from the time of full moon. The Christians of Jerusalem, and after them those of the Asiatic churches generally, were accustomed to hold the feast of Easter on this same day or simultaneously with the Jewish Passover. This usage was unacceptable to the Gentile churches in Italy and the West generally, which preferred to celebrate Easter on the Sunday following the fourteenth day of the moon; and the difference of practice in this particular led to grave dissensions between the East and West, which were at length pacified by the agreement reached in the Council of Nicæa (A. D. 325), to make the Western usage universal. Since this early period Easter has always been observed throughout the world on the Sunday following the fourteenth of that lunation of which this fourteenth day falls on the 21st of March or next later. In order to find the time of Easter for any given year, it would seem that we should calculate the exact time of the new moon in that year for March, and try whether the fourteenth day of that moon (the day of new moon itself being counted the *first*) would fall not earlier than the 21st; in which case the Sunday following this fourteenth day might be presumed to be Easter. But should this fourteenth day fall earlier than the 21st of March, we should conclude that the new moon of April must be taken. The ecclesiastical calendar, however, is only nominally dependent on the moon in the heavens, the true moon and the calendar moon sometimes differing in their age more than two days. The practical reason for this is, that if the astronomical time of new moon is taken, this time will not be the same in the local times of different longitudes; so that a meridian may always be assigned such that the same new moon may fall on different calendar days on different sides of it. And if the calculation is very nicely made, when new moon happens exactly at midnight of Saturday or Sunday in the middle of a large city like London, the east and west halves of the city may have their Easter upon two very different days. The ecclesiastical moon is therefore an ideal or artificial moon; and in determining the beginning and end of each lunation no account is taken of any differences smaller than a day. In order to divest the ecclesiastical calendar as much as possible of complexity, advantage is taken of the fact discovered by Meton, an Athenian astronomer in the fifth century before our era, that in a period of nineteen solar years the sun and the moon return almost exactly to the same relative positions which they occupied at the beginning of this period, the difference amounting to little more than the space the moon would move over in two hours. The calendar therefore assumes that the moons determining Easter will recur in the same order every nineteen years throughout an entire century, and sometimes throughout two or three centuries. The Easters themselves do not therefore necessarily recur on the same days of the month of March or April in each of these successive series of nineteen years, but would do so if the same days of the week always corresponded to the same days of the month. This, however, is not usually the case; and as Easter must be Sunday, it is necessary, in order to fix definitely the date of Easter in any given year, to know both the place of the year in the series of nineteen (or in the Metonic cycle) and also the day of the week on which the year began, or (what is practically the same thing) the dominical letter for the year. Various methods have been given for finding Easter, but all of them commence, expressly or implicitly, with the determination of these two elements. The rules given by Prof. de Morgan in the "Companion to the British Almanac" for 1845 occupy about a page. The formulæ of Delambre, in the first volume of his "History of Modern Astronomy," and those of Gauss, given in the first volume of the "Theoretical and Practical Astronomy" of the same writer, though concise as mathematical expressions, involve much laborious computation in their practical application. The following rules, however, originally devised by the writer of the present article, are very simple and easy. It is to be observed, first, that the fourteenth day of the Easter moon, being approximately the time of full moon, is called the *paschal full moon.* The number of the year in the lunar cycle is also called the Golden Number. (See GOLDEN NUMBER.) Then, supposing that we know the golden number and the dominical letter, we find, for the present century, the paschal full moon as follows:

If the golden number is *odd:* To four times the golden number add *ten;* and

If the golden number is *even:* To four times the golden number add *twenty-five.*

The result, in either case, if greater than twenty and less than fifty, is the date of paschal full moon, *considered as a day of March* (that is to say, if it happens to be, say, thirty-three, it is the thirty-third of March = the second of April, and so on). If not greater than twenty and less than fifty, add *thirty,* or subtract *thirty,* or *twice thirty,* if necessary to make it so, and the result is once more paschal full moon.

Then, to find Easter: To the constant number *eighteen* add the numerical value of the dominical letter (*i. e.* A = 1; B = 2; C = 3, etc.), and the sum, if greater than the value of paschal full moon just found, is the date of Easter; but if not, add *seven,* or *twice seven,* or *three times seven,* and so on till a total is obtained which exceeds that value; and this total is the date of Easter considered as a day of March.

To find the golden number and the dominical letter: In either case first separate the hundreds in the number expressing the given year of our Lord from the years less than a hundred, and treat the parts independently of each other. First, for the dominical letter: If the hundreds be divided by *four,* the remainder from the division will have

one or other of the following values—viz., 0, 1, 2, 3. And the dominical letters belonging to the hundreds which give these remainders respectively will be A, C, E, G = 1, 3, 5, 7. These, for convenience, call *centurials*. Then for the *years* take half the largest number divisible by *four*—*i. e.* half the number of the latest leap-year—increase this by *seven*, and subtract the excess of fours (*i. e.* the remainder left in the previous division by four). To this result add the centurial, and the excess of sevens in the sum will be the value of the dominical letter; it being observed that if there is no excess the dominical letter has the value of seven itself, or is G. Leap-years have two dominical letters—one for January and February; the other, which is less than the former by a unit, for the remainder of the year. This last, which only is used in finding Easter, is that given by the rule.

To find the dominical letter for *Old Style* the process is the same except as to the centurial. The centurial for old style is found by adding *three* to the number of *hundreds*, and suppressing *sevens*. Thus, if the hundreds be *fifteen*, we have 15 + 3 = 18. And 18 with seven dropped as often as possible, leaves 4, which is the old style centurial. If there is *no* excess of sevens, the centurial is seven itself.

Secondly, for the golden number: Add a unit to the number expressive of the given year; then divide the *years* by *twenty*, and add the quotient to the remainder. Next divide the centuries by *four*, and add the quotient to *five times* the remainder. Finally, add the two results, and the sum, if nineteen or less, is the golden number. If it exceeds nineteen, drop nineteen, or, if necessary, twice nineteen, and the number left, being not greater than nineteen, will be the golden number.

Take, as an example, the year 1873. For the dominical letter: 18 + 4 gives 2 remainder, and the *centurial* is accordingly 5. The number of the largest leap-year in 73 is 72, and the half of this is 36. Then 36 + 7 = 43, and 43 − 1 = 42. Finally, 42 + 5, with the sevens suppressed, is evidently 5 = E, which is the dominical letter of 1873.

For the golden number: 1873 + 1 = 1874. Then, 74 + 20 = 3, with 14 remainder, and 14 + 3 = 17. Also, 18 + 4 = 4, with 2 remainder, and 2 × 5 + 4 = 14. Then, 17 + 14 = 31, and 31 − 19 = 12, the golden number for 1873.

For Easter in 1873: 12 × 4 + 25 = 73. Then 73 − 30 = 43, or paschal full moon is the 43d day of March. To 18 add 5, the value of the dominical letter, and the result, 23, is smaller than the date of paschal full moon. But 23 + 7 + 7 + 7 = 44, which is greater than that date (43), and Easter is the 44th day of March, or the 13th day of April.

There is one case not provided for in the foregoing. If in finding paschal full moon we obtain a result which is *exactly twenty* or *exactly fifty*, adding or subtracting thirty will not bring it between those limits. In this case paschal full moon must be taken at 49. There is also an irregularity arbitrarily introduced by the mathematicians of Pope Gregory XIII., by whom the calendar was regulated, which is this: Should the rules above laid down give *forty-nine* directly as the date of paschal full moon, *this must be reduced to forty-eight in case the golden number is* 12 *or upward;* not otherwise.

For centuries earlier or later than the present, the rules are the same, except that the numerical terms *ten* and *twenty-five* used in finding paschal full moon are liable to variation (but do not always vary) in passing from century to century. The second of these terms always exceeds the first by *fifteen*. The first may be found for any century up to the forty-second by the following rule: From the number of the centuries take its fourth part and its third part (disregarding fractions in both cases), and increase the result by *two*. Thus, for the twentieth century we have 20 − 5 − 6 + 2 = 11. Hence, these numerical terms for the next century will be 11 and 26. In *old style* dates these numerical terms are invariable, and are always *two* for odd golden numbers and *seventeen* for even. For more complete information on this subject the reader is referred to the essay above mentioned. The author of this article has also designed an instrumental contrivance for finding Easter by inspection, for any year from the beginning of the Christian era down to the end of hundredth century, in old style or new. This is constructed of card-board, and a facsimile of it, reduced in size, is given below. In the centre is a rotary disk, on the lower border or limb of which are inscribed the numbers below 100 which consist of even *twenties*, and also the zero. These are called *vigesimals*. On the upper limb appear all the numbers less than twenty, called *residuals*, the leap-year numbers being written twice. Around this disk is a fixed ring, bearing the dominical letters above and the centurial numbers below—the new style centurials being on the left, and the old style centurials on the right. The centurial numbers here employed are simply the remainders left in dividing the hundreds by 4 for new style and by 7 for old style. To use this for finding the dominical letter, turn the disk till the proper vigesimal of the given year stands opposite the proper centurial; then opposite the proper residual will be found the dominical letter (or letters) of the year. In case of leap-years there will be found two such letters, of which the lesser or right-hand one is the Easter dominical letter.

Around the fixed ring here described is a rotary ring bearing the numbers from 1 to 19 (the golden numbers), twice repeated, and at the left of these the vigesimals, arranged in regular order. Outside of this rotary ring is a second fixed ring, which bears on the left the numbers 0 to 19, arranged *en échelon*, so as to allow the natural sequence to be observed. These are called the centurials of the lunar cycle, and are simply what remains after suppressing the *nineteens* out of the hundreds in the given year of our Lord. Thus, in the year 4173 there are *forty-one* hundreds, from which, if we suppress 19 × 2 = 38, there will remain 3, which is the centurial for the forty-second century. On the right the same fixed ring bears the residuals, or excesses of twenties in the years of the incomplete century, in which it is not necessary to duplicate the leap-year numbers. When the movable ring is turned so that the proper vigesimal stands opposite the proper centurial, the golden number for the year will be found opposite the proper residual.

On this same fixed ring, outside of the numbers already mentioned, is an annular row of figures distributed without any obvious order, which embraces all the possible golden numbers from 1 to 19, each entered twice. Of these, all up to 11 are printed in full face; all from 12 to 19 inclusive in outline. Their use will presently appear.

Around this second fixed ring is a second rotary ring, on which are inscribed all the days of March and April on which paschal full moon or Easter can fall; together with the calendar letters belonging to them severally. From the 17th to the 25th of April the day numbers and letters are entered twice, the second or inner series being advanced beyond the outer by a single place. This same rotary ring also bears an arrow, which is designed to be used as an index. Finally, surrounding this rotary ring there is another fixed ring, in the several divisions of which are written the centuries from 15 up to 100, none below 15 being necessary, as the new style, or Gregorian reckoning, began in 1582. The use of the last-mentioned rotary ring is to find, first, the date of paschal full moon, and subsequently, by consequence, the date of Easter. In employing it, the ring is turned until the arrow points to the golden number for the year, when the date of paschal full moon will be found opposite the proper centurial number in the outer fixed ring. Then, looking along the series of letters to the right of the date of the paschal moon, Easter will be found immediately over the next succeeding dominical letter for the year. If the time of Easter for years before 1582 is sought, the paschal moon will be found, not opposite the century, but opposite the words "Old Style" written in one of the compartments into which the outer fixed ring is divided, and Easter will be opposite the proper dominical letter next following, as before.

As it is arbitrarily ruled that the paschal full moon shall never fall later than April 18th, and as a consistent method of computation or of instrumental determination would make it sometimes fall on the 19th, the double series of days and letters is introduced at the end of April in the outer revolving ring to meet this case. When, therefore, in the use of the instrument, paschal full moon would seem to fall on the 19th of April by the series of outer, full-faced figures, we must pass to the inner series of figures printed in outline, which will give paschal full moon on the 18th. Also, if the outer series of full-faced figures should at any time directly give paschal full moon on the 18th, we must pass to the inner series again, and make paschal full moon the 17th, *provided the arrow stands opposite a golden number printed in outline*, but not otherwise. When the light-faced numbers are thus used instead of the full-faced for the paschal moon, the light-faced letters must of course also be used in finding Easter.

The table in the figure is adjusted for the Easter of 1873. In 73 the vigesimal is 60 and the residual is 13. For 18 (centuries) the centurial is 2, and the Easter sought belongs to new style. It is seen that, 60 being opposite 2, the residual, 13, is opposite E; which is the dominical letter of 1873. In the first rotary ring the same vigesimal, 60, is opposite the golden number centurial, which is 18; and under the residual 13 we have 12, the golden number for 1873. Bringing, finally, the arrow of the outer rotary ring opposite to the golden number, 12, we find under 18 in the outer row of centuries, the 12th of April, which is the date of paschal full moon for 1873; and opposite E, the dominical letter of the year next following the date of the paschal full moon thus found, we have April 13th for the date of Easter.

This little instrument is useful in the solution of many questions connected with chronology and the calendar, besides that for which it was expressly constructed. Any person possessed of a little mechanical skill can construct a working instrument of this kind for himself, by copying this diagram on a scale about one-fourth larger.

The Churchman's Companion to the Calendar.

BY PRESIDENT BARNARD.

The principal festivals and fasts of the Church dependent for the time of their celebration upon Easter are Septuagesima Sunday, nine weeks before Easter; Ash Wednesday, which is the Wednesday of the seventh week before Easter; Good Friday, which is the Friday next before Easter; Ascension Day, which is the Thursday of the sixth week after Easter; Whitsun Day, the seventh Sunday after Easter; and Trinity Sunday, the eighth Sunday after Easter.

F. A. P. Barnard, *Columbia College.*

Eas'ter Island, a small island of volcanic origin in the Pacific Ocean, is in lat. 27° 6′ S., lon. 109° 30′ W., and is 12 miles long and 4 miles wide. It rises 1200 feet above the level of the sea, and is scantily supplied with water. It is the easternmost inhabited Polynesian island. Its people were quite recently cannibals. They have traditions of their ancestors having come from the island of Oparo, 1900 miles distant. The island has wonderful colossal statues in stone, but the natives have no account of their sculptors.

Eas'tern Archipel'ago, The, also called **The Malay Archipelago** and **Australasia,** comprises all those islands which lie in the north-eastern part of the Indian Ocean. Area, about 650,000 square miles. They are divided, according to their position, into three groups. The first group comprises the Molucca Islands, the Spice Islands, Banda, Amboina, Ternate, and the Philippines; the second group consists of Sumatra, Java, and the small Sunda Islands east of Java, from Bali to Timorlaut; and the third comprises Borneo and Celebes, together with a large number of smaller islands, as Billiton, Banca, Singapore, etc. In its position this archipelago forms the connection between Asia and Australia. The soil is very fertile, and resembles in its products that of the neighboring countries of Asia. It has therefore attracted at all ages almost every nation. The original inhabitants consisted of many tribes, but all belonged to one race called the Malay Race (which see). At a later age the Arabs came to these islands, and as a consequence Mohammedanism gained a good many followers. At last, the Europeans came, and subjugated almost the entire archipelago, and especially the Dutch have become masters of the greatest number of islands; while the Spaniards have only the Philippines; the Portuguese, Dilli and part of Timor; and the British, Singapore and Labuan. Besides these races, a large number of Chinese are found throughout the islands. The total population is estimated at 22,829,000.

Eastern Churches is a title given to certain bodies of Christians of Western Asia, Eastern Europe, and of Africa. These are the Greek, the Armenian, the Jacobite (or Syrian), the Nestorian, the Coptic, and the Abyssinian Church, and the Christians of St. Thomas. The entire population connected with the Eastern churches may be estimated at about 76,500,000, of whom 70,000,000 are of the Greek Church, 3,000,000 are Armenians, 3,000,000 Abyssinians, and the remainder belong to the other communions.

Eastern Empire. See Byzantine Empire.

Eastern Question, in European diplomacy, signifies the problem of the future of Turkey, especially of the European portion; and in a more extended sense expresses those difficulties which have from time to time arisen with regard to the relations of Turkey to Russia, Austria-Hungary, Greece, and Egypt; the affairs of the Danubian provinces; the navigation of the Black Sea; the supposed ambitious designs of Russia; and the difficulties between Christians and Mohammedans in Palestine, Crete, and other parts of the East. These questions have led to some of the most serious complications which have happened in

Europe during the last one hundred years. (See TURKEY, RUSSIA, CRIMEAN WAR.)

Eastern Rite, or **Oriental Rite.** Those branches of the Roman Catholic Church which acknowledge the supremacy of the pope, but which do not employ the Latin ritual, are said to be of the Eastern rite. In fact, they employ several different rituals. According to the "Roman Almanac" for 1872 ("La Gerarchia Cattolica"), there were bishoprics of the following rites: I. Armenian; II. Coptic (1, Egyptian; 2, Ethiopian or Abyssinian); III. Greek (1, Roumanian; 2, Ruthenian; 3, Bulgarian; 4, Melchite); IV. Syrian (1, Syrian; 2, Syro-Chaldæan; 3, Maronite). The aggregate number of episcopal sees, according to the same authority, in 1872, was 78; of which five were patriarchal and twenty-six archiepiscopal. The United Christians of St. Thomas have no bishop of their own, but are under the vicar-apostolic of Verapoli, who is of the Latin rite, but the people and clergy use, in part, a modified Syrian rite.

The Eastern rite differs from the Latin, not only in the languages employed in the service (Greek, Slavic, Armenian, Syriac, Ethiopic, Coptic), but generally also in the use of both elements for the laity in the Eucharist, and in the permission of marriage to the lower clergy.

Eastern Shore, a name given to those parts of Maryland and Virginia which are E. of Chesapeake Bay, and sometimes applied to the whole peninsula, including, in addition, the entire State of Delaware. The Eastern Shore has been proverbial for its conservatism, and from the character of its inhabitants claimed the title of "the land of gentlemen;" but it is now traversed by railroads, and the excellence of its soil and climate for peach-culture and market-gardening has caused the development of much industrial enterprise. Its western side is remarkably indented by navigable rivers and creeks, affording great commercial advantages. The waters on both sides abound in oysters, which are a source of great wealth. The fisheries are also extensive. Most of the surface is low and level, but healthy. Malarial fevers are endemic at some places. The climate is singularly mild. Bog-iron ore of fine quality is extensively mined in some parts. Kaolin is found in the extreme N. Oak timber is cut in some parts for market. The Eastern Shore was the scene of many of the labors and triumphs of Asbury and the early Methodists, and it is still one of the strongholds of their faith. Its people are famed for hospitality and generosity.

East Ev'ans, a post-village of Evans township, Erie co., N. Y., 4 miles from Angola Station, on the Lake Shore R. R. Pop. 100.

East Fair'field, a twp. of Crawford co., Pa. P. 741.

East Fal'lowfield, a township of Chester co., Pa. It is traversed by the Wilmington and Reading R. R. Pop. 1291.

East Fallowfield, a township of Crawford co., Pa. It is traversed by the Franklin branch of the Atlantic and Great Western R. R. Pop. 1167.

East Felician'a, a parish in the E. of Louisiana. Area, 480 square miles. The Mississippi River touches the S. W. extremity of this parish, which is bounded on the E. by the Amite. The surface is undulating; the soil is fertile. It is traversed by the Clinton and Port Hudson R. R. Corn and cotton are the chief products. Capital, Clinton. Pop. 13,499.

East Fin'ley, a post-village and township of Washington co., Pa., 17 miles S. S. W. of Washington, the county-seat. Pop. 1186.

East Fish'kill, a post-township of Dutchess co., N. Y., on the New York Boston and Northern R. R. Pop. 2306.

East'ford, a post-township of Windham co., Conn. Eastford Village is 11 miles W. of Putnam, a station on the Norwich and Worcester R. R. It has a savings bank. Pop. 984.

East Fork, a township of Conway co., Ark. Pop. 410.

East Fork, a post-township of Montgomery co., Ill. It is 11 miles E. of Hillsborough, a station on the St. Louis Alton and Terre Haute R. R. Pop. 1421.

East Fork, a township of Barton co., Mo. Pop. 452.

East Fork, a township of Douglas co., Nev. Pop. 132.

East Fork, a township of Haywood co., N. C. P. 286.

East Fox'borough, a post-village of Foxborough township, Norfolk co., Mass., 22 miles S. S. W. of Boston, on the Boston and Providence R. R.

East Frank'lin, a township of Armstrong co., Pa. Pop. 1451.

East Gale'na, a twp. of Jo Daviess co., Ill. P. 856.

East Ger'mantown, a post-village of Jackson township, Wayne co., Ind. Pop. 536.

East Glouc'ester, a post-village of Gloucester township, Essex co., Mass., on the seashore, 2 miles from Gloucester. It is a fashionable summer resort, and has a fine soldiers' monument.

East Go'shen, a township of Chester co., Pa. P. 696.

East Gran'by, a post-township of Hartford co., Conn. Pop. 853. It is 3 miles E. of Granby Station, which is on the New Haven and Northampton R. R.

East Green'bush, a post-township of Rensselaer co., N. Y. Pop. 1845.

East Green'wich, a post-village and township, capital of Kent co., R. I., is on Narragansett Bay and on the Providence and Stonington R. R., 14 miles from Providence. It has a national bank, a savings bank, an academy (under the supervision of the Boston University), a weekly newspaper, two cotton-mills, one woollen-mill, print-works, free library, six churches (one of them built and supported by a single individual), three hotels, a court-house and jail, and a good harbor. It is one of the healthiest places on the seaboard. Incorporated Oct. 31, 1677. Pop. of township, 2660.

W. N. SHERMAN, ED. "R. I. PENDULUM."

East Grove, a township of Lee co., Ill. Pop. 765.

East Had'dam, a post-township of Middlesex co., Conn., on the Connecticut River, 30 miles below Hartford, has a national and savings bank, a newspaper, a music seminary, 7 churches, 13 cotton-mills, 3 britannia-shops, etc. Pop. 2951. J. E. SELDEN, ED. "ADVERTISER."

East'ham, a post-township of Barnstable co., Mass., on the Cape Cod R. R., 24 miles from Barnstable. Pop. 668.

East Ham'burg, a post-township of Erie co., N. Y. It has five churches, and is the seat of "East Hamburg Friends' Institute." It is 7 miles E. of Hamburg Station, which is on the Lake Shore R. R. Pop. 2270.

East Ham'ilton, a post-village of Hamilton township, Madison co., N. Y. It is on the Utica division of the Delaware Lackawanna and Western R. R. Pop. 53.

East Hamp'ton, a post-village of Chatham township, Middlesex co., Conn., on the New Haven Middletown and Willimantic R. R.

East Hampton, a post-village of Hampshire co., Mass., on the New Haven and Northampton R. R., 5 miles S. W. of Northampton, and on a branch of the Connecticut River R. R. It has a national and a savings bank, and manufactures of suspenders, pumps, thread, vulcanized rubber, buttons, etc., and is the seat of Williston Seminary, an excellent school for young men. It has four churches, a public library, a fine town-hall, a fire department, and fifteen public schools. Pop. of East Hampton township, 3620.

East Hampton, a post-township of Suffolk co., N. Y. Pop. 2372. At the beach of East Hampton is very fine surf-bathing. The township is the easternmost part of Long Island.

East Han'over, a twp. of Dauphin co., Pa. P. 1723.

East Hanover, a post-township of Lebanon co., Pa. Pop. 1737.

East Hard'wick, a post-village of Hardwick township, Caledonia co., Vt., on the Portland and Ogdensburg R. R., 31 miles N. W. of St. Johnsbury. It has one weekly newspaper.

East Hart'ford, a post-township of Hartford co., Conn., on the Connecticut River opposite Hartford, with which it is connected by a bridge, and by the Hartford Providence and Fishkill R. R. Pop. 3007.

East Ha'ven, a post-township of New Haven co., Conn. It is on the Shore Line R. R. and on Long Island Sound, 4 miles E. of New Haven. Here is Saltonstall Lake, which affords large quantities of ice. Copper-smelting is largely carried on here. Pop. 2714.

East Haven, a post-township of Essex co., Vt. P. 191.

East Hat'ley (called also **Hatley** and **Charleston-Hatley**), a post-village of Hatley township, Stanstead co., Quebec, Canada, 2½ miles from Massawippi Station, is the seat of Charleston Academy, and has a large cheese-factory. Pop. about 300.

East Ha'verhill, a post-village of Haverhill township, Grafton co., N. H., on the Boston Concord and Montreal R. R., 5 miles E. of Haverhill. It has manufactures of lumber, charcoal, and starch. Here is the Owl's Head, a lofty cliff of rock. The village stands at the base of Moose Hillock Mountain.

East Hemp'field, a post-township of Lancaster co., Pa. It is on the Lancaster branch of the Reading and Columbia R. R. (Petersburg Station). Pop. 2602.

East Henriet'ta, a village of Henrietta township, Monroe co., N. Y., is the seat of Monroe Academy.

East Humboldt Mountains, a lofty range in Elko co., Nev., some of whose peaks exceed 15,000 feet in height. Secret Valley and Fremont Pass cut the range, which is in parts well timbered with pines and firs, affording lumber. Its snows feed the springs by which Lakes Franklin and Ruby are supplied. Silver is reported to exist in the mountains.

East Hunt'ingdon, a township of Westmoreland co., Pa. Pop. 2134.

East In'dia Com'pany, a famous joint-stock trading company formed in England to carry on commerce with the East Indies. In 1600 a royal charter was granted to a number of London merchants under the title of "The Governor and Company of Merchants of London trading to the East Indies." This charter gave them an exclusive right to trade for fifteen years within certain limits, which were of immense extent. They established factories at Surat, Cambay, and other places in India about 1612. The charter was renewed from time to time. Madras was founded in 1639, and Calcutta in 1645. In 1698 the king granted a charter to a rival company, but the two companies were united in 1702 under a new charter, with the title of "The United Company of Merchants trading to the East Indies." Every person who held £500 of the company's stock became a member of the court of proprietors, who annually chose a court of directors composed of twenty-four members, each of whom must own £2000 of the stock. The executive power of the company was vested in this court of directors, each of whom retained his office for four years.

In 1708, Parliament granted the company the exclusive privilege of trading to all places eastward of the Cape of Good Hope to the Strait of Magellan. The monopoly of the China trade was abolished in 1833, and the company was then deprived of its original character as a commercial association. Many years before this date the company had become a great territorial power, and had laid the foundation of the British empire in India. By conquest and other means the company obtained sovereign power over vast regions of Hindostan. This region was coveted by the company not only as a source of commercial profit, but as a field in which their relatives might enrich and distinguish themselves by political and military enterprises. By the act 3 and 4 William IV. the functions of the East India Company were rendered merely political. It was to continue to govern India, with the concurrence and under the supervision of the board of control. All the real and personal property belonging to the company on April 22, 1834, was vested in the Crown, and to be held or managed by the company in trust for the same; and the stockholders were to receive an annual dividend of 10½ per cent. on a capital of £6,000,000 out of the revenues of India. The Sepoy mutiny of 1857, which was repressed with a great expenditure of life and treasure, combined with other causes, induced Parliament to transfer the dominion of India to the Crown. This change was effected, after strenuous opposition from the company, in 1858. (See INDIA.) The political affairs of British India are now managed by a minister, who is styled secretary of state for India, and a council of fifteen members.

The Scottish East India Company was formed in 1695, but soon met a calamitous fate.

The Danish East India Company was first organized in 1618. It was dissolved in 1634 and reorganized in 1670. A new company was formed in 1686, and a fourth in 1731. The king purchased the rights of the company in 1777. The charter was renewed in 1792, but the company has long since ceased to exist.

The Dutch company was formed in 1595, and several companies of the kind were united into one in 1602.

The French company was established in 1664, and dissolved by Louis XV. in 1770. A new one was formed in 1785, and dissolved in 1790.

A Swedish company was formed in 1741, and reorganized in 1806.

The Ostend India Company was created in 1718. In 1721 all Dutchmen were prohibited from supporting it, on pain of death. The emperor Charles VI. dissolved it in 1731.

East In'dies [Fr. *Les Indes Orientales*], a collective term vaguely applied to Hindostan, Farther India, and the Malay Archipelago. (See INDIA.)

East Ir'ving, a village of Iowa township, Benton co., Ia. Pop. 84.

East Jaf'frey, a post-village of Jaffrey township, Cheshire co., N. H., on the Monadnock R. R., 10 miles N. of Winchendon, Mass. It has a national and a savings bank, three churches, and manufactures of wooden-ware, shoes, boxes, and cotton drillings.

East Kings'ton, a post-township of Rockingham co., N. H., on the Boston and Maine R. R. It has manufactures of shoes, etc. Pop. 553.

East Lackawan'nock, a township of Mercer co., Pa. Pop. 672.

East Lake, a township of Dare co., N. C. Pop. 251.

East'lake (Sir CHARLES LOCK), F. R. S., D. C. L., an English historical painter, born at Plymouth Nov. 17, 1793. He visited Italy in 1817, and passed about nine years in Rome (1820–29). In 1828 he exhibited an admired picture of "Pilgrims to Rome Coming in Sight of the Holy City." He was chosen a Royal Academician in 1830, and became president of the Royal Academy in 1850. Among his works are "Christ Weeping over Jerusalem" (1841), "Helena" (1849), "Violante" (1853), and "Beatrice" (1855). He was appointed director of the National Gallery in 1855, and wrote "Materials for a History of Oil Painting" (1847), "Contributions to the Literature of the Fine Arts," and other works. He translated Goethe's "Farbenlehre" and Kugler's "History of Painting." Died Dec. 23, 1865. A biography of Eastlake was published by Lady Eastlake (born Elizabeth Rigby) in the second series of the "Contributions to the Literature of the Fine Arts" (1870).

East Lam'peter, a tp. of Lancaster co., Pa. P. 2263.

East Lan'caster, a village of Berne township, Fairfield co., O. Pop. 566.

East'land, a county in N. Central Texas, has an area of 790 square miles. It is drained by the sources of Leon River. The eastern part is densely timbered with oak. A part of the county is rocky and hilly, but there are fine level plains which are fertile. Pop. 88.

Eastland, a village of Eastland co., Tex. Pop. 88.

East Lew'istown, a post-village of Beaver township, Mahoning co., O., 5 miles N. of Columbiana, which is on the Pittsburg Fort Wayne and Chicago R. R. Pop. 105.

East Liberty, a suburb of Pittsburg, Pa. (Allegheny co.), 5 miles E. of the city, on the Pennsylvania R. R., is the seat of the Western Pennsylvania Hospital, and has many fine residences.

East Lin'coln, a twp. of Logan co., Ill. Pop. 3397.

East Liv'ermore, a post-township of Androscoggin co., Me., on the Androscoggin R. R. and River, 71 miles N. of Portland. It has manufactures of lumber, condensed milk, clothing, carriages, needles, ploughs, etc. Pop. 1004.

East Liv'erpool, a post-village of Columbiana co., O., on the Ohio River and the Cleveland and Pittsburg R. R., 44 miles W. N. W. of Pittsburg; has potteries and manufactures of stone-ware, and two weekly newspapers. P. 2105.

East Lyme, post-tp. of New London co., Conn. P. 1506.

East Machi'as, a post-township of Washington co., Me., 4 miles N. of Machias Port. It has an academy, three churches, and extensive manufactures of lumber, carriages, etc. Pop. 2017.

East Maho'ning, a twp. of Indiana co., Pa. P. 1139.

East'man, a post-village, capital of Dodge co., Ga., on the Macon and Brunswick R. R., 56 miles S. S. E. of Macon. It has a fine court-house, presented to the county by Messrs. W. E. Dodge of New York and W. P. Eastman (from whom the county and town are respectively named), these gentlemen having large lumber and land interests in the county. It has a weekly newspaper. It was formerly called EARTMON.

East'man, a post-tp. of Crawford co., Wis. P. 1214.

Eastman (CHARLES GAMAGE), an American poet and journalist, born at Fryeburg, Me., June 1, 1816. He edited the "Spirit of the Age" and the "Vermont Patriot," which latter was published at Montpelier. He has also been connected with other journals and contributed much to periodical literature. In 1848 he produced a volume of poems.

Eastman (MARY HENDERSON) was born in Warrenton, Va., in 1818. Her father was Dr. Thomas Henderson, and in 1835 she married Captain Seth Eastman of the U. S. army, and long resided on the frontier. She has published many works illustrative of Indian character, among which are the following: "Dahcotah" (1849), "Romance of Indian Life" (1852), "Chicora" (1854), and also "Aunt Phillis's Cabin" (1852), a reply to "Uncle Tom's Cabin."

Eastman (PHILIP), LL.D., born in Chatham, N. H., Feb., 1799, graduated at Bowdoin College in 1820, became a lawyer, and practised at North Yarmouth, Harrison, and Saco, Me. Died Aug. 7, 1869. He was one of the editors of the "General Statutes of Maine" (1840), and published a "Digest" of Maine law reports (1849).

Eastman (SETH), an army officer, born in Brunswick, Me., Jan. 24, 1808, graduated at West Point in 1829. He entered the infantry, and was teacher of drawing at West Point (1833–40). He published a "Treatise on Topographical Drawing" (1837) and a "History, etc. of the Indian

Tribes" (1850–57). In 1863 retired with rank of lieutenant-colonel and brevet brigadier-general. D. Aug. 31, 1875.

East'mann, a township of Pulaski co., Ark. P. 1731.

East Marl'borough, a twp. of Chester co., Pa. P. 1401.

East Mauch Chunk, a post-borough of Carbon co., Pa., on the Lehigh River opposite Mauch Chunk, and on the Lehigh and Susquehanna R. R. Pop. 1585.

East Monroe, a post-village of Fairfield township, Highland co., O., on the Marietta and Cincinnati R. R. (Monroe Station). Pop. 163.

East Montpe'lier, a post-township of Washington co., Vt. It has manufactures of woollen goods and musical instruments, and produces much maple-sugar. Pop. 1130.

East Morrisa'nia, a village of New York City, has an academy and a convent of Ursuline nuns.

East Mor'row, a village of Salem township, Warren co., O., is a suburb of Morrow (which see). Pop. 262.

East Mount Ver'non, a village of East Chester township, Westchester co., N. Y. Pop. 500.

East Nant'meal, a twp. of Chester co., Pa. P. 920.

East Nas'sau, a post-village of Nassau township, Rensselaer co., N. Y. Pop. 192.

East Nel'son, a twp. of Moultrie co., Ill. Pop. 1021.

East New Mar'ket, a post-township of Dorchester co., Md. Pop. 2347.

East New York, a post-village of New Lots township, Kings co., N. Y., on the Brooklyn Central branch of the Long Island R. R., 6 miles S. E. of New York City. It has two weekly newspapers and manufactures of shoes, etc. It is connected with the Brooklyn ferries by horse-railroads.

East Norwe'gian, a twp. of Schuylkill co., Pa. P. 983.

East Not'tingham, a twp. of Chester co., Pa. P. 1400.

East Oak'land, a twp. of Coles co., Ill. Pop. 1500.

Eas'ton, a post-twp. of Fairfield co., Conn. P. 1288.

Easton, a post-twp. of Leavenworth co., Kan. P. 1169.

Easton, a post-village, capital of Talbot co., Md., is on Tred Haven Creek, a navigable branch of the Great Choptank River, 16 miles from Chesapeake Bay and 35 miles E. S. E. of Annapolis, and on the Maryland and Delaware R. R., 42 miles from Clayton, Del., in a fine peach-growing region. It has a good trade, a national bank, a building association, a peach-canning establishment, a fruit-drying house, and manufactures of lumber, sash, castings, and farming implements. It has six churches, an orphan asylum, gas-works, and a high school. It is the seat of a Protestant Episcopal bishop, and has the schools of the diocese of Easton. It has three weekly newspapers. Pop. 2110; of Easton district, 4637. Thomas K. Robson, Ed. "Star."

Easton, a post-township of Bristol co., Mass., on the Old Colony R. R., 18 miles from Boston, has a very extensive shovel-manufactory, a national and a savings bank, a free library, a weekly newspaper, and manufactures of boots, shoes, hinges, thread, etc. Pop. 3668.
D. S. Hasty, Ed. "Journal."

Easton, a post-township of Ionia co., Mich. P. 1401.

Easton, a post-village of Marion township, Buchanan co., Mo., on the Hannibal and St. Joseph R. R. Pop. 318.

Easton, a post-township of Washington co., N. Y. Pop. 3072. It is the seat of Marshall Seminary, and has important manufactures. Excellent limestone abounds.

Easton, a city, the capital of Northampton co., Pa., is situated at the confluence of the Delaware and Lehigh rivers, the scene of the famous treaty with the Five Nations, recorded as having taken place at the Forks of the Delaware. It is 75 miles from New York by the Central R. R. of New Jersey and the Morris and Essex R. R., and 60 miles from Philadelphia by the Belvidere Delaware R. R. The Lehigh Valley and the Lehigh and Susquehanna R. Rs. traverse the coal-regions and connect it with the North and West, and the unfinished Easton and Amboy R. R. will extend to New York Bay. Easton is the seat of Lafayette College, and has numerous churches, a fine opera-house, gas and water works, two national and two savings banks, three street railways, two daily and four weekly newspapers, etc. Its vicinity abounds in rolling-mills, furnaces, and other manufactories. Pop., exclusive of its extensive suburbs, 10,987. Cole & Morwitz, Pubs. "Argus."

Easton, a post-township of Adams co., Wis. Pop. 338.

Easton (Col. James), a Revolutionary officer, born at Hartford, Conn. He became a resident of Pittsfield, Mass., in 1763. He raised a Berkshire regiment in 1775, served at Ticonderoga, and in Canada under Montgomery, expending his whole fortune in the service. In 1776, after receiving the thanks of Congress, he was obliged by his enemy, Benedict Arnold, to leave the army, and died at Pittsfield, Mass., in poverty.

Easton (Nicholas), born about 1593, emigrated from Wales to Ipswich (Mass.) in 1634, and afterwards lived in Newbury, Mass., and Hampton, N. H. Having had trouble with the officials, he removed to Rhode Island in 1638, and built the first house in Newport. He was governor of the United Colonies (Rhode Island, Providence, etc.) 1650–52. Died Aug. 15, 1675.—His son, John Easton, was governor of Rhode Island (1690–95), and wrote a "Narrative of the Causes which led to Philip's Indian War," which was published in 1858.

East Or'ange, a pleasant post-township of Essex co., N. J., on the Morris and Essex R. R., 12 miles from New York. It has fine suburban residences. Pop. 4315.

East Ot'to, a post-township of Cattaraugus co., N. Y. It has four churches and five cheese-factories. Pop. 1164.

East Pal'estine, a post-village of Unity township, Columbiana co., O. (Palestine R. R. Station), on the Pittsburg Fort Wayne and Chicago R. R.

East Par'is, a village of Bourbon co., Ky. (See Paris.) Pop. 212.

East Pem'broke, a post-village of Pembroke and Batavia townships, Genesee co., N. Y., is the seat of an academy. Pop. 156.

East Penn, a township of Carbon co., Pa. Pop. 862.

East Penns'borough, a township of Cumberland co., Pa. Pop. 2719.

East Pikeland, a township of Chester co., Pa. P. 826.

East Pike Run, a twp. of Washington co., Pa. P. 817.

East Point, a post-village of Fulton co., Ga., 6 miles from Atlanta, at the junction of the Atlanta and West Point and the Macon and Western R. Rs.

East'port, a port of entry of Washington co., Me., is on Moose Island in Passamaquoddy Bay, at the extreme eastern point of the territory of the U. S. It has a good harbor, in which the tide rises twenty-five feet; also a national bank, seven churches, a savings bank, a fire insurance company, and a newspaper. Its prosperity is mostly derived from the lumber-trade and fisheries. It is a place of great natural beauty. Steamers ply to Boston, Portland, Calais, and St. John, N. B. Pop. of township, 3736.

Eastport, a village of Mill township, Tuscarawas co., O. Pop. 25.

Eastport, a village of Southampton township, Suffolk co., N. Y. Pop. 136.

East Port'land, a post-village of Multnomah co., Or. Pop. 830.

East Prov'idence, a twp. of Bedford co., Pa. P. 1274.

East Providence, a post-township of Providence co., R. I., on a branch of the Boston and Providence R. R., 4 miles E. of Providence. The township is traversed also by the Providence Warren and Bristol R. R., and is on the E. bank of Providence River. Pop. 2668.

East Ran'dolph, a post-village of Randolph township, Cattaraugus co., N. Y., contains several manufactories and has a weekly newspaper.

East River, a post-village of New Haven co., Conn., on the East River, a stream flowing into Long Island Sound, and on the Shore Line R. R., 18 miles E. of New Haven.

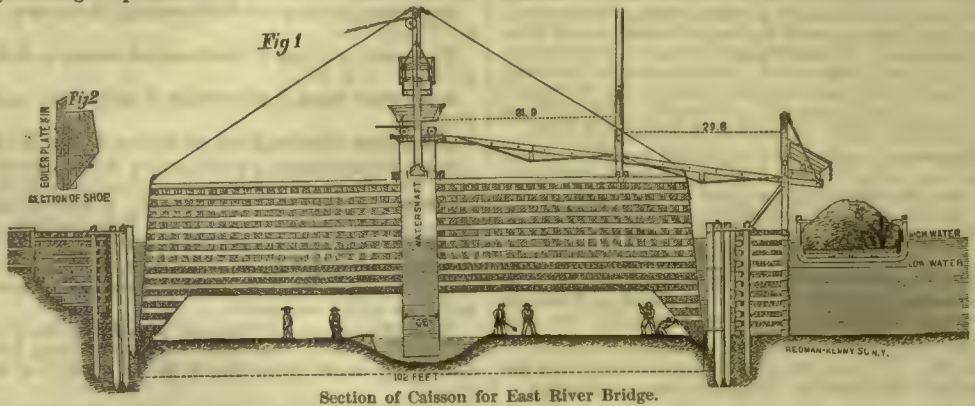
East Riv'er, of New York, is a strait connecting Long Island Sound with New York Bay, and separating the city of New York from Brooklyn, which is about three-fourths of a mile distant. It is nearly 20 miles long, and is navigable by large vessels. A bridge is now (1874) in course of construction across this strait at New York. About 7 miles from that city, on this strait, is a narrow and formerly dangerous pass called Hell Gate (which see), from which the obstructions are being removed. The East River is an important arm of New York harbor, and for miles its shores are lined with piers and slips for shipping. Its tides are higher and somewhat later than those which enter the harbor through the Narrows. Hence the phenomenon of double tides often observed in the North River.

East River, a township of Page co., Ia. Pop. 977.

East River, a twp. of Mercer co., W. Va. Pop. 1419.

East River Bridge, a structure now (1874) in process of construction over the East River, for the purpose of connecting the cities of New York and Brooklyn. Mr. John A. Roebling, of Trenton, N. J., was at first the chief engineer for its construction. He had already built two of the finest bridges of this kind in the world—that at Niagara Falls and that at Cincinnati, both of which will be far surpassed in dimensions by the East River suspension

bridge. Including its approaches, it will be over one mile long, and the bottom will be, in clear height, 130 feet over the channel of the river. Mr. Roebling was spared long enough to complete the plans for this colossal work, the execution of which is, since his death, entrusted to his son, Col. W. A. Roebling.



East River Bridge.

The bridge will have only two piers, situated on the shores, thus not in any way obstructing navigation. They are 1620 feet apart, and 280 feet in height—higher than the cross on the spire of Trinity church, the highest in New York. The base of these piers, at the water-line, is 134 feet long and 56 feet wide; their height, 130 feet below the floor and 150 above it, not including balustrade and ornamental blocks. In each pier are two arches for entrances to the bridge; each archway, being 32 feet wide, gives passage to a railroad-track, a carriage-way, and a sidewalk. These openings, or archways, are intended to be 120 feet high. The piers are built wholly of granite, and hollow; each will contain over 900,000 cubic feet of stone, and weigh over 70,000 tons. The bridge will weigh 3600 tons; its maximum transitory weight by crowds of people, railway-trains, carriages, and horses being 1400 tons, gives together 5000 tons. As the base of each pier is nearly 5000 square feet, there is a weight of about 17 tons per foot, which cannot be safely constructed without enlarging the foundation considerably. At the lower part of the foundation, therefore, the surface will be 17,000 square feet, reducing the pressure from 17 tons to a little over four tons per square foot, which is perfectly safe, especially in view of the considerable depth to which the foundation will be laid, the nature of the compact, gravelly sand on the Brooklyn side, and the rock which probably will be reached on the New York side.

The whole bridge will be supported by four cables, consisting of parallel steel wires, stretched in a bundle nearly one foot thick. These cables are anchored in solid walls, 1337 feet from the pier on the New York side, and 837 feet from the pier on the Brooklyn side. The real span of the suspension bridge, from anchor-wall to anchor-wall, is thus 1337 + 1620 + 837, or 3794 feet. The approaches beyond these points are of arched masonry, thrown, like the half-spans between anchorage and piers, over houses and streets.

Each of the four cables enters the anchor-walls through the masonry to a distance of twenty feet, where it connects with the anchor-chains, composed of ten links, each 12 feet or more in length, together measuring 130 feet, and forming a downward curve of a quarter of a circle, in order to convert a portion of the tension into downward pressure—a plan always followed in the anchorage of suspension bridges. The tension, or pull, of each of these four cables on the anchorage will be 5600 tons, which is only about one-tenth of the breaking strain of the structure.

Section of Caisson for East River Bridge.

The cables have, however, not to support the whole bridge. It is also secured by straight stays running from the top of each pier towards the bottom of the bridge, as seen in the engraving. Mr. Roebling asserts that the bridge would not fall even if the cables were removed, the stays being sufficient to hold it—only it would sag in the middle. The cables have, therefore, only to sustain a portion of the weight and to give stiffness to the bridge, so that it will not be swayed by heavy gales. A simple arrangement of the cables increases this stiffness against side pressure. The outside cables are much farther apart at the piers than the width of the bridge, and approach each other; while with the two middle cables the reverse is the case. They are near together at the piers, where they pass over the middle between the two arches, and widen towards the middle of the bridge.

The bridge will commence in New York City at the City Hall Park, at the foot of Chatham street. Slowly rising 3½ feet in 100, it will cross William street and Franklin Square, so high that no interruption of street travel will result. It will be supported by arches, girders, and trusses till it arrives at the anchorage of the chains, 90 feet above high tide, located in the block bounded by Cherry, Water, and Dover streets, where the suspension commences; and the whole structure runs over all the houses to the pier at the river-side, a distance of 1337 feet. Here the full sweep of the cables, passing over the top of the piers, 260 feet high, descends 130 feet below that point, and rises to the same height on the Brooklyn pier, to descend to the Brooklyn anchorage, situated in James street; and, beyond that, by an archway of masonry and trusses, to extend to the junction of Fulton and Sand streets, almost on a level with Brooklyn Heights.

Having thus given a general description of the bridge as a whole, we will proceed to the details of construction. The first step is, of course, the laying of the foundation for the piers. The labor on the Brooklyn pier was commenced Jan. 3, 1870, and was afterwards continued by means of dredging-machines, etc., preparatory to sinking the colossal caisson.

A caisson is literally a chest. Applied to bridge-building, the term signifies a wooden box or frame of strong timbers, used for laying the foundations of a bridge in situations where the coffer-dam cannot be employed. In the present instance there having been no suitable rock foundation found on the Brooklyn shore, the caisson itself was made part of the foundation, as we shall show. The system

adopted involves also the principle of the pneumatic pile, which is usually a tubular pile or cylinder of large dimensions forced down by atmospheric pressure. In this case, however, the atmospheric pressure was assisted by the continual excavation of material beneath the mass. In fact, there was also something of the diving bell in this apparatus.

The caisson proper, or chamber within which the work of excavation was carried on, was rectangular in shape, 168 feet long and 102 wide on the outside, and about 15 feet high. The sides were wedge-shaped in section, the lower edge being eight inches, and the upper eight feet three inches thick. The roof resting on these sides was five feet thick, leaving a working-chamber (the dimensions of roof and sides being allowed for) 166 by 98 feet in ground-area, and 9 feet in height. The whole was constructed of yellow-pine timbers a foot square; the seams were payed with a vegetable tar, to render them impervious to water; and between the outside layers of timber was a sheathing of tin between two of felt, intended to prevent air from leaking through. As the sharp lower edges were intended to facilitate the sinking of the caisson, they were made very strong. The first course of timber was oak; to this was bolted a cast-iron shoe, eight inches wide and oval on its face, being three inches thick in the centre. Around the shoe was placed an armor of boiler-iron, extending three feet above, on both sides of the wall, the whole being strengthened by heavy interior angle-irons. Especial pains were taken to prevent the corners at the bottom from "spreading" under the great pressure to which they were subjected. At each corner in the second course was inserted a knee of hard-wood timber, extending twenty feet each way. The timbers of the caisson were all bolted together vertically, horizontally, and diagonally, with 1¼-inch bolts, varying in length from two to seven feet. The bolts were, on an average, eighteen inches—none more than two feet eight inches—apart throughout the whole structure; and the heads and nuts were made air-tight by rubber washers.

As this huge frame was sunk to its desired position, thirty feet below low tide, additional courses of timber were laid on the top to the height of fifteen feet, and filled in with concrete; and when the whole mass had become fixed in its final resting-place, the tower was built on the solid foundation thus obtained.

Six shafts, lined with half-inch boiler-iron, passed through the roof of the caisson. The two outside ones were rectangular, and 6 feet 6 inches by 7 feet in size. These were the water-shafts, in which the water collecting in the caisson rose by the atmospheric pressure to the height of the tide outside. Next to these were the two man-shafts or supply-shafts, circular in form. Through these the workmen could pass and the earth be hoisted. The last pair were the air-shafts, also circular, and 42 inches in diameter. The shafts were made in couples, both for convenience and for safety. Through the air-shafts large air-pumps forced air into the caisson, expelling the water, and enabling the workmen to descend and work upon the bottom. The earth excavated was deposited around the square water-shafts; and a Cummings dredging-machine lifted the mud and dumped it into scows. Gas was introduced for lighting the caisson. The following figures will give some idea of the size and importance of this construction: Length of caisson, 168 feet; width, 102 feet; height, 15 feet; height, including superincumbent timber and concrete, 30 feet; timber in caisson, 1,500,000 feet (105,000 cubic feet); weight of caisson, 2500 to 3000 tons; wrought iron employed in bolts, angle-irons and plates, 100 tons; lumber in launching-frames and ways, 127,000 feet.—*Manuf. and Build.*, N. Y. (See BRIDGE, by GEN. J. G. BARNARD, *U. S. Army.*)

East Rush'ville, a village (Rushville P. O.) of Richland township, Fairfield co., O., on the Cleveland Columbus Cincinnati and Indianapolis R. R. Pop. 221.

East Sag'inaw, a city of Saginaw co., Mich., on the navigable Saginaw River, 17 miles from its mouth, and on the Flint and Père Marquette, the Jackson and Saginaw, the Saginaw and St. Clair, and the Saginaw Valley and St. Louis R. Rs. It is well laid out and substantially built, has Holly waterworks, two horse-railroads, and a good system of public schools. It has a large trade by lake and rail in lumber and salt, having seventeen saw-mills, capable of producing 135,000,000 feet of lumber per annum, and eleven salt-manufactories, which can produce nearly 200,000 barrels of salt in a year. The assessed valuation in 1873 was $3,304,663. In that year $1,000,000 were expended in erecting buildings, of which five alone cost $400,000. The surrounding country is very fertile, but manufacturing is the chief pursuit. It is a very thriving and enterprising town, the increase in population being some 40 per cent. per annum. It has the car-shops of the Flint and Père Marquette R. R., six large machine-shops, three national banks, a library association, eleven fine churches, two daily and three weekly newspapers, and is the base of supplies for a large lumber-region. It is nearly opposite the city of Saginaw. Pop. 11,350.

E. COWLES, ED. "COURIER."

East Salaman'ca, a post-village of Salamanca township, Cattaraugus co., N. Y., at the junction of the Erie and the Atlantic and Great Western R. Rs., 413 miles from New York. It has large repair-shops and manufactures of leather and lumber.

East Spring'field, a post-village of Springfield township, Otsego co., N. Y., is the seat of a seminary.

East Springfield, a post-village of Salem township, Jefferson co., O. Pop. 170.

East St. Lou'is, a post-village of St. Clair co., Ill., on the Mississippi River opposite St. Louis. It is the terminus of several railroads. It is the seat of a Roman Catholic college. Two weekly newspapers are issued here. Pop. 5644.

East Stough'ton, a thriving post-village of Stoughton township, Norfolk co., Mass., on the Old Colony R. R., 17 miles S. of Boston. It has extensive manufactures of boots.

East Strouds'burg, a post-village of Monroe co., Pa., on the Delaware Lackawanna and Western R. R., 1 mile N. of Stroudsburg, the county-seat. Stroudsburg R. R. Station is at this point.

East Taunton, Mass. See TAUNTON.

East Ta'was, a post-village of Iosco co., Mich., on Tawas Bay, Lake Huron, 2 miles E. of Tawas City, the county-seat.

East Tem'pleton, a post-village of Templeton township, Worcester co., Mass. It has manufactures of chairs.

East Tennessee University. In 1806 the U. S. ceded to the State of Tennessee certain public lands, upon condition that Tennessee should appropriate 100,000 acres of land for the use of two colleges, "one in East Tennessee and one in West Tennessee." In 1807 the State established East Tennessee College at Knoxville, as one of the beneficiaries of this endowment. The legislature, however, failed to fulfil its trust concerning the appropriated lands, and the college languished for many years. Blount College was incorporated in 1792, while Tennessee was yet the "Territory south of the river Ohio." By consent of its trustees its charter was annulled, and its small property transferred to East Tennessee College. In 1838 the legislature partially remunerated the college for the almost total loss of its original endowment by appropriating to it a half township of land in the "Ocoee District." With the fund derived from that source the college entered upon a period of comparative prosperity. In 1840 it obtained a university charter. Owing to several causes, the institution began to decline a few years later, and from 1850 until 1858 was in a very depressed condition. It then revived, but the war intervened, and from 1862 to 1866 it was entirely suspended. Its buildings were seriously injured by the U. S. army, which occupied them for nearly two years, and its cabinets, apparatus, and library were nearly or altogether destroyed.

In these circumstances, and with little available pecuniary means in the hands of the trustees, the prospect in 1866 was discouraging. To add to the difficulties of the situation, education in the State, especially because of its long interruption by the war, had fallen into an extremely low condition, and but few youth could be found able and willing to enter college classes. Notwithstanding, the college was reopened, and the work of instruction began with a crude mass of pupils in the preparatory department. At length higher classes were formed, and in 1871, 1872, and 1873 students were graduated. In 1869 the legislature appropriated to East Tennessee University the proceeds of the land script received by the State from the U. S. under the law of Congress approved July 2, 1862, for the maintenance of a college. The trustees accepted the trust with its conditions, and proceeded to establish the Tennessee Agricultural College, in which three courses of study are provided. Each succeeding year it increases in usefulness. The number of students entered in 1872–73 was 271, of whom 187 were appointed by the State.

The names of the presidents of East Tennessee College (now University) from its foundation are as follows, viz.: Rev. Samuel Carrick, A. M., from 1808 to 1809; Rev. David Sherman, A. M., from 1820 to 1825; Rev. Charles Coffin, D. D., from 1827 to 1832; James H. Piper, A. M., from 1833 to 1834; Joseph Estabrook, A. M., from 1834 to 1850; Hon. Wm. B. Reese, LL.D., from 1850 to 1853; Rev. George Cooke, A. M., from 1853 to 1857; Rev. Wm. D. Carnes, A. M., from 1858 to 1860; Rev. Joseph I. Ridley, D. D., from 1860 to 1862; Rev. Thomas W. Humes, S. T. D., from 1865 to ——.

T. O. SUMMERS.

East Toledo, O. See TOLEDO.

East'town, a township of Chester co., Pa. Pop. 736.

East Troy, a post-township of Walworth co., Wis. Pop. 1431.

East U'nion, a village of Stock township, Noble co., O. Pop. 857.

East Union, a post-township of Wayne co., O. Pop. 1865.

East Union, a township of Schuylkill co., Pa. Pop. 614.

East'ville, a post-village, capital of Northampton co., Va., is on a narrow peninsula, "the Eastern Shore," between the Atlantic Ocean and Chesapeake Bay, about 4 miles E. of the latter and 180 miles by water E. of Richmond. Pop. of Eastville township, 3395.

East Vin'cent, a post-township of Chester co., Pa. Pop. 1961.

East Wa'co, a village of McLennan co., Tex. P. 612.

East Wa'terloo, a township of Black Hawk co., Ia. Pop. 913.

East Wal'lingford, a post village of Wallingford township, Rutland co., Vt., on the Central Vermont R. R. (Rutland division), 13 miles S. S. E. of Rutland. (See WALLINGFORD.)

East Wey'mouth, a post-village of Weymouth township, Norfolk co., Mass., on the South Shore R. R., 14½ miles S. of Boston. It has important manufactures of boots, nails, etc. (See WEYMOUTH.)

East Wheat'field, a township of Indiana co., Pa. Pop. 1104.

East Whiteland, a township of Chester co., Pa. Pop. 1222.

East'wick (EDWARD B.), an English Orientalist, born in 1814, entered the service of the East India Company, became in 1845 professor of Hindostanee and Teloogoo, and 1850 librarian at the college of the company in Haileybury. He published a "Vocabulary of the Sindhi Language" (1843), a "Grammar of the Hindoostanee Language" (1847), Sadi's "Gulistan" and a translation of it (1850), and several Indian works.

East Wil'ton, a post-village of Wilton township, Franklin co., Me., near the Androscoggin R. R., 5 miles S. of Farmington. It has manufactures of scythes, pegs, lumber, and other goods. (See WILTON.)

East Wind'sor, a post-township of Hartford co., Conn. Pop. 2882.

East Windsor, a township of Mercer co., N. J. Pop. 2383.

Eat'on, a county in S. Central Michigan. Area, 576 square miles. It is intersected by Grand River, and also drained by Battle Creek. The surface is undulating; the soil is fertile and deep. Lumber, cattle, grain, wool, potatoes, hay, and butter are produced. It is traversed by the Grand River Valley R. R. and the Peninsular R. R. Capital, Charlotte. Pop. 25,171.

Eaton, a township of Aroostook co., Me. Pop. 522.

Eaton, a post-township of Eaton co., Mich. Pop. 2035.

Eaton, a post-township of Carroll co., N. H. Pop. 657.

Eaton, a post-township of Madison co., N. Y., contains Morrisville, the county-seat, and several canal reservoirs. Eaton Village has the county poor-house, a bank, a tannery, a distillery, a woollen-mill, a forge, and other manufacturing interests. Pop. of township, 3690.

Eaton, a township of Lorain co., O. Pop. 1052.

Eaton, a post-village, capital of Preble co., O., on Seven-Mile Creek and the Cincinnati Richmond and Chicago R. R., 53 miles N. of Cincinnati. It has one national and one independent bank, three newspapers, five churches, two school-houses, one grist-mill, three saw-mills, several stores, two machine-shops, one school-seat factory, three benevolent societies, and is surrounded by a fine farming country. Pop. 1748.

W. F. ALBRIGHT & CO., PUBS. OF "REGISTER."

Eaton, a post-township of Wyoming co., Pa. Pop. 830.

Eaton, a township of Brown co., Wis. Pop. 358.

Eaton, a township of Clarke co., Wis. Pop. 316.

Eaton, a post-township of Manitowoc co., Wis. Pop. 1468.

Eaton, a township of Monroe co., Wis. Pop. 392.

Eaton (AMOS), an American botanist, born in Chatham, N. Y., in 1776, graduated at Williams College in 1799. He studied law and was admitted to the bar. In 1828 he became principal and senior professor of Rensselaer Institute at Troy. He published, besides other works, a "Manual of the Botany of North America" (1833; 7th ed. 1836). Died May 6, 1842.

Eaton (AMOS B.), an American officer, born in 1806 in New York, graduated at West Point in 1826, and June 29, 1864, commissary-general of subsistence U. S. A., rank of brigadier-general. He served as infantry officer, chiefly on the Northern frontier, till July 7, 1838, when he was transferred to the subsistence department, and served as commissary in the Florida war 1837–41, during Canada border disturbances, and in New York City 1841–46; as chief commissariat of Major-General Taylor's army in Mexico 1847–48, engaged at Buena Vista (brevet major), of the department of the Pacific 1851–55, and at New York City 1855–61. In the civil war was dépôt commissary at New York City, and purchasing commissary for the armies in the field 1861–64; and was in charge of the commissary bureau at Washington, D. C., 1864–74. (Brevet major-general U. S. A. for faithful, meritorious, and distinguished services.) Retired May, 1874.

GEORGE W. CULLUM, *U. S. Army.*

Eaton (DANIEL CADY), an American botanist, was born at Fort Gratiot, Mich., Sept. 12, 1834, graduated at Yale in 1857, and at Lawrence Scientific School (Harvard) in 1860. He became professor of botany at Yale in 1864. He is the author of that part of Chapman's "Flora of the Southern States" (1860) which treats of the Ferns, and the corresponding part of "Gray's Manual" (5th ed. 1867), and has published various scientific papers.—His cousin, DANIEL CADY EATON, is professor of the history and criticism of art in Yale College.

Eaton (GEORGE W.), D. D., LL.D., an American scholar and Baptist minister, was born at Henderson, Huntingdon co., Pa., July 3, 1804, and was educated at Ohio University and Union College, Schenectady, N.Y.; he was a fellow and tutor in Union College (1829–30), professor of ancient languages in Georgetown College, Ky. (1831–33), professor of mathematics and natural philosophy (1833–37) and ecclesiastical and civil history (1837–50) at the Literary and Theological Institution, Hamilton, N. Y., and professor of systematic theology at the same place (1850–61), president of Madison University (1856–68), president of Hamilton Theological Seminary and professor of homiletics (1861–71). Died Aug. 3, 1872.

Eaton (HORACE), M. D., was born at Barnard, Vt., June 22, 1804, graduated at Middlebury in 1825, graduated in medicine in 1828, was professor of chemistry and natural philosophy at Middlebury College (1848–54), and governor of Vermont (1846–48). Died July 4, 1855.

Eaton (JOHN, JR.), PH. D., an American educator, born Dec. 5, 1829, at Sutton, N. H., graduated at Dartmouth in 1854, was superintendent of public schools, Toledo, O. (1856–59), studied theology at Andover (Mass.) Theological Seminary (1859–61), ordained by the Maumee (O.) Presbytery (1861), commissioned chaplain of the Twenty-seventh Ohio Volunteers (Aug. 15, 1861), appointed superintendent of contrabands (Nov. 14, 1862) by General Grant, general superintendent of freedmen for Mississippi, Arkansas, West Tennessee, and North Louisiana (Dec. 15, 1862), and served as such till May 27, 1865, commissioned colonel of the Sixty-third U. S. colored troops (Oct. 2, 1863), brevetted brigadier-general of volunteers (Mar. 13, 1865), assistant commissioner of the bureau of refugees, freedmen, and abandoned lands (May 27, 1865), established and edited the "Daily Post" at Memphis, Tenn. (1866–70), State superintendent of public instruction for Tennessee (1867–69), secretary of the board of visitors to the West Point Military Academy (1869), and was appointed U. S. commissioner of education (Mar. 17, 1870), which position he still occupies. He has published many addresses and reports, chiefly upon education and the public affairs with which he has been connected.

Eaton (JOHN HENRY), politician, was born in Tennessee about 1790, and represented that State in the U. S. Senate (1818–29), was secretary of war under his friend Gen. Jackson (1821–31), governor of Florida Territory (1834–36), and U. S. minister to Spain (1836–40). He published a "Life of Jackson" (1824). Died Nov. 17, 1856.

Eaton (Gov. THEOPHILUS) was born in Stony Stratford, England, about 1591, and was the son of a clergyman. He was for a time English agent at the Danish court, and afterwards was a reputable merchant of London. He came to Massachusetts in 1637, and was chosen a magistrate. He went to New Haven in 1638, and was the first governor of the New Haven colony (1638–57). Died Jan. 7, 1658.

Eaton (WILLIAM), GENERAL, an American officer, born at Woodstock, Conn., Feb. 23, 1764, was educated at Dartmouth College, and entered the army in 1792. He became consul at Tunis in 1799, and displayed courage and enterprise in a successful expedition which he conducted against Derne. He was about to attack Tripoli, when his opera-

tions were suspended by a treaty of peace between the U. S. and Tripoli in 1805. The Massachusetts legislature granted him 10,000 acres of land in Maine as a reward for his valor. Died June 1, 1811.

Ea'ton Cor'ner, a post-village of Eaton township, Compton co., Quebec, Canada, is the seat of an academy. Pop. about 200.

Eat'on Rap'ids, a post-village of Eaton co., Mich., on Grand River and the Grand River Valley R. R., 24 miles N. N. W. of Jackson. It is noted for its mineral magnetic springs, which are visited annually by thousands, and has one weekly newspaper. Pop. 1221; of Eaton Rapids township, 3636.

Eat'onton, a post-village, capital of Putnam co., Ga., on a branch of the Central Georgia R. R., 21 miles N. N. W. of Milledgeville, has one weekly newspaper. Pop. 1240.

Eat'ontown, a post-village of Monmouth co., N. J., on the New Jersey Southern R. R., 4 miles S. of Long Branch.

Eau Claire, ō klair', a county in the W. of Wisconsin. Area, 648 square miles. It is partly drained by the Eau Claire River, an affluent of the Chippewa, which flows through the north-western part of the county. The soil is mostly fertile. Grain, wool, and lumber are produced. It is intersected by the West Wisconsin R. R. Pop. 10,769. Capital, Eau Claire.

Eau Claire, a city, capital of Eau Claire co., Wis., at the junction of Eau Claire and Chippewa rivers, and on the West Wisconsin R. R. and head of navigation on Chippewa River, has a national bank, a bank of deposit, one daily and two weekly newspapers in English, and one in German, two foundries, thirteen saw-mills, three planing-mills, four grist-mills, three graded schools and one common school, a Wesleyan seminary, two parks, six hotels, ten churches, carriage and railroad bridge over the Chippewa, two carriage and railroad bridges over the Eau Claire, and a large number of stores and wagon and boiler shops. The principal business is lumbering, over 150,000,000 feet being manufactured in the vicinity yearly, and over 250,000 feet in the city and its immediate vicinity. It is the chief commercial city of N. W. Wisconsin. The improvements during the past four years in the city have cost $1,694,000. Pop. in 1870, 1476.

Brackett & Hunner, Props. "Daily Free Press."

Eau Claire City, a village of Eau Claire co., Wis., is near the Chippewa River, 1 or 2 miles W. of Eau Claire, the county-town. It has many steam saw-mills and an active trade in lumber. Pop. 2293.

Eau de Cologne, ō deh ko-lōn' (Fr. pron. ō deh ko'-loñ'), or **Cologne Water,** a celebrated liquid perfume invented by Farina of Cologne, where large quantities of it are prepared. It is also made in France and almost all other countries. The following recipe affords a good imitation of the original article: Take of alcohol 1 pint; of the oils of bergamot, orange peel, and rosemary, each 1 drachm; of bruised cardamom seeds, 1 drachm; orange-flower water, 1 pint: distil one pint from a water-bath.

The secret of the composition of true cologne has been carefully preserved by the Farina family, and the different business-houses of Cologne bearing the name of Farina prepare perfumes which are by no means identical in odor. One of the family is reported to have published in 1863 the following as the formula for genuine eau de cologne: Take of oil of lavender 4 ounces; purified benzoin, oil of rosemary, each 2 ounces; strong alcohol, 9 gallons: dissolve the oil and benzoin in the alcohol, and to the solution add successively oil of neroli, oil of young orange (*huile des petits grains*), oil of lemon, each 10.4 ounces; oil of sweet orange, oil of lime-peel, oil of bergamot, each 20.8 ounces; tincture of rose-geranium flowers, a sufficient quantity. Macerate for several weeks, and then bottle the mixture. There are hundreds of recipes, many of which are vouched for as the genuine, but all, no matter how complicated the formula, are simply aromatized alcohol. It is essential that the alcohol be perfectly deodorized and freed from fusel oil before use.

There is a class of cologne-water obtained by macerating aromatic substances in alcohol for some time, and then distilling the whole. But these waters require to be allowed a few months of rest to develop their better qualities. It is probable that the original article was of this class. Good colognes have a rich and permanent odor, not clearly alcoholic. Not one of the essential oils employed should be recognizable by the sense of smell. The best brands have long borne the name of Jean Maria Farina, and there are many claimants to the original proprietorship of the name. In Cologne all children who can lawfully bear that name are promptly baptized with it.

Eau de Javelle, or **Javelle's Solution,** a chlorinated solution of potash, analogous to Labarraque's solution of soda. It has bleaching and disinfecting properties, and is employed in removing fruit-stains, etc. from linen. When swallowed in considerable quantity it has remarkably poisonous effects.

Eau de Luce (*Aqua lucis*), a soapy liniment made of ammonia-water mixed with tincture of oil of amber, mastic, and sometimes Mecca balsam. It is employed in Europe and the East as a remedy for the bites of snakes and insects.

Eau de Vie, the French for Brandy (which see).

Eau Galle, a post-township of Dunn co., Wis. P. 978.

Eau Galle, a township of St. Croix co., Wis. P. 535.

Eau Pleine, a post-twp of Portage co., Wis. P. 333.

Eaux Bonnes, ō bon (*i. e.* "good waters"), a fashionable resort of France, department of Basses Pyrénées, 22 miles S. of Pau. Here are warm sulphur-springs, which are efficacious for affections of the lungs and chest, the skin, etc.

Eaux Chaudes, Les, lāz ō shōd, a village of France, 2 or 3 miles S. W. of Eaux Bonnes, has warm medicinal springs. The waters have a wide range of usefulness in the diseases of the lungs, joints, and skin.

Eaux Vives, a town of Switzerland, canton of Geneva, near the city of Geneva. Pop. in 1870, 5875.

Eaves [Ang.-Sax. *efese*, "brim," "brink," "eaves"], in architecture, the lowest edges of the inclined sides of a roof, which project beyond the face of the wall, so as to throw off the water from the roof. The eaves are sometimes provided with a gutter and a downpipe, or they discharge the water directly on the ground.

Ebal. See Gerizim.

Eb'bert (Isaac), D. D., a minister of the Methodist Episcopal Church South, born at Ellicott's Mills, Md., Mar. 2, 1817. He graduated at Augusta College, and joined the Ohio Conference in 1840. At the division of the Church he joined the Kentucky Conference, the Memphis Conference in 1858, and in 1870 the Little Rock Conference. He died in Paducah, Ky., in 1872. T. O. Summers.

E'bel (Hermann Wilhelm), one of the most prominent writers on Celtic language and literature, born in 1820, became in 1858 professor at the gymnasium in Schneidemühl. He published, among other works, a new edition of Zeuss's "Grammatica Celtica" (1871), and many essays in the "Zeitschrift für vergleichende Sprachforschung," and in Kuhn's and Schleicher's "Beiträge zur vergleichenden Sprachforschung," some of which have been translated into English under the title "Celtic Studies" (1863).

Ebe'lians [called in Germany, *Mucker*, "hypocrites"], a sect of religionists, taking their name from Johann Wilhelm Ebel (1784–1861), one of their founders. Ebel, a preacher of Königsberg, was a follower of Schönherr the theosophist. Teaching the doctrine that the relation of the sexes is a symbol of the relation between the spiritual and material principles, he was joined by many even of the upper classes, and his followers are accused of making this doctrine a pretext for immorality.

Ebena'ceæ [from the Lat. *eb'enus*, the "ebon tree" (see Ebony)], a natural order of exogenous plants (trees or shrubs), mostly natives of tropical countries. They are allied to Oleaceæ and to Aquifoliaceæ. They have alternate entire leaves and axillary flowers, which are monopetalous and usually unisexual. Some species of this order are remarkable for the hardness and blackness of their wood, as the ebony. This order comprises the American persimmon (*Diospyros Virginiana*) and the Chinese kaki, the fruit of which is edible, like that of many other species. There are eight or ten genera and numerous species, of which a large majority are tropical.

Ebene'zer, a post-village of West Seneca township, Erie co., N. Y. Pop. 449.

Ebenezer, a township of York co., S. C. Pop. 2157.

Eb'ensburg, a post-borough, capital of Cambria co., Pa., is on the Ebensburg and Cresson branch of the Central R. R., 26 miles W. of Altoona. It has two weekly newspapers and one monthly publication. Pop. 1240.

E'ber [Lat. *Eb'rus*], (Paul), a German Protestant theologian, born at Ritzingen Nov. 8, 1511. He became professor of Hebrew at Wittenberg in 1556. Among his works are an "Exposition of the Gospels" and a "History of the Jews" (1561). He was a friend of Melanchthon. Died Dec. 10, 1569.

Eb'erhard (Johann August), D. D., a German philosopher, born at Halberstadt Aug. 31, 1739, studied theology at Halle. He gained distinction as an elegant writer, and became professor of philosophy at Halle in 1778. He was a rationalist in theology, and an adversary of Kant in philosophy. Among his best works are an "Apology for Socrates" (1772), a "Theory of the Fine Arts and Sci-

ences" (1783), a "General History of Philosophy" (1788), and an excellent "Dictionary of German Synonyms" (6 vols., 1793–1802). Died Jan. 6, 1809.

Eberhard (KONRAD), a German sculptor and painter, born in Bavaria Nov. 25, 1768. He became professor of sculpture in the Academy of Munich in 1816. Among his works are statues of St. George and St. Michael. His best works are in Munich. Died Mar. 12, 1859.

Eberhard im Bart, the first duke of Würtemberg, born in 1445, became count of Würtemberg when only fourteen years old, and led a wild and dissipated life, but reformed after a voyage to Palestine, and became one of the most popular princes of Germany. Having consolidated his part of Würtemberg with that of his cousin, the emperor created him in 1495, in consequence of his services to the empire, duke of Würtemberg. Died in 1496. (See PFISTER, "Eberhard im Bart, erster Herzog in Würtemberg," 1822.)

Eb'erle (JOHN), M.D., an American medical writer, born in Hagerstown, Md., Dec. 10, 1787. He was professor in Jefferson Medical College, Philadelphia, and other medical colleges, and published a "Treatise on Therapeutics" and other works. Died at Lexington, Ky., Feb. 2, 1838.

E'berling (CHRISTOPH DANIEL), a German scholar and writer, born at Hildesheim Nov. 20, 1741. He devoted himself chiefly to geographical studies, and for his great work, "Geography and History of North America" (Hamburg, 5 vols., 1793–99), he was thanked by the Congress of the U. S. His valuable collection of books and maps relating to this subject was purchased in 1818 by Israel Thorndike, and presented to Harvard College. Died June 30, 1817.

E'bernburg, a small town of Bavaria, on the river Nahe, 20 miles S. W. of Mentz. Here is an old ruined castle which belonged to Franz von Sickingen, and was used as a place of refuge by Melanchthon and other Reformers.

E'bers (GEORG MORITZ), an eminent Orientalist, born in 1837, lectured since 1865 in Jena on the language, history, and monuments of ancient Egypt, and became in 1870 professor of Egyptian archæology in Leipsic. His chief work is a "Commentary on the Books of Moses" ("Die Bücher Moses. Sachlicher Commentar zu Genesis und Exodus," vol. i., 1868). He also published a novel, "The Daughter of an Egyptian King" (3d ed. 1873), which was translated into English, both in London and in the U. S.; an essay in Virchow and Von Holtzendorf's collection, "Hieroglyphisches Schriftsystem" (1871), and "Through Goshen to Sinai," an account of his travels in Palestine (1872). In this work he agrees with Lepsius, and differs with Robinson, in making Serbal the mountain of the Law.

E'bert (FRIEDRICH ADOLPH), a German bibliographer, born near Leipsic July 9, 1791. He became chief librarian of the royal library at Dresden in 1828. He published, besides other works, a "Universal Bibliographic Dictionary" (2 vols., 1821–30). Died Nov. 13, 1834.

Ebert (JOHANN ARNOLD), a German poet, born at Hamburg in 1723. He translated Young's "Night Thoughts" into German, and wrote several original poems. Died Mar. 19, 1795.

Eberus. See EBER.

E'bingen, a town of Würtemberg, 39 miles S. W. of Stuttgart, has large velvet, hat, and shoe factories. Pop. in 1871, 5029.

E'bionites [Heb. *ebion*, "poor"], a name given at first to all Christians, on account of their poverty; then given by Gentile Christians to Jewish Christians; and finally restricted to heretical Jewish Christians. Irenæus (between 182–188 A. D.) is the first to mention the Ebionites by name, though they are thought to be the "heretics" spoken of by Hegesippus some years earlier. The Pharisaic Ebionites rejected the writings of Paul, insisted upon the observance of the Mosaic ritual, and were humanitarians and millenarians. The Essenic Ebionites were more speculative and ascetic. Ebionism dates, according to Gieseler, from about 107 A. D., and in the fifth century had wholly disappeared.

Eblana. See DUBLIN.

E'boli, or **Evoli** (anc. *Eburi*), a town of Italy, province of Salerno, about 16 miles E. S. E. of Salerno. It has an annual fair. Pop. in 1861, 6946.

Eb'oli (AÑA DE MENDOZA), PRINCESS OF, a Spanish lady, born in 1535, became the wife of the prince of Eboli. She was a mistress of Philip II. of Spain, and was accused of complicity in the assassination of Escovedo. Schiller has idealized her character in his "Don Carlos."

Eb'onite [named from its resemblance to ebony], a hard black compound obtained by blending caoutchouc with variable proportions of sulphur, generally about half its weight. It is called vulcanite in the U. S.

Eb'ony [Lat. *eb'enum;* Fr. *ébène*], a very hard, heavy wood of a deep black color, is the duramen or heart-wood of several species of *Diospy'ros*, a tree of the natural order Ebenaceæ. It is heavier than water, takes a good polish, and emits an aromatic odor when burned. Ebony of excellent quality is obtained from the *Diospy'ros eb'enum*, which abounds in Ceylon and attains a large size. The ebony which comes from Mauritius and Madagascar is the produce of the *Diospy'ros reticula'ta*. Another species of *Diospyros* produces the beautiful wood called CALAMANDER (which see). Ebony is also obtained from the *Diospyros tomento'sa*, which grows in India. This wood is mentioned by Virgil as coming from India: "Sola India nigrum fert ebenum." (*Georgics*, book ii. 116.) It is used by cabinet-makers. Ebony is produced in Texas, Mexico, and California from the japote or persimmon (*Diospyros Texana*).

Eboulemens, a post-village of Charlevoix co., Quebec, Canada, on the N. shore of the St. Lawrence River, 69 miles below Quebec. Pop. about 2400.

E'brard (JOHANN HEINRICH AUGUST), a German Protestant theologian, born at Erlangen Jan. 18, 1818. He obtained the chair of theology at Erlangen in 1847, became in 1853 consistorial councillor in Spires, and resigned in 1861. He is a prominent representative of the orthodox school. Among his works are "Christian Dogmatics" (2 vols., 1852), "The Divine and Human in Christianity" (1844), and a "Manual of the History of the Christian Church and Doctrines" (4 vols., 1864–66).

E'bro [anc. *Ibe'rus;* Fr. *Èbre*], a river of Spain, rises in the Cantabrian Mountains near the northern boundary of the province of Burgos. It flows nearly south-eastward through the provinces of Navarre and Saragossa, forms the boundary between Huesca and Teruel, and enters the Mediterranean 22 miles E. of Tortosa. The chief towns on its banks are Logroño, Tudela, Saragossa, and Tortosa. Its whole length is about 350 miles. Its navigation is rendered difficult by rapids and rocks. A canal nearly 100 miles long has been cut along the Ebro below Tudela.

Ebul'lioscope [from the Lat. *ebul'lio*, to "boil," to "bubble," and the Gr. *σκοπέω*, to "see"], an instrument for ascertaining the strength of alcohol or other distilled liquids by observing the boiling-point and the barometrical pressure at the time of the experiment. These instruments are of various kinds; those of Vidal and of Conatty are the best known.

Ebulli'tion [from the Lat. *ebullio*, to "boil"], boiling; the violent agitation into which liquids are thrown by the rapid escape of their vapor when sufficiently heated. Before ebullition begins, if sufficient heat is applied, the temperature of the liquid continually rises; but when the liquid reaches the "boiling-point"—the point at which ebullition is seen—the temperature is constant. Ebullition is caused by the rapid escape of vapor. (See BOILING-POINT.)

Eburi. See EBOLI.

Eburovices. See IVIÇA.

Ecbat'ana, or **Agbatana** [Fr. *Ecbatane*], a celebrated ancient city, the capital of Media, was situated near the base of Mount Orontes (*Elwend*), about 165 miles S. W. of Teheran. Its foundation is attributed by tradition to Semiramis, but according to Herodotus it was founded by Deïoces (708 B. C.). It stood on a conical hill, and was surrounded by seven concentric walls, each of which was higher than the next outer one. It was the favorite summer residence of the kings of Media and Persia, who had here a magnificent palace and a citadel of immense strength. Alexander the Great captured it in 331 B. C., and obtained a very large booty. This city is called *Achmetha* in the book of Ezra. Some recent writers believe it to be the modern HAMADÂN (which see). Rawlinson attempts to identify it with the ruined *Takht-i-Soleimân*.

Eccaleo'bion [from the Gr. *ἐκκαλέω βίον*, "I call out life"], a mechanical contrivance for hatching eggs by artificial heat. It consists of an oven with shelves, on which the eggs are placed, ranged one above the other. The temperature is kept of uniform warmth by steam or hot water conveyed in pipes. A somewhat similar machine has long been employed in Egypt with success.

Ec'ce Ho'mo [Lat., meaning "Behold the Man!"], the words uttered by Pilate (John xix. 5) when he brought Jesus forth to the people. Monkish tradition points out the spot, now marked by an arch called *Ecce Homo*, only the piers of which appear to be ancient. It spans the *Via Dolorosa* at its highest point, and has "a narrow gallery or chamber on the top." "Ecce Homo" is the name given to pictures of Christ crowned with thorns. Correggio's, in the National Gallery, London, is generally considered the best.

In 1864, Prof. Seeley, then of London, now of Cambridge, England, published a book entitled "Ecce Homo," which made a great stir.

Eccen'tric [from the Gr. *ἐκ*, "out of," and *κέντρον* (Lat. *cen'trum*), a "point," a "centre"], in machinery, a device by which circular motion gives rise to "to-and-fro" motion. In one of the forms of the eccentric a disk is made to revolve around a point not in its centre. The disk turns in a metallic collar, which is thrown back and forth by the revolutions, and to the collar a rod is attached which receives the required to-and-fro motion. This arrangement is often used to give motion to sliding valves in steam-engines.

Ecchelensis. See ECHELLENSIS.

Ec'cles (HENRY), Q. C., a Canadian barrister, born at Bath, England, in 1817, was educated by his father, an accomplished army officer, long resident in Canada. He was called to the bar in 1842, became queen's counsel in 1856, and attained the highest rank in his profession. Died at Toronto Nov. 22, 1863.

Ec'clesfield, a parish of England, in the West Riding of Yorkshire, 5 miles N. of Sheffield. It has manufactures of cutlery, linen, and nails. Coal mines are worked in the vicinity.

Eccle'sia [Gr. *ἐκκλησία*, an "assembly," from *ἐκ*, "out," and *καλέω*, to "call"], the Latin name for CHURCH (which see).

Ecclesia [for etymology see above], the great assembly of the Athenians, in which every free citizen might vote. Although possessing supreme authority in the state from a very remote period, it was after a time seldom convened, so that the management of the state fell into the hands of the archons, who were elected from the nobles. Solon afterwards appointed it to meet four times every thirty-five days, besides extraordinary occasions on which it might be assembled. The subjects discussed in the ecclesia were restricted by Solon to such as had passed through the senate of five hundred, but this rule was not strictly observed. The magistrates who managed these assemblies were the prytanes, probedri, and epistates; the first convened the people, the second proposed the subjects on which they were to decide, the third presided over the whole. The name ecclesia was afterwards given generally to any public assembly regularly convoked.

Ecclesias'tes [Septuagint Gr. *Ἐκκλησιαστής*, the "preacher," from *ἐκκλησία*, an "assembly;" Hebrew *Koheleth*, a noun feminine in form, meaning "preacher" or "gatherer"], a canonical book of the Old Testament. Its author is called "Koheleth" (*i. e.* the "preacher"), and he is described as king in Jerusalem and son of David—*i. e.* Solomon. Since the time of Grotius (1644) the Solomonic origin of the book has been denied by continental critics generally, even by orthodox writers like Hengstenberg, Keil, and Delitzsch, the dates assigned ranging from 536 to 150 B. C. Its post-Solomonic origin has been argued (1) from the Aramaic and other foreign words which occur in it; (2) from the sentiments expressed. On the other hand, the old traditional ascription of the book to Solomon has been defended by such scholars as Schelling, Van Essen, Hahn, Pusey, Wordsworth, and Tayler Lewis. The two leading ideas of the Preacher are the vanity of earthly good and the certainty of judgment. The alleged epicureanism of several passages, so much emphasized by some critics, is thought by others to be simply ironical.

Ecclesias'tical Commissioners, in England and Wales, are the archbishops, bishops, the principal deans, several of the principal judges, the chief baron of the exchequer, the master of the rolls, and twelve lay members, all churchmen, who are appointed for the purpose of examining the state of dioceses and the episcopal revenues, of uniting or dividing parishes (when expedient), and of carrying out other measures for the benefit of the Established Church. Much popular indignation has been excited by their large expenditures of money in renewing and improving the bishops' palaces; and it is evident, whatever may be the good or evil they have accomplished, that there is a large possibility that their powers may be misused. The commission was established in 1835.

Ecclesiastical Courts, in England and Wales, until 1857, had important jurisdiction not only in marriage and divorce cases and the probate of wills, but in some cases they could exercise the discipline of the Church for heresy, incontinence, defamation, and other faults, though in more recent times the latter duties were exercised only in cases where clergymen were accused. It is said that the publication of Dickens's novel "David Copperfield" hastened the transfer of non-ecclesiastical business from these courts to those of the civil law. There are (1) "peculiar courts" of many grades, from the royal to the parochial; (2) archdeacons' courts; (3) commissaries' courts; (4) diocesan courts; and (5) provincial courts at London and York. (See ARCHES, COURT OF; DELEGATES, COURT OF; and DOCTORS' COMMONS.) In civil causes their jurisdiction is virtually at an end.

Ecclesiastical History. I. *Nature and Object.*—Ecclesiastical history or church history is one of the four divisions of theological science—viz., exegetical (or biblical), historical, systematic (or philosophical), and practical (homiletical and pastoral) theology. Of these divisions the historical is the most extensive in bulk, and furnishes material to all the rest. In importance it yields only to exegetical theology, which has to do with the interpretation of the Holy Scriptures. Historical theology begins with the creation of man in the image, and for the glory, of God, and comes down to the present as its relative goal, but will go on till the general judgment or the final settlement of all the affairs of men. It embraces within these limits all that belongs to the religious development of the race within the line of revelation—the origin, progress, and fortunes of the kingdom of God, and its relations to the kingdoms of this world. Since the fall of man it has assumed the character of a history of redemption (and is so represented, for instance, by Jonathan Edwards in his well-known popular book). In a narrower sense, church history is the history of Christianity from the birth of Christ, or, according to others, from the day of Pentecost (A. D. 30), when Christianity first assumed an organized form distinct from Judaism, down to the present time.

II. *Church History and Secular History.*—They differ as Church and State, as Christianity and humanity, as the order of grace and the order of nature. Yet they are inseparably connected and interwoven, and the one cannot be understood without the other. Among the Jews the spiritual and secular history together form one history of theocracy. Both currents intermingle in the old Byzantine empire, in the European states and the Latin Church during the Middle Ages, in the period of the Reformation, during the colonial period of America, and in all countries where Church and State are united. Gibbon's "History of the Decline and Fall of the Roman Empire" is in great part also a "History of the Rise and Progress of Christianity," which survived the fall of the Old and New Rome, and went forth to conquer the barbarian conquerors by Christianizing and civilizing them. Every history of the papacy is also a history of the German empire, and *vice versâ*. No history of the sixteenth century can be written without constant reference to the Protestant Reformation and the Roman Catholic reaction. (Compare, *e. g.*, Hume, Macaulay, and Burnet for England; Ranke for Germany; Motley for Holland.) The Puritan settlements of New England are the beginning alike of the ecclesiastical and secular history of North America. In modern times the tendency is more and more towards separation of the spiritual and temporal, the ecclesiastical and civil powers; nevertheless, the Church will always be more or less influenced by the surrounding state of civil society, and must adapt itself to the wants of the age and progress of events; while, on the other hand, the world will always feel the moral influence, the restraining, ennobling, stimulating, purifying, and sanctifying power of Christianity, which works like a leaven from within upon all ramifications of society.

III. *Periods and Epochs.*—These represent the different stages in the religious development of the race, and must not be arbitrarily made according to a mechanical scheme (such as the centurial division adhered to by Mosheim), but taken from the actual stops or starting-points (*ἀποχή*) and circuits (*περίοδος*) of the history itself. The following are the natural divisions:

A. *Sacred* or *Biblical History*, the history of the Divine revelation from the creation to the close of the apostolic age, running parallel with the Scriptures from Genesis to Revelation. Here we must distinguish the dispensation of the Law and the dispensation of the Gospel, or the history of the Old Testament religion and of that of the New Testament religion.

(*a*) Under the *Old Dispensation*, from the creation down to John the Baptist. Subdivisions: The antediluvian period; the patriarchal period; the Mosaic period (the establishment of the Jewish theocracy); the period of the Jewish monarchy and prophecy; the period of the Babylonian exile; the period of the restoration, the Maccabees, the Roman rule till Herod the Great (or down to the destruction of Jerusalem).

(*b*) Under the *New Dispensation*. Christ and the apostles, or primitive and normative Christianity in its divine-human founder and inspired organs. Subdivisions: The preparatory mission of John the Baptist; the life of Christ; the founding of the Church by the apostles; the labors of Peter, Paul, and John.

B. *Christian History*, or *Church History* proper, from the close of the apostolic age to modern times. Subdivisions:

(*a*) History of *Ancient* Christianity, embracing the first six centuries to Gregory I. (590): Græco-Latin, patristic, Catholic, the common stock from which the Greek, the Roman, and the Protestant churches have sprung. Subdivisions: (1) The apostolic age (see A *b*); (2) the age of persecution to Constantine the Great and the Council of Nicæa (325); (3) the age of patriarchs, Christian emperors, and œcumenical councils (to 590). Some historians carry the age of ancient Christianity down to Charlemagne, A. D. 800 (so as to include John of Damascus, the last of the Greek Fathers), and the beginning of the German Roman empire and the temporal power of the papacy. In this case we have a fourth subdivision, from Gregory I. to Charlemagne (A. D. 590 to 800).

(*b*) History of *Mediæval* Christianity, from the close of the sixth to the beginning of the sixteenth century, or from Gregory I. (A. D. 590), the first mediæval pope, to Luther (A. D. 1517). Character: The Greek and Roman churches, divided, pursue their independent course; the Latin Church extending west among the Celtic and Germanic races, the Greek north-east among the Slavonians (in Russia); conversion of the barbarians; conflicts with Mohammedanism; the Crusades; rise and progress of the papacy, scholasticism, mysticism; the reformatory councils of Pisa, Constance, and Bâle; revival of letters; invention of printing; discovery of America; biblical theology; forerunners of Protestantism (Wycliffe in England, Huss in Bohemia, Savonarola in Italy, Wessel in Holland, etc.). Subdivisions: (1) The missionary period of the Middle Ages, from Gregory I. to Hildebrand or Gregory VII. (590 to 1049); (2) the palmy period of the papacy, from Gregory VII. to Boniface VIII. (1049 to 1294); (3) the decay of the mediæval papacy and scholasticism, and the preparation for the Reformation, from Boniface VIII. to Leo X. or Martin Luther (1294–1517).

(*c*) History of *Modern* Christianity, from the Reformation of the sixteenth century to the present time. Protestantism and Romanism; founding of the various evangelical churches, the Lutheran, Calvinistic, Anglican, etc.; progress of Christianity among the Teutonic races; restoration of Romanism; Jesuitism; Jansenism; Puritanism and Methodism in England; Pietism and the Moravians in Germany; settlements in North America; growth of the Greek Church in Russia, and of the Protestant in the United States; revival and triumph of ultramontane Romanism; conflict of faith with modern rationalism and infidelity; immense activity in theology, literature, missions, and all forms of Christian philanthropy. Subdivisions: (1) The age of the Protestant Reformation and the Roman Catholic counter-reformation or reaction (from 1517 to 1600, perhaps better to 1648); (2) the age of scholastic and polemic confessionalism in conflict with non-conformity and subjective piety (from the middle of the seventeenth to the middle of the eighteenth century); (3) the age of revolution and revival, and conflict between Christianity and various forms of skepticism and secularism (from deism in England and the French Revolution to our time).

IV. *Sources.*—They are mostly written, in part unwritten. The *written* sources include (*a*) the official documents of ecclesiastical and civil authorities, such as acts of councils, creeds, liturgies, hymn-books, church laws, papal bulls and encyclicals; (*b*) the writings of the personal actors in the history, and contemporary observers and reporters, such as the Fathers for ancient Christianity, the Schoolmen for mediæval, the Reformers and their opponents for the Reformation period; (*c*) inscriptions on walls, pictures, churches, tombstones, and other monuments.

The *unwritten* sources are works of Christian art, as churches, chapels, pictures, sculptures, crosses, crucifixes, relics, and other remains which symbolize and embody the spirit of Christianity in different epochs and phases. Thus, the Roman catacombs, with their vast extent, their solemn darkness, their labyrinthine mystery, their rude epitaphs and sculptures, their symbols of faith and their relics of martyrdom, give us a lifelike idea of the Church in the period of persecution, its trials and sufferings, its faith and hope, its simple worship and devoted piety. "He who is thoroughly steeped in the imagery of the catacombs will be nearer to the thoughts of the early Church than he who has learned by heart the most elaborate treatises of Tertullian or Origen." The basilicas are characteristic of the Nicene, the Byzantine churches of the Byzantine age, the Gothic cathedrals of the palmy days of the Middle Ages, the Renaissance style of the revival of letters. Even now most churches and sects can be best appreciated in the localities and in view of the monuments and the people where they originated or have their centre of life and action.

V. *Duty of the Historian.*—He must (1) master the sources in the original languages in which they were written (Greek, Latin, and the modern languages of Europe); separating the genuine from the spurious, the original from corruptions and interpolations; sifting the truth from falsehood, the facts from fiction and partisan judgment; comparing the accounts of all actors, friend and foe, narrator, eulogist, advocate, and antagonist, whether orthodox or heretic, whether Christian, Jew, or Gentile; aiming in all this laborious investigation at "the truth, the whole truth, and nothing but the truth." (2) He must then reproduce the clearly ascertained facts and results of his investigation in a faithful and lifelike narrative, so as to present the objective course of history itself as it were in a miniature photograph. The genuine writer of history differs as much from the dry chronicler of isolated facts and dates as from the novelist; history has a body and a living soul, and its facts are animated by thoughts and principles. The historian must exhibit both; he must be able to particularize and to generalize, to descend into minute details, and to take a comprehensive bird's-eye view of whole ages and periods. He must have a judicial mind, which deals impartially with all persons and events coming before his tribunal, and is swayed by no consideration but that of strict justice. This aim should be constantly kept in view, although in the limited and imperfect state of our information, and the inability to emancipate one's self from all the influences of education and prevailing opinions and prejudices, we can expect no more than an approximate solution of the difficult task. It is the exclusive privilege of the Divine Mind to view all things *sub specie eternitatis*, to see the end from the beginning. We can only know things consecutively and in fragments. But history is its own best interpreter, and the farther it advances the more we are able to understand and appreciate the past.

VI. *Value.*—The study of history enables us to understand the present, which is the fruit of the past and the germ of the future. It is the richest storehouse of wisdom and experience. It is the best commentary of Christianity. It is full of comfort and encouragement. It verifies on every page the promise of the Saviour to be with his people always, and to build his Church on a rock against which the gates of hell cannot prevail. It exhibits the life and power of Christ in all its forms and phases, and the triumphant march of his kingdom from land to land and generation to generation. Earthly empires, systems of philosophy have their day, human institutions decay, all things of this world bloom and fade away like the grass of the field; but the Christian religion has the dew of perennial youth, survives all changes, makes steady progress from age to age, overcomes all persecution from without and corruption from within, is now stronger and more widely spread than ever before, directs the course of civilization, and bears the hopes of the human race. The history of the world is governed in the interest and for the ultimate triumph of Christianity. The experience of the past is a sure guarantee of the future.

VII. *Literature.*—(1) Works on *General Church History:* Eusebius (died 340), "Church History," from the birth of Christ to Constantine the Great (324). His successors in the Greek Church: Socrates, Sozomen, Theodoret. The "Magdeburg Centuries," by Matthias Flacius (died 1575) and other Lutheran divines of Germany (Bâle, 1559–74), covering thirteen Christian centuries in as many volumes, the first history from a Protestant point of view in opposition to the claims of Romanism. The "Ecclesiastical Annals" of Cæsar Baronius (died 1607), in 12 folio volumes, published at Rome, 1588 *sqq.*, to which were added the continuations of Raynaldus, Spondanus, and others—a work of astounding learning and industry, but altogether in the interest of the papacy. Tillemont (died 1698), in his invaluable "Mémoires" (Paris, 1693–1712, 16 vols.), wrote the history of the first six centuries from the sources, in biographical style and in the spirit of the more liberal Gallican Catholicism. Gottfried Arnold (died 1714), of the Pietistic school of Spener, in his "Impartial History of the Church and of Heretics" (Frankfort, 1699 *sqq.*, 4 vols. fol., to A. D. 1688), advocated the interests of practical piety and the claims of heretics and schismatics and all who suffered persecution from an intolerant hierarchy and orthodoxy. J. L. Mosheim (died 1755) wrote his "Institutes of Ecclesiastical History" (in Latin, Helmstädt, 1755, and often since in several translations) in the spirit of a moderate Lutheran orthodoxy, with solid learning and impartiality, in clear style, after the centurial arrangement of Flacius, and furnished a convenient text-book which (especially in Murdock's translation) has continued in use in England and America even to this day. Schroeckh's "Christian Church History" (Leipsic, 1768–1810, in 45 vols.) is a far more extensive and far less readable work, but invaluable for reference, full of reliable information from the sources; it forsakes the mechanical centurial division, and substitutes for it the periodic arrangement. Henke (died 1809) followed with a thoroughly rationalistic work in 9 vols. (1788–1810). Neander (professor of church history in Berlin, died 1850) marks an epoch in this branch of theological literature, and

by his truly Christian, conscientious, impartial, truth-loving, just, liberal, and withal thoroughly learned and profound spirit and method, he earned the title of "father of church history." His "General History of the Christian Religion and Church" (Hamburg, 1825–52, 11 vols.), though incomplete (it stops with the Council of Bâle, 1430) and somewhat diffuse and monotonous in style, is an immortal monument of genius and learning; it pays special attention to the development of Christian life and doctrine, and is edifying as well as instructive. It has been naturalized in England and America by the translation of Prof. Torrey (Boston, 1847–52, 5 vols.; 12th ed. 1872), and will long be studied with profit. Equally valuable, though of an altogether different plan and spirit, is the "Church History" of GIESELER (Bonn, 1824–56), translated from the German first by Cunningham in Philadelphia (1846), then by Davidson and Hull in England, and revised by H. B. Smith of New York (1857 *sqq.*). The text is merely a meagre skeleton of facts and dates, but the body of the work consists in carefully selected extracts and proof-texts from the sources, which furnish the data for an independent judgment. BAUR'S "Church History" (partly published after his death, Tübingen, 1861, in 5 vols.) is distinguished for philosophic grasp, critical combinations, and bold conjectures, especially in the treatment of the ancient heresies and systems of doctrine. HAGENBACH'S "Church History" (now completed in 7 vols., Leipsic, 1873) is an admirable digest of the vast material for the lay reader. SCHAFF'S "History of the Christian Church" (New York, 1859–67, in 3 vols.; German ed. Leipsic, 1868) is the first general church history prepared on American soil, but not yet completed (two more volumes are in course of preparation). Of English church historians, WADDINGTON represents the general history in six volumes to the Reformation, inclusive (1835 *sqq.*); ROBERTSON in three (1854 *sqq.*) to the close of the Middle Ages. The older work of MILNER (died 1797) is written in popular style for edification. Of the numerous compends of church history in one or more volumes, we mention those of DÖLLINGER, MÖHLER, RITTER, ALZOG, among Roman Catholics; HASE, NIEDNER, GUERICKE, KURTZ, EBRARD, among Protestants: all in German, some also translated into English.

(2) Works on *special departments* of church history. On Old Testament history: MILMAN ("History of the Jews"), EWALD ("History of Israel," 7 vols., translated by Russell Martineau), STANLEY ("History of the Jewish Church"). Life of Christ: NEANDER (German and English), LANGE (German and English, 6 vols.), PRESSENSÉ (French and English), ELLICOTT, ANDREWS, EWALD, RIGGENBACH, SEPP (R. C.), PAULUS (rationalistic), STRAUSS (mythical theory), RENAN (legendary theory). History of the Apostolic Church from A. D. 30 to 100: NEANDER, LANGE, THIERSCH, SCHAFF, REUSS, CONYBEARE and HOWSON (on St. Paul). History of Christian Doctrines, or Dogmatic History: PETAVIUS (R. C.), MÜNSCHER, BAUMGARTEN CRUSIUS (2 vols.), HAGENBACH (translated by Buch, revised by H. B. Smith, New York, 1861, 2 vols.), NEANDER (1 vol., posthumous), BAUR (Leipsic, 1867, posthumous, 3 vols.; also a compend in 1 vol.), SHEDD (New York, 1863, 2 vols.), BECK, SCHWANE (R. C.); "History of Protestant Theology," by DORNER (Munich, 1867; also in English, Edinburgh, 1871); "History of Roman Catholic Theology," by WERNER (Munich, 1866). History of special doctrines: BAUR on the "Trinity and Incarnation" (3 vols.), on the "Atonement" (1 vol.); DORNER on "Christology" (2 vols.; also in English); EBRARD on the "Lord's Supper." History of Councils: MANSI, HARDOUIN, WALCH, FUCHS, HEFELE. History of Church Polity: PLANCK, RITSCHL, SUGENHEIM, GREENWOOD. History of Missions: BLUMHARDT, WIGGERS, and numerous monographs. Patrology and Patristics: the Benedictine editions, and large collections of the works of the Fathers by GALLANDI, MIGNE, etc. The biographical and literary works on the Fathers, by TILLEMONT, DU PIN, CEILLIER, CAVE, LUMPER, MÖHLER, FESSLER, ALZOG, BOHRINGER. Separate biographies of Tertullian and Chrysostom, by NEANDER; Justin Martyr, by SEMISCH; Origen, by THOMASIUS; Augustine, by BINDEMANN; Jerome, by ZÖCKLER. Ecclesiastical Antiquities, by BINGHAM, AUGUSTI, SIEGEL, COLEMAN. On Ancient Christianity: MOSHEIM, MILMAN, SCHAFF, PRESSENSÉ; "History of the Greek (Eastern) Church," by DEAN STANLEY (London and New York, 1862); "History of Latin Christianity," by DEAN MILMAN (to the Pontificate of Nicholas V., London and New York, 1860 *sqq.*); "History of the Crusades," by MICHAUD, WILKEN, SPITTLER. The Papacy: WALCH, PLANCK, SPITTLER, GREENWOOD ("Cathedra Petri"), RIDDLE, BAUER, WYLIE; also many monographs on single popes, as VOIGT on Gregory VII., HURTER on Innocent III. (4 vols.), REUTER on Alexander III. (3 vols.). Scholasticism and Mysticism of the Middle Ages: STÖCKL ("History of the Philosophy of the Middle Ages," Mayence, 1864 *sqq.*, 3 vols.); GÖRRES ("History of Christian Mysticism," 1836–42, 4 vols.); and the monographs of HASSE on Anselm of Canterbury, WERNER and VAUGHAN on Thomas Aquinas, NEANDER and MORISON on St. Bernard, CHRISTLIEB on Scotus Erigena, LIEBNER on Hugo of St. Victor. History of Monasticism: SPITTLER, MÜNCH, DÖRING, MONTALEMBERT, and especially the colossal biographical work of the Jesuits, "Acta Sanctorum" (for every day in the year, not yet completed). Revival of Letters and Forerunners of the Reformation: ULLMANN on the "Reformers before the Reformation" (2 vols., Hamburg, 1841); VAUGHAN on John Wycliffe (London, 1854); LECHLER on Wycliffe (Leipsic, 1873, 2 vols.); HERFERT and GILETTE on Huss and Jerome of Prague; MEIER, RUDELBACH, PERRENS, MADDEN on Savonarola; MÜLLER on Erasmus; STRAUSS on Ulrich von Hutten; SEEBOHM on "The Oxford Reformers, John Colet, Erasmus, and Thomas More" (London, 1869). "History of the Reformation," by MARHEINEKE, NEUDECKER, RANKE, MERLE D'AUBIGNÉ, DÖLLINGER (R. C.), FISHER (just published, New York, 1873), KAHNIS (1873); not to mention the numerous monographs on Luther, Melanchthon, Zwingli, Calvin. On the English Reformation in particular: STRYPE ("Ecclesiastical Memorials and Annals of the Reformation;" also his "Memorials of Cranmer, Parker, Grindal, Whitgift," etc.); BURNET, COLLIER (non-juror), DODD (R. C.), CARDWELL, FULLER, SOAMES, FROUDE (from the fall of Wolsey to the death of Elizabeth). On the Reformation in Scotland: BUCHANAN ("Rerum Scoticarum Historia"), J. KNOX (till 1567), CALDERWOOD, ROBERTSON, M'CRIE ("Life of John Knox"), HETHERINGTON, RUDLOFF. On the literature of the modern history of the principal churches and sects see the respective articles.

PHILIP SCHAFF.

Ecclesiastical Law. See CANON LAW.

Ecclesias'ticus [Gr. ἐκκλησιαστικός, probably meaning the "church-book," because anciently read in "church" (ἐκκλησία)], or **the Wisdom of Jesus the Son of Sirach,** a book considered apocryphal by Jews and Protestants, and received as canonical by the Roman Catholic and Greek churches. By the Anglican Articles it is recommended to be read for edification. It appears to have been written in Hebrew by one Jesus (Joshua), the son of Sirach, at Jerusalem, at an uncertain date.

Ecclesiol'ogy [Gr. ἐκκλησία, "church," and λόγος, "treatise"], a word denoting properly the doctrine of the Church and its government, but commonly applied to the building and furnishing of church edifices. The subject has attracted much attention in Great Britain of late years. There are societies for promoting the study, a journal ("The Ecclesiologist") is published, and there is "A Handbook of English Ecclesiology" (London, 1847).

Echellen'sis (ABRAHAM), a learned Maronite, born at Eckel in Syria. He was professor of Arabic and Syriac at Rome, and removed about 1630 to Paris, where he assisted in the edition of Le Jay's polyglot Bible. He was the author of an "Oriental Chronicle." Died in Italy in 1664.

Échelon [a French word signifying the "round" of a ladder], a military term applied to a certain arrangement of troops when several divisions are drawn up in parallel lines, each to the right or the left of the one preceding it, like "steps" or the rounds of a ladder, so that no two are on the same alignment. Each division by marching directly forward can form a line with that which is in advance of it. There are two sorts of échelon, *direct* and *oblique*, the former of which is used in an attack or a retreat.

Échevin [Lat. *scabinus*] in France from the time of Charlemagne to the Revolution (1789), a royal officer of justice and of finance, whose duties were various in different periods. For the last six hundred years of the duration of the office it was chiefly exercised in the cities. The échevins of Paris were assessors, and had authority as magistrates in some kinds of civil business.

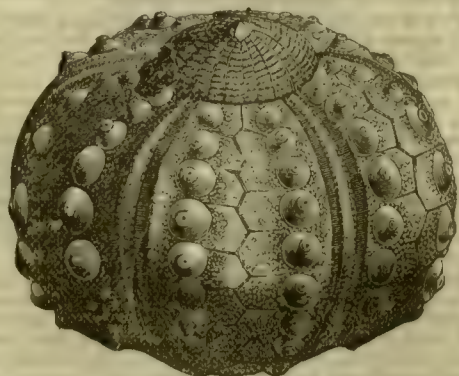
Echid'na [Gr. "Εχιδνα], in Greek mythology, a monster, half serpent and half woman, supposed to be the daughter of Tartarus, and the mother of Cerberus and the Chimæra.

Echidna, a genus of Australian quadrupeds belonging to the order Monotremata. The *Echidna* is covered with spines, and is nearly as large as a hedgehog. It deviates in a remarkable manner from the typical structure of the Mammalia in the organization of the generative and osseous systems. The muzzle is elongated and slender, and the mouth destitute of teeth. The feet are armed with claws, which enable the *Echidna* to burrow with great rapidity. It feeds on ants, which it catches by means of a long adhesive tongue.

Echi'mys [from the Gr. ἐχῖνος, a "hedgehog," and μῦς, a "mouse"], a South American genus of rodent mammals called "spiny rats." They are about the size of large rats, and have numerous spines scattered through their hair. They are of six or eight species, and are a kind of link between the rats and the true porcupines.

Echin'ades [Gr. Ἐχινάδες, from ἐχῖνος, a "hedgehog," alluding to their irregular, sharp outlines], the ancient Greek name of a group of islands of the Ionian Sea, off the mouth of the Achelous. Some of the ancient islands have been joined to the mainland by alluvial deposits. The islands are small, rocky, and unimportant. Seventeen of these islands have names, but only nine are cultivated. They are now called Kurtzelari Islands, and the largest is named Petalá: but Oxiá, Makrí, and Vrómona are the most important. Lat. of the S. end of Oxiá, 38° 17′ N., lon. 21° 6′ E.

Ech'inate [from the Gr. ἐχῖνος, a "hedgehog"], in botany, furnished with rigid hairs or prickles, as the husk of the chestnut.



Echin'ida [named from *Echi'nus*, one of the genera], called also **Ech'inoids** or **Sea Ur'chins** (urchin being the old English for hedgehog), an order of echinoderms with calcareous shells more or less globular, and composed of symmetrically-arranged plates, bearing tubercles armed with movable spines. They have no arms like star fishes, but the five radiations are distinctly marked by holes, through which the ambulacra are protruded. These holes occur in the alternate plates. These animals are divided into regular sea urchins (Cidaridæ), often spherical or oval, and irregular sea urchins, of which there are several families. Many species of echinoids occur in the American seas.

Echinoder'mata (plu.), or **Ech'inoderms** [from the Gr. ἐχῖνος, a "hedgehog," and δέρμα, a "skin"], the highest class of animals of the Cuvierian sub-kingdom Radiata, having a tough covering, containing more or less calcareous matter, or composed of pieces which are either movable or bound together and covered with spines (whence the name); the body divided into two parts, the actinal (or oral) and the abactinal portion. Along certain of the rays are regular rows of tube-like suckers (ambulacra) used in locomotion. The muscular system is well developed. The internal vessels, etc. have walls of their own. The principal nerve-centre is a peri-œsophageal ring; all are oviparous. Echinoderms have their parts in multiples of five. The living species are all marine. They are divided into five orders—the holothurians, the sea urchins (echinoids), the star fishes (asteroids), the ophiuroids, and the crinoids. To these some append the sipunculoids as a sixth order.

Echi'nus [Gr. ἐχῖνος, a "hedgehog," a name applied to this genus on account of its spines], a genus of Echinodermata, of the family Cidaridæ, comprising a large number of European sea-urchins, several species of which are used as food. Forbes counted on one of these animals more than 300 polygonal plates, over 4000 spines, and nearly 1900 suckers.

Shell of Sea Urchin (*Echinus*), with the spines.

Echinus, divested of its spines.

Echinus, in architecture, a moulding consisting of a series of egg-shaped or alternately egg- and anchor-shaped ornaments. It especially appears as an ornament of the Doric capital or cushion, and is one of the characteristic decorations of early Greek art. It is said to have taken its original form and its name from the chestnut and its spiny burr.

Echmiedzin', or **Eschmiazin,** a celebrated Armenian monastery in the province of Erivan, in Asiatic Russia, 15 miles W. of Erivan. It is the residence of the catholicos or head of the entire Armenian Church. Twelve archbishops and bishops, four vartabeds, about sixty clerical and five hundred lay monks live in the monastery, the archbishops, bishops, and vartabeds constituting the synod of the catholicos, which must be consulted on all important occasions. The monastery was founded in 524.

Ech'o [Gr. Ἠχώ], in classic mythology, was a nymph who aided Jupiter in escaping the watchfulness of Juno, by detaining the latter with her amusing talkativeness; but that goddess, discovering the deception, ordained that she should not be able to speak until some person had spoken to her, nor to be silent after any one had spoken to her. Cherishing for Narcissus a passion which was not requited, she pined away until nothing remained of her but her voice.

Echo [for etymology see preceding article], the reflection of sound from a distant surface. Several conditions must be fulfilled before an echo can be produced. The ear must be situated in the line of the reflection; and in order that the person who emits the sound may himself hear the echo, this line must be perpendicular to the reflecting surface, but if there are several such surfaces the sound may be brought back by a series of successive reflections. The opposing surface must be at a certain distance from the ear, for if the direct and reflected sounds succeed each other with great rapidity, they are confounded. Thus, vaulted caves and large rooms have a strong resonance, but produce no echo.

Sound passes through the atmosphere at the rate of about 1125 feet in a second; hence, a person placed at half that distance would hear the echo exactly one second after the sound was emitted by him. The least distance of the reflecting surface from the point whence the sound is emitted must be about fifty feet.

Unless the surface reflecting the sound is of considerable extent, the echo will be too feeble to be heard. Some concavity in the surface by which diverging rays of sound are concentrated at the point where the echo is audible, is favorable, if not absolutely essential, to the production of echoes. It is a property of the ellipse that every sound proceeding from one of its foci and impinging against the curve is reflected into the other focus; whence two persons placed in the two foci of an elliptic chamber may converse with each other in a whisper, and not be heard by those who are in the other parts of the room. Thus, walls or buildings approaching the elliptic form return sounds with great force and distinctness. The faintest sound is conveyed from one side of the "whispering gallery" of St. Paul's, London, to the other, but is not heard at any intermediate point. Some echoes are remarkable for their frequency of repetition. An echo in Woodstock Park, England, repeats seventeen syllables by day and twenty by night. An echo in the Simonetta palace, near Milan, is said to repeat the report of a pistol sixty times.

Echo, in music, is the repetition of a musical phrase often written for the organ, by the stops of which it can be produced with facility.

Ech'o, a township of Dale co., Ala. Pop. 950.

Ech'o Cañ'on, Utah Territory, is a remarkable ravine or defile visible to passengers on the Union Pacific R. R., 975 miles from Omaha. It is in Summit co., and is enclosed between high vertical walls of rock. The scenery is of surprising grandeur and beauty.

Ech'o Cit'y, a post-village of Summit co., Ut., on the Union Pacific R. R., 39 miles S. E. of Ogden. It is picturesquely situated more than 5000 feet above the sea.

Ech'ols, a county in the S. of Georgia. Area, 400 square miles. It is intersected by the Allapaha River. The surface is level; the soil sandy. Corn, rice, and wool are raised. It is traversed by a branch of the Atlantic and Gulf R. R. Capital, Statenville. Pop. 1978.

Ecija, ā'the-hȧ (anc. *As'tigi*), a city of Spain, in Andalusia, on the river Genil, about 50 miles E. N. E. of Seville. It is well built, and has numerous churches, convents, and hospitals; also manufactures of linens and coarse woollen

fabrics. On the border of the river is an *alameda* (promenade) adorned with statues and fountains. Many Roman remains are found here. The climate is so hot that Ecija is called "the frying pan of Andalusia." The ancient *Astigi* was one of the chief towns of Hispania Bætica. Pop. in 1860, 27,216.

Eck, von (JOHANN **Mayr**), [Lat. *Eck'ius*, or *Ec'cius*], D. D., a German theologian and able adversary of Luther, was born at Eck, in Suabia, Nov. 13, 1486. He was a professor in the University of Ingolstadt, and was noted for his skill in disputation. He went to Rome in 1520, and instigated the pope to persecute Luther. At the Diet of Augsburg held in 1530 he controverted the Lutheran confession of faith. Among his works is a "Manual of Controversy." Died Feb. 10, 1543.

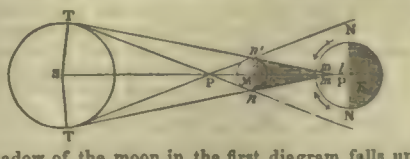
Eck'art, the greatest among the mystic writers of Germany during the Middle Ages, was vicar of the Dominican order in Erfurt, then vicar-general in Bohemia, and in 1327 provincial in Cologne. He introduced many reforms into the monasteries, attracted great attention by his sermons in the German language, and was connected with the Brethren of the Free Spirit. A papal bull issued soon after his death condemned twenty-eight sentences in his sermons. He has been called the "father of modern pantheism," and is regarded as one of the greatest men of the German race, and one of the deepest thinkers of all ages. Died in 1329, near the beginning of the year. A collection of his writings, as far as they have been preserved, has been published by Pfeiffer in the second volume of "Deutsche Mystiker" (1857).

Eck'ert (THOMAS THOMPSON), born in St. Clairsville, O., April 23, 1824. In 1849 he was appointed postmaster at Wooster, and placed in charge of the telegraph-office there; in 1852 he was appointed superintendent of telegraph, which position he held till 1859, when he accepted the management of a gold-mining company in North Carolina, which he retained till the spring of 1861, when on the outbreak of war he was compelled to abandon all he possessed. He reached Cincinnati nearly destitute. His information of the condition of affairs in the South was valuable, and he was invited to Washington by the authorities for consultation. He was at once placed in charge of the military telegraph-office at the head-quarters of Gen. McClellan. In 1862 he accompanied the Army of the Potomac as superintendent of military telegraph, with the rank of captain and acting quartermaster. In Sept., 1862, he was called to Washington to establish the head-quarters of the military telegraph at the war department, with the rank of major. His service in organizing and conducting the immense system was freely acknowledged, and he enjoyed the confidence of both President Lincoln and Secretary Stanton. In the latter part of 1864 he was made assistant secretary of war, which office he retained till Aug., 1866. (Brevet lieutenant-colonel 1864, brevet brigadier-general 1865.) Immediately after his retirement from the war department he accepted the general superintendence of the Western Union Telegraph in the East, securing valuable results both to the public and the telegraph service, and to himself a high reputation as a telegraph manager; in 1874 became president of the Atlantic and Pacific Telegraph Co.

G. C. SIMMONS, *Clerk Board of Engineers.*

Eck'ford, a township of Calhoun co., Mich. Pop. 1011.

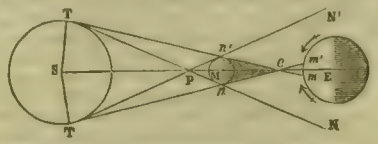
Eckford (HENRY), born in Scotland Mar. 12, 1775, removed to the city of New York in 1796. During the war of 1812–14 he was employed by the U. S. to build fleets for the lakes. He also built ships of war for foreign nations. His ships were remarkable for strength and speed. In 1831 he entered the service of the Turks as naval constructor. Died at Constantinople Nov. 12, 1832.



Eckley, a post-village of Foster township, Luzerne co., Pa., on a branch of the Lehigh Valley R. R. It has productive mines of excellent anthracite coal.

Eck'mühl [Ger. *Eggmühl*], a village of Bavaria, 13 miles S. S. E. of Ratisbon. Here on the 22d of April, 1809, Napoleon defeated the Austrian archduke Charles, who lost 5000, killed and wounded, besides 7000 prisoners. Davoust received the title of prince of Eckmühl for his conduct in this battle.

Eclec'tic [Gr. ἐκλεκτικός, from ἐκ, "out," and λέγω, to "choose;" Lat. *eclec'ticus;* Fr. *éclectique*], selected or chosen from several others. This term was applied to philosophers who endeavored to select from the systems of various schools the true or most probable doctrines, and to combine these into a harmonious system. An eclectic spirit, it is evident, can only exist or prevail at a period of some maturity in philosophical speculation. In one sense of the word, Plato and Aristotle may be regarded as eclectics, for they both availed themselves largely of the doctrines of preceding philosophers. But in the hands of these great thinkers the *discerpta membra* are endued with a principle of vitality, and reunited as coherent parts of a harmonious system. The term eclectic is especially applied to philosophers of a later age and inferior order. Among these may be classed Epictetus, Potamon, Plutarch, and Plotinus. Plutarch, a man of great and various endowments, may be taken as an example of false eclecticism. His great object seems to have been to reconcile the profound speculations and pure morality of the philosophers with the fanciful inventions and gross mythology of the poets and priests. Plotinus and others endeavored to reconcile Neo-Platonism with Christianity. Among the most eminent modern eclectics Victor Cousin, the brilliant expounder of the history of philosophy, affords a favorable specimen of the eclectic spirit. He was perhaps the most ingenious thinker of modern France. (See his "Lectures on the History of Philosophy.")



Eclipse [Gr. ἔκλειψις, from ἐκλείπω, "to fail;" Lat. *defectus*], in astronomy, the obscuration of a celestial body by another. Eclipses are divisible into three classes, viz.: 1, the obscuration of the sun by the moon, which is called a *solar eclipse;* 2, the obscuration of the moon by the shadow of the earth, which is a *lunar eclipse;* and 3, the obscuration of a satellite of a planet by the shadow of the primary, which is called the *eclipse of a satellite*, as distinguished from an occultation of the satellite, by which is to be understood the disappearance of the satellite behind the body of the primary. The most interesting of these phenomena are the eclipses of the sun and moon. The earth and the moon cast their shadows in a direction opposite to the sun; and as the earth and moon are nearly spherical, and the sun is larger than either, it is evident that these shadows must be nearly conical in form. The moon is eclipsed when it enters the shadow of the earth; in other words, when the earth is interposed between it and the sun. This can occur only at the time of full moon, or when the moon is in opposition to the sun, and when both bodies are at the same time near one of the moon's nodes; that is to say, near to the points in which her orbit intersects the plane of the ecliptic. When at the time of mean full moon the difference of the mean longitude of the moon and of her node is greater than 13° 21′, there cannot be an eclipse; when less than this, there may be; and when less than 7° 41′, there must be. These distances are called the *lunar ecliptic limits.* If only part of the moon's disk enters the earth's shadow, the eclipse is called partial; but if the whole disk is involved in the shadow, it is total. The orbit of the moon is inclined about 5° to the plane of the ecliptic, and this is the reason why eclipses do not happen every full moon. The moon cannot be eclipsed more than twice during the year, and it may escape eclipse for an entire year altogether. Lunar eclipses are visible to all parts of the earth at which the body is above the horizon at the time of their occurrence.

Solar eclipses occur at the time of new moon, or when the moon is between the sun and the earth. If at the time of mean new moon the difference between the mean longitudes of the sun or moon and the node is greater than 19° 44′, there cannot be an eclipse; if less than this, there may be; and if less than 13° 33′, there must be. These distances are called the *solar ecliptic limits.* They are greater than the lunar ecliptic limits; and hence eclipses of the sun are more frequent than those of the moon. To all parts of the earth on which the moon's true shadow or *umbra* falls, the eclipse is total; to those from which only a portion of the solar disk is concealed, it is partial; and the diminution of the sun's light over these regions defines what is called the *penumbra* or partial shadow. The greatest breadth of the moon's true shadow on the earth's surface never exceeds 127 miles; the breadth of the penumbra may reach 4900 miles. At the time of new moon, or when the moon is between the sun and the earth, her shadow or penumbra may fall on a part of the disk of the earth, and produce the phenomenon of a total or partial eclipse of the sun, which is limited to the portions of the earth on which the moon's shadow or penumbra happens to fall. The shadow of the moon does not always extend so far as the earth. In the two following diagrams the former represents the case in which the shadow does reach, and the latter illustrates the case in which it does not reach, the surface of the earth.

The shadow of the moon in the first diagram falls upon a portion of the earth between *n* and *n′*, and the inhabitants of that portion will witness a *total eclipse of the sun.* But in the second diagram, where the shadow of the moon does

not reach the earth, if we suppose the dark conical shadow *n n'* to be produced into the small opposite cone *m m'*,

meeting the surface of the earth, it will be obvious that to any spectator within this latter cone, or any inhabitant of the portion *m m'* of the earth, the central part of the sun's disk will be covered or obscured by the moon, and the unobscured part of the sun will present the appearance of a beautiful luminous ring or *annulus*. This phenomenon is an *annular eclipse* of the sun. In other cases, the moon's penumbra N N' is projected against a portion of the earth's surface, so as to cause a partial eclipse. The diagram, owing to the disproportion between the relative distances and magnitudes of the bodies, exaggerates the extent of the penumbra, which is never large enough to cover the entire disk of the earth.

The largest number of eclipses of both sun and moon which can occur in any one year is seven, of which five will be of the sun and two of the moon. The smallest number possible in one year is two, both of which will be of the sun. The sun passes each of the moon's nodes once only in a year, unless the first passage occurs near the first of January, in which case, owing to the retrogradation of the nodal points, it may pass one node twice and the other once. Two solar eclipses may then occur in January, two in midsummer, and one in December, making five in all. But owing to the limited extent of the earth's surface to which solar eclipses are visible, they are less frequently observed at the same place than lunar. The eclipses of Jupiter's satellites, which can be calculated long beforehand, afford a convenient method of determining longitude.

The *duration* of an eclipse is the time between the immersion and the emersion. Immersion signifies the moment when the luminary begins to be obscured, and emersion is the reappearance of the luminary from behind the body by which it has been obscured. The term *digit* is used to denote one-twelfth part of the diameter of the sun's disk, and the eclipse is said to be of ten digits if ten out of twelve parts of its diameter are obscured when the phase is maximum. A total eclipse of the sun is an impressive phenomenon, and was regarded by the ancients as a very portentous, supernatural, and alarming event. The Christians of the Dark Ages offered formal prayers in order to avert the recurrence of eclipses. Even brute animals are filled with dismay by the lurid gloom or peculiar twilight of a total eclipse, during which the temperature of the air sinks rapidly. The duration of such an eclipse is usually only about three or four minutes, but may extend to eight. A total eclipse of the sun was visible in some parts of the U. S. Aug. 7, 1869, when the duration of totality was two minutes and forty-two seconds. The corona of this eclipse is thus described by a person who observed it: "On looking up, one of the grandest spectacles met the eye of which it is possible to conceive. Surrounding the dark body of the moon was a crown of light, with rays shooting out in five great sheaths to a distance equal to the sun's diameter, or nearly a million of miles. We gazed for eight or ten seconds with astonishment at this magnificent spectacle. No painting can represent it, and no pen can describe it." "The peculiar phenomena which have attracted so much attention in solar eclipses are only visible during the brief period of totality. The difficulty of observing them lies in this exceeding brevity, and in the fact that however much the observer may have studied the experiences of others, the phenomena come upon him as a complete surprise. The moment that the last ray of light disappears with the extinguishment of Bailly's beads there bursts upon him a vision so marvellously beautiful, so startling by its novelty, that his self-possession and self-control desert him." "No one," he adds, "who has not seen a total eclipse can fully appreciate the grandeur of the occasion. As the light, ray by ray, is cut off, a strange and ghastly darkness comes down upon us; not like the darkness of night, but a violet-colored darkness, which makes the faces of our neighbors turn ashy pale, and gives to the landscape the hues which it takes in a stereoscopic picture." (*Annual of Scientific Discovery for* 1870.) A total eclipse occurs very infrequently at any one place. J. P. Nichol states that no total eclipse was visible at London for a period of 575 years (1140–1715). The occurrence of eclipses at the exact time predicted by astronomers is a signal demonstration of the constancy of the laws of Nature, and of the undeviating punctuality with which her grand operations are performed.

Great importance has heretofore been attached to spectroscopic and polariscopic observations of the sun's envelopes and coronal appendages during solar eclipses. Recently, however, it has been found practicable to make such observations quite as satisfactorily when the body is entirely unobscured. These observations have already added much to our knowledge of the physical condition and chemical constitution of our great central luminary; and there is reason to expect that in coming years they will be still more fruitful in interesting discovery. (See SUN and CORONA.)

Eclip'tic [so called because eclipses can only occur when the moon is on or very near its plane], in astronomy, the great circle of the heavens which the sun appears to describe in his annual revolution. It is the circle to which longitudes and latitudes in the heavens are referred. From time immemorial the ecliptic has been divided into twelve equal parts, called signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces. These signs, however, do not coincide with the constellations of the same names, but are merely arcs of thirty degrees reckoned from the intersection of the ecliptic and equator, which is not a fixed point, so that they are carried backward by the precession of the equinoxes. The sign Aries is now in the constellation Pisces. The angle which the plane of the ecliptic makes with the plane of the equator is called the obliquity of the ecliptic, which is a variable quantity—about 23° 27′ 30″. The change of seasons is the result of this angle.

Eclogue, ĕk'log [Lat. *ec'loga;* Gr. ἐκλογή, a "selection"], originally the select pieces of an author. The word usually signifies a pastoral poem, the main and proper subjects of which are the loves of shepherds or their adventures. These shepherds, however, are mostly imaginary personages, whose sentiments and circumstances belong rather to an ideal golden age than to the realities of common life. The "Bucolics" of Virgil are often called *eclogues*, but they have not all the true pastoral character, some of them being occasional poems on events of the day, only slightly enveloped in the pastoral costume. Spenser and Philips are among the eminent English pastoral poets. It is worthy of notice that this species of composition is now nearly obsolete.

École Polytechnique. See POLYTECHNIC SCHOOL.

Econom'ic Geol'ogy, also called **Practical Geology,** is that branch of the science which relates to the distribution, modes of occurrence, properties, and uses of minerals employed by man. The applications of geology are—1, to agriculture, in the knowledge it conveys of the composition, structure, and origin of soils, the distribution and properties of mineral fertilizers, etc.; 2, to architecture, in materials for construction; 3, to engineering, in drainage, excavations, and construction; 4, to manufactures, in its revelations of the distribution, properties, and uses of ores, fuels, clays, oils, asphalts, gems, and other minerals employed in the arts. It also includes the theory and practice of mining. By its investigations into the structure and resources of the earth, economic geology may have an important bearing upon the health, wealth, occupations, and history of every community and nation.

Econ'omy [Lat. *œcono'mia;* Fr. *économie,* from the Gr. οἶκος, a "house," and νόμος, "law" or "regulation"], the regulation and government of a household or family; a frugal and prudent use of money or commodities; prudent management of affairs; sometimes the regular operations of nature in the reproduction, nutrition, and preservation of animals and plants. Rural economy is nearly synonymous with agriculture and the pursuits of farmers.

Econ'omy, a post-village of Beaver co., Pa., on the Ohio River and on the Pittsburg Fort Wayne and Chicago R. R., 18 miles N. W. of Pittsburg. It was settled by German socialists called the Harmony Society. It has manufactures of cotton and wool. Pop. of Economy township, 1324. (See HARMONISTS.)

Economy, Political. See POLITICAL ECONOMY.

Ecora Fabra, a township of Ouachita co., Ark. Pop. 2325.

Écorché, ā'kor'shā' [a French word, past part. of *écorcher,* to "flay," to "skin"], is a figure used as a model by artists, in which the muscles are represented deprived of the skin. In a portion of the figure the upper muscles are also removed, so that those lying below them may be seen. The écorché is sometimes represented in action. This was first done by the French artist and anatomist Salvage.

Ecorse, a post-township of Wayne co., Mich. P. 2211.

Écoutes, ā'koot' [a French word from *écouter,* to "listen"], in military engineering, are small galleries excavated at regular intervals beyond the glacis and towards the enemy's works, whose mining operations may by this means be heard and estimated.

Écraseur, ā-krȧ′zŭr [Fr., signifying "crusher," from *écraser*, to "crush"], a surgical instrument for performing amputation, invented by Chassaignac of Paris. The cutting is done by a small but very strong steel chain, a loop of which is passed around the tumor or other part to be removed. The two ends of the chain run through a steel tube, and in operation are drawn through the tube by an endless screw with a lever handle, which puts the ends of the chain into tension, diminishing the size of the loop and very slowly but irresistibly tearing away the enclosed substance. Its use is always to be preceded by an anæsthetic. Its advantages are that the hæmorrhage following its judicious use is usually slight, and that healing takes place rapidly, with comparatively little suppuration. The shock is also comparatively slight; but it can never be used where nice dissection and skilful operation are required; and it is also somewhat unmanageable in its effects. Its use is becoming limited to a small and peculiar class of operations, chiefly upon mucous surfaces; in these cases its value is great.

Ectozo'on (plu. **Ectozo'a**), [from the Gr. ἐκτός, "without," "outside," and ζωόν, an "animal"], a term used in contradistinction to Entozoa [ἐντός, "within," and ζωόν, an "animal"], to indicate parasitic animals which live upon the outside of other animals, such as lice and ticks, and the crustaceans found upon fishes and whales. A more common name for these creatures is Epizoa (which see).

Ecuador, ĕk-wȧ-dōr′ [Fr. *L'Équateur;* Port. *Equador*], (*i. e.* "equator"), a republic of South America, so called because it is situated under the equator. It extends from lat. 1° 35′ N. to 5° 50′ S., and is about 800 miles long from E. to W. Area, estimated at 250,000 square miles; Guyot says 206,692. It is bounded on the N. by Colombia, on the E. by Brazil, on the S. by Peru, from which it is separated by the river Amazon, and on the W. by the Pacific Ocean. Its limits are nearly the same as those of the former Spanish province of Quito.

Physical Features and Climate.—This region presents a great variety of surface and climate in its lofty mountains, elevated valleys or plateaus, and low tracts called *tierras calientes*, the temperature of which is intensely hot. The surface is mostly mountainous, except the plains called *Llanos* in the eastern part. Ecuador is traversed by two Cordilleras of the Andes, many peaks of which, called *nevados*, rise above the limit of perpetual snow. About sixteen active volcanoes occur in this republic, one of which, Cotopaxi, is 18,875 feet high, and is remarkable for its symmetrical form, resembling a truncated cone. The highest peak in Ecuador is Chimborazo, which rises 21,424 feet above the level of the sea, and belongs to the western range. The culminating points of the Eastern Cordillera are Cayambe, 19,535 feet, and Antisana, 19,137 feet high. Between these two cordilleras is the long valley or table-land of Quito, which is 9543 feet above the level of the sea, and enjoys a temperate and very equable climate. Here and in the high valleys of Cuenca and Hambato prevails delightful weather, like perpetual spring. Winter is only distinguishable from summer by a greater quantity of rain. Copious rains often fall at Quito, and a regular rainy season prevails in the vicinity of Guayaquil on the coast, where the temperature is often above 100° Fahrenheit. Ecuador is subject to frequent earthquakes.

The chief rivers are the Amazon (here called the Marañon) and its tributaries, the Napo, Tigre, Pastaza, and Putumayo or Içá. The last of these forms the north-eastern boundary of the republic. They flow in a south-east direction, except the Marañon, which flows nearly eastward. They are navigable for steamboats in the lower part of their course. The Putumayo and Napo are said to be navigable for 500 miles or more.

Minerals, Animals, and Plants.—Granite, syenite, trachyte, and porphyry abound in the Andes of Ecuador. Among its mineral resources are gold, silver, mercury, copper, antimony, lead, iron, zinc, and salt. The forests are infested with the cougar (*Felis concolor*), the jaguar or American tiger, the panther, the bear, and the ounce. The tapir, armadillo, vicuña, guanaco, monkey, sloth, llama, and antelope are also found here. Large numbers of wild horses and cattle roam over the plains or *llanos*. Noxious reptiles and insects are very numerous and troublesome in some parts of the country. Ecuador is partly covered with extensive forests of large timber, and is said to surpass most other countries in trees suitable for shipbuilding and cabinet-work. The cinchona abounds here. Among the vegetable productions are vanilla, cocoa, balsam of tolu, caoutchouc, croton oil, the orange, cherimoya, pineapple, and many other tropical fruits. Cotton, sugar-cane, rice, pepper, coffee, and the banana are cultivated in the high lowlands, and maize, wheat, and barley flourish in the high table-lands of Quito.

Divisions, Towns, Population, Religion, Education.—Ecuador is divided into three departments—viz., Assuay, Pichincha, and Guayas, which, after their capitals, are also called Cuenca, Quito, and Guayaquil. The departments are subdivided into provinces, the department of Quito containing the provinces of Pichincha, Imbabura, Leon, Chimborazo, Esmeraldas, and Oriente; the department of Guayaquil, the provinces of Guayaquil and Manano; and the department of Cuenca, the provinces of Cuenca and Loja. The chief towns are Quito (which is the capital), Cuenca, Riobamba, Guayaquil, and Loja. Guayaquil is the principal seaport of the republic. According to Villavicencio ("Geografia de la Republica del Ecuador," 1858), the population amounted in 1858 to 1,108,082, exclusive of 200,000 uncivilized Indians. Wappäus ("Geograph. Handbuch," new ed. 1871) estimates it, on the basis of an official census of 1856, at 881,943, exclusive of 150,000 uncivilized Indians. About 600,000 inhabitants are of Spanish or European extraction; the remainder, with the exception of a small number of negroes (about 8000) and mestizoes (about 36,000), are Indians. All the races enjoy political equality. The entire population, except the uncivilized Indians, belong to the Roman Catholic Church, and the public exercise of any other form of religion is forbidden. The Roman Catholic Church has in Ecuador the archdiocese of Quito and the dioceses of Cuenca, Guayaquil, Riobamba, Ibarra, Loja, and Puerto Viejo, the last four of which have been established by Pius IX. The republic has a university at Quito (established in 1684), four colleges, eleven other high schools, several seminaries, and about 290 primary schools, of which only thirty are for girls. The Indian population grows up almost entirely without education. In accordance with the concordat of 1863, the entire public instruction is in agreement with the Catholic Church.

Government, Finances, Commerce, Army, and Navy.—The constitution of Ecuador, which is democratic and republican, was adopted in 1845, and amended in 1852 and 1853. The executive power is vested in the president, and in case of a vacancy of the presidential chair, in the vice-president. According to a law passed in 1869, the minister of the interior is at the same time vice-president of the republic. The legislative power is vested in a congress, consisting of a senate of eighteen members and a house of representatives consisting of thirty members. Congress assembles annually at Quito on Sept. 15, without being convoked by the president. The revenue of the republic amounted in 1870 to 1,813,870 piastres (1 piastre = 1 dollar), the chief source of the revenue (more than two-thirds) being duties on imports. The expenditures amount to about 1,400,000 piastres. The home debt was, in 1865, 9,390,554 piastres; the foreign debt, 3,692,955 piastres. Nearly the whole foreign trade passes through the port of Guayaquil, the ports of Manta and Esmeraldas being as yet of only small importance. The aggregate value of the exports from Guayaquil during the year 1871 amounted to 3,807,105 piastres, exclusive of precious metals, the exports of which in 1870 amounted to 1,135,467 piastres. The most important articles of export are cacao (2,134,000 piastres), gum (867,000 piastres), straw hats (93,000 piastres), cinchona bark (115,000 piastres), cotton (38,000 piastres). The total number of vessels entering the port of Guayaquil in 1870 was 125 (among which were 72 English and 18 German), of an aggregate tonnage of 55,310. The army consists of one regiment of artillery, four battalions of infantry, and three regiments of cavalry; in all, 3151 men. The navy is composed of only two steamers and one pilot-boat. The roads throughout the republic are in a shocking condition, and at the close of the year 1872 no beginning had been made yet with the construction of either railroad or telegraph.

According to the traditions of the Indians, Ecuador was anciently a mighty kingdom, consisting of fifty provinces, and probably much larger than it is at present. The name of the kingdom was Quito, and that of its inhabitants Quitoos or Quichoos. About the tenth century a strange people called Cara, who had come from the coast, conquered the Quitoos, and reigned for about 500 years. In 1475 the nation was conquered by the inca Huayana-Capac, called the "Great," who divided his dominions between his two sons, Huascar and Atahuallpa. Huascar became inca of Peru, and Atahuallpa king of Quito. Dissensions between the two brothers ultimately led to war, and in 1520 Huascar was conquered and kept a prisoner in his own capital. Atahuallpa thus became ruler of the whole empire of the incas, but in the war against the Spaniards he lost his throne and his life. (See Peru.) The Spaniards, after subduing the entire country, made Quito a presidency in the vice-kingdom of New Spain, which for nearly three centuries yielded to Spain large quantities of gold and silver, and was at one time its richest and most profitable colony. In some of its districts, however, the mines were utterly destroyed by the Indians, who by Spanish despotism were driven to desperation.

The first attempt to establish their independence was

made by the colonists in 1809, but it was unsuccessful. A second attempt in 1812 had the same fate. More successful was the revolution which in 1820 began at Guayaquil under the leadership of Bolivar. Two years later, Ecuador joined the republic of Colombia, which had been formed by New Granada and Venezuela, and in Dec., 1824, the battle of Ayacucho for ever overthrew the Spanish rule. In 1831, Ecuador separated from Colombia and became an independent republic, of which General Juan José de Flores, the companion of Bolivar, was the first president. Since then the history of Ecuador has been an almost uninterrupted series of revolutions and wars with neighboring republics. Flores remained at the head of the republic, either as president or as general-in-chief, until 1845, when he was forced to sign an agreement that he would leave the country. An insurrection attempted by the party of Flores in Oct., 1846, against the new president, Vicente Roca, was unsuccessful. In 1850 the candidate of the clerical party, Noboa, was elected president, but as early as July, 1851, he was deposed and exiled. President Urbina (1851–56) was a representative of the ultra-democratic party. During the administration of his successor, General Francisco Robles (1856–59), the French decimal system of currency, weights, and measures was adopted. A war with Peru led to the blockade of the port of Guayaquil, and was terminated by a convention concluded between Gen. Guillermo Franco, the commander of Guayaquil, and the commander of the Peruvian squadron. President Robles refused to ratify the convention, resigned, and went to Chili. In Jan., 1861, a national convention elected Dr. Garcia Moreno, the leader of the conservative and clerical party, president, while Flores was appointed governor of Guayaquil. Two wars with New Granada, which were carried on during the administration of Moreno, ended unfortunately for Ecuador. Moreno resigned in 1865; a defensive and offensive alliance which he had arranged with Chili was rejected by congress during the administration of his successor, Geronimo Carrion, but on Jan. 30, 1866, Ecuador joined the alliance of Chili, Peru, and Bolivia against Spain. Carrion, who resigned in Nov., 1867, was succeeded by Dr. Espinosa. In Aug., 1868, the country severely suffered from a terrible earthquake, by which more than 3000 persons perished. In Jan., 1869, a revolution, headed by Moreno, overthrew the administration of Espinosa. Moreno was for a short time dictator, until in May a national convention elected Dr. Carvajal provisional president. At the new presidential election Moreno was again elected president. In 1872 an insurrection of the Indians took place, which was not suppressed until many farms had been laid waste. In June, 1872, a large college, embracing schools of art, a polytechnic school, and an astronomical observatory, was opened at Quito under the direction of European professors.

A. J. Schem.

Ecumen'ical [Lat. *œcumen'icus*; Fr. *œcuménique* or *écuménique*, from the Gr. *οἰκουμένη*, the "habitable world"], a term signifying universal, applied to councils of the Christian Church in which all parts of the world are represented. (See Council, Œcumenical.) The latest of the councils called ecumenical (the Roman Catholic Council of the Vatican, 1869–70) proclaimed the infallibility of the pope.

Ecusson. See Escutcheon.

Ec'zema [Gr. *ἔκζεμα*, an "eruption," from *ἐκ*, "out," and *ζέω*, to "boil"], commonly called **Salt Rheum,** a vesicular disease of the skin, characterized by watery blisters smaller than those of herpes and larger than ordinary sudamina, such as are sometimes seen in the difficulty known as "prickly heat." Eczema is often accompanied by intense itching, and is frequently transformed into a pustular or scabbing disease. It is generally chronic. Its treatment is both local and general. The local treatment, when the epidermis is thickened, is by alkaline applications with or without tarry or astringent admixtures. The "benzoated ointment of oxide of zinc" is an excellent application. If the system has received a specific taint, the iodides, with mercury judiciously used, are indispensable, and produce the happiest results. Arsenic in small doses is an extremely useful tonic in many cases. Change of air and visits to thermal and other springs and baths, though not strictly curative, often appear to be wonderfully palliative.

Edam' [Lat. *Eda'mum*], a town of Holland, province of North Holland, has a port on the Zuyder Zee, 12 miles N. N. E. of Amsterdam. It derives its prosperity from shipbuilding and a trade in cheese and wood. Pop. in 1867, 5267.

Ed'da [Norse for "great-grandmother," so named by Bishop Sveinsson, either on account of its great age, or, according to some, as being a compilation of "grandmothers' tales"], a collection of ancient Scandinavian poems and tales illustrating the mythology of the Northern nations. It consists of two parts—(1) the poetic, old, or Sæmundic Edda, named from its compiler, Sæmund Sigfusson Frodi (1054–1133), who was a priest in Iceland: this was first published by Sveinsson in 1643; (2) the prose, or New Edda, called also "Snorro's Edda," which is the work of several writers, though ascribed to Snorro Sturleson (1178–1241). Editions of the older Edda are those of Rask (1818), Munch (1847), and Möbius (1859). The edition of Rask includes the prose Edda also. The extreme antiquity of the Eddas has been called in question by some German critics, but in arguments which have attracted very little attention.

Ed'dington, a post-township of Penobscot co., Me. Pop. 776.

Eddy (Samuel), LL.D., jurist, was born at Johnston, R. I., Mar. 31, 1769, and graduated at Brown University in 1787, became a lawyer, was clerk of the supreme court of Rhode Island (1790–93), secretary of state (1798–1819), member of Congress (1819–25), and chief-justice of the supreme court of Rhode Island (1827–35). Died at Providence Feb. 2, 1839. He published a volume of "Antiquities" and valuable historical papers.

Eddy (Thomas M.), D. D., an eloquent Methodist divine, was born Sept. 7, 1823, in Hamilton co., O., studied in the classical seminary of Greensboro', Ind., joined the Indiana conference in 1842, was editor of the "Northwestern Christian Advocate" from 1856 to 1868, served as pastor in Baltimore three years, was appointed to the Metropolitan church, Washington, D. C., in 1872, and elected the same year corresponding secretary of the Methodist Missionary Society. He was pre-eminent as a journalist, and is author of a "History of Illinois during the Civil War," 2 vols. 8vo. Died in New York Oct. 7, 1874.

Eddy (Zachary), D. D., son of the Rev. Isaac Eddy, and the seventh in descent from the Rev. William Eddy, vicar of Cranbrook, Kent, England, was born at Stockbridge, Vt., Dec. 19, 1815, was ordained by the (Cumberland Presbyterian) presbytery of Pennsylvania in 1835, was for several years a home missionary in Western New York and Wisconsin, was pastor of the Congregational church at Warsaw, N. Y., from 1850 to 1855, of the First church at Northampton, Mass., from 1857 to 1867, of the Reformed (Dutch) church on the Heights in Brooklyn, N. Y., from 1867 to 1871, and was then settled over the Central Congregational church in Chelsea, Mass. Besides occasional sermons and pamphlets, he has published "Immanuel, or the Life of Jesus Christ," 1868, and was the principal compiler of "Hymns of the Church" (Reformed), 1869.

Ed'dystone Lighthouse is in the English Channel, 14 miles S. S. W. of Plymouth Breakwater, and 9 miles from the coast of Cornwall; lat. 50° 10′ 54″ N., lon. 4° 15′ 53″ E. It stands on the Eddystone Rocks, which are daily submerged by the tide, and it rises about eighty-five feet above the high-water mark in the form of a circular tower, which gradually decreases in diameter, with a curved outline resembling the trunk of a tree, from the bottom to the top. It was erected in 1757–59 by Mr. Smeaton. (See Lighthouse.) The material is Portland limestone. It has a fixed light seventy-two feet high, visible at a distance of 13 miles. The first lighthouse here (1699–1703) was destroyed by a storm. The second was burned in 1755.

Ed'dytown, a post-village of Starkey township, Yates co., N. Y., is the seat of Starkey Seminary, under the patronage of the Christian denomination.

Ed'dyville, a post-village of Wapello co., Ia., on the river Des Moines and the Central Iowa R. R. where it connects with the Des Moines Valley R. R., 16 miles N. W. of Ottumwa, has one weekly newspaper. Pop. 1212.

Eddyville, a post-village, capital of Lyon co., Ky., on the Cumberland River, near the Elizabethtown and Paducah R. R., about 36 miles E. by S. from Paducah. Pop. 386.

Eddyville, a village of Kingston township, Ulster co., N. Y., on Rondout Creek, 2¼ miles above Rondout, is the terminus of the Delaware and Hudson Canal, and has a cement-factory.

Ede, a town of the Netherlands, in the province of Gueldern, 24 miles E. of Utrecht. Pop. in 1867, 10,452.

Ed'elinck (Gerard), an excellent Flemish engraver, born at Antwerp in 1649. He worked for many years in Paris, and was patronized by the French court and Louis XIV. He engraved portraits of many eminent persons, the "Holy Family," after Raphael, the "Virgin," after Guido, and several works of Lebrun. His engravings are commended for fidelity of design, freedom of touch, and harmony. He carried what is called color in engraving to greater perfection than any artist before his time. He is ranked among engravers of the first order. Died April 2, 1707.

E'den [a Hebrew term signifying "delight"], the name given in Genesis to the region including the garden where at first dwelt Adam and Eve, the first parents of mankind, and from which they were expelled in consequence of disobedience. Much discussion has prevailed among critics as to the country where this early paradise was situated. Ceylon, the Vale of Cashmere, the lower, middle, and upper regions of the Euphrates, the Caucasus, Toorkistan, and other regions, have been named. At present our choice appears to lie between Armenia and Babylonia, with a preponderance of argument and authority in favor of the latter. The difficulty consists in identifying the four rivers mentioned in the biblical narrative. Some commentators believe the story of Eden to be allegorical.

E'den, a township of Alameda co., Cal. Pop. 3341.

Eden, a township of La Salle co., Ill. Pop. 1523.

Eden, a township of La Grange co., Ind. Pop. 930.

Eden, a township of Benton co., Ia. Pop. 804.

Eden, a township of Clinton co., Ia. Pop. 985.

Eden, a township of Decatur co., Ia. Pop. 1065.

Eden, a post-township of Fayette co., Ia. Pop. 927.

Eden, a post-township of Marshall co., Ia. Pop. 649.

Eden, a post-township of Hancock co., Me., on Mount Desert Island, is famous for its beautiful scenery, and is a place of summer resort. It has fourteen hotels, and manufactures of lumber. Pop. 1195.

Eden, a post-township of Erie co., N. Y. Pop. 2270.

Eden, a village of Brown township, Delaware co., O., on the Cleveland Columbus and Cincinnati R. R. (P. O. name, LEONARDSBURG.) Pop. 191.

Eden, a township of Licking co., O. Pop. 782.

Eden, a township of Seneca co., O. Pop. 1483.

Eden, a township of Wyandot co., O. Pop. 1423.

Eden, a township of Lancaster co., Pa. Pop. 1075.

Eden, a post-township of Lamoille co., Vt. It has manufactures of lumber and starch. Pop. 958.

Eden, a post-twp. of Fond du Lac co., Wis. Pop. 1448.

E'denburg, a post-village of Shenandoah co., Va., on the Manassas division of the Washington City Virginia Midland and Great Southern R. R., 106 miles W. of Alexandria. Pop. 452.

E'denkoben, a town of Bavaria, in the circle of Pfalz, is on a railway, 7 miles N. of Landau. It has mineral springs and manufactures of firearms. Pop. 5103.

Eden Lake, a township of Stearns co., Minn. P. 244.

Eden Prairie, a post-twp. of Hennepin co., Minn. P. 576.

Edenta'ta (plu.), [from the Lat. *e*, privative, and *dens, dentis*, a "tooth"], an order of mammals named by Cuvier from the fact that they are either without teeth, or in other cases without incisors. Wagner and others extend the order so as to include the MONOTREMATA (which see), but the arrangement which places the latter animals below the marsupials is the more philosophical. Indeed, the Monotremata among non-placental appear to represent the Edendata among placental mammals. The order includes the sloths, the armadilloes, the true ant-eaters, etc., mostly natives of the warm parts of the southern hemisphere. The fossil bones of the *Megatherium, Glyptodon*, etc., which are found in Brazil and other countries, show that animals of this order were once large and numerous.

E'denton, a port of entry and the capital of Chowan co., N. C., is on Edenton Bay, which opens into Albemarle Sound, and about 150 miles E. of Raleigh. It has a newspaper office. Pop. 1243; of Edenton township, 3664.

Edes (BENJAMIN), a Revolutionary journalist, was born at Charlestown, Mass., Oct. 14, 1732. With John Gill he began in 1755 to publish the "Boston Gazette and Country Journal," a newspaper zealously advocating the cause of liberty, and which he continued to edit for forty-three years. Died Dec. 11, 1803.

Edes'sa [Fr. *Édesse*], or **Callirrhoe,** an ancient city of Mesopotamia, supposed to be on or near the site of Ur of the Chaldees, mentioned in Genesis xi. The extreme antiquity of its origin is undoubted. It was 78 miles S. W. of Diarbekir. It became the capital of an independent kingdom in 137 B. C., and was tributary to Rome in the reign of Trajan. In 216 A. D. it became a Roman military colony. It was an important place in the early history of the Christian Church, contained numerous monasteries, and was the residence of Ephraem Syrus. For many years it was the principal centre of Oriental learning. Baldwin, a leader of the crusaders, and afterwards king of Jerusalem, became prince or count of Edessa in 1097 A. D., and made it the capital of a Latin principality. This city was captured about 1144 by the Saracen chief Noor-ed-Deen, who massacred the inhabitants. It was afterwards possessed successively by the Byzantine emperors, the Mongols, Persians, and Turks. The site is occupied by the modern town of OORFA (which see).

Edessa, the ancient capital of Macedonia, about 46 miles N. W. of Salonica (*Thessalonica*). It continued to be the burial-place of the Macedonian kings after the court was removed to Pella. Philip, father of Alexander the Great, was killed here. This site is occupied by *Vodina*.

Edesville, a post-township of Kent co., Md. P. 3343.

Ed'foo, or **Edfou** [anc. *Apollinopolis Magna;* Coptic, *Atbo*], a small town of Upper Egypt, on the W. bank of the Nile, about 60 miles above Thebes. It has two temples, the larger one of which, recently cleared out by Mariette, is on a grand scale, and being in excellent preservation gives a good idea of the Egyptian temples in their glory. It was built chiefly by Ptolemy Philometor (181–145 B. C.), the last king of Egypt who is noticed in sacred history. Its entire length (including court and temple) is 405 feet. On each side of the entrance is a pyramidal tower 108 feet 2½ inches high, adorned with gigantic sculptures. The town has manufactures of blue cotton cloth and earthenware, and is noted for the importunity and insolence of its beggars. Pop. 2000.

Ed'ford, a township of Henry co., Ill. Pop. 948.

Ed'gar, a county of Illinois, bordering on Indiana. Area, 600 square miles. It is partly drained by Little Embarras River. The surface is nearly level, the soil fertile. Grain, cattle, wool, hay, butter, etc. are produced. Carriages, saddlery, etc. are among its most important manufactures. A large part of the county is prairie. It is intersected by the Indianapolis and St. Louis, the Paris and Decatur, and the Paris and Danville R. Rs. Pop. 21,450. Capital, Paris.

Edgar, a township of Edgar co., Ill. Pop. 1617.

Edgar, a post-village, capital of the parish of St. John the Baptist, La., is situated on the W. bank of the Mississippi River. It has a court-house, two Catholic and two Protestant churches, sugar-mills, one steam rice-mill, a number of stores, and two newspapers.

DUMEZ & BELLOW, EDS. OF "THE MESCHACÉBÉ."

Ed'gartown, a port of entry and the capital of Dukes co., Mass., is on the E. shore of the island of Martha's Vineyard, 30 miles from New Bedford. It is a much-frequented watering-place, containing the noted camp-meeting grounds of Oak Bluffs. It has a national bank, a savings bank, a newspaper, three churches, good schools, and numerous hotels. It has a small but safe harbor, and a pier on which is a fixed light 37 feet high, in lat. 41° 22′ 25″ N., lon. 70° 29′ 51″ W. This place formerly sent out many whaling-ships, but that business has of late declined. Edgartown has communication by steamboat with the mainland. Pop. of Edgartown township, 1516.

E. MARCHANT, ED. "VINEYARD GAZETTE."

Edgecomb, a post-twp. of Lincoln co., Me. P. 1056.

Edgecombe, a county in the N. E. of North Carolina. Area, 600 square miles. It is intersected by the Tar River. The surface is nearly level; the soil is mostly sandy. Cotton, rice, and corn are raised. The Wilmington and Weldon R. R. passes through the western part of the county. Capital, Tarborough. Pop. 22,970.

Edgefield, a county in the W. of South Carolina. Area, 1540 square miles. It is bounded on the N. by the Saluda River and on the S. W. by the Savannah. The surface is diversified by hills of moderate height; the soil is fertile. Grain, cattle, cotton, wool, and lumber are produced. It is intersected by the Charlotte Columbia and Augusta R. R. and the South Carolina R. R. Pop. 42,486. Capital, Edgefield Court-house. Since the census of 1870 a part of this county has been included in the new county of Aiken.

Edgefield, a village of Davidson co., Tenn., on the right bank of the Cumberland River, opposite Nashville, with which it is connected by a suspension bridge. Pop. 4389.

Edgefield Court-house, a post-village, the capital of Edgefield co., S. C., is about 24 miles N. of Augusta, Ga. It has three or four churches and one weekly newspaper. Pop. 846.

Edgehill, a ridge in England, in Warwickshire, 7 miles N. W. of Banbury, was the scene of the first great battle of the civil war, which occurred Oct. 23, 1642. The royalist army was commanded by Charles I., and that of the Parliament by the earl of Essex. Prince Rupert, by a charge of cavalry, broke the left wing of the Parliamentarians, whom he pursued to Keinton, while the right wing of Essex's army defeated the royalists.

Edgemont, a post-twp. of Delaware co., Pa. Pop. 678.

Edg'erton, a post-village of St. Joseph's township, Williams co., O. Pop. 690.

Edgerton, a post-village of Rock co., Wis., on the Milwaukee and St. Paul R. R., 25 miles S. E. of Madison. Good cream-colored bricks are made here.

Edgewater, a post-village of Middletown and Southfield townships, Richmond co., N. Y. It is on Staten Island, and is inhabited chiefly by New York business-men and their families.

Edgewater, a borough of Allegheny co., Pa. Pop. 380.

Edgeworth (Maria), a popular English authoress, born near Reading Jan. 1, 1767. She removed with her father, Richard Lovell Edgeworth, to Edgeworthstown, in Ireland, in 1782. She assisted him in the composition of a "Treatise on Practical Education" (1798) and in an "Essay on Irish Bulls" (1802). In 1801 she produced "Castle Rackrent," the first of a series of novels, which have a good moral tendency, are pervaded with agreeable humor and sound sense, and give a graphic delineation of character. Among these novels, which obtained a durable popularity, are "Belinda" (1803), "Leonora" (1806), "Patronage" (1814), "Ormond" (1817), and "Helen" (1834). She also published "Popular Tales" (1804) and "Tales of Fashionable Life" (1809–12). Died May 21, 1849. "The writings of Miss Edgeworth," says Lord Jeffrey, "exhibit a singular union of sober sense and inexhaustible invention, and a minute knowledge of all that distinguishes manners or touches on happiness in every condition of human fortune." (See "Edinburgh Review" for July, 1809, July, 1812, and Aug., 1817; also Sir Walter Scott's critique in the "Edinburgh Review" for Jan., 1814.)

Edgeworth (Richard Lovell), F. R. S., an English writer and philosopher, the father of the preceding, was born at Bath in 1744. He inherited from his father an estate at Edgeworthstown, in county Longford, Ireland. He married a Miss Elers about 1764, after which he resided in Berkshire, England, where he associated intimately with Dr. Darwin and Thomas Day. In 1782 he removed to Edgeworthstown. Among his works are "Professional Education," a "Treatise on Practical Education" (1798), "Irish Bulls" (1802), and autobiographic memoirs. He was a man of genial temper and versatile talents. Died June 13, 1817.

Edg'ington, a post-township of Rock Island co., Ill. Pop. 1106.

E'dict [Lat. *edic'tum;* Fr. *édit*], a public decree or proclamation issued by a sovereign or other potentate; an instrument signed and sealed as a law. In ancient Rome the power of making edicts was principally exercised by the *prætor urbanus* and the *prætor peregrinus,* who on coming to office published rules for regulating the practice of their courts, etc. The edicts of a prætor were not binding on his successor, but if confirmed by the latter they were called *edicta vetera* (old edicts), as distinguished from the *edicta nova* (new edicts) framed by himself. A digest of the best decisions of the prætors was made under the emperor Hadrian by Sylvius Julianus. It was called "Edictum Perpetuum," and made the invariable standard of civil jurisprudence. The "Edict of Milan" was issued, after the conquest of Italy, by Constantine (313 A. D.), to secure to Christians their civil and religious rights.

Edict of Nantes, one of the most famous edicts of history, was issued by Henry IV. of France in 1598, to secure to the Protestants the free exercise of their religion. This act was repealed by Louis XIV. in 1685, and its revocation led to a renewal of the bloody scenes which before the issuing of this edict had been carried on against the Huguenots. The depopulation caused by the sword was also increased by emigration. Above half a million of her most useful and industrious subjects deserted France, and exported, together with immense sums of money, those arts and manufactures which had chiefly tended to enrich the kingdom. About 50,000 refugees passed over into England, and many more into Germany and America; and there can be little doubt that the cruelties perpetrated by the king of France tended to excite the suspicion of the English against their own Roman Catholic sovereign, and accelerated the revolution of 1688.

Edi'na, the county-seat of Knox co., Mo., 40 miles N. W. of Quincy, Ill., on the Quincy Missouri and Pacific R. R. It has two newspapers, five churches, a public school building completed at a cost of $10,000, and two hotels. Pop. 807.

James C. Claypool, Ed. of "Sentinel."

Ed'inboro, a post-borough of Erie co., Pa. It is the seat of a State normal school. Pop. 801.

Edinburg, a post-village of Johnson co., Ind., on the Blue River and Indianapolis and Louisville R. R., 29 miles S. of Indianapolis. It has one bank, three churches, a high school, two hominy-mills, a starch-factory, good water-power, and one newspaper. Pop. 1799.

A. M. Ernsberger, Ed. "Watchman."

Edinburg, a township of Penobscot co., Me. Pop. 55.

Edinburg, a post-village, capital of Hidalgo co., Tex., on the Rio Grande, about 50 miles above Brownsville. It has a custom-house.

Ed'inburgh, capital of Scotland and of Edinburghshire or Mid-Lothian, is picturesquely situated about 1 mile S. of the Frith of Forth, 399 miles by railway N. N. W. of London; lat. 55° 57′ N., lon. 3° 12′ W. It is divided into the Old and New Town, the former of which occupies the middle and highest of three ridges extending E. and W. The Old Town is separated by a narrow hollow or ravine from the New Town, which is built on a broader ridge with more gently sloping sides. Edinburgh is remarkable for the elegance and solidity of its buildings, which are all of stone. The adjacent country is pleasantly diversified with hills and plains. On the south-eastern border of the city a hill called Arthur's Seat rises to the height of 822 feet, and about 4 miles S. W. of Edinburgh is the range of the Pentland Hills.

The principal street of the Old Town is that which extends along the crest of the ridge, bearing in different parts the names of Canongate, High street, Lawn Market, and Castle Hill. It is more than a mile long, and rises with a regular but rather steep acclivity from the palace of Holyrood, which is at its eastern end, to the huge rock on which stands Edinburgh Castle, 443 feet above the level of the sea. This street is lined with lofty and antique residences, many of which have seven or more stories. The houses of the New Town are built of a fine white freestone quarried in the vicinity, and are remarkably handsome. Here are three parallel avenues called Queen street, George street, and Prince's street, the last of which extends along the S. side of the New Town, close to the hollow which separates it from the Old. Prince's street is the most agreeable promenade in the city, and as it is lined with houses only along its northern side, it commands a fine view of the Old Town with its lordly castle and of the intervening valley adorned with public gardens. At the eastern end of this street is a rocky eminence called Calton Hill, the broad verdant summit of which commands a beautiful view of the Frith of Forth, here about 6 miles wide. Arthur's Hill and another high hill called Salisbury Crags afford prospects of almost unrivalled beauty and magnificence.

The most remarkable public edifices and monuments are the castle, which is a large fortress capable of accommodating 2000 men, and is one of the oldest structures in the city; the royal palace of Holyrood, or Holyrood House, the oldest part of which was built about 1528: this palace is quadrangular in form, with a central court 94 feet square, and is famous as the residence of Mary queen of Scots; the cathedral of St. Giles, a large and ancient edifice of unknown date, in the later Gothic style; Victoria Hall, or Assembly Hall, a magnificent structure, which stands at the head of High street, has a spire 241 feet high, and is the place where the General Assembly of the Church of Scotland annually meets; the Parliament House, now a hall connected with the courts of law; and the admirable monument erected to Sir Walter Scott, which stands on Prince's street, is 200 feet high, and is unequalled among the monuments of this metropolis for artistic beauty. Among the other objects of interest are the old Tron church; the Free St. George's church; the Free High church; the university buildings; the observatory; the National Gallery of Art; the Royal Institution, a beautiful Grecian edifice containing the apartments of the Royal Society; a chapel belonging to the ruined abbey of Holyrood, founded by David I. about 1128; the theatre; and the National Monument (an imitation of the Parthenon) on Calton Hill.

In 1861, Edinburgh contained 115 churches and chapels, classified as follows: Free Church, 31; Church of Scotland, 26; United Presbyterian, 18; other Presbyterian, 3; Episcopal, 13; Baptist, 7; Congregational, 3; Roman Catholic, 3; Methodist and Evangelical, 4; Unitarian, 1; other bodies, 6. It is the seat of a bishop of the Episcopal Church and of a Roman Catholic vicar-apostolic. It has numerous large and richly endowed hospitals and charitable institutions, among which is Heriot's Hospital, founded for the education and maintenance of poor boys. This city is important as a centre of learning, and is distinguished for the number and excellence of its literary, scientific, and educational institutions. The aristocracy, the literati, and professional men form an unusually large proportion of its population, which is extensively engaged in the business of printing and publishing books. Edinburgh is the head-quarters of the book-

trade in Scotland, and as a literary mart is second only to London among British cities. Here is the celebrated University of Edinburgh, founded by James VI. in 1582, which has a library of about 140,000 volumes. (See separate article.) The other chief educational institutions are the High School, which occupies a handsome Doric edifice 270 feet long; the New Academy (or college) of the Free Church; the Royal College of Surgeons; the medical school; the Royal Academy of Fine Arts, and the Royal Society. The Advocates' Library has the largest and most valuable collection of books in Scotland—about 170,000 volumes.

Edinburgh is the seat of the supreme courts of Scotland, the principal of which is the court of session, composed of thirteen judges. This court tries all civil causes, and decides not only on the law of the case, but also in questions of equity. This city returns two members to Parliament. By virtue of ancient charters and modern acts of Parliament it is a royal burgh, governed by a town council elected by popular vote, and by a lord provost, who is elected by this town council. It is the terminus of important railways—viz., the North British, the Edinburgh and Glasgow, and the Caledonian Railway. This city has two ports on the Frith of Forth—Leith and Granton, the former of which is 2 miles from the Cross of Edinburgh. Pop. in 1871, 196,500.

History.—This place was recognized as a burgh by David I. in 1128, and a Parliament was held here in 1215. It became the capital of Scotland about 1436, when its castle was selected as the only place of safety for the royal household and the Parliament. It was enclosed by walls in the fifteenth century, and for a long period was confined to the central ridge. The hollow between this and the northern ridge was filled with water, called the North Loch. The New Town originated about 1765, when a bridge was erected across that loch to connect the Old Town with the New. Here occurred in May, 1843, the disruption of the Established Church, from the General Assembly of which 203 members seceded and organised the Free Church. Sir Walter Scott and Lord Brougham were born here.

Edinburgh, a post-village of Grundy co., Mo., is the seat of Grand River College, founded in 1858.

Edinburgh, a post-township of Saratoga co., N. Y. It has manufactures of lumber. Pop. 1405.

Edinburgh, a post-township of Portage co., O. P. 929.

Edinburgh (Alfred Ernest Albert), Duke of, second son of Victoria, queen of Great Britain, was born at Windsor Castle Aug. 6, 1844. He was educated chiefly by private tutors. He entered the British navy in 1858, and served chiefly on foreign stations. In 1862 he declined the crown of Greece, which was offered him, and in 1866 took a seat in the House of Peers by his present title. In 1867 he set sail in command of the frigate Galatea, visiting Australia, Japan, China, India, etc. At a picnic at Clontarf, New South Wales, Mar. 12, 1868, he was slightly wounded by a pistol-shot fired by a Fenian named O'Farrell. The latter was soon afterwards executed. The full title of this prince is, "His Royal Highness Prince Alfred Ernest Albert, Duke of Edinburgh, Earl of Kent, and Earl of Ulster, K. G., K. P." He is also a duke of Saxony and prince of Saxe-Coburg-Gotha.

Edinburgh Review, a celebrated critical journal founded at Edinburgh in 1802, is the oldest of the great British quarterly reviews. Francis Jeffrey, Sydney Smith, Henry Brougham, and Francis Horner were the founders and first contributors of this review, which was a strenuous advocate of Whig principles. Sydney Smith edited the first number, of which 750 copies were printed. Mr. Constable was the original publisher. Lord Jeffrey became its editor in 1803, and conducted it with great ability and success for twenty-six years. The brilliant wit, the critical keenness, the eloquent style, and the extensive knowledge displayed by the contributors produced a great sensation in the literary world. Its circulation had risen to 9000 in 1808, and 12,000 or more in 1813. Among the eminent men who contributed largely to this review were Macaulay, Carlyle, Lord Brougham, Sir J. Mackintosh, and Henry Rogers. Macvey Napier succeeded Lord Jeffrey as editor in 1829. The price paid to contributors was at first ten guineas a sheet, but it was soon raised to sixteen guineas.

Ed'inburghshire, or **Mid-Lothian,** a county in the S. E. part of Scotland, has an area of 397 square miles. It is bounded on the N. by the Frith of Forth. The surface is diversified by plains and high ridges, among which are the Moorfoot Hills and the Pentland Hills, composed of porphyry. The highest point of the Pentland Hills rises 1839 feet. The rocks of this county belong mostly to the carboniferous and Silurian formations. Valuable coal mines are worked in the valley of the Esk. The soil is generally fertile and well cultivated. Near the metropolis are many nurseries, dairy pastures and vegetable gardens. It is traversed by five great railways. Pop. in 1871, 328,335. Capital, Edinburgh.

Edinburgh, University of, was founded by James VI. of Scotland in 1582. In 1600 the senatus academicus consisted of a principal and four regents. The first chair of theology was founded in 1642, and the first professor of medicine was appointed in 1685. In 1760 the senatus academicus consisted of a principal and eighteen professors. Since that date ten chairs have been added. In 1858 its constitution was changed by an act of Parliament, which took the government out of the hands of the lord provost and town council of Edinburgh, and gave it to the senatus academicus and a university court. The patronage of the chairs was then transferred to seven curators, three of whom are nominated by the university court and four by the town council. The university consists of the faculties of arts, medicine, theology, and law. The faculty of arts comprises the chairs of humanity, Greek, mathematics, logic and metaphysics, moral philosophy, natural philosophy, rhetoric and belles-lettres, universal history, astronomy, agriculture, and music. Connected with this university are a large library, a museum of natural history, and a botanic garden.

Ed'isto, a river of South Carolina, is formed by the North and South Edisto, which unite at Edisto, a station on the South Carolina R. R. The North Edisto is the boundary between Barnwell and Orangeburg counties. The main stream flows south-eastward and southward through Colleton county, and enters the Atlantic Ocean by two channels, called the North and South Edisto Inlets, between which is Edisto Island.

Edisto Island, one of the most important of the Sea Island group, is in Charleston co., S. C., between the North and South Edisto Inlets. It produces sea-island cotton. It has a post-office of the same name. Pop. 2762.

Ed'meston, a post-twp. of Otsego co., N. Y. P. 1744.

Ed'monds (Francis W.), an American painter, born at Hudson, N. Y., Nov. 22, 1806. He visited Rome in 1840, before which date he had exhibited, besides other works, "The City and Country Beaux" and "Dominie Sampson." Died about 1860.

Edmonds (John Worth), an eminent American jurist, was born at Hudson, N. Y., Mar. 13, 1799, and graduated at Union College (now Union University) at Schenectady, N. Y., in 1816. In 1819 he was admitted to the bar, and in 1820 commenced the successful practice of law in his native town. In 1831 he entered the New York legislature as a member of the Assembly, and in 1832 became a State senator. In 1836 he was appointed a U. S. Indian agent. He retained the position for two years, and became familiar with several Indian languages. In 1841 he re-entered upon the practice of law, and opened an office in New York City, which was from that time his home. In 1843 he was appointed one of the State prison inspectors, and labored with zeal and success in introducing reforms in prison discipline. In 1845 he was appointed a circuit judge, and in 1847 became one of the judges of the supreme court, New York. In 1852 he was appointed to the bench of the court of appeals, from which in 1853 he retired to the private practice of law, in which he was after a time a partner with Hon. William H. Field. In 1851, Judge Edmonds became a convert to the doctrines of Spiritualism, and in 1853 openly avowed and defended his belief of that unpopular faith by the publication of a work entitled "Spiritualism." He subsequently published many other writings in favor of his belief, of which he became one of the leading champions. He also became an active medium, and believed himself to be in almost constant communication with departed spirits. There can be no doubt that his advocacy of Spiritualism cost him his place on the bench. Judge Edmonds was a man of cultivated mind and of singularly pure and amiable character. In public and private life alike he was honorable and universally respected. As a lawyer he was able and learned. As a judge he was sound, wise, and above any suspicion of wrong-doing. He avowed his peculiar religious views with the greatest courage and persistency, and there can be no question that he was fully convinced of the truth of what he professed. During the latter part of his life he suffered much from a severe chronic disease, but his legal advice was much sought in difficult cases to the last. He died April 5, 1874, an unwavering believer in the truth of Spiritualism.

Ed'mondson, a county in S. W. Central Kentucky. Area, 230 square miles. It is intersected by Green River. The surface is undulating or hilly; the soil fertile. Tobacco and grain are staple crops. Beds of coal and cavernous limestone underlie this county, in which the celebrated Mammoth Cave is situated. Capital, Brownsville. P. 4459.

Ed'monson, a township of Crittenden co., Ark. Pop. 160.

Ed'monton, a post-village, capital of Metcalfe co., Ky., about 50 miles E. of Bowling Green. Pop. 146.

Ed'mund I., king of the Anglo-Saxons, born about 922 A. D., was a son of Edward the Elder and a grandson of Alfred the Great. He became king in 941, and conquered the Britons of Cumbria. He is said to have been a brave and prudent ruler. He was assassinated by Liof May 26, 946, and was succeeded by his brother Edred.

Edmund II., surnamed IRONSIDE, king of England, born in 989 A. D., was a son of Ethelred II. At the death of the latter, in 1016, the Danes possessed the greater part of England. Edmund, who was renowned for courage, waged war against Canute the Dane, and gained several victories, but was defeated at Assandun. The two rivals then agreed to divide the kingdom, of which Edmund received the southern part. He died Nov. 30, 1016, and Canute then became sole king.

Ed'munds, a township of Washington co., Me. P. 448.

Ed'munds (GEORGE F.), an American lawyer and Senator, born at Richmond, Vt., Feb. 1, 1828. He was chosen in 1854 a member of the legislature of his native State, which in 1865 elected him to the Senate of the U. S. He was re-elected as a Republican for a term of six years (1869–75). In Dec., 1872, he was appointed chairman of the committee on the judiciary.

Ed'na, a post-township of Cass co., Ia. Pop. 367.

Ed'neyville, a post-township of Henderson co., N. C. Pop. 1125.

Edom, a name of ESAU (which see).

Edom, a country of Asia. See IDUMÆA.

Ed'red, king of the Anglo-Saxons, was a son of Edward the Elder. He succeeded his elder brother, Edmund I., in 946 A. D. Saint Dunstan acquired an ascendency over Edred, and was his most powerful minister. Edred died Nov. 23, 955, and was succeeded by his nephew Edwy.

Ed'riophthal'ma [from the Gr. ἑδραῖος, "fixed," and ὀφθαλμός, "eye"] are a group of crustaceans called the sessile-eyed Crustacea, because their eyes are placed directly upon the shell, instead of being mounted upon footstalks. They have the organs of respiration connected with the organs of locomotion. None of the Edriophthalma attain more than an inch and a half in length. They are generally marine, though some of them of the order Amphipoda inhabit fresh water, and a few, belonging to the Isopoda, such as the wood-louse, are terrestrial, but inhabit damp places. To the Amphipoda belong the common sand-hoppers, which are found in myriads along sandy shores. Some of the Edriophthalma are parasitic on other marine animals.

Edri'si, or **Edree'see,** an eminent Arabian geographer, was born at Ceuta, in Africa, about 1100. He was descended from the royal family of Edrisites. He travelled extensively in Europe and Asia, and passed many years at the court of Roger II., king of Sicily, by whom he was liberally patronized. Edrisi made for this prince a silver terrestrial globe, and wrote a large book on geography, which was long a standard work. M. Jaubert published a French translation of it in 1836. Died about 1175.

Ed'son, a township of Chippewa co., Wis. Pop. 231.

Educa'tion [Lat. *educatio*]. The word *educate* signifies "to lead out," or, as applied to the human mind or body, to draw forth its faculties into vigorous action. Education may be defined, *the process of developing and training the powers and capacities of human beings.* It pertains not to any part, as the mind in distinction from the body or the moral faculty, but in its widest and truest sense it relates to the whole of man. The education of any part exclusively or unduly results in disproportion or distortion in development, and destroys harmony and symmetry in mind and character.

In determining beforehand what course of education shall be adopted, it is essential to have a definite conception of *the object* to be attained. Different opinions as to the proper object to be sought will lead to the choice of different courses and methods. Each enlightened nation of both ancient and modern times has had its own general theory of the purpose of education, and has made its practice conform thereto. The object, and therefore the method, of education in ancient Greece and ancient Rome were essentially unlike. And so the several nations of modern Europe have differed in their views on this subject, and have illustrated their differences in their educational systems. In the U. S. there has prevailed an ideal, and a corresponding practice, unlike those of any other country. Different sections or states in the same nation have also had their peculiar views and usages. Ancient Athens and Sparta had very little resemblance, though both were prominent cities in the same country.

Without attempting to give even an outline of the various theories as to the object of education, and of the systems based upon them, the following is suggested as a supreme object which can hardly fail to commend itself to candid and thoughtful persons. Education, wisely directed, should aim to accomplish three things: (1) the imparting and acquiring of knowledge as extensive, various, and comprehensive, and also as thorough and complete, as practicable; (2) the training, discipline, and culture of all the faculties, physical, intellectual, social, and moral, to as high a degree of effectiveness for their several functions as opportunities and circumstances permit; and (3) the elevation of the whole man to as high and worthy a character as can be attained. To lead men to know, to do, and to become—these three results education should achieve.

1. The imparting and acquiring of knowledge. This is the first step in human development. The mind of a new-born child is an utter blank. The miniature man contains the germs and possibilities of all that he may afterwards become. The body has the organs of sense, by which its indwelling soul is to communicate with the outward world, and the soul has those latent susceptibilities and faculties and tendencies which will be disclosed as development and education draw them forth into activity. The theory of "innate ideas" has also strong claims to be recognized as true. The opposite theory, that all knowledge is derived from communication between the soul and the visible world through the senses, is manifestly not true. But education, while it should recognize the reality and high importance of these "innate ideas"—*e. g.* those of right and justice, of extension and duration—is mainly concerned, at first, with the giving and receiving of knowledge respecting those objects which come within the range of the child's observation. The aspects and qualities of any object are new and strange and wonderful to the infant's opening mind. He is perpetually investigating and examining and inquiring, and thus gathering up new truths. The ceaseless inquisitiveness of children is sometimes sharply rebuked. Doubtless, it is somewhat annoying, but it is inevitable. The little world in which they live is, for them, full of wonders and mysteries, and their minds crave knowledge as eagerly as their bodies crave food. A healthy mind healthily trained never loses this instinctive longing for new truth. The sources and objects of knowledge are innumerable. The material world gives rise to the ever-increasing number of sciences, or rather branches of science, for every science is connected, nearly or remotely, with every other. The human body is itself a most interesting and important subject of study. But careful thought respecting the body naturally suggests further inquiry as to the nature and source of the life that dwells within it, and this leads by easy transition to the discussion of the nature and the faculties of the human soul, or from material to mental science. Then the pursuit of this latter science leads upward from man to higher beings, even to the Highest of all. Thus, the acquirement of knowledge is, in point of time, the beginning of education, though it may also continue through all subsequent life.

2. The discipline, culture, and training of the several faculties. The mere acquisition of knowledge is not education. In early childhood it is doubtless the most important part, and almost the only part that is practicable. But it calls into exercise chiefly the observing or perceptive powers and the memory; the latter faculty being employed, at that stage of education, in storing up an ever-growing multitude of facts. But the development of memory alone is not education. Knowledge is the food of the mind. In order that food may strengthen the body, it must be duly digested and assimilated. And so knowledge must be not merely grasped, in its rudiments, by the indiscriminating memory, but must be comprehended, and, so to speak, digested, in order that it may nurture the mind. The body is of more worth than the food that sustains it; the mind is of more value than all the knowledge it can acquire. In the process of mastering that knowledge it puts its powers into exercise, and thus learns how to use them. Knowledge is good in itself, and may wisely be sought for its own sake. But the immense majority of mankind can spend but a very small part of their lives in acquiring it. Necessity demands of them to make some practical use of their powers, both of body and mind. Their education must not be for the gratification of taste nor for display, but must fit them for some active service in the world. It is a common error to suppose that the ability to excite astonishment by the array of learning is proof of thorough education. But he who, in mastering knowledge, acquires full mastery of himself, and is thus able to employ any faculty as duty or inclination may require, is most truly educated. Power is what men instinctively desire. They can gain it by so training their faculties as to have them always at command. To know how to use

the mind or the body is to have given it a real education. It is well known that great scholars are often men of little practical efficiency. Cloistered students, who seldom mingle with the world, are more useful to it than is generally believed, but not many can thus serve their generation. The education demanded is one that shall train the faculties, by exercising them, for wielding power. The body, the intellect, the conscience, the affections, the will, *the whole man*, is to be disciplined and cultured to labor in and for the world.

3. But the *kind* of power which a man shall wield is even more important than the degree. The *quantity* of power in any man depends upon his natural gifts, and his acquired ability to use them effectively; the *quality* of his power is determined by his *character*. The world is unhappily too familiar with those who have used great power in doing great harm. Selfishness, ambition, greed of gain, indifference to the rights and the sufferings of others, have characterized multitudes of the world's great men. Any person, whether his power be great or small, is a blessing or a curse to his generation and to the world, according as his character is good or evil. The *moral* element of education determines its quality. The spirit of gentleness, kindness and beneficence invariably carries joy and gladness wherever it goes; the opposite spirit as invariably produces pain and grief. Character determines what kind of exertion any one shall put forth, and what direction shall be given to it. A noble character is the grandest and most permanent result of education. Knowledge is at the best partial and fragmentary. Only an infinitesimal part of the universe of truth can be grasped by any mind. Human wisdom or power, however great, is weakness itself when compared with the boundless physical power that is latent in nature, and is nothing in comparison with the wisdom and might of the Infinite One. Let knowledge be increased. Let discipline and culture be carried upward to the highest attainable point. But, especially, let education be directed towards the building up of strong, symmetrical, well-balanced, pure, exalted, perfect character. Learning is good, power is good, culture is good, but character is more important than all of them. Knowledge and culture are *in* the man, but character *is* the man. Education should regard what he is to *know*, and what he shall be able to *do*, but, above all, what he is to *become*. It should develop and train him with continual reference to the destiny that awaits him as heir to an endless, God-like existence.

Since the object to be sought by education is nothing less than the perfecting of human character and the exaltation of human nature, the next point to be considered is, *How may this be most surely accomplished?* The difference between a human being at the beginning of his existence, and that which he may become when ennobled, by means of education, to the highest conceivable perfection, is almost infinite. The process of thus lifting him up ever higher and higher cannot be an easy nor a sudden one. The work is so great, and the difficulties so many; the workers, the instruments, and the material wrought upon are so imperfect; and the time requisite for completing the work is so long, that the perfected result must come, if at all, in the far-off future. But a high ideal is of great worth, even though it be far beyond present attainment.

Any process of education, to be successful, must conform to the natural order of human development. There is a regular fixed succession in the growth of the human soul, as in the growth of the body.

1. *Physical education* demands the earliest care. This includes the observance of the laws of health in respect to food, clothing, cleanliness, pure air, and exercise and rest in due measure and alternation. Soon comes the period for practising and training the various members of the body, to strengthen them, and to give the will perfect control over them, so that they shall perform their several functions accurately, vigorously, and promptly. The habits of the body as regards its modes of action are acquired very early. The flexible limbs of children may readily be trained to easy, graceful motions. Those persons whose earliest years are passed in cultivated society acquire almost unconsciously an ease and freedom of manner which no later training could impart. The impressions which the human body receives and the lessons which it learns in its infancy can never afterwards be effaced. Children instinctively imitate older persons, even in trifling particulars. The importance of good models and correct examples is therefore obvious. Education in manners, though it may seem to be merely superficial, has a closer connection with character than is often believed.

2. The *intellect* is the part of man most commonly considered in education. In the process of intellectual education a careful observance of the mind's natural order of development is indispensable. The mental faculties are developed in an unvarying order. (*a*) The *perceptive* powers are first called into activity. There is an exact adaptation of these powers to the phenomena of the visible world. The newly-awakening senses observe these phenomena, curiosity is excited, and ideas of form, size, color, space, and distance are acquired. Especially does a young child learn very early to read human character, and to interpret with accuracy the meaning of tones of voice and expressions of countenance. Beauty and brightness attract him, and he distinctly reveals his preference for gentleness and kindness. A very few years are past ere he has gained complete use of his bodily senses, and of the perceptive powers that are so intimately connected with them. The other mental faculties await their time while these powers are unfolding. Their office is to ascertain facts, and to report them to the memory, which holds them in readiness for subsequent use. (*b*) Next appears in activity the power of *expressing the ideas* that have been acquired; in other words, the use of language. The learning of a language requires the recollection of a large number of words and of their several meanings. A child's memory is adapted to this kind of recollection. It lays hold of particulars, and retains them singly, while he is not yet able to grasp their connections. So readily do children acquire language that many cases have been known of their learning simultaneously to talk in two or more languages, and to use each correctly in conversing with those unacquainted with the others, passing readily from one to another in addressing different persons. But for the great majority a single language suffices. Those early years are the time when it should be learned correctly. Vicious habits of speech commonly result from incorrect early training, and, like other lessons of early childhood, they are seldom perfectly unlearned. Children have also a strong propensity to copy visible objects. Next to a living animal itself, they admire a picture of it, and they soon desire to make such a picture. Their first efforts of this kind are necessarily crude and unsuccessful, but the disposition to make such efforts is a clear indication, in the order of mental development, that education at that period should be directed to training the eye and the hand in the useful arts of writing and drawing. Working with Nature, and at the time which she indicates as the best, will be most successful. (*c*) A little later in the process of intellectual development comes *the power of perceiving the connections of truths*. The understanding is developed, and facts acquire new meaning as their relations and combinations are understood. There is a unifying of the knowledge previously gained, and principles are recollected instead of isolated facts. This perception of the logical relations of truths enables the learner to think consecutively and to reason correctly. He can advance into new regions of thought and master new truths, acquainting himself with them not in their isolation, but as parts of a harmonious system. The man who has not learned to think logically may accumulate in memory vast numbers of facts, but he cannot use them; they are a burden and a hindrance to further mental growth. He cannot be a man of power, for he has not learned to use his acquisitions. (*d*) But logical power is not the highest development of the mind. Logic arranges knowledge and makes it available. Higher than mere logic is the *reason*. This faculty connects man most nearly with his Maker. It rests not upon the opinions and deductions of men; it is not dependent upon the processes of logic; but it summons all human thoughts and opinions before its tribunal, and pronounces upon them in accordance with the eternal principles of right and truth. It takes cognisance of truths and laws of which the senses can give no evidence, and perceives a unity where the multiplicity of facts tends to produce confusion. It leads up from all visible things, and from the phenomena of the self-conscious soul, to the invisible and almighty Author of all.

3. The *moral faculty* of the soul also requires education. The development of this faculty and of the intellect advance simultaneously. *Moral education is the training of the will to act firmly in accordance with the dictates of conscience.* This training should begin with infancy. Intellectual training culminates in the development and supremacy of reason; moral training, in the complete subordination of all propensities and desires to the control of conscience. Every child has an inborn perception of the distinction between right and wrong, but experience abundantly proves that the tendency to disregard the inward command to do right is universal. There is from the outset a necessity for strengthening the moral faculty, and for educating the young to obey its commands. The inclination to disobey or disregard it tends to weaken it, and to detract from the clearness of its perceptions and the force of its mandates. This tendency must be resisted and overcome by education. At first, this education must involve *obedience to authority*. A command is to be given in accordance

with the right, and absolute submission to such command must be enforced. Afterwards the right and wrong of proposed conduct must be shown, and the child trained to do the right because it is right. When he does this voluntarily, he has begun to submit his will to his conscience. By constant, careful, and persistent training, with judicious encouragement and aid, or, if necessary, with occasional severity, he learns self-control. Moral education must lead to the *voluntary* doing of the right and rejection of the wrong. The decision for the right must be reached in spite of temptations and inclinations to the contrary. The most weighty reason for choosing the right is that it conforms to the will of the Supreme Author and Controller of human destiny. Perfected moral education results in entire conformity to that Will which is in supreme accord with Right.

Physical, intellectual, and moral education includes all the powers and capacities of man. To train all these aright is to fit him for his duties and his destiny—to make him, ultimately, the wise, exalted, and happy being that he is fitted to become. But the relations in which men stand to each other and to Him who made them may properly receive a brief consideration. From the first-named relation certain duties result, for which preparation is requisite. This preparation may be termed—

4. *Social or Political Education.*—Social education is acquired chiefly by intercourse with mankind. It is largely the result of the incidental connection of people with each other in the ordinary transactions of life. But an essential part of a right social education is a careful regard for the rights of others, and a manifest desire to promote their enjoyment. This connects it closely with moral education. There is a social training which is wholly superficial, which is profuse in *professions* of interest and good-will, but deficient in *proof* of them. There is another kind which unduly neglects to *manifest* interest and regard that are really felt. Both the feeling and the manifestation, in due measure, are requisite to a symmetrical social education. *Political education* concerns the relations of the citizen to the government. In a nation where the government is "of the people, by the people, and for the people," the necessity and importance of this education are obvious. The rights and duties of citizens; their obligation of obedience to law; of seeing that good laws are enacted and enforced; that the weak and helpless are protected; that the grasping and unjust are restrained and evil-doers punished; that the enacting, explaining, and enforcing of laws are entrusted to competent and trustworthy men; that the rights of both labor and capital are duly protected; that the nature and rights of property are understood; and that all necessary burdens of taxation are equitably adjusted, and all productive industries properly encouraged,—these are some of the lessons included in political education.

5. The relation of man to his Maker necessitates *religious education.* This explains the intuitive conceptions and feelings of the soul with regard to what it recognizes as good and right, and teaches that the Author of the soul is supremely just and good. It shows in what way his will is made known, and what are the proofs that he has revealed himself to man. It declares his earnest desire that all shall be perfect in rightness and happiness, and shall attain to the Godlike nobility and glory for which they are to be qualified by being made "partakers of the Divine nature." Especially, it declares his inconceivable gentleness, goodness, and condescension, and his boundless compassion and helpfulness for those who struggle upward towards the good, in opposition to downward tendencies, both without and within. It tells of an endless future destiny, and of the divine Deliverer from evil and Redeemer unto purity and nobleness of life, the climax of which shall be another life, whose enjoyment and progress and duration shall have no limit. Religious teaching, like all other, should have careful regard to the natural order of intellectual and moral development. It should begin at a very early period of life, and should be adapted to the advancement of the child in knowledge and character. It should continue not through childhood only, but through life. No part of education, whether of body, mind, or conscience, is ever absolutely completed, but religious education, as it has the widest scope and pertains to the most enduring interests, should continue to the end of life.

Having thus considered the *object* of education, and the *mode of accomplishing* that object, the way is prepared for answering the inquiry, *By whom* shall education be conducted? In other words, Who shall make sure that the benefits of education are shared as generally and as completely as possible? Preliminary to the determining of this question, two others arise—viz., *How many* shall be educated? and, *to what extent?* The answer to these questions is near at hand: *all* should receive at least the rudiments of education, and in each case the training should be as complete and thorough as practicable. As regards the education of *children*—to which this part of the discussion will be mostly restricted—all must be done *for* them. They are not competent to know what they need, much less to devise the means for gaining it. When a person has passed beyond childhood, and is fitted by maturity of mind and knowledge of himself to decide what his future training shall be, he may safely be left to himself and to such advisers as are within his reach. *Professional* education is of this kind, and therefore is not here to be discussed. The extent and completeness of that kind of education must be decided in each case by the inclination, the opportunity, or the resources of the student. But for securing ordinary and general education some provision must be made. Who shall make that provision? and who shall see that it is sufficient and well directed?

1. In the order of nature the earliest teachers are *the parents.* The instinctive love of parents for their children leads them naturally to do what they can for their dependent little ones. Bodily care and training devolve by nature upon parents alone. The duty of providing for the intellectual and moral education of children is also the untransferable duty of parents. The development of an infant's mind, the gradual manifestation of consciousness, observation, perception, and knowledge, cannot but interest profoundly every parent's heart. And when there comes at length the necessity for imparting instruction, the mother is the person designated by the law of nature to perform that service. But the time arrives when the teaching of a household would require more time and thought and labor than this first and natural teacher can bestow. Successful teaching is an art, to be acquired, like any other art, by study and labor. In every country where education has been duly regarded, persons have devoted themselves to the distinctive work of teaching. Families or communities depute this work to persons believed to be fitted for performing it. But who shall select teachers? and who shall decide upon their qualifications? Primarily, this is the duty of parents, and their responsibility for it can never be transferred. But if the children of several families are to be educated together, some agreement for this purpose must be made between the parents. In this way a *school* comes into existence. But if it is actually established in this manner, some part, and possibly the larger part, of the children may not be reached by it. Social or class prejudices, or the poverty of some parents, or the indifference of others, or family feuds, or other causes, may effectively shut out multitudes of the young from all opportunity of education. This is not mere theory. In thousands of cases precisely this result has been witnessed. How shall these neglected multitudes be reached? The gifts of the benevolent have been profusely bestowed to remedy the evil, and it has thus been much diminished. But such gifts can benefit only particular places, which will naturally be those where wealth most abounds and where education is appreciated. The communities most destitute of educational opportunities are those last reached by the occasional beneficence of individuals. Excellent as the schools thus founded may be, they cannot be extended into a complete system; they cannot fully supply the imperative want of the entire country. There is need of some agency that shall be felt everywhere and shall reach every part of the land. This agency some would find in an organization which exists in all Christian countries, and this organization is—

2. *The Church.*—The earliest endeavors to educate all the people originated in the Christian Church. Through all the centuries of Christianity the great power of the Church has been generally in favor of education, though corruptions within it have at times given it the opposite tendency. The church schools of the early centuries were designed especially to give instruction in Christian doctrines, and the same class of schools in later times have usually the same object. If this kind of instruction satisfies the wants of the people, and if they are substantially of one mind in regard to accepting it, it may for the time suffice. But where there is freedom of religious thought, different sects will spring up, each strenuous for its own particular tenets. No one party in the Church can then claim the right to control the instruction of all the people. If such a claim were made it would be strenuously resisted by all other parties. Not even a majority may rightfully compel the whole to accept what education the stronger party may choose. But why not permit each sect to have its own schools and to educate its own children? This would draw the lines of sectarian division deeper than they now are, and would aggravate an evil already too great. Some sects are wealthy, others comparatively poor; some zealous for education, others comparatively indifferent. There are also large numbers not belonging to any sect. For these the scheme now under consideration would make no provision. Furthermore, in small communities

several feeble schools might be established where a much smaller number would better serve the people. Then, again, the day for church dogmas as the staple of education is past. Religion is not less esteemed, but intelligent people wish their children to be taught something more closely connected with the active business of life than the ancient church dogmas. In whatever way the subject is regarded, the theory that the Church, or any part of it, shall control education is at variance with the spirit of the age and the necessities of the times.

3. But if *parental* control alone, or when supplemented by the liberality of the benevolent, cannot cover the whole ground, and if *church* control will not meet the emergency, where shall the direction of education be placed? There is need of an agency coextensive with the entire community, and equally concerned with all classes of people. This agency may be found in the *civil government*. There are three institutions which exist by the same divine authority — the Family, the Church, and the State. The necessary and intimate relations of the first of these to education has already been pointed out. The historical connection of the second with the instruction of the people has been recognized, and its duty to teach them religion is undeniable. But that is its controlling object. It would train only *one part* of the human being, and thus destroy the harmony which should prevail between the several parts. The State has the same kind and degree of connection with men of all sects and parties. It can therefore act impartially towards them all. It aims to promote their welfare in all their relations. Especially, it must protect itself from the perils inseparable from widely prevailing ignorance. It must recognize the need of both intelligence and good morals to its safety and perpetuity. It must accordingly provide that the schools under its control give attention to the morality as well as the intelligence of their pupils. It may even provide for instruction in the *general principles* of religious truth, giving no place to sectarian peculiarities. The control of education by the civil authority is no mere theory. It has been tried for centuries, and is successfully operating to-day in the best-educated nations of the world. Other nations are adopting it, and it bids fair to prevail at last in every enlightened part of the world.

Thus have been considered in succession the *object*, the *method*, and the *agency* of universal education. The world has much yet to learn upon this subject. A few years may bring changes of opinions and of systems, but education in the future will certainly be more general and more complete than in the past.

JOHN G. BAIRD,
Asst. Sec. Conn. Board of Education.

Educational Reform in Japan and China.

The first full annual report of the new educational department of Japan has lately been received in this country. The plans which it unfolds are surprisingly liberal, comprehensive, and wise. If once thoroughly carried out, they will in due time work a marvellous transformation of the nation. Japan has at one bound jumped from the fifteenth to the nineteenth century. The material, intellectual, and moral advancement has been truly marvellous, but of all her progressive movements her educational plans are the most significant and prophetic. Recognizing the fact that ignorance has proved to them a source of waste and weakness, the Japanese have already demonstrated that knowledge is power. They fully appreciate the bearing of popular education on national industry, thrift, and prosperity.

Schools are no new thing in Japan. They have long existed, and education is far more general than in any other country of the East. The following are the more prominent features of the newly adopted system: 1. It is to embrace youth of all classes, without distinction of caste or rank, so that education shall become truly universal throughout the empire. 2. The new system is to be uniform throughout the whole country, and to incorporate and remodel all the existing schools and educational institutions. 3. Its administration will be national rather than provincial, and will be under the charge of the central educational department. 4. The whole empire is divided into eight collegiate departments, and in each a college is to be organized. 5. Each collegiate division is to contain thirty-two academies or high schools, making 256 academies in all. 6. Each academic division is to contain on an average 210 schools, making 53,760 schools in all. 7. Attendance is to be compulsory for children over six years of age. 8. Female education having hitherto been less cared for, provision is to be made for the education of girls as well as boys. 9. Teachers are to be selected irrespective of sex. 10. Normal schools are to be established. 11. Charity schools, evening schools, and schools for the trades are to be encouraged. 12. Technical institutions for applying science to industrial pursuits are to be established. 13. An educational report is to be published annually by the department of education. 14. The number of government students to be sent abroad annually is 180. 15. At home promotion is to be made from grade to grade solely on the ground of merit. 16. "Foreign students" are to be selected by competitive examination — thirty from the colleges, who are to be allowed each $1600 annually, and 150 from the secondary schools, who are to receive each $1000 per year. Students under fourteen years of age will be allowed $800 a year. All these sums are paid in gold. 17. Scholarships and other rewards will be offered to the most meritorious in the schools at home. 18. In the primary schools no foreign language will be taught. 19. In the higher schools students can pursue any three modern languages they may select.

The above outline is enough to show that the new system of the Japanese is neither American nor European. It is not a mere copy or imitation of any foreign system. After studying all other improved plans, they have wisely constructed one for themselves, fitted to their exigencies, in some measure built upon old foundations, so as to introduce innovations without doing violence to cherished traditions. The fact that it is thus a truly Japanese system, both in its nature and origin, is one of its characteristic excellences. Obviously, no foreigner could get up a system "ready made" that would "fit." It could not be "made to order" without the most intimate knowledge of the Japanese, such as they only can have. The plan for this empire, therefore, should not be the Swiss, German, English, or American. It should not seem exotic. If not indigenous in origin, it must be grafted on a native stock, and become thoroughly acclimated.

The most important institution yet organized in Japan is the Imperial College of Yedo (or Tokei, as it is now called). Five years ago this institution, though a college in name, was little more than a large school, especially of foreign languages, and English and other foreign clerks, bartenders, and even sailors, were tried as teachers. Fortunately, a scholarly American missionary of the Dutch Reformed Church, Rev. Guido F. Verbeck, was called to preside over this institution. He found in it 1100 pupils and 77 teachers, seventeen of whom were foreigners. A native of Holland, educated in the U. S., well versed in the Japanese language and familiar with Japanese character, from a twelve years' missionary service there, he has rare qualifications for his important post. He has won the confidence both of the government and the people, has thoroughly reorganized the college, reduced the number about one-half, "relieved" the incompetent teachers, and selected with care able and cultured assistants from abroad. The new instructors well merit the name of a faculty.

The present is a critical time in the history of the Japanese. They have been the victims of frauds and spoliations by foreign traders and contractors. Enormous outlays have been made in the grand system of internal improvements now so rapidly progressing. A debt for $140,000,000 has been contracted, besides a large amount of paper currency now in circulation. Until the renewal of the treaties with the other powers, they are debarred the privilege of a proper and remunerative tariff, for in some cases the customs have little more than paid the expense of their collection; yet Japan is, and still more is to be, a country of vast resources, mineral, agricultural, and manufacturing. When the new tariff is established, and their mines and varied industries fully developed, their means will be ample.

The educational system outlined above is prospective; as yet it is a plan on paper. Even such a grand ideal will be an inspiration to the nation. Ardent, hopeful, and enthusiastic, perhaps the Japanese consider less the obstacles to be overcome than the advantages to follow the introduction of a system of universal education.

NEW EDUCATIONAL MOVEMENTS IN CHINA.—The present educational movement of China is justly regarded as a new departure for the oldest and largest nation of the globe. If wisely managed at the outset, it will expand into broad agencies and vast results. This scheme originated with Mr. Yung-Wing, whose peculiar history evinces his special fitness for this work. He graduated at Yale College in 1854, where he took high rank as a scholar, and won prizes even for English composition. He has since gained still higher eminence and influence in his native country. Eight years ago he was sent to America to secure the most improved modern inventions and machinery of various kinds, but especially for the manufacture of firearms. The models which he took home, the large and successful arsenals since established, and the other new or improved manufactures thus introduced, demonstrated the superiority of our inventions, applied science, and mechanic arts. The success of the new arsenals, now manned by Chinese engineers and artisans, has produced a profound impression. There are made the best of breech-loading rifles and

"repeaters." There their gunboats, iron-clads, and forts are supplied with light and heavy ordnance. The result has verified the remark which Yung-Wing made soon after his graduation: "By introducing the practical and material advantages of modern science, I can accomplish more for the improvement of my country and the introduction of Western culture than by direct missionary service." New ideas of growth and power now pervade the land. New methods of developing the mineral wealth and exhaustless resources of that vast country are introduced and are highly appreciated.

The great material progress already made is, however, only a preparation for higher intellectual and moral achievements in the future. "The wall" of exclusiveness is broken down and prejudice is yielding. An American missionary, Rev. Dr. Martin, presides in the new Imperial College at Peking, and now Chinese youth are sent by their government to America for a thorough course of education. The present educational mission to this country is the result of plans of Mr. Yung-Wing, formed years ago, and steadily pursued in the face of many obstacles. It is a striking feature of this movement that it is wholly Chinese in its origin. Other schemes for national improvement or for the increase of international intercourse and influence have been prompted, if not pushed, by foreigners, but in this case the Chinese element predominates. No outside pressure has been used to induce the government to take this step. The plan is Chinese in its execution as well as its origin. This plan contemplates the thorough education of 120 Chinese students in this country. They are to remain fifteen years, so as to allow time for a complete course of study, academic, collegiate, and professional. Four Chinese commissioners come to supervise this movement. Under their direction one hour a day is devoted to the study of the writings of Confucius and Chinese language and literature generally. As these youth are preparing for positions of responsibility at home, the knowledge of their vernacular and history should be kept up and enlarged. The thirty-two of these boys who have been in Connecticut and Massachusetts nearly one year are models of studiousness and good deportment. Thirty others have since arrived, and at once begin their course of study. They are evidently "picked specimens." Having been invited by the commissioners to aid in the organization of this plan, the writer has been highly gratified by the remarkable progress of these students. They are contented and happy, as well as studious and exemplary. The hope that they may become the exponents of our culture, science, and civilization, and thus the benefactors of their country, is already an inspiration to these ambitious youth. Filial piety and patriotism are carefully inculcated. Love of country is manifestly a strong incentive to them, and to a rare degree they appreciate their privileges and responsibilities. Sixty other boys will in due time follow the students now here, and it is not improbable that soon, like the Japanese students, they will come by hundreds.

Nothing should be omitted on our part to give efficiency and success to this comprehensive scheme. The movement is most significant and prophetic. It is already seen and felt that the education of the boys will necessitate the higher culture of the girls. Those who here learn the refinements and amenities of our best society will need companions of kindred taste and culture.

B. G. Northrop, *Sec. Conn. Board of Education.*

Education, Commissioner of. By act of March 2, 1867, the Congress of the U. S. established a department of education, consisting of a commissioner and three clerks. The commissioner of education is appointed by the President, subject to confirmation by the Senate. His duties are "to collect such statistics and facts as shall show the condition and progress of education in the several States and Territories;" to diffuse such "information respecting the organization and management of schools and school systems and methods of teaching as shall aid the people . . . in the maintenance of efficient school systems, and otherwise promote the cause of education;" . . . and also "to present annually to Congress a report embodying the result of his investigations and labors, together with a statement of such facts and recommendations as will in his judgment subserve the purpose for which the department is established." In 1868 the department was abolished, and the commissioner of education became an officer of the department of the interior, but his duties remain substantially as before.

Edward, surnamed the Confessor, an Anglo-Saxon king of England, was born at Islip in 1004. He was a son of Ethelred II. After the death of Ethelred, in 1016, Canute the Dane became master of the kingdom, and married Emma, the mother of Edward. The latter succeeded his half-brother, Hardicanute, in 1042. He married Editha, a daughter of Earl Godwin, but did not permit her to share his bed, and for this ascetic virtue was surnamed "the Confessor." He died Jan. 5, 1066, and was succeeded by his wife's brother, Harold. Edward the Confessor is honored as a saint in the Roman Catholic Church.

Edward I., surnamed Longshanks, king of England, the eldest son of Henry III. and his wife Eleanor, was born at Westminster in 1239. He fought for his father against the barons in the war which began in 1263. In 1265 he gained a decisive victory at Evesham. He took part in a crusade to Palestine in 1271, and returned to England and took his deceased father's throne in 1274. The conquest of Wales he completed in 1282, after a war of several years. In 1291 several competitors for the crown of Scotland recognized Edward as lord-paramount, and chose him as umpire. He decided in favor of John Baliol, who took the oath of fealty to the English king. The Scots took arms to maintain their independence. In 1296, Edward invaded Scotland, dethroned Baliol, and made himself master of the kingdom. The national cause was bravely defended by Sir William Wallace, who gained a victory at Stirling in 1297. Edward invaded Scotland in 1303, and captured Wallace, who was hanged as a traitor in 1305. The English king was marching against Robert Bruce, who had renewed the contest, when he died near Carlisle July 7, 1307. Edward was an ambitious and able ruler, having great political talents as well as military genius. He greatly promoted the improvement of law and the reformation of civil abuses. Among the important events of his reign was the institution of the House of Commons. He was succeeded by his son, Edward II. (1284–1327), a feeble prince.

Edward III., king of England, the eldest son of Edward II., was born at Windsor Nov. 13, 1312. He ascended the throne Jan. 24, 1327, but during his minority the royal power was exercised by the queen-mother and Roger de Mortimer. Edward married Philippa of Hainault in 1328. In 1330, Mortimer was arrested, tried, and executed by the order of the young king, who then assumed the royal power. To support Edward Baliol, who claimed the Scottish throne at the death of Robert Bruce, Edward invaded Scotland, and defeated the Scotch at Halidon Hill in 1333. The Scottish people generally refused to recognize Baliol, and although the English army ravaged their country in several campaigns, they again and again rallied and fought resolutely for independence. When his uncle, Charles IV. of France, died without male issue, Edward claimed the throne of France, but Philip of Valois was recognized by the French people. The English king began war in 1339, but hostilities were several times suspended by truce. In 1346, Edward, with his son, the Black Prince, invaded France, marched to the gates of Paris, and gained a complete victory at Crécy (Aug. 26). He took Calais after a siege of several months in 1347, and a long truce was then concluded between the two powers. The war having been renewed in 1356, the Black Prince defeated the French at the great battle of Poitiers, Sept. 19th of that year, and took King John prisoner. In 1360 the war was suspended by a treaty, in accordance with which Edward retained the French provinces which he had conquered. King John's successor, Charles V., renewed the war in 1370, gained a series of victories, and recovered nearly all the French territory which the English had occupied. Edward died June 21, 1377, and was succeeded by his grandson, Richard II. He was popular, and left a high reputation for ability.

Edward IV., king of England, born at Rouen in 1441, was a son of Richard, duke of York. After the death of his father, in 1460, Edward was the head of the house of York, then waging a civil war against the Lancastrians, who fought for Henry VI. Edward gained a victory at Mortimer's Cross, near Hereford, entered London in February, and was proclaimed king Mar. 4, 1461. His courage, handsome person, and other popular qualities rendered him a favorite of the people of London. The cause of the Lancastrians was supported by Margaret of Anjou, the ambitious queen of Henry VI., whose army was defeated at Towton in Mar., 1461. Edward gained another victory at Hexham in 1464, and took Henry VI. a prisoner. By his marriage with Elizabeth Woodville (1464), Edward offended the earl of Warwick, the most powerful of his subjects. Warwick expelled Edward from the country in 1470; but the latter returned in 1471, defeated Warwick at Barnet (April 14), and recovered the throne. On May 4, 1471, he gained a decisive victory at Tewkesbury, which ended the War of the Roses. He died April 9, 1483.

Edward V., king of England, born in Westminster Nov. 4, 1470, was the eldest son of Edward IV., whom he succeeded April 9, 1483. His uncle Richard, duke of Gloucester, then became protector of the kingdom, and obtained possession of the person of Edward V. The young king

and his brother disappeared in June, 1483, and were probably murdered in the Tower by the order of Richard, who then usurped the throne.

Edward VI., king of England, a son of Henry VIII. and Jane Seymour, was born at Hampton Court Oct. 12, 1537, and succeeded his father Jan. 28, 1547. His uncle, Edward Seymour, earl of Hertford (afterwards duke of Somerset), acted as regent with the title of lord protector. The latter promoted the Protestant cause. During this reign the images were removed from the churches, the articles known as the "Bloody Statute" were repealed, and the Reformation made great progress in England. Somerset invaded Scotland, because the Scottish government refused to form a matrimonial alliance between Mary Stuart and Edward VI. He defeated the Scots at Pinkie in 1547. Somerset's enemy, John Dudley, earl of Warwick, obtained the ascendency in 1550, and caused him to be executed. Dudley persuaded the young king to exclude the princesses Mary and Elizabeth from the throne, and to appoint Lady Jane Grey as his successor. Edward died July 6, 1553. (See SHARON TURNER, "History of the Reigns of Edward VI., Mary, and Elizabeth," 1829.)

Edward, prince of Wales, called the **Black Prince** (from the color of his armor), born June 15, 1330, was the eldest son of Edward III. of England. He commanded a part of his father's army at the battle of Crécy (1346), and then adopted the crest of ostrich feathers and the motto *Ich dien* ("I serve"). This crest and motto had been borne by John, king of Bohemia, who was slain at that battle. Ever since it has been borne by the princes of Wales. He gained in 1356 a brilliant victory over the French at Poitiers, and took their king, John, a prisoner. In 1361 he married his cousin Joanna, a daughter of the earl of Kent, and received from his father the title of prince of Aquitaine. He defeated Henry de Transtamare in battle, and in 1367 restored Henry's rival, Peter the Cruel, to the throne of Castile. He died June 8, 1376, leaving a son, who became king as Richard II. The Black Prince was a splendid example of the virtues and qualities fostered by the spirit of chivalry.

Ed'wardes (Sir HERBERT BENJAMIN), K. C. B., an English officer, born in Shropshire Jan. 17, 1820. He entered the army of the East India Company in 1840, and defeated the Dewan Moolraj near Chenab in 1848. In 1851 he published "A Year on the Punjaub Frontier, 1848–49." He was appointed commissioner of Peshawur in 1853. Died Dec. 23, 1868.

Ed'wards, a county in E. S. E. Illinois. Area, 200 square miles. It is partly drained by the Little Wabash River, an affluent of the Wabash, which latter touches the S. E. corner of the county. The soil is fertile. Cattle, grain, tobacco, and wool are raised. Capital, Albion. Pop. 7565.

Edwards, a county in the S. W. of Texas. Area, 1225 square miles. It is partly drained by the East Fork of the Rio Nueces. It is a rocky region, and has forests of cedar.

Edwards, a post-township of St. Lawrence co., N. Y. Pop. 1076.

Edwards, a township of Wilks co., N. C. Pop. 1556.

Ed'wards (ARTHUR), an able Methodist journalist, was born in Ohio in 1834, graduated at Ohio Wesleyan University in 1858, entered the ministry in the Detroit conference in 1858, during the civil war was chaplain in the army for two years and a half, and served for some years as assistant editor of the "North-western Christian Advocate," the official organ of his denomination in that part of the country. His superior editorial ability led, in 1872, to his election as editor-in-chief of that journal.

Edwards (BELA BATES), D. D., an American theologian, born in Southampton, Mass., July 4, 1802, graduated at Amherst College in 1824. In 1833 he founded the "American Quarterly Observer." He became editor of the "Biblical Repository" in 1835, professor of Hebrew at Andover in 1837, and editor of the "Bibliotheca Sacra" in 1844. In 1848 he obtained the chair of biblical literature at Andover Seminary. He was equally distinguished for the exactness of his scholarship and for the modesty and beauty of his character. He published a "Life of Elias Cornelius" (1842), a work on the Epistle to the Galatians, and other works. Two volumes of his sermons, addresses, etc., with a memoir of his life by Prof. E. A. Park, were published in 1853. Died April 20, 1852.

Edwards (BRYAN), an English writer, born at Westbury May 21, 1743, passed many years in Jamaica, where he became a wealthy planter. He wrote an interesting "History of the British Colonies in the West Indies" (1793), which was highly esteemed, and an "Historical Survey of St. Domingo" (1797). He died in England July 15, 1800.

Edwards (GEORGE), F. R. S., an English naturalist, born in Essex April 3, 1694. He travelled on the Continent, and acquired skill in drawing and coloring figures of animals. He published a good "Natural History of Birds," with colored plates (1743), and "Gleanings of Natural History" (1763). Died July 23, 1773.

Edwards (HENRI MILNE). See MILNE-EDWARDS.

Edwards (HENRY WAGGAMAN), LL.D., born in New Haven, Conn., in 1779, was a grandson of Jonathan Edwards. He graduated at Princeton in 1797, and studied at Litchfield law-school, was a member of Congress from Connecticut (1819–23), U. S. Senator (1823–27), Speaker of the House in the State legislature (1830), and governor (1833 and 1835–38), besides holding other important offices. Died at New Haven July 22, 1847.

Edwards (JONATHAN), a celebrated divine and metaphysician, born at East Windsor, Conn., Oct. 5, 1703. His father, Timothy Edwards, a man of talents and of uncommon learning for those times, was settled as minister at East Windsor. Jonathan is said to have commenced the study of Latin when only six years old. When he was ten years of age he composed an essay in which he ridiculed the idea, which some one had recently put forth, of the materiality of the human soul. In 1716 he entered Yale College, and graduated in 1720. Strong religious impressions appear to have been made on his mind in early childhood, but he dated his "conversion" from about his seventeenth year, after which all nature seemed changed in his view, everything revealing to his purified understanding the wisdom, glory, and love of God. In 1723 he took at Yale the degree of master of arts. He was tutor at Yale two years (1724–26). In the early part of 1727 he was settled as pastor of a church at Northampton. He was soon after married to Miss Sarah Pierrepont of New Haven, who in the sweetness and purity of her spirit, in the elevation of her character, and in her entire devotion to duty, may be said to have greatly resembled him. After some years of comparative peace and happiness, a difficulty arose in his congregation which put his firmness and conscientiousness to a severe test. It had become a custom in the church to admit to the communion-table all who professed with the congregation, without any inquiry as to whether they had been truly converted, or whether their spirit and life were consistent with their external profession. Jonathan Edwards believed that it was his duty to adopt a higher and purer standard. But his attempted reform caused great dissatisfaction, and he was at length driven forth from his congregation, not knowing whither to go and without any means of support for his family. Not long afterwards, however, he was offered the situation of missionary at Stockbridge, among the Housatonic Indians. About this time he wrote out his celebrated treatise on the "Freedom of the Will," the plan of which had been matured, it is said, while he was still a student at college. In 1757 he was appointed president of Princeton College in New Jersey, where he died March 22, 1758.

As a close and subtle reasoner Edwards has no superior, perhaps no equal, among those who have written in the English language. But he has a still higher claim to our respect and admiration—the spotless purity of his character and the faultless consistency of his Christian life.

Among his various writings are a "Treatise concerning the Religious Affections" (1746), and "An Inquiry into the Qualifications for Full Communion in the Church" (1749); his great work, "An Inquiry into the Modern Prevailing Notions respecting that Freedom of the Will which is supposed to be Essential to Moral Agency" (1754); "The Great Christian Doctrine of Original Sin Defended" (1757); "The History of Redemption," etc. His works were published at Worcester, Mass., in 1809, in eight volumes; and again, including much new material, in 1829, in ten volumes. A work of his, entitled "Charity and its Fruits," was published in 1852 for the first time. (See S. EDWARDS DWIGHT, "Life of Jonathan Edwards," 1830; SAMUEL HOPKINS, "Life of Jonathan Edwards;" and his life in SPARKS's "American Biography," written by SAMUEL MILLER; also THOMAS's "Dictionary of Biography and Mythology.")

Edwards (JONATHAN), D. D., a son of the preceding, was born at Northampton, Mass., May 26, 1745, and graduated at Princeton in 1765. He was minister of a church at White Haven, near New Haven, Conn., from 1769 to 1795, and was dismissed for his religious opinions. He became president of Union College, Schenectady, in 1799, and published several sermons and theological treatises. He is commonly known as "the younger Edwards." Died Aug. 1, 1801.

Edwards (JONATHAN W.), a lawyer, a son of the preceding, was born at New Haven, Conn., Jan. 5, 1772, and graduated at Yale with distinction in 1789. He practised law at Hartford. Died April 3, 1831.

Edwards (JUSTIN), D. D., an American clergyman and writer, born at Westhampton, Mass., April 25, 1787. He graduated at Williams College in 1810, and for fifteen years was pastor of a Congregational church at Andover. He removed to Boston, where he preached for two years more. He resigned on account of failing health, and became secretary of the American Temperance Society, of which he was the originator. While in this office he prepared the "Temperance Manual," of which nearly 200,000 copies have been printed. He was one of the founders of the Tract Society at Boston. Of his "Sabbath Manual" over 500,000 copies have been printed. Died at Virginia Springs July 23, 1853.

Edwards (NINIAN), an American lawyer and Senator, born in Montgomery co., Md., in Mar., 1775. In 1808 he became chief-justice of the State of Kentucky, and in 1809 governor of Illinois. He was U. S. Senator from Illinois (1818–24), and governor (1826–30). Died July 20, 1833. His wife was a sister of Mrs. Abraham Lincoln.

Edwards (OGDEN), a son of Pierrepont Edwards, was born in Connecticut in 1781. He became a prominent member of the New York bar, and, besides holding other public offices, was a circuit judge (1821–41) of the first judicial district. Died at Staten Island April 1, 1862.

Edwards (PIERREPONT), a lawyer, and son of Jonathan Edwards, born April 8, 1750. He commenced practice in New Haven in 1771. He served in the Revolutionary army, and was a member of the old Congress (1787–88). At the time of his death he was judge of the U. S. district court of Connecticut. Died April 14, 1826.

Edwards (TRYON), D. D., great-grandson of Jonathan Edwards, was born at Hartford, Conn., Aug. 7, 1809, and graduated at Yale in 1828. He has been pastor of churches at Rochester, N. Y., and at New London, Conn. He has published memoirs of Bellamy and of the younger Jonathan Edwards, "The World's Laconics" (1852), "Wonders of the World" (1853), and numerous other works, chiefly of a religious character.

Edwards (WILLIAM), an American inventor, born Nov. 11, 1770, at Elizabethtown, N. J. His father was a son of Rev. Jonathan Edwards, president of the college at Princeton, N. J., in 1755, and his mother was a sister of Aaron Ogden, a governor of New Jersey. William Edwards introduced the system now employed in nearly all American tanneries by which leather is made in about one-fourth of the time required by the old European process. His first tannery was built at Northampton, Mass., and the first leather made in it was sent to Boston in 1794. The supply of hemlock bark having failed in the valley of the Connecticut, he turned his eyes towards the vast hemlock forests on the Catskill Mountains; and in 1817 he removed to Hunter, Greene co., N. Y., and erected on the Schoharie Creek his model tannery, which was capable of converting imported hides into sole leather with marvellous rapidity. From this establishment about 10,000 sides of sole leather were sent to the city of New York annually. He not only invented several machines, but he adapted many devices previously used for other purposes to the art of tanning, and thus he was enabled to make water-power take the place of manual labor to a great extent. The success which has attended the manufacture of leather in the U. S. must be ascribed not only to the plentiful supply of tanning material, but also to the improved methods first employed by Edwards. Died Dec. 1, 1851, at Brooklyn, N. Y. SAMUEL D. TILLMAN.

Edwardsburg, a post-village of Ontwa township, Cass co., Mich., on the Peninsular R. R. Pop. 297.

Ed'wardsport, a village of Vigo township, Knox co., Ind., on the Indianapolis and Vincennes R. R., 20 miles N. E. of Vincennes, and on the West Fork of the White River. Here are mines of excellent coal.

Ed'wardsville, a post-village, cap. of Cleburne co., Ala.

Edwardsville, a post-village, capital of Madison co., Ill., on Cahokia Creek and the Toledo Wabash and Western R. R., 19 miles N. E. of St. Louis, Mo. It has three weekly newspapers. Pop. 2193.

Eeck'hout, van den (GERBRAND), an eminent Dutch painter, born at Amsterdam Aug. 19, 1621, was a pupil of Rembrandt, whom he imitated with success. He excelled in history and portraits, and was very skilful in the expression of character. Among his masterpieces is "Christ in the midst of the Doctors." Died July 22, 1674.

Eeckhout (JACOB JOSEPH), one of the most prominent Dutch painters of the nineteenth century, born in 1793, was first jeweller, then sculptor, and, after his twenty-eighth year, painter. He published in 1822 a lithographic collection of 60 portraits of Dutch masters.

Ee'cloo, or **Eccloo,** a town of Belgium, province of East Flanders, 11 miles N. W. of Ghent. It has a town-hall, a convent, and several churches; also salt-refineries, oil-mills, and manufactures of cotton and woollen fabrics, hats, soap, tobacco, etc. Here is a large weekly market for grain. Pop. in 1866, 9564.

Eel [Lat. *anguilla;* Fr. *anguille;* Ger. *Aal;* Ang.-Sax. *æl*], a name applied to many fishes of elongated and more or less serpentine shape, but properly belonging to the Anguillidæ, a family of apodal malacopterygians, of which the type is the common fresh and salt water eel (*Anguilla vulgaris*), having in Europe and America many varieties, which by most writers are considered distinct species. The CONGER (which see), the *Gymnotus* (see ELECTRICAL FISHES), and the *Muræna* are among the most remarkable eels. The sand-eels, or launces (*Ammodytes*), have a very long dorsal, a long anal, and a forked caudal fin. They are all marine, and bury themselves in the sand.

Eel, a township of Cass co., Ind. Pop. 160.

Ee'lee, Ele, Ili, or **Gooldja,** a fortified city formerly in the Chinese empire, now (1874) in the newly formed empire of Jakoob Kushbegi, on the river Eelee. It was a place of banishment for Chinese criminals, is enclosed by a stone wall, and contains barracks, forts, granaries, many mosques and Chinese temples, etc. It is one of the most important commercial towns of Central Asia. It is about lat. 43° 46′ N., lon. 82° 30′ E. Pop. 80,000.

Eelee, a river of Central Asia, rises on the N. side of the Thian-shan Mountains, flows through a part of Chinese Tartary (the new Kushbegi empire), and empties itself, after a course of 600 miles, into Lake Balkash. At various times the valley of the Eelee has been the course of Oriental nations who have invaded Europe, while at present the Russians make it their course for approaching China.

Eel Riv'er, of Indiana, rises in Allen co., flows southwestward, and enters the Wabash at Logansport. It affords abundant water-power. Length, about 100 miles. Another Eel River rises in Boone co., Ind., and after a course of nearly 100 miles enters the West Fork of White River, in Greene co.

Eel River, a post-twp. of Humboldt co., Cal. P. 827.

Eel River, a post-township of Allen co., Ind. P. 1217.

Eel River, a township of Greene co., Ind. Pop. 501.

Eel River, a township of Hendricks co., Ind. P. 1676.

Effect' [Lat. *effectus,* from *efficio, effectum,* to "accomplish," "effect," or "bring to pass;" Fr. *effet*], that which is produced by a cause or agent; a result of causation; a consequence; validity, reality. Cause and effect are correlative terms in natural science. In the plural, effects signifies goods, chattels, or personal property. In the fine arts, effect is that quality whose tendency is to give particular efficacy to other qualities, so as to attract the eye of the spectator, or the impression which a picture produces when seen at a distance so great as to render the details invisible.

Ef'fen, van (JUSTUS), a popular Dutch writer, born at Utrecht in 1684. He was the chief editor of an able review called "The Literary Journal," published in French at The Hague (1715–18). He published in Dutch the "Hollandsche Spectator" (1731–35), which was formed on the model of Addison's "Spectator," and obtained a durable popularity. He passed several years in London as secretary of embassy. Died in Bois-le-Duc Sept. 18, 1735.

Efferves'cence [from the Lat. *effervesco,* to "boil over"], the agitation caused by the sudden escape of gas when certain substances are mixed or combined; the escape of gaseous matter from liquids. An example of effervescence is seen when carbonate of lime is put into dilute muriatic acid. All liquids from which bubbles of gas escape rapidly are said to *effervesce.*

Effervescing Powders, in medicines, are of various kinds, usually put up in two papers—one containing an alkaline bicarbonate, and the other citric or tartaric acid. After dissolving and mixing the solutions, carbonic acid escapes with effervescence. These powders are useful refrigerants, and are gently laxative. Rochelle salts are often added to increase the laxative effect, constituting what are called Seidlitz powders.

Ef'figy [Lat. *effigies,* from *effingo,* to "form," to "fashion"], a representation of a person; sometimes applied to a portrait, but more usually to a sculptured figure on a monument, and to the heads of monarchs, etc. stamped on coins and medals. (See BRASSES, MONUMENTAL.)

Ef'fingham, a county in the E. of Georgia. Area, 480 square miles. It is bounded on the E. by the Savannah River and on the W. by the Ogeechee. The surface is nearly level; the soil is sandy. Rice and corn are staple products. It is intersected by the Central Georgia R. R. Capital, Springfield. Pop. 4214.

Effingham, a county in S. E. Central Illinois. Area, 500 square miles. It is intersected by the Little Wabash River. The surface is nearly level; the soil is fertile. Lumber, grain, cattle, wool, hay, butter, etc. are produced. A large part of it is prairie. It is traversed by the Chicago division of the Illinois Central R. R., and by the St. Louis Vandalia and Terre Haute R. R. Capital, Effingham. Pop. 15,653.

Effingham, a post-village, capital of the above county, is on the Chicago division of the Central R. R. where it crosses the St. Louis Vandalia and Terre Haute R. R., 98 miles E. N. E. of St. Louis, and 199 miles S. by W. from Chicago. It has two weekly newspapers and extensive manufactures of bricks. Pop. 2383.

Effingham, a post-township of Carroll co., N. H. It has six churches, a literary institute, and manufactures of baskets, spools, rakes, etc. Pop. 904.

Efflores'cence [from the Lat. *effloresco* (*ef* (for *ex*), "out," and *floresco*, to "bloom"), to "flower" or "bloom"], in botany, the expansion of the flower-buds, or the time of flowering; in chemistry, the spontaneous conversion of transparent or saline crystals to powder, in consequence of the loss of their water of crystallization.

Efflu'vium (plu. **Efflu'via**), a Latin word signifying a "flowing out" [from *effluo*, to "flow out"], is applied to vapors or exhalations arising from putrefying matter, especially to vapors of a morbific quality.

Eft, or **Ev'et,** the popular name of many small lizards and of several tailed batrachians. One of the best known is the common red salamander (*Salamandra rubra*), a batrachian of the U. S. There are numerous allied species, which are incorrectly believed by many to be venomous.

Effu'sion [Lat. *effusio*], the act of pouring out or shedding, as effusion of blood; the escape of any liquid out of its natural vessel or viscus into another cavity or into the cellular texture; also openness of heart or exuberance of sympathy.

Égalité [Fr. for "equality"], one of the popular watchwords of the first French revolution—"Liberté, égalité, fraternité" ("Liberty, equality, fraternity"). The duke of Orleans (1747–93) assumed in 1792 the name of "Citizen Égalité." (See Orleans, Louis Philippe Joseph, Duke of.)

E'gan, a township of Dakota co., Minn. Pop. 670.

Egan (Pierce), an author, artist, and journalist, born in London, of Irish descent, in 1815. He has published more than twenty novels, among which are "Robin Hood," "The Flower of the Flock," and "The Poor Girl." He has furnished many excellent designs on wood for the "Illustrated London News," and was long an editor in London. He has contributed largely to English and American journals.

Eg'bert, surnamed the Great, a Saxon king of England, was a descendant of Cerdic. He passed many of his early years at the court of Charlemagne, and began to reign in 800 A. D. At this date England was divided into three separate kingdoms, Mercia, Northumbria, and Wessex. He defeated the Mercians at Ellandune in 823, soon after which he completed the conquest of Mercia and Northumbria, ruled over all the states of the Heptarchy, and gave the name of England to the whole. In 835 he defeated an army of Danes who had invaded England. He died in 836 A. D., and was succeeded by his son Ethelwulf. (See Lappenberg's "History of England under the Anglo-Saxon Kings," translated by Thorpe, 1845.)

Eg'ede (Hans), a Danish missionary, born at Harstad, Norway, Jan. 31, 1686. He became pastor of the church of Vaagen in 1707, and went in 1721 to Greenland, where he founded a mission for the conversion of the natives. He labored in Greenland about fifteen years, and endured great privations. His wife, who had accompanied him, died in 1735, and he then returned to Copenhagen, where he was appointed a bishop in 1740. He wrote an account of his missionary labors (1738), and a "Description of Greenland" (1741–44). Died Nov. 5, 1758. (See Rudelbach, "Christl. Biographie," part vi.) His son Paul, born in 1708, went with his parents to Greenland in 1721. He assisted Hans in the work of converting and teaching the heathen, and remained there until 1740. He became bishop of Greenland in 1776. He published a valuable dictionary (1754) and grammar (1760) of the Esquimaux; and also "Information on Greenland" (1789), besides other works. Died June 3, 1789.

Eg'er, a river of Bohemia, rises near the town of Eger, and enters the Elbe 33 miles N. N. W. of Prague, after a course of about 125 miles.

Eger, a town of Bohemia, on the river Eger, 92 miles W. of Prague, was formerly fortified. It is situated at the junction of six railroad lines. It is built on a rock, and was an important fortress. Here are the ruins of a citadel or castle formerly the residence of kings and emperors. Eger has seven churches, a fine town-hall, and two monasteries; also manufactures of broadcloth, cotton goods, chintz, and soap. Wallenstein was assassinated here in 1634. Near it is the watering-place Franzensbad, with five springs. Pop. in 1869, 13,441.

Eger, in Hungary. See Erlau.

Ege'ria [Fr. *Égérie*], a nymph who, according to the Roman mythology, was one of the Camenæ, and was a prophetic divinity from whom Numa derived religious inspiration and directions respecting the forms of worship. The poets feigned that Numa had interviews with her in a grove, and that when he died she melted away in tears, which became a fountain.

Egeria, one of the asteroids of the solar system, was discovered at Naples in Nov., 1850, by De Gasparis.

Egerton (Francis Henry). See Bridgewater, Earl of.

Eg'erton (Francis Leveson **Gower**), Earl of Ellesmere, an English author and patron of art, was born in London Jan. 1, 1800. He was the second son of the first duke of Sutherland, and his original name was Francis Leveson Gower, but he assumed the name of Egerton in 1833, when he inherited the estate of the last duke of Bridgewater. He entered the House of Commons in 1820, became chief secretary for Ireland in 1828, and was secretary at war for several months in 1830. Among his works is a poem called "The Camp of Wallenstein." He was created earl of Ellesmere in 1846. His gallery of paintings was one of the most valuable collections in England. Died Feb. 18, 1857.

Egg [Lat. *o'vum;* Fr. *œuf;* Ger. *Ei*] is properly the name of the ovum of certain animals (birds, reptiles, fishes, insects, etc.) which discharge the embryo with its envelopes before the development of the organism. The name is frequently used in an extended sense to include all ova. The most perfect examples of the egg are those of birds and the higher reptiles. These eggs consist of a shell (*puta'men*) consisting of carbonate of lime, a little animal matter, and traces of magnesia, phosphorus, iron, and sulphur. Lining the inside of the shell, we find the tough shell-membrane. The albumen, or white of egg, differs from the albumen of the blood in some of its chemical reactions, and is distinctively known as egg-albumen. It is of great importance in the arts, chiefly in the preparation of albumenized paper for photographers' use. In medicine it is used as an antidote for poisoning by corrosive sublimate and sulphate of copper, with which it forms insoluble compounds. The yolk (*vitellus*) is a highly nutritious substance, containing large proportions of nitrogenous and fatty matter. The structure and development of the different parts of the egg are described under Embryology (which see).

Egg, or **Eigg,** an island of Scotland, is 8 miles S. W. of Skye, and 12 miles from the W. coast of Inverness-shire. Length, 4½ miles. Here are some remarkable cliffs of trap or basalt, and columns of pitchstone nearly two feet in diameter.

Egg (Augustus), an English painter, born in London May 2, 1816. He was elected an associate of the Royal Academy in 1848. Among his works are illustrations of comic scenes in Shakspeare's plays, and "The Life and Death of Buckingham." Died at Algiers Mar. 26, 1863.

Eg'ga, a populous town of Africa, in Guinea, on the right bank of the Niger, in lat. 8° 42′ N. and lon. 6° 20′ E. It extends nearly 2 miles along the river. The houses are mostly small huts of clay. Narrow cotton cloth is manufactured here in large quantities. Egga has an active trade in corn, yams, calabashes, dried fish, etc.

Egg Bird, or **Soot'y Tern** (*Sterna fuliginosa*), the name of a bird belonging to the gull family, and having the back and wings sooty black and the under parts white. The wings and tail are long and pointed, the latter deeply forked. It abounds in the West Indian seas and in Florida. It lays its eggs in a small excavation in the sand. Its flesh is said to be very delicious, and is much sought after.

Eg'ger (Émile), Dr. Lit., was born of German descent in Paris July 13, 1813, and received his degree in letters in 1833. He has held various professorships of ancient languages in Paris, and is well known for his editions of the less known Latin writers. He is a member of the Institute and of the Academy, and an officer of the Legion of Honor. He has published "Latini Sermonis Vetustioris Reliquæ Selectæ" (1843), "Notions Élémentaires de Grammaire Comparée" (1852), "Mémoires d'Histoire Ancienne et de Philologie" (1863), and numerous other works.

Egg Har'bor, a township of Atlantic co., N. J. Pop. 3585.

Egg Harbor, or **Egg Harbor City,** a post-village

of Galloway township, in Atlantic co., N. J., on the Camden and Atlantic R. R. The large majority of the inhabitants are Germans. It has one English and two German weekly newspapers, and four German churches. Pop. 1311.

Egg Harbor, a post-township of Door co., Wis. Pop. 165.

Eg'gleston, a township of Muskegon co., Mich. Pop. 233.

Eggleston (Edward), D. D., a distinguished Methodist divine and author, was born in Vevay, Ind., in 1837, joined the Methodist ministry in his nineteenth year, and preached during ten years in Minnesota. He began his literary career in 1866 as editor of "The Little Corporal," commenced in 1867 the "Sunday-School Teacher," in 1870 went to New York City and became editor of "The Independent," was some time editor of "Hearth and Home," and contributor to "Scribner's Monthly." His tales commanded immediate and general interest, and his success led him to retire from editorial life and devote his time exclusively to authorship. In 1871 appeared his "Hoosier Schoolmaster," the remarkable excellences of which immediately determined his rank as among the first of American novelists; it has been extensively reproduced in translations in Europe. In 1872 was published his "End of the World," and in 1873 "The Mystery of Metropolisville."

Egg Plant (*Sola'num Melonge'na*), an annual herbaceous plant of the same genus as the potato and nightshade, is a native of India and Northern Africa. The fruit is a globose or egg-shaped berry about four inches in diameter, but the size varies much according to the quality of the soil and climate. It is cultivated for food in India, the U. S., and various warm climates, and is cooked before it is eaten. This plant flourishes in New Jersey, but not so well in the more northern States of the Union. The seeds should be sown in a hot-bed in April, and transplanted in May or June. There are several varieties of this plant, which produce respectively purple, white, and red fruits. In some countries it is called auberjine or aubergine.

Eg'ham, a village of England, in Surrey, on the Thames, 18 miles W. of London and 3 miles E. of Windsor. Here is the field of Runnymede, where King John and the barons held a conference which resulted in the signing of Magna Charta in 1215. Egham is near Cooper's Hill, which was the subject of one of Denham's poems.

Egidistadt. See Nagy Enyed.

Egina. See Ægina.

Eginhard, or **Eginard,** a French historian, was born in Austrasia, and was a pupil of Alcuin. He gained the confidence of Charlemagne, who appointed him his secretary. He accompanied that emperor in his journeys and military expeditions. After the death of Charlemagne he passed into the service of Louis le Débonnaire. According to a doubtful tradition, he married Emma, a daughter of Charlemagne. His chief works are a "Life of Charlemagne" (in Latin), which Parke Godwin characterizes as "a neat and lively specimen of biography," and "Annals of the French Kings from 741 to 829;" best edition of both in Pertz, "Monumenta Germaniæ Historica," vols. i. and ii. Died in 844 A. D.

Eg'lantine [Fr. *églantine,* probably akin to the Fr. *aiguille,* a "needle," so called on account of its prickles], a name of the *Ro'sa rubigino'sa,* a species of rose sometimes called sweetbrier. It is a native of Europe, and is naturalized in the U. S. The flower is single and fragrant. The leaves also emit a peculiar fragrant odor from their russet-colored glands. This plant sometimes attains the height of eight feet, and is often found in fields and roadsides.

Eg'linton Cas'tle, in Ayrshire, Scotland, 2 miles N. of Irvine, is a magnificent Gothic structure, surrounded by a park of 1200 acres. (See next article.)

Eg'linton and Win'ton (Archibald William Montgomerie), Earl of, a British peer, born Sept. 29, 1812. He succeeded the fourteenth earl of Eglinton in 1819. In politics he was a conservative. He was appointed lord lieutenant of Ireland in 1852 and in 1858. A famous tournament occurred at his castle (above noticed) in 1839, and was attended by Louis Napoleon, afterwards emperor. Died in Oct., 1861.

Eg'mont or **Egmond** (Lamoral), Count of, and Prince de Gavre, an eminent Flemish nobleman and general, born in 1522. He was descended from the dukes of Gelderland, and married Sabina, duchess of Bavaria, about 1545. He served in the armies of Charles V., who created him a knight of the Golden Fleece in 1546. In 1557 he commanded the cavalry of the Spanish army, and defeated the French at Saint-Quentin. He gained a decisive victory at Gravelines in 1558, and acquired much popularity. As an associate of William, prince of Orange, he opposed the intolerant and despotic policy of Philip II., but he constantly adhered to the Catholic Church. He was appointed a member of the council of state in 1559. He ceased to act with the popular party after they revolted against the Spanish king, but the latter regarded him with jealousy and hatred, and sent the duke of Alva to Flanders with viceregal power in 1567. Alva was a bitter enemy of Egmont, and is said to have brought his death-warrant from Philip. Egmont and Count Horn were arrested, tried for treason, and executed June 5, 1568, at Brussels. This cruel act provoked a general revolt against Philip II. The story of Egmont is the subject of a tragedy by Goethe. (See Motley, "Rise of the Dutch Republic," chap. ii., part 3; Brunelle, "Éloge du Comte Egmont," 1820.)

Eg'mont, Mount, an active volcano of New Zealand, is in the northern island or New Ulster, 18 miles S. of New Plymouth. It rises 8840 feet above the level of the sea.

Egmont, Port, is on the N. coast of West Falkland Island, between Keppel and Saunders islands. It affords good anchorage and fresh water, but the adjacent shore is nearly destitute of wood.

Eg'remont, a township of Berkshire co., Mass. Pop. 931.

E'gret, or **Aigret** [the diminutive of the provincial Fr. *égron* or *aigron,* a "heron"], a name applied to several species of heron. The egret is a handsome bird with soft flowing plumage, pure white excepting the train, which has a creamy tinge. The plumes are much used for ornamental purposes, particularly those of the little egret (*Ardea garzetta*). The egret frequents low, marshy grounds, and subsists on fish, frogs, snakes, lizards, etc.

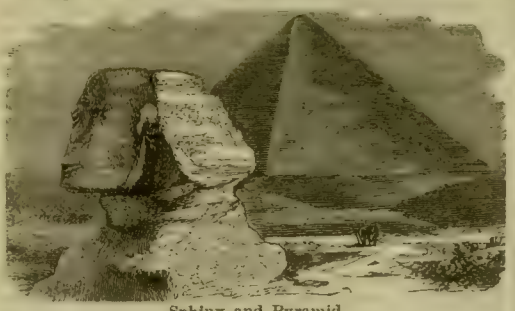
Egripo, or **Egripos,** a town of Greece. See Chalcis.

E'gypt [Gr. Αἴγυπτος; Lat. *Ægyp'tus;* Heb. *Mizr* or *Mizraim;* Fr. *Égypte;* Ger. *Aegypten;* Coptic, *Cham* or *Khem;* It. *Egitto;* Arab. *Misr* or *Musr*], a country in the N. E. part of Africa, is bounded on the N. by the Mediterranean Sea, on the E. by the Red Sea, on the S. by Nubia, and on the W. by the Great Desert. Being isolated on several sides by seas and sandy deserts, its limits have remained nearly the same in all the successive periods of its history. It extends from lat. 24° 2′ to 31° 37′ N., and is about 525 miles long N. and S. It comprises the lower portion of the valley of the Nile, from the cataract of Asswan to the mouth of the river. This region is unique in several respects, and is renowned as the home of the first civilized nation of the world—the foremost pioneers in the march of human progress. When Plato was born the monuments of Egypt had stood for many centuries, and they still exist. The area of Egypt Proper is estimated, in the official "Guide Général d'Egypte" (Alexandria, 1870), at 216,200 square miles, of which only 9737 are under cultivation, and only 2040 square miles more are adapted for cultivation. But the rulers of Egypt also claim jurisdiction over all the Soodan, embracing all Nubia, Sennaar, Dongola, Taka, Fazogloo, Kordofan, the provinces of the White Nile, and Khartoom. In this wider sense the area of Egypt is generally estimated at about 659,000 square miles; but E. de Regny, in his "Statistique de l'Égypte d'après des documents officiels" (Alexandria, 1872), claims 927,000.

Besides the Delta and several oases in the Desert, Egypt Proper is a valley about 500 miles long, confined between two ridges or continuous chains of barren limestone hills. Anciently, the desert east of the Nile supported a considerable population, chiefly pastoral. The altitude of the highest hills is not much over 1200 feet. The average breadth of the valley is about seven miles. The fertility and verdure of this narrow tract present a remarkable contrast to the aridity and desolation that prevail on either side. The most important physical feature of Egypt is its great and unique river, the Nile, which in the last 1300 miles of its course receives no tributary stream, and is the source of all the country's fertility. The periodical overflow of this once mysterious river is among the most remarkable instances of the stability of the laws of nature. For several thousand years the average height and duration of the inundation have continued nearly the same. The ordinary rise of the water at Thebes is about thirty-six feet, and at Cairo about twenty-five feet. The average rate of addition to the soil is about four and a half inches in a century. About 100 miles from the sea the Nile divides into several channels, and its narrow valley expands into the vast level and alluvial plain of the Delta. According to Herodotus, the Nile had seven mouths in ancient times, but at present there are only two large navigable channels—namely, the Damietta and the Rosetta mouths. This country is divided into three primary divisions—the Said or Upper Egypt, the Vostani or Middle Egypt, and the Delta or Lower Egypt. The term Delta, however, is some-

times restricted to the triangular tract enclosed between the two main channels of the Nile.

The great Libyan desert lying W. of the Nile is diversified by several fertile *oases*. The Great Oasis, situated near the W. border of Upper Egypt, is nearly 100 miles long. The oasis of Seewah (anc. *Ammonium*) is about 300 miles W. of Cairo. Here was the site of the famous temple of Jupiter Ammon. The date-palm, grapevine, and fig tree flourish in this oasis, but all the divisions of Egypt are destitute of forests and deficient in timber. But forests have been planted by the khedive in the Delta, and it is asserted that the annual rainfall has already been greatly increased thereby. It appears that all the ancient temples were built to shed rain. The climate is remarkably dry, serene, and equable. Rain seldom falls in Upper Egypt. In the Delta the mean temperature of winter is about 54° Fahrenheit, and that of summer 82°. A hot and pernicious south wind called khamseen or simoom prevails for nearly two months in spring. During eight months in the year the north wind blows, and favors those who wish to sail up the river. The Nile, replenished by the annual rains which fall on the highlands of Abyssinia, begins to overflow in July, and continues to rise until September. The inundation reaches its maximum near the autumnal equinox. The water, in which fertilizing mud and slime are suspended, is distributed over the valley by numerous canals, for the purpose of irrigating the land in summer. In October the country resembles a sea, in which the towns and villages appear as islands. After the inundation has subsided, grain and seeds are sown, and the earth is rapidly covered with verdure, so that nature here displays the brightest green in the winter months of December and January. The chief productions are wheat, barley, maize, cotton, tobacco, sugar, beans, millet, durrah (*Sorghum vulgare*), indigo, hemp, flax, onions, clover, oranges, figs, and grapes. Two crops are raised in a year on the same piece of land. The wheat harvest comes in April, or earlier in some parts of Egypt. The soil in the Delta is said to be fifteen feet deep.



Minerals, Animals, etc.—Limestone, sandstone, and red granite or syenite are abundant here. The last is found in the southern part, at Asswan, the ancient *Syene*, from the cliffs of which were obtained the material for the obelisks and other colossal monolithic monuments of ancient Egypt. Between Asswan and Esneh is an extensive sandstone formation, which supplied material for the great temples at Thebes and other ancient cities. The Pyramids are built of limestone quarried in their vicinity. In the Jebel Mokattem, between the Nile and Suez, is a tract covered with the silicified trunks of trees. A similar phenomenon of a petrified forest occurs also in the desert of the natron lakes near the western border of the Delta. The soil of Lower Egypt is an alluvium deposited by successive inundations, and consists of a dark-brown mould or argillaceous loam mixed with sand. This delta has increased enormously within the historic period. Among the minerals of Egypt are alabaster, porphyry, and emeralds. The principal wild animals are the wolf, hyæna, jackal, antelope, crocodile, and jerboa. The hippopotamus was formerly found here. The domestic animals of Egypt are camels, horses, horned cattle, asses, sheep, etc. Among the birds are the vulture and the ibis, the latter reputed sacred by the ancient Egyptians. The flora of Egypt abounds in dicotyledonous plants armed with thorns and bearing pale-green leaves, as the acacia. The principal trees are the date-palm (which is commonly cultivated), the doum-palm, the sycamore, the cypress, and the tamarisk. Among the indigenous plants are the papyrus, the lotus, a species of water-lily, and the *Acacia vera* (or *nilotica*), from which gum-arabic is obtained.

The Turks have been the ruling class in Egypt since they conquered the country, and they still occupy most of the high places in the civil administration as well as in the army. The ruling dynasty is descended from them, but of late has begun to favor the Arabic element of the population in preference to the Turkish. The Bedouins, whose number is officially estimated at about 400,000, are the unmixed descendants of the Arabs; while the Arabs of the towns and the Fellahs, the peasants and laborers, are believed to descend from a mixture of the ancient Arabs and the ancient Egyptians. The Copts (which see) are the unmixed descendants of the ancient Egyptians. Nominally, Egypt is still a pashalic of Turkey, but in 1841 a hattisherif made the rule over it hereditary in the family of Mehemet Alee, the oldest living male member of the family being entitled to succession in accordance with the law which also predominates at Constantinople. In 1866 the sultan, at the request of Ismaeel Pasha, changed the law of succession so as to make the pashalic hereditary in the direct male line of the ruling prince. At the head of the administration are a council of state, established in 1852, and consisting in 1872 of the eldest son of the khedive as president, of a son-in-law of the khedive, and five of the most prominent statesmen; and of a state ministry, which in 1872 was divided into seven departments—namely, justice and grace, foreign affairs, finances, interior, public instruction and public works, war, and navy. An assembly of deputies was for the first time convoked by the khedive on Nov. 27, 1866, and has since met annually. It is to control the administration of the country and to fix the budget. For administrative purposes Egypt Proper is divided into fourteen provinces, at the head of each of which is a governor called moodeer. The cities of Cairo, Alexandria, Suez, Port Saeed, Damietta, Rosetta, and Cossaieer do not belong to any of the provinces, but have their special governors. The provinces are subdivided into districts, and these into cantons. Special governors have also been appointed at Massowah and Sooakin, who are dependent upon the governor-general of the Soodan, who resides at Khartoom. A large majority of the inhabitants are Mohammedans of the Sunnite sect. The supreme authority for all matters of religious law is the council of ulemas at Cairo, consisting of the heads of each of the four orthodox rites of the Sunnites, of the head of the Cairo University, of the chief kadi of Cairo, and the nukees or chiefs of the descendants of the Prophet. Among the Mohammedan high schools, the one which is connected with the Mosque al Azhar at Cairo, often called the University of Cairo, is the most celebrated. It was formerly one of the chief seats of Arabic learning, and had sometimes as many as 20,000 students; and even at present it attracts students from all parts of the Mohammedan world. A great progress in the cause of education was made by the establishment in 1868 of government schools in the large towns of the countries. These schools numbered in 1870 about 4000 pupils, and embrace both primary and secondary instruction. In the latter department a number of special schools, as a polytechnic school, a law school, a philological school, an art school, a medical school, a naval academy, are included, and more recently Prof. Brugsch of the University of Göttingen has received and accepted a call from the Egyptian government to organize an academy of Egyptian archæology. The periodical press is still in its infancy. In 1870 there was only one weekly newspaper published in the Arabic language; all the other papers appeared in the French, Italian, or Greek language.

The population of Egypt Proper was in Mar., 1871, officially estimated at 5,203,405; inclusive of the Soodan, it was believed to amount to 8,000,000. The number of foreign residents was 90,000, embracing 34,000 Greeks, 24,000 Italians, 17,000 Frenchmen, 6000 Austrians, 6000 Englishmen, and 1100 Germans. The two largest cities are Cairo, the capital, and Alexandria. The revenue in the budget for the year Sept., 1871, to Sept., 1872, was estimated at 1,458,729 purses (1 purse = $20); the expenditures, at 1,283,830 purses; the surplus, at 174,900 purses. The public debt in Jan., 1872, amounted to £40,550,000. The value of the imports of Alexandria in 1871 was 560,900,000 piastres, that of exports, 999,500,000; in the same year, 2921 vessels entered the port of that city, and 2787 were cleared. The army, which is recruited by conscription, numbers about 14,000 men, and the navy consists of twelve steamers. A ship-canal connecting the Mediterranean with the Red Sea has been cut through the Isthmus of Suez under the direction of M. de Lesseps. It was opened on the 17th of Nov., 1869; it is about 100 miles long, 25 feet deep, and 71 feet wide at the bottom. The receipts during the year 1871 were 13,276,674 francs; the expenditures, 15,918,579 francs. In 1871 the canal was traversed by 765 vessels, of 761,467 tons; during the first nine months of 1872, by 827 vessels, of 880,096 tons. In Jan., 1872, Egypt had 711 English miles of railroad in operation; the aggregate length of telegraph lines was 3904 miles, and of telegraph wires, 8292 miles.

Ancient History and Monuments.—"Egypt," says Bunsen, "is the monumental land of the earth, as the Egyptians are the monumental people of history." The same writer calls the Egyptians "the chronometers of universal history." The sacred history of the Hebrews informs us that the Egyptians were descendants of Ham. The other chief authorities in relation to the antiquities and chronology of Egypt are Bunsen, Champollion, Lepsius, Wilkinson, Sharpe, and Poole, who differ widely in their computations. The first mortal who is recorded to have reigned over all Egypt was Menes, the founder of the first of thirty dynasties. His epoch is fixed by Bunsen at 3643, by Lepsius at 3892, and by Poole at 2717 B. C. Before Menes, Egypt was perhaps divided into two or more independent kingdoms. Menes is said to have founded Memphis, but no contemporary monuments of his reign exist. The great pyramid of Cheops is supposed to have been built by a king of the fourth dynasty, and is among the oldest Egyptian monuments that are extant. According to a somewhat doubtful tradition,

Cheops, who reigned nearly 500 years after Menes, oppressed his subjects with forced labor in the construction of this

Sphinx and Pyramid.

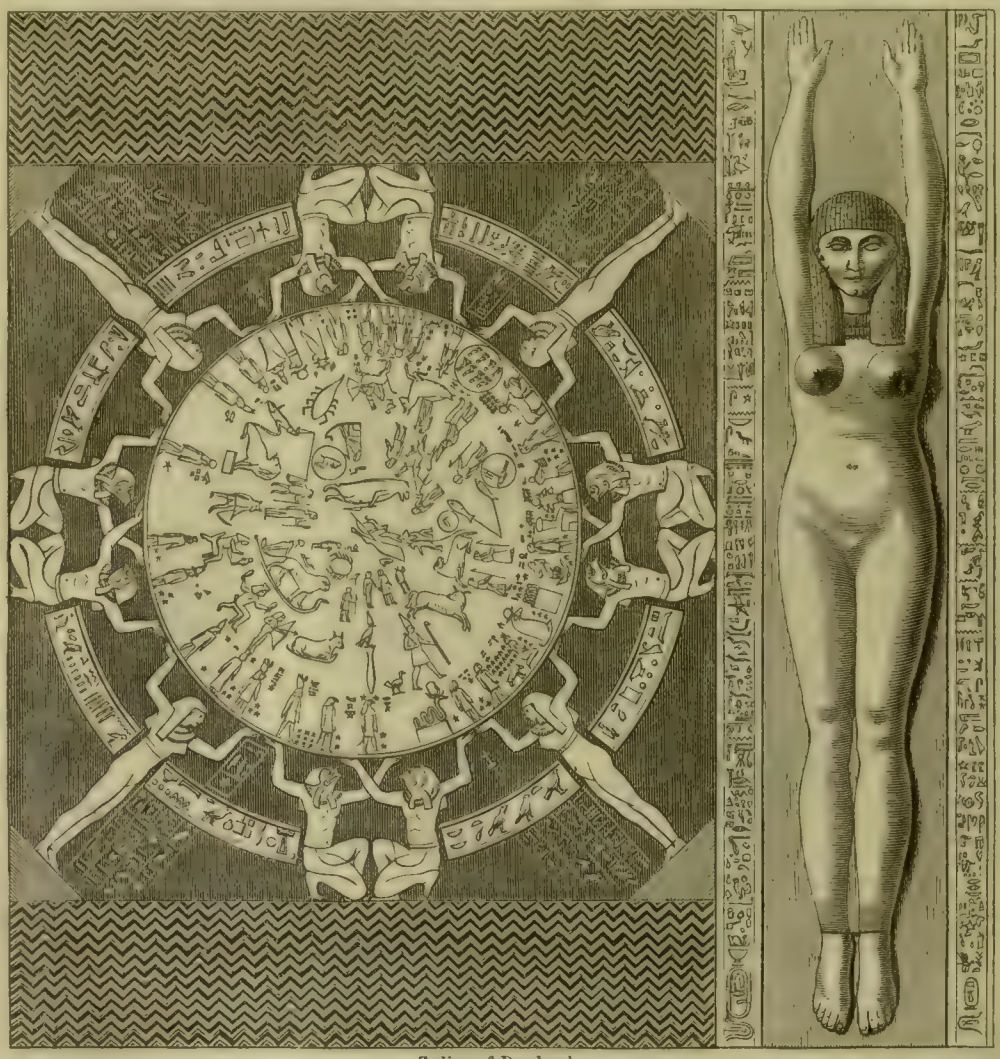
pyramid. Memphis was the capital of many of the kings who reigned before the time of the eleventh dynasty. Each king appears to have founded a pyramid as a memorial of his reign or as a monument for himself. Among the oldest cities of Egypt was Thebes (*Dios'polis*, called *No* or *No-Ammon* in the Bible), the temples and palaces of which are at this day the most magnificent ruins on the globe. Before the foundation of Carthage and Rome, Egypt was the central point of the civilization of the world. Among the famous kings of the twelfth dynasty was the warlike Osirtesen I., who is supposed to have been the Sesostris of the Greeks. An obelisk which he erected at Heliopolis is still standing. Amenemha, a king of the twelfth dynasty, excavated Lake Mœris, and constructed the famous Labyrinth, which Bunsen describes as "the most gorgeous edifice on the globe." It contained twelve palaces and 3000 saloons. (See LABYRINTH.) After the fourteenth dynasty the Hyksos or "shepherd kings," who were of foreign origin, ruled over Lower Egypt for several centuries. According to some writers, the Hyksos invaded Egypt about 2200 B. C. With the eighteenth dynasty, about 1525 B. C., commences the most brilliant period of Egyptian history and the greatness of Thebes. Among the most famous of the Theban kings were Amenoph I., Thothmes I., Thothmes III., Amenoph II. and III., and Horus, of the eighteenth dynasty, and Sethos and Rameses II. of the nineteenth. These kings builded the grand temples and palaces of Karnak and Luxor. Their conquests and victories over the Assyrians, Ethiopians, and other nations are recorded on obelisks, temples, and tombs with elaborate art and very copious details. "The most splendid period of the empire of Thebes," says Heeren, "must have occurred between 1800 B. C. and 1300 B. C." Probably no ancient nation has worked with such assiduity and ingenuity to perpetuate the record of its life and actions, and to eternize the memory of its ideas and institutions. In consequence of the peculiarly dry and equable climate and the solidity of Egyptian architecture, the monuments of this country have surpassed all others in durability. The permanence of the institutions of Egypt was doubtless promoted by the sight of public monuments which had defied the corroding power of time. "No people, ancient or modern," says Champollion, "has conceived the art of architecture on a scale so sublime, broad, and *grandiose* as the ancient Egyptians." "In ancient art," says the "Encyclopædia Britannica," "the Egyptian has the highest place with respect to intention, and equals that of Greece and Assyria in the excellence with which that intention has been carried out." According to Bunsen, the "Egyptians left imperishable monuments of deep ethical thought, of high artistic instincts, and of noble institutions."

A king of the twenty-second dynasty, called Shishak in the Bible, captured Jerusalem in the reign of Rehoboam, about 972 B. C. The Hebrew writers employ the name of Pharaoh as a general title of the kings of Egypt. Among the notable kings of the twenty-sixth dynasty was Psammetichus, who began to reign about 670 B. C., and favored the immigration of the Greeks into Egypt. A revival of art occurred in his long reign, which was an important epoch. His son and successor, Necho, defeated Josiah, king of Judah, at Megiddo. Egypt was conquered about 525 B. C. by Cambyses, king of Persia, but regained its independence under Amyrtæus, a king of the twenty-eighth dynasty. In the year 350 B. C., Egypt was again conquered, by the army of Darius Ochus, king of Persia, and Nectanebus II., the last king of the thirty dynasties, ceased to reign. The succession of Egyptian monarchs, embracing a period of 3553 years, is unexampled in history. In 332 B. C., Alexander the Great invaded Egypt, which became an easy conquest, as the natives refused to fight for their Persian masters. He founded Alexandria, and partially Hellenized the country, but the Egyptians continued to be governed by their own laws. The regulations which he made for the government of Egypt were equally wise and popular. The privileges of the priests were secured to them, but the Greeks became the dominant class. Egypt continued to be a prosperous and powerful kingdom under several Grecian or Macedonian kings named Ptolemy. Under the rule of the Ptolemies, and of the Romans, who became masters of Egypt about 30 B. C., Alexandria was a famous centre of learning and philosophy, as well as a great commercial emporium. According to some Egyptologists, the first seventeen dynasties were not consecutive, but some of them were contemporaneous, and two kings reigned at the same time over different portions of the country. (Some notice of the ancient monuments of Egypt may be found under the heads of THEBES, EDFOO, KARNAK, PYRAMID, and OBELISK.)

Among the peculiarities of this nation was the hieroglyphic mode of writing, and the practice of covering their obelisks and the outer and inner walls of temples and palaces with sculptured bas-reliefs and hieroglyphic symbols, which not only recorded historical events, but also represented in copious detail their social customs and private life. They lavished labor and expense on temples and tombs, while their private houses were plain and inexpensive. The priests were the ruling class, and were distinguished by their superior science, which they kept secret. The government was a limited hereditary monarchy. The priests were in ordinary times the real governing body. They were the sole depositaries of learning and science. The chief priests were the judges of the land, the councillors of the sovereign, the legislators, and the guardians of the great mysteries. The king himself was anciently a priest. Nowhere in the ancient world was the number of temples so great as in Egypt; nowhere was ordinary life so intimately blended with religion. The ancient Egyptians were people of a devout, serious, and contemplative disposition. They believed in the immortality of the soul, and apparently also in the resurrection of the body, but they worshipped beasts, reptiles, and even vegetables, probably as symbols. They were brave in war, and less cruel than the Assyrians. They excelled in magic arts, and had made much progress in various sciences before the time of Moses, who was "learned in all the wisdom of the Egyptians." They calculated solar and lunar eclipses, and carried astronomy to the highest point it could attain without the aid of modern instruments. They appear to have been well versed in geometry, arithmetic, mechanics, and hydraulics, and must have had a considerable knowledge of chemistry. Herodotus and Cicero concur in the opinion that they were the most learned and accurate of all nations in relation to their native annals. More than 1000 years before Phidias was born they had attained great proficiency in sculpture. Champollion, in a letter dated at Thebes, says: "I write these lines almost in the presence of bas-reliefs which the Egyptians executed with the most elegant delicacy of workmanship 1700 years before the Christian era." In their temples and palaces we see massive grandeur of form, noble taste in design, exquisite finish in decoration, and a pervading expression of repose which is one of the highest results of art. Among the arts in which they acquired skill was music, and it appears that they played on the harp, lyre, and sistrum during the twelfth dynasty or earlier. The Greeks attributed to them the invention of the lyre and flute. They also fabricated glass bottles and beads, some of which are marked with symbols indicating a date of 1500 B. C. Women enjoyed nearly equal rights, and were so well treated that their condition was more favorable in Egypt than in other ancient nations. Several women, among whom was Nitocris, a queen of the sixth dynasty, inherited the throne and exercised royal power. The soldiers, who were all landholders, constituted the highest class except the hereditary priesthood. According to Strabo, there were only three castes—priests, soldiers, and husbandmen (farmers). The stamp of caste was not indelible. The land was divided into three unequal portions, of which one belonged nominally to the king, and was held by tenants, who paid a low rent or one-fifth of the crop; another portion was possessed by the priests, who paid no rent or tax; the third part was held by the military class or order, who amounted to 410,000 men, and had six acres each, for which they paid no rent, but they were bound to serve in the army in time of war. They used many war-chariots, which appear to have been introduced about the time of the eighteenth dynasty. The ancient Egyptians carried on an extensive commerce, for which their position was very advantageous. The navigation of the Nile (the longest inland navigation known to the ancients) and the Red Sea enabled them to command the trade of several foreign countries. The rich products of India and Arabia have in almost all ages passed through Egypt on their way to Europe. Necho, the Nekao II. of Manetho, and the Pharaoh-Necho of Scripture (611–595 B. C.),

of the twenty-sixth dynasty, is said to have been the first of their kings who had a navy of war-vessels. His navy was built by Phœnicians in the Red Sea, and having sailed around Africa, entered through the Strait of Gibraltar into the Mediterranean. This statement is doubted by some writers. Diodorus states that the population amounted to 7,000,000 in the Pharaonic era.

The style of architecture and decorative art which prevailed in ancient Egypt was one of the characteristic and almost unchangeable peculiarities of the race. For example,



Temple of Denderah.

the celebrated temple of Denderah has been assigned to a date of the most extreme antiquity, though it is now generally referred to the early Roman period. The ceiling of this temple is adorned with figures arranged in the style of a zodiac, and well known as "the Zodiac of Denderah;" but some recent writers deny that it has any astronomical significance. The temple itself is believed to have been dedicated to the service of the goddess Athor, the Egyptian Venus.

Modern History.—When the Roman empire was divided, on the death of Theodosius in 395 A. D., Egypt became a part of the dominions of Arcadius, emperor of the East. For several centuries after the time of Constantine the Great (306–337 A. D.), Egypt was greatly disturbed by religious controversies and violent tumults between the different sects or parties of Christians, who were very numerous there. The Arians and orthodox shed torrents of blood in Egypt. In 640 A. D. the Arabs, led by Amroo, a general of the caliph Omar, invaded Egypt. The oppressed Egyptians, being disaffected to the emperor Heraclius, and having no strong motive to fight, offered little resistance, and the conquest of the country was easily effected in December, 640. Amroo wrote to Omar that "he had taken a city [Alexandria] which beggared all description, in which he found 4000 palaces, 400 theatres," etc. Greek civilization and literature, which had flourished in this country for 900 years, then came to an end, and Egypt became a part of the kingdom of the caliphs who reigned at Damascus and afterwards at Bagdad. About 970 A. D., Egypt was conquered by the Fatimite dynasty, under which Cairo was founded and became the capital. Saladin, the famous adversary of the crusaders, obtained the sovereign power as sultan of Egypt about 1170. He died in 1193, leaving several sons, among whom his extensive empire was divided. Louis IX. of France conducted a crusade against Egypt in 1248, but was defeated and taken prisoner by the Saracens. In 1250 the government was revolutionized by the Mamelukes (slaves of Turkish or Caucasian origin), who deposed the sultan and usurped the chief power. This country was conquered in 1517 by the Ottoman sultan, Selim I., who reduced it to a Turkish province. The turbulent Mamelukes afterwards filled the country with disorder for more than two centuries, and it was under their domination when it was invaded by the French in 1798. A French army of about 35,000 men, commanded by Bonaparte, was conveyed to Egypt by a fleet, and arrived at Alexandria in July, 1798. This expedition was accompanied by a large number of savants and artists, among whom were Berthollet, Monge, and Denon. Bonaparte defeated the Mamelukes at the battle of the Pyramids, July 23d, and took Cairo on the 24th. The conquest of Egypt was soon completed. The French savants and artists explored the topography, natural history, and antiquities of Egypt, and obtained materials for a great descriptive work, which was published by the government under the title of "Description de l'Égypte, etc.," with more than 900 engravings (25 vols., 1826). In Aug., 1799, Bonaparte returned to France, leaving his army, under the command of Gen. Kleber, to contend against the combined forces of Great Britain and the Turkish sultan. After several battles at Heliopolis, Aboukeer, etc., the French were expelled from Egypt in 1801. Mehemet Ali was appointed pasha of Cairo in 1804, and massacred a large number of the Mamelukes in 1811. He founded colleges and schools, promoted commerce and manufactures, and introduced European civilization. As viceroy of Egypt he was nominally a vassal of the Turkish sultan, but his power was nearly absolute. In 1830 he invaded and conquered Syria. He afterwards revolted against the

sultan, whose army he defeated at Nizeeb in Syria in June, 1839, soon after which the great powers of Europe intervened to check his victorious progress. Peace was restored in 1841 by a treaty which made the viceroyalty hereditary in the family of Mehemet Ali. When Mehemet Ali became imbecile (he died Aug. 2, 1849) the Turkish government in July, 1848, appointed his adopted son Ibrahim, and after Ibrahim's death (Nov. 10, 1848) a grandson of Mehemet Ali, Abbas Pasha, regent of Egypt, who showed himself a fanatical Mohammedan, and repealed many of

Zodiac of Denderah.

the reforms which had been introduced by his predecessors. His successor was Said Pasha, a younger son of Mehemet Ali, who reigned from 1854 to Jan., 1863, and was succeeded by Ismaeel Pasha, a son of Ibrahim, who in 1867 received from the Turkish government the title of khedive. (See BUNSEN, "Aegyptens Stelle in der Weltgeschichte," 5 vols. 8vo, 1845–57, and English translation of the same; LEPSIUS, "Denkmäler aus Aegypten und Aethiopien," 12 vols. folio, 1849–59; WILKINSON, "Manners and Customs of the Ancient Egyptians," 6 vols. 8vo, 1840–47; SHARPE, "History of Egypt," 2 vols., 1838; 5th ed. 1870; LANE, "Modern Egyptians," 2 vols. 8vo, 1842; MARIETTE-BEY, "Aperçu de l'Histoire d'Egypte," 2d ed. 1870; STEPHAN, "Das heutige Aegypten," 1872; REGNY, "Statistique de l'Egypte d'après des documents officiels," published annually since 1870.)

REVISED BY A. J. SCHEM.

E'gypt, a township of Ashley co., Ark. Pop. 513.

Egypt, a township of Yancey co., N. C. Pop. 781.

Egyptian Architecture is characterized by an almost monotonous simplicity, and a wonderful solidity and heaviness of structure. It has been assumed, perhaps too hastily, that the sloping walls and ponderous, almost imperishable, structure of the Egyptian temples was an imitation of the caverns or of the excavations in which its inhabitants are assumed to have dwelt in primitive times; and facts are not wanting which would appear to confirm the opinion that the pre-historic Egyptians were troglodytes or cave-dwellers.

The pyramid, though not peculiar to Egyptian architecture, seems to have lent its solidity to all the important buildings, the walls of which generally incline inward, and are never more than one story high. The use of columns, often monolithic, far exceeded the requirements of safety or strength, the shafts being very large and short, and set very near each other. The form of many is suggestive of that of the date-palm with its crown of leaves. They are sometimes polygonal. Burnt or sun-dried brick, granite, limestone, marble, syenite, and a great variety of materials were employed. The roof of important buildings was of great masses of stone, requiring the use of numerous interior columns. The roofs, though flat, are said to be always inclined, so as to shed rain. All buildings, with scarcely an exception, were rectangular.

The decorations were chiefly of a hieroglyphic character; and those which were not hieroglyphic had to a great extent, it is believed, an emblematic purpose. Many other decorations were illustrative of the daily life and industries of the people. The vastness, darkness, and enduring character of these prodigious structures were well calculated to impress the mind with feelings of the mystery and dignity of the religious system which so completely pervaded the social life of ancient Egypt. The palm-branch, the lotus, the vulture's wings, the human head, and various emblems from animal and vegetable life, adorn the capitals of columns.

Whether the Egyptians invented the arch is not known, but it was used, it is said, as early as the eleventh dynasty, but at no period was it very freely employed. It is still a great mystery how the ancient Egyptian builders could have raised to position the prodigious blocks of stone which they employed in building.

Egyptian (or **Maltese**) **Vulture,** called also **Pharaoh's Hen** (*Neophron percnopterus*), a small vulture of Southern Europe, Northern Africa, and of Asia, having

Egyptian Vulture.

almost perfectly white plumage with black quill-feathers. These birds are protected by law and custom, and are valuable scavengers, and consequently are half domesticated.

Ehninger (JOHN WHETTON), an American artist, born in New York July 22, 1827. He graduated at Columbia College, and studied art in Europe, was a pupil of Couture in Paris, and was much in Düsseldorf and the great European capitals. His pictures have merit, but he is best known by his illustrative drawings and etchings, several series of which have been published and gained a wide popularity.

Ehrenberg, a post-village, capital of Yuma co., Ara., 7 miles S. of La Paz, on the Colorado.

Eh'renberg (CHRISTIAN GOTTFRIED), M. D., an eminent German naturalist and microscopist, born at Delitzsch, in Prussian Saxony, April 19, 1795. He studied medicine at Leipsic, and graduated as M. D. in 1818. Among his favorite studies was botany, on which he wrote several treatises in his youth. In company with Dr. Hemprich, he visited Egypt, Arabia, and Syria, and spent about six years (1820–26) in the exploration of the natural history of those countries. Having returned to Berlin, he obtained in 1826 a chair of medicine in the university of that city. He published in 1828 "Scientific Travels through Northern Africa and Western Asia," and "Physical Symbols of Birds, Insects, etc." (in Latin). In 1829, Humboldt and Ehrenberg performed together an excursion to the Ural and Altai mountains. Ehrenberg afterwards made interesting discoveries with the microscope, and published important works entitled "The Infusoria as Perfect Organisms" (1838) and "Mikro-Geologie" (1854–56). He discovered that cretaceous and other strata of great extent are composed of microscopic organisms. His reputation as an observer is justly great, while the conclusions he has drawn from his observations are frequently faulty.

Ehrenbreitstein, ā'ren-brīt'stīn (*i. e.* "honor's broad stone"), a fortified town of Rhenish Prussia, is picturesquely situated on the E. bank of the Rhine, opposite Coblentz, with which it is connected by a bridge of boats. It stands at the base of a rocky hill. On the summit of this hill stands the citadel of Ehrenbreitstein, situated on a rocky promontory which rises 400 feet above the water, inaccessible on three sides, and defended on the N. and only attackable front by a double intrenchment. It contains casemates for the whole garrison, artillery, and stores, and forms the key of the whole fortified position of Coblentz. It has been a fortress from time immemorial, the first origin of it dating from the time of Drusus, when the Romans erected various castles and strongholds on the Rhine, and a stone bridge over that river at Engers, between Coblentz and Neuwied, where Cæsar is also supposed to have constructed his first bridge. It was besieged without success in 1688 by the French, who took it after a long siege in 1799. The citadel was rebuilt in 1815 by the Prussian general Aster, the projector of all the works at Coblentz. The present improved construction has been by some military writers regarded as impregnable except to famine, as the old castle sustained a siege of eleven months with a small garrison; but modern developments of artillery-power furnish new elements which may have some influence in forming a present judgment on this point. The artillery is mostly in casemates, of which there are 181, and the English colonel Humfreys states that "with sufficient artillery a battalion (say 1000 or 1200 in all) could hold the position" against an attack in force. Pop. in 1871 (without the garrison), 2504.

J. G. BARNARD, *U. S. Army.*

Eibenstock, ī'ben stock, a town of Saxony, 16 miles S. S. E. of Zwickau. It has manufactures of muslin, lace, chemical products, and tinware. Tin-mines have been opened in the vicinity. Pop. in 1871, 6362.

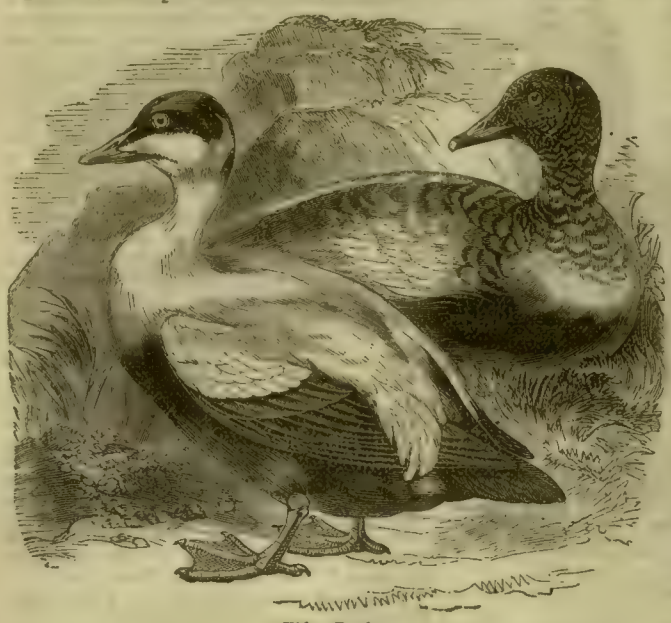
Eibergen, a town of the Netherlands, in Gelderland. It has calico factories. Pop. 5324.

Eich'berg (JULIUS), a musical director, was born in Germany in 1825, and was educated at the Conservatory of Brussels, where he received several first prizes for excellence. He was afterwards musical director in Germany and Switzerland, and in 1856 established a conservatory of music at Boston, Mass., where for some years he has been principal music-teacher in the public schools. He was one of the directors in the Peace Jubilee of 1872 at Boston, and is the author of successful operas, etc., such as "The Doctor of Alcantara," "The Rose of the Tyrol," etc.

Eichhoff (FRÉDÉRIC GUSTAVE), a philologist, born at Havre Aug. 17, 1799, was the son of a merchant formerly of Hamburg. He devoted himself at Paris to Oriental languages, and established his reputation by his "Parallèle des Langues" (1836). He has written on the Indic origin of the Slavic tongues, the mythology of the Edda, the roots of the German language, the poetry of the Hindoos, and a "Grammaire Générale Indo-Européenne" (1867).

Eich'horn (JOHANN GOTTFRIED), an eminent German scholar and biblical critic, was born at Dörenzimmern Oct. 16, 1752. He was educated at Göttingen, and became professor of Oriental languages at Jena in 1775. In 1788 he obtained the chair of Oriental and biblical literature at Göttingen, which he filled nearly thirty-eight years. He edited the "General Repository of Biblical Literature" (10 vols., 1787–1801), and wrote numerous works, which display an almost unequalled knowledge of Oriental and biblical antiquities. As a biblical critic he belongs to the rationalistic school. Among his principal works are an "Introduction to the Old Testament" (3 vols., 1783), an "Introduction to the New Testament" (2 vols., 1804–10), "Primitive History" ("Urgeschichte," 3 vols., 1790–93), a "Universal History" (5 vols., 1799), and a "History of Literature from its Origin to the Most Recent Times" (6 vols., 1806–12). Died June 25, 1827.

Eichhorn (KARL FRIEDRICH), a jurist and historian, a son of the preceding, was born at Jena Nov. 20, 1781. He was professor of German law at Göttingen from 1817 to 1828. He published, besides other works, a "German Political and Legal History" (4 vols., 1808–23; 5th ed. 1843–45). Died in July, 1854.



Eichstädt, IK'stĕt, or **Aichstädt** [Lat. *Aurea'tum* or *Dryop'olis*], a town of Bavaria, on the river Altmühl, about 42 miles W. S. W. of Ratisbon. It has a Gothic cathedral founded in 1259, a ducal palace once belonging to Eugene de Beauharnais, a public library, a museum, and the castle of St. Wilibald, now used as a barrack; also manufactures of hardware, cotton and woollen fabrics, stoneware, etc. A bishopric was founded here about 745 A. D. Eichstädt was given to Prince Eugene de Beauharnais in 1817. Pop. in 1871, 7011.

Eich'wald (EDWARD), an eminent Russian naturalist of German extraction, was born at Mitau in 1795. He visited the Caspian Sea and Persia, and became professor of mineralogy and zoology at St. Petersburg in 1838, after which he made scientific excursions to several parts of Russia and Italy. Among his works are "Travels to the Caspian Sea and the Caucasus" (1834), "Fauna Caspio-Caucasia" (1841), "The Primitive World in Russia" ("Die Urwelt Russlands," 4 vols., 1840–47), and "The Palæontology of Russia" (1851).

Eider, ī'der [Lat. *Eidora*], a river of Germany, forming the boundary between Sleswick and Holstein, rises about 10 miles S. W. of Kiel, flows nearly westward, and enters the German Ocean at Tönning. It is about 90 miles long, and is navigable from its mouth to Rendsburg. A

canal cut from Rendsburg to Kielfiord opens a communication from the Baltic to the North Sea.

Ei'der Duck [Old Icelandic *æðr*, the name of the bird in question; regarded as a primitive form], (*Somateria*), a genus of sea-ducks, natives of the northern parts of Europe and America. The *Somateria mollissima* is larger than the common duck, and the color of the plumage in the male varies with the changing seasons. The female is of a light reddish-brown color, transversely marked with darker shades. They construct their nests of fine mosses and seaweeds, and their eggs, from five to seven in number, are about three inches long and two broad, and of a light green color. During incubation the female deposits in the nest the down which she plucks from her breast. When this is removed by the hunters she furnishes another supply, and if this is taken the male contributes down from his breast. This down is of the finest quality, and is an important article of commerce. The eggs also are highly prized as food. The king eider (*Somateria spectabilis*) is found in great numbers on the coasts of Nova Zembla, Greenland, Spitzbergen, etc., but is rarely seen in Britain or the U. S.

Eider Ducks.

Eight-hour Law, a measure to provide for the improvement of the condition of the laboring classes which has been agitated in the U. S. since 1866. A law of this name, adopted by Congress in 1868, and by the legislatures of New York, Pennsylvania, Illinois, Ohio, and Iowa in 1868 and 1869, provides that all government work is to be performed in eight hours' work per day; and when the government officials gave this law the interpretation that the laborers should only receive four-fifths of their former wages when they worked ten hours per day, President Grant decided that they should receive their full pay; which decision was sustained by both houses of Congress. The object of the workingmen's associations throughout the country is to reduce the length of a working day to eight hours, with the same or very nearly the same wages. This question was first agitated in England, where it was decided by parliamentary investigation that a legal restriction of laboring time was necessary for the preservation of society; because otherwise, through the weakness of the laborers in their opposition to capital, they are overworked, their health ruined, their mean length of life reduced from fifteen to twenty-five years, their moral education neglected, their capability for self-help and self-rule destroyed; whence great dangers for the state and for the community may arise. Since 1840 a number of laws have been passed reducing the length of a working day from sixteen or twenty hours, which had been not uncommon as a day's work up to that time for adult persons, and very little less for children, first to twelve, then to eleven, and at last to ten, and for children to eight hours. The reports of the government inspectors of factories, as well as those of physicians, state that these laws will produce the most beneficial effects upon both laborers and employers. How, indeed, some occupations, like that of farmers, with whom longer hours of labor are necessary at some times, will fare under the eight-hour law, only the future can determine. A. J. Schem.

Eight Mile Grove, a p.-twp. of Cass co., Neb. P. 480.

Ei'kon Basil'ike, or I'con Basil'ice [Gr. εἰκὼν βασιλική, "the royal likeness"], a famous book descriptive of the sufferings of King Charles I. of England, was long believed by the royalists to have been written by the king himself, but most critics now believe that it was composed by Bishop Gauden (1605–62).

Eilenburg, ī'lẹn-boorg', a town of Prussian Saxony, on an island in the river Mulde, 27 miles E. N. E. of Merseburg. It is enclosed by walls, and has an old castle and two bridges; also manufactures of calico, woollen yarn, brandy, starch, and tobacco. Pop. in 1871, 10,135.

Eim'beck, or Einbeck, a town of Germany, in the Prussian province of Hanover, is on the river Ilme, about 40 miles S. S. E. of the city of Hanover. It is enclosed by old ruinous walls, and is less important than it was in the fifteenth century. It has three churches; also manufactures of cotton and woollen goods and chemical products. Pop. in 1871, 6189.

Ei'meo, one of the Society Islands, in the Pacific Ocean, about 30 miles N. W. of Tahiti. Taloo Harbor is in lat. 17° 30′ S., lon. 149° 47′ W. Eimeo is 9 miles long and 5 miles wide. The surface is diversified by valleys and hills, which produce excellent timber. Here is a missionary station connected with the London Missionary Society.

Einsiedeln, īn'see-dẹln, a town of Switzerland, in the canton of Schwytz, about 24 miles S. S. E. of Zurich. Here is a famous Benedictine abbey, containing a black image of the Virgin Mary, which is visited annually by about 150,000 pilgrims. An abbey was built here in the ninth century, but the present edifice was erected about the year 1720. It contains a library of 28,000 volumes. Zwingle the Reformer was curate of Einsiedeln in 1516. Pop. in 1870, 7633.

Eisenach, ī'zẹ-nȧk, a town of Germany, in Saxe-Weimar, is finely situated amid wooded hills on the river Hörsel and on the railway from Leipsic to Cassel, about 48 miles W. of Weimar. It is well built, with wide and clean streets, is enclosed by walls, and has a handsome ducal palace, several churches, and a school of design. It is the chief town in the Thuringian Forest. Here are manufactures of cotton and woollen fabrics, carpets, soap, white lead, etc. In close proximity to this town is the castle of Wartburg, formerly a residence of the landgraves of Thuringia, and memorable as the place of refuge in which Luther remained secreted ten months (1521–22), having been carried thither for safety by his friend the elector of Saxony. Pop. in 1871, 13,967.

Ei'senberg, a town of Germany, in Saxe-Altenburg, is near the Saale, 26 miles E. of Weimar. It has a castle, an observatory, and a town-house; also manufactures of porcelain and woollen stuffs. Pop. in 1871, 5261.

Ei'senburg [Hun. *Vas*], a county of South-western Hungary, is bounded on the N. by Odenburg, on the E. by Veszprem, on the S. by Zala, and on the W. by Styria. Area, 1945 square miles. The soil is very fertile. The chief products are grain, tobacco, flax, wine, and fruit. Pop. in 1869, 331,602.

Eisenerz, ī'zẹn-ẽrts' (*i. e.* "iron ore"), also called **Innerberg,** a town of Austria, in Styria, is at the base of the Erzberg, 20 miles W. N. W. of Bruck. The Erzberg, which is 2800 feet high, is a solid mass of iron ore of rich quality. Mines have been worked here for 1000 years. Eisenerz has twelve smelting-furnaces. Pop. in 1869, 3841.

Ei'senstadt [Hung. *Kis Márton*], a royal free town of Hungary, is near the W. bank of Lake Neusiedl, 12 miles N. N. W. of Œdenburg. Here is a palace of Prince Esterhazy, having 200 chambers for guests. Connected with this palace is a zoological garden, an orangery, and a conservatory containing 70,000 exotic plants. P. in 1869, 2476.

Eis'leben, a town of Prussian Saxony, about 20 miles W. of Halle, with which it is connected by a railway. It is divided into the old and the new town, the former of which is enclosed by walls. It has an old castle and a gymnasium, also manufactures of potash and tobacco. Copper and silver are mined in the vicinity. Martin Luther was born here in 1483, and died here in 1546. Pop. in 1871, 13,434.

Eit'elberger von E'delberg (Rudolf), a German art-historian, born in 1817, became in 1852 professor of art-his-

tory at the University of Vienna, and has contributed much to the improvement of Austrian industry and art. He wrote, among other works, "Die Reform des Kunstunterrichts" (1848), "Mittelalterliche Kunstdenkmale des Oesterreichischen Kaiserstnats" (2 vols., 1858–60), and "Quellenschriften zur Geschichte der Kunst des Mittelalters und der Renaissance" (1871).

Eject'ment [Lat. *ejec'tio fir'mæ*, from *ejic'io, ejec'tum*, to "cast out"], in law, is a *mixed* action, as it is resorted to in order to recover the possession of land, and damages for the wrongful withholding of it, though the damages are nominal. Originally, it was a "possessory" action—that is, adapted to the recovery of the possession of land. By a series of fictions it finally came to be a convenient means of testing the title. The substance of the fiction was a supposition that a lease for a certain number of years had been made to a tenant, John Doe, who had entered into possession, and had then been ejected by a person supposed to represent the party to be ultimately made defendant. This person was termed "a casual ejector," and was usually represented as Richard Roe. An action was then brought substantially under the following title: "Doe, as tenant of Edwards (claiming the land), against Roe." A written notice was thereupon sent in the name of Roe by Edwards's attorney to the opposing claimant (Archer), who is the party in possession. By this notice Archer was advised to defend the action, otherwise Roe would allow judgment to be taken against him and the possession would be lost. Archer, on making application to be made defendant, was allowed to defend upon condition that he would admit the validity of the fictitious portion of these proceedings; so that the matter was narrowed down to a trial of the merits of the case. The action was now deemed really to be between Edwards and Archer, though Doe still remained plaintiff on the records of the court. It is a well-settled rule in this action that the plaintiff can only recover upon a *legal* title, as distinguished from a title in a court of equity. He can succeed only upon the validity of his own title, and not upon the weakness of that of his adversary. He must also have, in legal phrase, a "right of entry." Where that does not exist, another form of action must be adopted. There was one serious practical inconvenience following this method of procedure. There was no limit in law to the number of successive actions of ejectment that could be brought by a plaintiff, although he had been worsted. He had only to substitute another fictitious tenant in the place of Doe, and all the proceedings might be gone through with again. The only check upon repeated actions of this kind was a resort to a court of equity for an injunction to prevent harassing, and perhaps exhausting, litigation. The fictitious portion of the proceeding was abolished in England by the Common-Law Procedure act of 1852, and the action placed upon satisfactory grounds. The same result had been accomplished as early as 1830 in New York.

Should the plaintiff succeed in his action, he has also an independent cause of action for the loss of profits sustained by reason of the defendant's wrongful possession. This is known as an action of trespass for *mesne* (intermediate) profits. In some of the American States—*e. g.* New York—this cause of action may be united with the action of ejectment. The recovery would, by the statute of limitations, commonly be limited to the mesne profits for the last six years.

T. W. Dwight.

Ejutla, ā-hoot'lä, a town of Mexico, in the province of Oajaca, about 250 miles S. S. E. of the city of Mexico. Pop. about 7000.

Ekaterinburg, a town of Russia, in the government of Perm, 160 miles S. E. of Perm. It was founded in 1722, has straight broad streets, many churches, a government mint for copper coins, is the principal city of the mining district in the Ural Mountains, and is surrounded by mountains on every side. Pop. in 1867, 24,508.

Ekaterinoslav, a government of South-western Russia, is bounded on the N. by Kharkof and Poltawa, on the E. by the country of the Cossacks of the Don, on the S. by Tauria and the Sea of Azof, and on the W. by Kherson. Area, 13,758 square miles. It is traversed by the Dnieper, the Samara, and the Waltschija, and consists almost entirely of large steppes. The soil is fertile. Pop. in 1867, 1,281,482.

Ekaterinoslav, a city of Russia, capital of the above government, 115 miles S. W. of Kharkof, on the Dnieper. It has a monument of Catherine II., a large cloth factory, and many other manufactures. Pop. in 1867, 22,548.

Ek'ron, an important city of the ancient Philistines, was in Judea, about 25 miles W. by N. from Jerusalem. Its site is identified with the modern *Akir* or *Akrec*.

El is the Arabic definite article, often spelled *al*, the vowel employed in Arabic being the short, obscure *a*, whose sound approaches that of our short *e*. *El* is also the masculine article in Spanish. *El* occurs frequently as an initial or as a final syllable in Hebrew proper names. It is one of the Hebrew names of God.

E'la, a post-township of Lake co., Ill. Pop. 1277.

Ela (Jacob H.) was born in Rochester, N. H., July 18, 1820. He became a printer, was an editor of Free-Soil Democratic journals, holding several important public offices. He was U. S. marshal for New Hampshire (1861–66), M. C. (1867–69); is, 1874, fifth auditor U. S. treasury.

Elæagna'ceæ [from *Elæag'nus*, one of the genera], a natural order of exogenous plants (trees or shrubs), natives of Europe, North America, and other parts of the northern hemisphere, being rare south of the equator. They have entire leprous or scurfy leaves, superior ovary, and apetalous flowers. Several species indigenous in Persia and Nepaul bear edible berries. This order also comprises the *Shepher'dia argen'tea* or buffalo berry, which grows near the upper Missouri River, and bears a pleasant acid fruit; this and the *Shepherdia Canadensis* and the *Elæagnus argenta* (silver berry of the North-west) are the only known North American species. The oleaster (*Elæag'nus angustifo'lia*) is a native of the Levant and Southern Europe. This tree is often planted in shrubberies for the sake of its fragrant yellow flowers and its silvery white foliage. It attains a height of nearly twenty feet.

Elæagnus. See Elæagnaceæ.

Elæ'is [from the Gr. ἔλαιον, "oil"], a genus of trees of the natural order Palmaceæ. The *Elæ'is Guineen'sis*, or oil-palm, a native of Western Africa, produces the palm oil which is extensively used in the manufacture of candles and soap. This tree abounds in the tropical parts of Africa, and bears a very large quantity of fruit, from the outer fleshy rind or coating of which the oil is obtained by boiling in water. This oil is made into soap more readily than any other known oil. A still further supply of oil can be obtained from the fruit by treatment of the boiled fruit. This is called "palm-nut oil." This species and others of the genus have been naturalized to some extent in tropical America, where they are cultivated for their oil. They also yield a pleasant alcoholic drink.

Elæocarpa'ceæ [from *Elæocar'pus*, one of the genera (from the Gr. ἔλαιον, "oil," and καρπός, "fruit")], an order of exogenous plants allied to the Tiliaceæ, are mostly natives of the East Indies. Several species produce edible fruit.

Elæococ'ca [from the Gr. ἔλαιον, "oil," and κόκκος, a "berry"], a genus of plants of the natural order Euphorbiaceæ. Useful oil is obtained from the seeds of several species. A tree called *Elæococ'ca verruco'sa* is cultivated in Mauritius and Japan for its oil, which is used for burning. One or more species in China yield drying oils, used in that country for preparing varnishes and paints. These oils have acrid properties.

Elæoden'dron [from the Gr. ἔλαιον, "oil," and δένδρον, a "tree"], a genus of trees belonging to the order Celastraceæ. *Elæodendron croceum*, commonly called saffron-wood, grows near the Cape of Good Hope, where it is prized for building and cabinet-work. *Elæodendron glaucum*, found in Southern India, is called the Ceylon tea tree. Some of the species yield a fixed oil resembling oil of olives.

Elæop'ten [from the Gr. ἔλαιον, "oil," and πτηνός, "flying," hence "volatile"], the liquid portion of certain volatile oils when separated from the concrete part, which is called *stearopten*.

Elagaba'lus, or **Heliogaba'lus** [Fr. *Élagabale* or *Héliogabale*], (Marcus Aurelius Antoninus), a Roman emperor, born at Antioch in 204 A. D. His original name was Varius Avitus Bassianus, but on being appointed a priest of the god whom the Syrians called Elagabal, he assumed that name. On the death of Caracalla, in 218 A. D., he was proclaimed emperor by the army, through the intrigues of his grandmother Julia. He was cruel, and indulged in excessive debauchery. He was assassinated by his soldiers in 222 A. D., and was succeeded by Alexander Severus. Elagabalus was one of the most infamous of all the Roman emperors.

El Ahsa. See Lahsa.

Ela'in [from the Gr. ἔλαιον, "oil"], that portion of oil or fat which remains liquid at ordinary temperatures; the oily principle of solid fats. It is generally called olein, and is not of invariable composition; but in all cases it consists of oleic acid, or of some acid homologous with the oleic, combined in various definite proportions with glycerin. Drying oils and volatile oils do not contain elain. The elain of commerce is chiefly a crude oleic acid prepared from palm oil in the British candle-factories. "Lard oil" is a similar product derived from lard in the U. S. Both are now chiefly used for oiling machinery.

E'lam, the name given in the Bible and in the cuneiform inscriptions to that part of the ancient Persian empire called Susiana and Cissia by the Greeks; for the Elymais of the Greeks appears to have been only that part of Susiana next the Persian Gulf. Shushan or Susa was its chief city. The ancient, like the modern, people were chiefly nomadic. The northern part is mountainous, the southern flat, the gulf coast marshy and unproductive.

E'land [the Dutch name for the elk, incorrectly applied

Eland.

to this animal], (*Antilope,* or *Boselaphus oreas*), a species of African antelope, the largest of the family. It is about the size of a horse, measuring five feet high at the shoulder, with two horns, nearly straight, about a foot and a half long and turned backward. In form it somewhat resembles the ox tribe, being much less slender in the body and limbs than other antelopes. It also has a large protuberance on the larynx, like that of the elk. The elands are gregarious, and are found in large herds in South Africa. A variety has been discovered by Dr. Livingstone marked with narrow white bands across the body. The flesh of the eland is highly prized. The eland has been bred in England with complete success. His flesh is considered equal to the best beef, and has considerably less bone than that of the ox. The eland is a great eater, and hence his domestication may prove unprofitable. His flesh is remarkably tender. It is asserted by the best authorities that the eland never drinks, even upon his dry native plains. He is always fat, and hence is so unable to run that he falls an easy prey to the hunter. The eland is called *impoofo* or *pohu* by the natives. There are several varieties, besides the bastard eland (*Boselaphus Canna*), which is generally regarded as a distinct species. It is somewhat smaller than the true eland, but much resembles it.

Elanet (*Elanus*), a genus of birds of the kite kind, but differing from them in having the claws, except that of the middle toe, rounded, and the tarsi partly covered with feathers. The black-shouldered hawk (*Elanus dispar*) is found in the U. S., and *Elanus melanopterus* is a native of Africa and India, and is found in Europe, and even in Australia. The elanet is a bold and active little bird, feeding mostly on insects, but often capturing snakes, and more rarely mice and birds. Several other species of the genus are described.

E'laps [Lat. *elaps;* Gr. ἔλοψ; originally the name of a harmless serpent], a genus of mostly venomous snakes, natives of tropical America, Australia, etc. Three species are found in the U. S. They are very slender in form, often brilliant in color, and feed chiefly on other reptiles. The *Elapes* of the U. S. are scarcely venomous. The best known of them is the *Elaps fulvius,* or bead snake, which is often dug up in sweet-potato fields in the Southern States. It is one of the handsomest snakes known, having bands of jet black, carmine red, and golden yellow. It has erect poison-fangs, but is never known to use them. It may be handled without fear, since it is of very gentle disposition. The Labarri snake of South America (*Elaps lemniscatus*) is a large, fierce, and mortally poisonous reptile. The same is true of *Elaps lubricus* of that continent.

El Araiseh, called **Carache,** or **Larache,** a fortified town of Morocco, in the province of Aygar, at the mouth of the Lucco, which forms an excellent but shallow harbor. It is 15 leagues S. W. of Tangier. The surroundings are covered with olive groves and rich pomegranate and orange orchards, but they are unhealthy. It has a fine old mosque and market-place. The exports of corn, cork, wool, and beans are considerable. Lat. 36° 13′ N., lon. 6° 9′ W. The name signifies "The Garden of Enjoyment." Pop. 4000.

El Arish (anc. *Rhinocolura*), a walled town of Egypt, on the confines of Palestine, near the "river of Egypt" (Wady el Arish). It is situated on an eminence half a mile from the Mediterranean, in lat. 31° 6′ N., lon. 33° 56′ E., 195 miles N. E. of Cairo, and 52 miles S. of Gaza. It has a few remains of the Roman period. Pop. in 1871, 2255.

The ancient *Rhinocolura* or *Rhinocorura* is said to have taken its name (signifying "the cutting off of the nose") from the fact that King Actisanes of Æthiopia founded it as a penal colony, and the convicts sent thither had their noses cut off. Before the rise of Alexandria it was a great emporium of the Red Sea trade.

The Wady el Arish is supposed to be the "river of Egypt" mentioned in the Bible (in Num. xxxiv. 5 and elsewhere). It drains the central part of the peninsula of Sinai, and empties into the Mediterranean at El Arish. It is a small brook, which dries up in the summer.

Elas'tic Curve, in mechanics, is defined by James Bernoulli as the figure which would be assumed by a thin horizontal elastic plate if one end were fixed and the other loaded with a weight. The equation of the curve to rectangular co-ordinates, of which the origin is at the fixed extremity and the abscissa axis horizontal, is $y = b\,(3ax^2 - x^3)$, where b is a small quantity depending on the ratio of the attached weight to the elastic force of the plate, whose length is a.

Elastic'ity [from the Gr. ἐλαστής, "that which drives or strikes," from ἐλαύνω, to "drive," to "strike," and hence to "strike back," as a spring] is that property in physics possessed by certain bodies of recovering their original form and size after the external force is withdrawn by which they have been compressed. Matter is believed to be composed of molecules or small particles, acted upon by attractive and repulsive forces; and from the combined action of these forces result the various forms and properties of matter. According to this view, molecules are not in contact, but at an infinitesimal distance from each other, which, however, may be increased or diminished. When the body is at rest the opposite forces which any of its molecules exercise on each other are in equilibrium. If the distance between the molecules be increased within the limits of the action of the forces, both forces are diminished; and if the distance is lessened, both are increased, but not in the same proportion. Solid bodies are imperfectly elastic, and do not entirely recover their form when the disturbing force is removed; but there seems to be no limit to the elasticity of gases. The phenomena of elastic bodies are—1, That a perfectly elastic body exerts the same force in restoring itself as that with which it was compressed; 2, The force of elastic bodies is exerted equally in all directions, but the effect takes place chiefly on the side where the resistance is least; 3, When a solid elastic body is made to vibrate by a sudden stroke, the vibrations are made in equal times to whatever part of the body the stroke may be communicated. No theory of elasticity founded on any assumed hypothesis as to the molecular constitution of matter has as yet been found satisfactory when applied to solids. In this case, therefore, the theory of elasticity is best investigated without resorting to any such hypotheses.

Elas'tic Tis'sue, a form of fibrous tissue sometimes called **Yellow Fibrous Tissue,** is so named from its peculiar property of allowing its fibres to be drawn out to twice their original length, and returning again to the same. It is found in the membranes which connect the cartilaginous rings of the trachea and various other structures of the animal body requiring elasticity. In the human body perhaps the most remarkable example of the elastic tissue is seen in the *ligamenta subflava,* or intervertebral ligaments. Almost all other ligaments are unyielding and inelastic, but these are extremely elastic. Their action is to help restore the spinal column to its vertical position when it has been deflected by muscular action. In some of the lower animals the *ligamentum nuchæ,* the great ligament of the nape of the neck, is highly elastic, and serves to maintain the proper equilibrium between the muscles that erect and those that depress the head, as when the animal is grazing.

El'ater [Gr. ἐλατήρ, a "driver"], a Linnæan genus of coleopterous insects, now the type of a very large and distinct family of the serricorn Coleoptera, called Elateridæ. They have a narrow, elongated body, and are distinguished by the presence of a strong spine projecting from the posterior margin of the prosternum, and a groove or socket fitted for the reception of the spine. If they fall on their back, they recover their feet by a violent muscular effort, which throws them into the air with a jerk and a clicking

sound. Hence they are called click-beetle, snap-bug, etc. This movement is the rebound caused by the sudden disengagement of the spine from its socket. The wireworms of the U. S. are larvæ of the Elateridæ, and are very destructive to growing crops. The elaters feed on flowers, leaves, and other soft parts of plants. The firefly of tropical America is the *Elater* or *Pyrophorus noctilucus*, and it has been discovered that the larvæ of at least one North American species of *Melanactes* are luminous.

Elate'rium [Gr. ἐλατήριον, a "cathartic," from ἐλαύνω, to "force"], a drug obtained from the *Ecbalium agreste*, or wild cucumber, called also squirting cucumber. It is an annual belonging to the order Cucurbitaceæ, with a trailing stem, heart-shaped leaves, lobed and toothed, yellow flowers, axillary; fruit grayish-green, about an inch and a half long, covered with soft prickles. The fruit in parting from its stalk expels the seeds, along with a mucus, through the opening in which the stalk was inserted. Elaterium is contained in the thick green mucus surrounding the seeds. It is a powerful and dangerous cathartic, and is very irritating to the eyes and skin. The active principle called elaterin is obtained from it. Elaterium is sometimes used in dropsy.

E'lath [Heb. *Eloth*, "trees;" Lat. *Æla'na* or *Ela'na*], a town several times mentioned in the Bible, was built at the foot of the valley El Ghor in Idumæa, and at the head of the Elanitic arm of the Red Sea (now known as the Gulf of Akabah), near lat. 29° 30′ N., lon. 30° E., ten miles E. of Petra. It was conquered by King David, and under Solomon became an important commercial emporium. It continued to be a seaport of importance under the Romans. It was twice taken by the Crusaders (1116 and 1182 A. D.), but after their time fell into decay. It stood on or near the spot now occupied by the fortress of Akabah, which is held by a small garrison of Egyptian troops. Extensive ruins are found there.

El'ba [Fr. *Elbe;* anc. *Il'va* and *Æthal'ia;* Gr. Αἰθαλία], an island of Italy, is in the Mediterranean Sea, between Corsica and Tuscany, from which latter it is separated by a channel about five miles wide. It is about 18 miles long, and varies in width from 2½ to 10 miles. The coasts are bold, and deeply indented by several gulfs which form good harbors. The surface is mountainous, and the highest point has an altitude of about 3500 feet. Among the productions are iron, good wine, wheat, olives, and various fruits. Pop. in 1862, 20,340. Capital, Porto-Ferraio. By the treaty of Paris this island was designated as the residence of Napoleon I., who removed to it in May, 1814, and escaped in Feb., 1815.

El'ba, a post-village, capital of Coffee co., Ala., on Pea River, about 75 miles S. by E. from Montgomery.

Elba, a township of Knox co., Ill. Pop. 1045.

Elba, a township of Gratiot co., Mich. Pop. 323.

Elba, a township of Lapeer co., Mich. Pop. 1001.

Elba, a post-township of Winona co., Minn. Pop. 681.

Elba, a township of Genesee co., N. Y. Pop. 1905.

Elba, a township of Dodge co., Wis. Pop. 1496.

El Bacharieh (anc. *Oasis Trinythens*), one of the Libyan oases, N. of El Khargeh, about lat. 28° N. It yields fruit and alum, and is chiefly remarkable for its ancient Artesian wells. It has ruins, principally of the Roman period.

Elbe [anc. *Al'bis;* Bohemian, *La'be;* Dutch, *El've*], an important river of Germany, rises in the N. E. part of Bohemia, among the mountains called Riesengebirge. One of its sources is about 4500 feet above the level of the sea. It flows generally in a north-western direction, drains the northern part of Bohemia, intersects Saxony and Prussia, and enters the German Ocean near Cuxhaven. It drains an area of 59,000 square miles. Its total length is about 700 miles. This river is several miles wide at every point between its mouth and Altona, a distance of nearly seventy miles. Its principal affluents are the Havel, the Moldau, the Saale, and the Eger. The chief towns on its banks are Dresden, Magdeburg, Hamburg, and Altona. Between Dresden and Aussig it flows between high rocky banks like natural battlements, and presents very picturesque scenery. Vessels drawing fourteen feet of water can ascend at all times to Hamburg. Small steamboats navigate the Elbe between Hamburg and Magdeburg, and between Meissen and the mouth of the Moldau.

El'berfeld, an important manufacturing town of Rhenish Prussia, is on the Wipper, 16 miles E. of Dusseldorf, with which it is connected by a railway. It is irregular in plan, and is several miles long. The newer streets are well paved. Barmen, a rich and prosperous town, is contiguous to the eastern part of Elberfeld, which has a gymnasium, a museum, a public library, and a school of manufactures. Here are extensive manufactures of silk stuffs, velvets, cotton fabrics, merinoes, ribbons, and tapes. Elberfeld has about seventy dyeing establishments, ten bleaching-grounds, and several print-works. It is famous for the dyeing of Turkey red, and this dye is said to be imparted here at a cheaper rate and with more firmness of color than at any other town in Europe. Pop. in 1871, 71,394.

El'bert, a county in the E. N. E. of Georgia. Area, 420 square miles. It is bounded on the N. E. by the Savannah River, and on the S. by the Broad River. The surface is hilly; the soil is partly fertile. Corn, cotton, and wool are staple products. Capital, Elberton. Pop. 9249.

Elbert (Samuel), a Revolutionary officer, born in South Carolina in 1743. He distinguished himself as colonel in the war for independence. In 1785 he became governor of Georgia. At the time of his death he was major-general of militia. Died Nov. 2, 1788.

Elberton, a post-village, capital of Elbert co., Ga., lies near the Savannah River, 78 miles N. W. of Augusta. It has four churches, one male and one female academy, one newspaper, one hotel, one mill, and a number of stores, all of which are sustained by the cotton-trade.

J. T. McCarty, Ed. "Gazette."

Elbeuf, or **Elbœuf,** a town of France, department of Seine-Inférieure, is beautifully situated on the left bank of the Seine, 12 miles above Rouen and 75 miles N. W. of Paris. Several of the newer and finer streets converge to a spacious open area called the Champ de Foire. It has eight artesian wells and six public fountains, and is lighted with gas. Among the finest edifices are the churches of St. Etienne and St. Jean Baptiste. Steamers ply daily between this place and Paris and Havre. It has important manufactures of fine flannels, billiard-table covers, habit cloths, chequered stuffs, woollen fabrics, chemical products, machinery, etc. Pop. 21,784.

El'bing [Lat. *Elbinga*], a fortified town and river-port of Prussia, is on the navigable river Elbing, 5 miles from its entrance into the Frische Haff, and about 40 miles E. S. E. of Dantzic. It has eight or more Protestant churches, a gymnasium founded in 1536, and a large public library also manufactures of cotton and linen fabrics, sailcloth, soap, tobacco, leather, etc. Here are a number of iron-foundries, dye-works, print-works, sugar-refineries, and breweries. Nearly 500 vessels are employed in the trade of Elbing, which is connected by a railway with Berlin and other towns. Pop. in 1871, 31,162.

El'bridge, a post-township of Edgar co., Ill. Pop. 1807.

Elbridge, a township of Oceana co., Mich. Pop. 524.

Elbridge, a township and post-village of Onondaga co., N. Y. The village is nearly 2 miles from the Central R. R., and 16 miles W. of Syracuse. Chairs, buckets, etc. are made here. It is the seat of a collegiate institute with a very fine building. Pop. of village, 463. The township contains several other villages. Total pop. 3796.

Elbrooz', **Elbruz,** or **Elburz,** a range of high mountains in Asia, in the northern part of Persia, forming the connecting chain between the Anti-Taurus and the Kuen-Lun. The Elbrooz extends nearly parallel with the S. shore of the Caspian Sea, and forms the southern boundary of the basin of that sea. The highest point of this range is the volcanic peak of Demavend, which rises 20,000 feet or more above the level of the sea. This name is also applied to the loftiest range and summit in the Caucasus, between the Black and Caspian seas. Mount Elbrooz is situated in lat. 43° 20′ N., lon. 60° E.; its altitude is 18,526 English feet.

Elces'aites, or **Elkesaites** [a name said to be derived from *Elxai*, their pretended founder, though it is believed by some that the name is derived from *Elkesi*, a village of Galilee, while others say it is from *Elxai*, a book which was their great authority in doctrine], a sect of Essenian Ebionites, or of Jewish Christians who mingled Judaism and Christianity in their doctrines, adding to them certain pagan or Gnostic views and magical practices. This sect appears to have originated in the early part of the second century, and probably lasted till the fourth century.

El'che (anc. *Il'ici* or *Il'lice*), a town of Spain, in the province of Alicante, about 6 miles from the sea and 15 miles S. W. of the city of Alicante, is enclosed by walls. It is situated on both sides of a steep ravine, which is crossed by a handsome bridge. It has an Oriental aspect, being built in the Moorish style and surrounded by large groves of date-palms. Among the remarkable edifices are an old castle, and a church which has a majestic dome and a famous organ. It has manufactures of cotton and linen stuffs,

brandy, wine, cigars, and soap. Many dates are exported hence. Pop. about 18,000.

El'chingen, a village of Bavaria, on the left bank of the Danube, 8 miles N. E. of Ulm. Here the French marshal Ney defeated the Austrians on the 13th of Oct., 1805.

El'cho (Francis **Wemyss-Charteris**), Lord, eldest son of the earl of Wemyss, was born in Edinburgh, Scotland, in 1818, and was educated at Oxford. He became a conservative member of the House of Commons in 1841, and a lord of the treasury in 1853. He took a prominent part in the formation of the national rifle association in 1860. In 1866 he opposed the Reform bill of Russell and Gladstone, and was connected with the party called "Adullamites." He represented Haddingtonshire in Parliament for twenty years or more.

El Dakkel (anc. *Oasis Minor*), the third of the five Egyptian or Libyan oases, situated in lat. 29° 10′ N. It is well watered and has warm springs. It anciently yielded much wheat, and now furnishes dates, olives, etc.

El'der [Fr. *sureau;* Ger. *Holunder*], (*Sambu'cus*), a genus of shrubby plants belonging to the order Caprifoliaceæ. The common elder (*Sambucus nigra*) is indigenous to Europe and parts of Asia and Northern Africa. It sometimes attains the size of a small tree, having pinnate leaves, terminal cymes of creamy white flowers, and small black berries, 3-seeded. The young shoots contain a great deal of pith. The common elder (*Sambucus Canadensis*) of North America grows from five to ten feet high. Another American species is the red-berried elder (*Sambucus pubens*), which is found in rocky woods and among mountains. The *Sambucus glauca* grows in the West. There is also a scarlet-fruited elder (*Sambucus racemosa*) found in some parts of Europe, which is prized as an ornamental shrub in Great Britain. The dwarf elder or danewort (*Sambucus Ebulus*) is seen occasionally in Great Britain. It was formerly believed to have sprung from the blood of Danes killed in the Anglo-Saxon wars. The flowers of the elder are used in medicine, and elder-flower water, employed in perfumery, is distilled from them. Wine is also made from the berries.

Elder [Heb. *zaken*, "an old man;" Gr. *πρεσβύτερος*, "senior"], a term in use among the Hebrews and other ancient nations, originally indicative of age, but acquiring in time a secondary official sense. Each Hebrew town had its senate of elders, who administered justice. (Deut. xix. 12.) Commonly, each synagogue had also its board of elders, although in smaller towns there was often but a single rabbi. The early Christian Church is believed by many to have borrowed its eldership from the Jewish synagogue. In the New Testament elder and bishop are thought by many Christians to be identical, but opinion on this point is by no means uniform. But at least as early as the second century (in the Ignatian Epistles) we find the three orders of bishops, presbyters (or elders), and deacons. Presbyterians have both "teaching" and "ruling" (or lay) elders, but whether this distinction existed in the apostolic age is still a mooted question.

El'don (John **Scott**), Earl of, lord chancellor of England, was born at Newcastle June 4, 1751. He was educated at Oxford, where he gained in 1771 a prize of £20 for an English prose essay. In 1772 he contracted a clandestine marriage with a lady named Elizabeth Surtees, and by this act forfeited a fellowship which he had obtained in the college. He studied law in the Middle Temple, was called to the bar in 1776, inherited £3000 from his father in that year, and began to practise in the northern circuit. After four years of moderate success, he gained great distinction, and rose rapidly to fame and affluence. He became in 1783 a member of Parliament, in which he supported Mr. Pitt, and showed himself an able debater. He was appointed solicitor-general in 1788, and attorney-general in 1793. During the excitement of the French revolution he prosecuted Horne Tooke and others who were accused of treason, but they were defended by Erskine and acquitted. In 1799 he became chief-justice of the court of common pleas, was created Baron Eldon, and entered the House of Peers. On the formation of a new ministry by Mr. Addington in 1801, Lord Eldon was appointed lord chancellor. He appears to have owed this promotion to the favor of the king. He continued to fill that high office under several successive administrations for a period of twenty-six years, except an interval of nearly a year in 1806–07. His reputation as a judge was very high, but as a statesman his merit was not great. He was an enemy of religious liberty, and opposed the abolition of the slave-trade and parliamentary reform. He received the title of earl in 1821, and was compelled to resign the great seal when Canning became prime minister in 1827. He died Jan. 13, 1838. His brother William was an eminent judge, and bore the title of Lord Stowell. (See Twiss, "The Public and Private Life of Lord Eldon," 3 vols., 1844; Lord Campbell, "Lives of the Lord Chancellors."

Eldo'ra, a post-village, capital of Hardin co., Ia., on the Iowa River and the Central R. R. of Iowa, about 66 miles N. N. E. of Des Moines. It has two newspaper-offices. It has a State reform school. Pop. 1268; of Eldora twp., 2070.

Eldora, a township of Surry co., N. C. Pop. 858.

El Dora'do, a Spanish term signifying "golden" region, was the name given by the Spaniards in the sixteenth century to a country supposed to be situated in South America between the rivers Amazon and Orinoco. By fabulous reports, which were generally credited, this region was represented as abounding in gold and precious stones, and surpassing Peru in riches and splendor. Expeditions were conducted by Sir Walter Raleigh and others to discover this imaginary paradise of gold-seekers, but they were not successful. The term El Dorado has passed into the language of poetry, in which it is used to express a land of boundless wealth, or a region in which riches and pleasure are as abundant as they were supposed to have been in the Elysium of the Greeks and in the primeval golden age.

El Dora'do, a county of California. Area, estimated at 1800 square miles. It is drained by the Middle and South Forks of the American River, and bounded on the N. E. by Lake Tahoe. The eastern part is occupied by the high mountains of the Sierra Nevada, and is covered with forests from which good pine and oak timber is procured. Rich gold-mines have been opened here. Cattle, wheat, barley, fruit, wine, wool, butter, etc. are produced. Capital, Placerville. Pop. 10,309.

El Dorado, a post-village, capital of Union co., Ark., about 145 miles S. by W. from Little Rock. It has two newspaper-offices. Pop. of El Dorado township, 2349.

Eldorado, a twp. of McDonough co., Ill. Pop. 1105.

El Dorado, a post-township of Saline co., Ill. Here the Cairo and Vincennes R. R. crosses the St. Louis and South-eastern R. R., 76 miles N. E. of Cairo. Pop. 1691.

Eldorado, a township of Benton co., Ia. Pop. 777.

El Dorado, the capital of Butler co., Kan., on Walnut River, has a national bank, a newspaper, an academy, two churches, a flouring-mill, three hotels, and good water-power. It is in a fine agricultural region. Pop. of township, 797.

T. B. Murdock, Ed. and Prop. "Times."

Eldorado, a twp. of Montgomery co., N. C. Pop. 887.

Eldorado, a post-twp. of Fond du Lac co., Wis. P. 1674.

El'dred, a township of Jefferson co., Pa. Pop. 832.

Eldred, a township of Lycoming co., Pa. Pop. 739.

Eldred, a township of McKean co., Pa. Pop. 897.

Eldred, a township of Monroe co., Pa. Pop. 937.

Eldred, a township of Schuylkill co., Pa. Pop. 968.

Eldred, a township of Warren co., Pa. Pop. 557.

E'lea, or **Ve'lia,** an ancient Greek city of Southern Italy, in Lucania, on the Mediterranean Sea. It was the native place of Parmenides and Zeno. (See Eleatic School.)

Eleanor (el'ę-nọr) [Fr. *Éléonore*] of Guienne, queen of France, and subsequently queen of England, was born about 1122. She was the daughter and heiress of the last duke of Aquitaine, and was married in 1137 to Louis VII. of France, with whom she went to the Holy Land in 1147. She was divorced from Louis in 1152, and was soon married to Henry II. of England. It appears that she instigated her sons to rebel against their father (Henry II.), who imprisoned her for fifteen years. She acted as regent while her son, Richard I., conducted a crusade to Palestine. Died in 1203.

Eleat'ic School, a system of philosophy founded by Xenophanes of Elea, who flourished about 530 B. C. While the Ionic school gave their attention to outward nature, and investigated the laws which regulate its progress, the Eleatic philosophers directed their speculations to the idea of Being in itself, which they conceived to be the only object of real knowledge. They regarded as vain and illusory the world of change and succession, which they designated *τὸ γιγνομένον* ("that which becomes or happens," as by accident). Time, space, and motion they considered as phantasms, caused by the deceiving senses, and incapable of scientific explanation. They distinguished between the pure reason, the correlative of being, and opinion or common understanding, which judges according to the impressions of sense. Parmenides and Zeno were the most celebrated disciples of Xenophanes; the former was the author of an epic poem on the Eleatic and Ionic systems.

Elecampane (*In'ula*), a genus of plants belonging to the order Compositæ. The common elecampane (*Inula Helenium*) is indigenous to Middle and Southern Europe, and grows in various parts of the U. S. The root somewhat resembles camphor in taste, and has sudorific and diuretic properties. It contains the principles *helenin* or elecampane camphor, and *inulin*, which resembles starch.

Elec'tion [Lat. *elec'tio*, from *elec'tum* (from *e*, "out," and *le'go*, to "gather"), to "choose," to "read"], in law. The law frequently imposes upon a party the duty to choose between two inconsistent or alternative rights or claims. This obligation may present itself in all branches of the law, and often occurs as a rule of practice. In a court of law, as distinguished from equity, there may be a case of election where a contract is to be performed in the alternative, as where an insurance company stipulates that in case of loss of a building by fire it may either pay its value or rebuild. In such a case, should the company elect to rebuild, its election would be irrevocable. It may also happen that a creditor will have a right, from the circumstances of the case, to elect one of two persons as his debtor. A case of this kind occurs in the law of agency, when an agent purchases goods on credit for an undisclosed principal; the seller, on subsequently discovering the principal, may elect to regard the sale as having been made to him or to the agent, as he may see fit. An instance of election in the case of real estate is that of dower in land which the husband exchanged for other land. The widow has her choice to take dower in either parcel, but she cannot take it in both.

In courts of equity the doctrine of election assumes great importance. The case may occur where alternative benefits may be presented to a person by a will or other legal instrument, or more generally he may be required to choose between a gift made to him and something to which he is already entitled. The duty to choose in such a case is not a positive rule of law, but a matter of equity practice, and is not imperative when this artificial doctrine is not known to be a legal rule by the party to whom the gift is made. The fact of election must be shown by some positive act; and if a party who ought to elect holds two estates under inconsistent titles, there is no evidence of an election having been made. A person under a duty to elect between the retention of his own property and the gift of another, may retain his own without forfeiting the gift, but must make due compensation. Thus, if a testator devises an owner of property land of his own, and then assumes to dispose of the property of the devisee, and the latter elects to retain his own property, he does not forfeit the devise, but is required to make compensation to the testator's estate equivalent in amount to the property retained by him. Election in procedure may take place in the choice of remedies; as where an owner has been wrongfully deprived of a chattel, he may elect to sue for its value or for the chattel itself. A court will in some cases require a party to an action to elect as between inconsistent allegations as to the cause of action.

T. W. Dwight.

Election, in politics, is the choice of public officers by those persons who possess the right of suffrage, as distinguished from "appointment," which is such choice made by superior officers. Popular elections were held in ancient times, as, for example, in the Roman *comitia* and the Athenian popular assemblies; but soon after the establishment of the Roman empire elections, outside the Christian Church, became obsolete. Elections reappear in mediæval Europe in the choice of representative burgesses, who stood for the third estate. Certain monarchs, as the German emperors and the kings of Poland, were also elected to their place, but not as popular representatives. In no other European country did the election of representatives become so important in the Middle Ages as in England; and the representative systems of other nations have been chiefly imitations of, and in some cases improvements upon, the English system. Especially is this the case in the U. S. (See Representative System.) Elections are called *direct* when officers are chosen by a direct vote of their constituency; *indirect*, when electors are chosen for the purpose of designating the persons who shall exercise official powers.

With regard to the officers voted for, political elections are distinguished into *local* or *municipal elections*, at which officers for some particular town or locality are chosen; *general* or *State elections*, at which officers for the whole of a commonwealth are elected (the most important of which are the gubernatorial and presidential elections for filling the places of governor and President); and *congressional* or *legislative elections*, at which members of Congress or legislatures are voted for. Vacancies in offices are sometimes filled, and the acceptance or rejection of particular laws is decided, by *special* or *supplementary elections*. All questions relating to political elections must be fully provided for in the election laws of the State. The great interests which are frequently at stake at elections naturally tempt bad men to *election frauds*, which have assumed in some countries, and in particular in some parts of the U. S., the most alarming dimensions. In view of them honest statesmen consider it their duty to improve, as much as possible, the existing election laws. Special attention has been given for that purpose to stringent registration laws, requiring every voter to register his name some time before the day of election, in order to enable the authorities to verify his claim to taking part in the election. *The inspectors of elections*, whether appointed or elected, are generally taken from the different political parties which engage in the contest. The excitement which often prevails at political elections is apt to lead to *election riots*. These are of frequent occurrence in England, Ireland, and Greece, and have also of late caused considerable trouble in the U. S.; they are almost unknown in France and Germany. As in most cases the instigators and leaders of election riots are acting under the influence of intoxicating liquors, many States have provided by law that on election days all liquor-stores must be closed. When the defeated party believes or claims that the declared majority owes its success to election frauds, the elections are likely to be contested. At elections to legislative assemblies these assemblies decide finally on the claims of rival candidates; in most other cases the decision rests with the courts. If a presidential election is contested in republics, there is danger of civil war, of which, in particular, the republics of South and Central America furnish many examples. Of still more frequent occurrence have been, in consequence of the weakness of the federal authority, the civil wars in the particular states constituting these federal republics in case the election for governor is contested. The U. S., which, on the whole, have been free from the sad experience of the South and Central American republics, had in 1873 a conspicuous instance of a contested gubernatorial election and its disastrous consequences in Louisiana, where for several months two rival governors claimed each to be the lawful executive of the State, and tried to enforce his claim, until on May 22, 1873, the President of the U. S. interfered by a proclamation in favor of one. (See also Nomination, Plébiscite, Representative System, Suffrage, and Vote.)

Election, in theology. See Calvinism, by Prof. A. A. Hodge, S. T. D.

Elec'tive Gov'ernments are those in which the rulers and public functionaries are chosen by popular vote or by the votes of a privileged class. The republics of ancient Athens and Rome were elective governments.

Elec'tor [Fr. *électeur;* Ger. *Kurfürst;* Lat. *elec'tor*, from *el'igo*, *elec'tum*, to "choose"], a title of those German princes who had the right or privilege of electing the emperor of Germany. There were originally (1256 A. D.) seven—namely, the electors of Cologne, Mentz, Treves, Bohemia, Brandenburg, Saxony, and the elector Palatine. The first three were archbishops of Cologne, Ments, and Treves. The electors had several important privileges, and a very peculiar position in the empire. They usually chose the heir or near relative of the preceding emperor. As the electoral dignity of the Palatine had been transferred to the dukes of Bavaria, an eighth electorate was established by the peace of Westphalia in 1648 for the Palatine, which ceased in 1777, when the House of Bavaria became extinct. In 1692 the electorate or dignity of elector was conferred on the dukes of Brunswick-Lüneburg, who were afterwards styled electors of Hanover. The electors were entitled to all royal dignities and honors except the title of majesty. In 1803 the duke of Würtemberg, the margrave of Baden, the landgrave of Hesse-Cassel, and the archbishop of Salzburg were made electors in the place of the electorates of Cologne and Treves, which were abolished. On the dissolution of the German empire in 1806, the office became obsolete, but the title was retained by the rulers of Hesse-Cassel until 1866, when that state was united to Prussia.

Elec'toral Crown, or **Cap,** was a scarlet cap worn by the electors of the German empire. It was surmounted with a golden demicircle, which was ornamented with pearls and a golden cross at the top.

Elec'tors, in the political system of the U. S., is the title of the persons who are chosen by the people of the several States to elect the President and Vice-President. Each State chooses a number of electors equal to the whole number of members it sends to both houses of Congress. No Senator or Representative, or person holding an office of profit or trust under the U. S., can be appointed an elector. The electors must be chosen on the same day in all the States—that is, on the Tuesday next after the first Monday in November. The Constitution ordains that the electors shall meet in their respective States on the first Wednesday in December, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves; and they shall make distinct lists of all persons voted for as President, etc., and of the number of votes for each; which lists they shall sign and certify, and transmit sealed to the seat of government of the U. S., directed to the president of the Senate. The electors of all the States constitute the electoral college. A majority of the whole number of electoral votes is necessary to elect the President and Vice-President. In 1872 the whole num-

ber of electors was 366. They meet at the capitals of their respective States. The electoral votes are opened and counted on the second Wednesday of February by both houses of Congress, which meet in the chamber of the Representatives. In the actual mode of performing their duty the electors do not exercise any judgment or discretionary power in the choice of President and Vice-President, but cast their votes for the candidates previously nominated by their party, usually in a national convention. If no candidate has a majority of all the votes, the House of Representatives has a right to choose either of the three persons having the highest number of votes.

Elec'tra [Gr. Ἠλέκτρα], a daughter of Agamemnon, king of Mycenæ, was sister of Orestes and wife of Pylades. She was sometimes called Laodice. Her story is the subject of dramas written by Æschylus, Euripides, Sophocles, and Racine. The most perfect of the ancient tragedies of "Electra" is that of Sophocles; in this she stimulates her brother Orestes (whose life she has saved from the violence of her father's murderers) to avenge the death of that parent. This he accordingly does, with the aid of Apollo.

No less than five other persons of this name occur in the Greek mythology.

Elec'trical Fishes are remarkable as being probably the only animals having the power to give sensible shocks of electricity. Nine or more species of very diverse character are known to have this power. Three species of *Torpe'do* (of the ray family), one of which is occasionally found on our Atlantic coast, are among the best known electric fishes. The *Trichiu'rus*, a sword-fish of the Indian seas, and the *Tetra'odon*, a balloon-fish of the Comoro Islands, have not been as well studied. The *Gymno'tus elec'tricus*, a fresh-water eel of South America, sometimes twenty feet long, has the power of overcoming men, and even horses, by its tremendous shocks. Two species of *Malaptern'rus* (*Silu'rus*) of the African rivers are also electric. Faraday observes that the *Gymnotus* may produce a shock equal to that of fifteen Leyden jars, containing in all 3500 square inches, charged to the highest degree. The force is ordinary static electricity, and readily affords a spark. The *Torpedo* and *Gymnotus* have electric organs intimately connected with the nervous system, consisting of a series of highly vascular cells or hollow prisms containing a watery fluid. Other electric fishes have a less definite apparatus for this function. It is not known that this remarkable power is of any service to these fishes, except in self-protection.

Elec'tric Clocks are of several kinds, but are nearly all constructed on one of the two following principles: (1) electricity is the motive-power which propels the machinery of the clock; or (2) power is obtained from weights or springs, and electricity is used for controlling or regulating the motion.

In some electric clocks there is an electro-magnet, which attracts a soft iron keeper whenever a current passes through it. The keeper gives motion to the clock-hands by an extremely simple arrangement of levers and wheels. The current is made and interrupted by the vibrations of a standard clock, which may serve to give time to any number of secondary electric clocks, even if they are at a great distance from each other.

Bain's clock has a soft, hollow electro-magnet for a pendulum, swinging between the like poles of two permanent magnets, the current in the pendulum being broken and reversed in every swing, so that it is forcibly repelled from each magnet.

Electric clocks are capable of running a long time without attention, but when moved by electricity alone are not very regular in their motion, owing to slight irregularities in the electric currents; but when electricity is used as a regulating power, it is capable of rendering important services in making ordinary clocks do accurate work. For example, an astronomical clock of great precision is connected in the proper manner by telegraph wires with a great number of common clocks, in such a way that signals are sent at given intervals. Now, suppose that any one of the common clocks has gained or lost a small interval of time between two signals, the electric current is found in practice to retard or accelerate the motion just enough to correct the work, and to impart to all the common clocks the precision of the astronomical clock. In these cases the common clocks are often fitted with a Bain's pendulum, but there are other successful modes of attaining the same result.

Elec'tric Col'umn, an instrument formed of numerous alternating disks of zinc-leaf, silver-leaf, and paper, was invented by De Luc. It is generally called a "dry battery" or "dry voltaic pile." The moisture of the air is an essential element in the operation of the "dry pile;" for if the apparatus be placed in an artificially dried atmosphere, it ceases to work, while in ordinary air it will act for years, with a somewhat feeble current.

Electricity.

lectric'ity. 1. The science of electricity owes its name to an observation attributed by Diogenes Laertius to Thales, one of the Seven Wise Men, who about the year 500 B. C. flourished, like his remote successor, Franklin, as a statesman and natural philosopher. The observation in question was, that when amber had been rubbed it acquired the property of attracting light bodies, and from the Greek name of amber (ἤλεκτρον) comes our term Electricity.

As knowledge was extended, however, it was found that many effects, such as those produced by magnets and by chemical action upon certain metals, which had at first sight no relation to this property of amber, were nevertheless due to the same force; and thus the title "electricity" in its widest sense comes to include the science relating to all those actions depending upon the force first seen in the amber, and must be divided into Statical or frictional, Dynamic or galvanic, and Magnetic electricity.

Of these we will first consider the one first named—

STATICAL ELECTRICITY.

2. The observation of Thales may be well regarded as one of the fundamental facts of the science, and as extended and modified by subsequent observers may be thus described:

If a light body A, such as a pith-ball, is attached to the end of a thread of shellac, a straw, or other light rod, suspended in the manner shown in the accompanying figure (Fig. 1), it will form a very sensitive means of recognizing the existence of forces of attraction or repulsion. If, then, a piece of amber, rosin, sulphur, glass, or the like is rubbed or beaten with a woollen cloth, silk handkerchief, piece of fur, or any similar material, and brought near to the pith-ball A, it will be found that this moves towards it, giving evidence of attraction.

FIG. 1.

3. A piece of metal held in the hand and similarly treated will fail to produce any such effect, but if supported on a rod of glass, or cut off from contact with the body by any of the above-mentioned substances, it will act as well as the others; and in fact we shall find that if the proper precautions are taken, not amber alone, but all bodies, can exhibit this power of attraction after friction.

We see, however, already, that this action is due to something which is carried off and lost by metals and the human body, but retained by glass, rosin, etc. We are therefore led at once to divide substances into electric "conductors," or those which will transmit this influence from one place to another, and "non-conductors," which refuse so to do. A wider experience, however, shows us that this is only a question of degree, the best conductor offering some obstacle or "resistance" to the transfer of electric force through it, and the worst conductor allowing some to pass; and that, moreover, every degree of transmitting power can be found in some substance or other—from silver, which is the best conductor, to dry air or other gas, which is perhaps the worst.

4. Returning to our first experiment, if we allow the ball A, when attracted by the rubbed or "excited" amber or other like body, to touch it, we shall find that the conditions are now reversed, and that in place of being attracted by the "excited" substance, it is repelled. This at once seems to indicate that whatever caused the excitement of the amber and its attractive action is self-repellent in its nature, since a portion of it, communicated by contact to the pith-ball, and reacting with the remainder in the amber, has overcome the attraction before exhibited and substituted a repulsion. If, again, while the pith-ball is still in this new (or, as we call it, "charged") state, we bring near it the "rubber" (*i. e.* woollen cloth or other substance with which the excitement was produced), the ball will be very powerfully attracted. Care, of course, must be taken that the "excitement" in this as in the previous case is not lost by contact with the hand or other conductor.

This last experiment teaches us that there is something developed in the "rubber" opposite in character to that found in the amber, since where the latter repels, it attracts.

Again, if we take a rod of glass and a silk handkerchief, and rub them together, and then, while the ball is still in the condition which causes it to fly from the amber, approach it with the excited glass, we shall find that the

glass attracts it as did the woollen cloth, while at the same time the silk handkerchief repels it as did the amber.

We thus learn that the cause of the opposite excitements first noticed in the amber and cloth did not lie in the fact of one being the rubber and the other being rubbed, but in the nature of the substances themselves.

5. Similar experiments repeated with a great number of bodies will show us that this ability to secure one or other of these sorts of excitement is not of essence, but of degree; so that if all bodies were arranged in a list according to this ability, any one when rubbed with a substance above it would acquire one kind, and with one below it the other kind of excitement.

Those kinds of excitement are for distinction called positive and negative, the kind produced in glass when it is rubbed with silk being positive, and that developed in amber when rubbed with wool, negative. These contrary terms are only employed to distinguish, and not to describe, the states, the negative being just as active, powerful, and efficacious for practical purposes as the positive.

A few familiar bodies are arranged in accordance with this view in the following table:

Most Positive.—	Wood,
Catskin,	Sealing-wax,
Diamond,	Rosin,
Flannel,	Amber,
Ivory,	Sulphur,
Rock-crystal,	India-rubber,
Wool,	Gutta percha,
Glass,	Prepared paper (*i. e.* parchment paper),
Cotton,	
Linen cloth,	Collodion,
White silk,	Gun-cotton.—*Most Negative.*
The dry hand,	

(*De la Rive, "Traité d'Électricité,"* tome ii., p. 549.)

6. To take an example from the foregoing table: Suppose a fragment of rock-crystal to be rubbed against some ivory; the crystal would acquire negative excitement, but if it were rubbed with wool it would be positive. Of course the most powerful effect would be obtained by selecting the substances at the extremities of the table, but the question of convenience from a mechanical point of view will here have great weight.

Another table frequently quoted gives the following order of many substances not included in the foregoing:

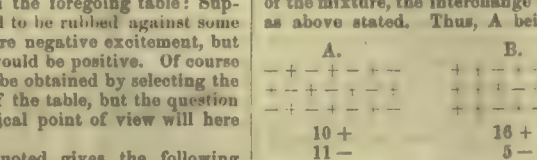
Positive.—Fur,	Paper,
Smooth glass,	Silk,
Woollen cloth,	Lac,
Feathers,	Rough glass,
Wood,	Sulphur.—*Negative.*

The difference between the positions of smooth and rough glass will indicate the cause of the great deterioration which the plate of an electrical machine suffers when it gets scratched to any considerable extent. Of course, all substances in nature might be arranged in such a table, but these brief lists will answer as a scaffolding into which we may fit such other members as we may from time to time wish to locate.

7. With the few simple facts which have been so far stated we can now proceed to an intelligible explanation of the electrical theories generally in use; which, however, are regarded rather as convenient means of associating and remembering the facts of the subject than as philosophical explanation of their ultimate cause.

The theory which owes its origin to Franklin, and is also called the single-fluid theory, assumes that all matter in its normal condition contains an imponderable fluid which attracts matter generally, but is self-repellent. Friction of dissimilar substances causes this substance to accumulate in one at the expense of another. Thus, the surcharged body attracts unexcited bodies generally, and repels others like itself, while the bodies more or less emptied of electricity are likewise attracted by unexcited matter, by reason of the reduction of repellent force between their fluid and that of the normal substances. The repulsion of negatively excited substances is due likewise to the superior attraction of surrounding matter generally, aided by certain actions called induction, to be presently explained. Conduction would on this theory be simply the flow of this fluid, and its tendency to pass from a positive to a negatively excited substance resemble the rush of air from a compressed reservoir into a vacuum.

8. The theory of double fluid, due to Dufay, assumes the existence of two fluids, alike in certain properties, but opposite in what we regard as their electric actions. These, in a proportionate mixture, exist in all substances without affording any indication of their presence. Friction of unlike materials separates them, and each being self-repellent, but attractive of the other, all the phenomena of attraction and repulsion already mentioned are equally well accounted for on this hypothesis.



9. Other theories, such as a dynamical theory, which represents the positive and negative states as vibrations of an opposite character, have also been proposed, but these, while deficient in that fulness and precision which can entitle them to confidence, are far less effective than the old ones as mnemonic aids, and have therefore, we think, deservedly failed to replace the former in the language of science or in works of reference and general treatises on this subject.

As regards the former (or fluid) theories, no facts now known to science are fatal to either of them; and though the general tendency of discovery in cognate subjects leads us to feel that the true theory is something else than either of these, we do not believe that this "true" theory has been as yet developed.

Minutely to discuss the merits of the two theories would be here out of place: suffice it to say that either will serve, and that the experiments regarded at one time as fatal to the first have been proved not to be so, and that it is rather gaining than losing ground at the present day.

As, however, the double-fluid theory furnishes us with the simplest and most direct expression for the co-ordination of facts, and is to be more generally encountered in works of reference, we shall adopt it in the present exposition as a matter of convenience.

The Double-fluid Theory.—10. According, then, to this view, a non-excited body contains equal or equivalent quantities of the two opposite fluids, which we may well designate by the signs + and —. When two such bodies are excited by friction, some of the positive fluid goes out of one into the other, being replaced at the instant by an equal amount of negative fluid leaving the second. Excitement therefore does not imply a change in the total amount of the fluids in a body, but only in the proportion of the mixture, the interchange being invariably reciprocal, as above stated. Thus, A being a normal or unexcited

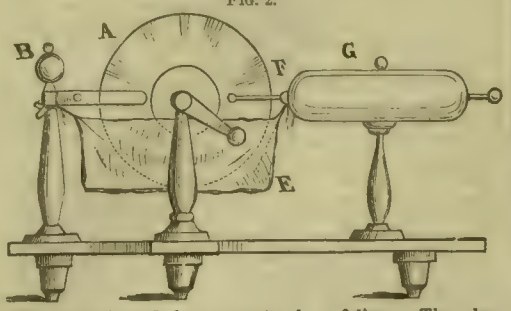
body, with about equal numbers of positive and negative units, B would be the same, positively charged, in which 6 positive units had been substituted for 6 of the negative ones; while C would represent the same in an equal negative state, having 6 negative units more than A. To introduce a single positive or negative unit without abstracting a corresponding one of the opposite kind in each case, is to be regarded as, in the nature of things, impossible. Every transfer is an interchange.

11. Remembering the self-repellent character of each fluid, it will be easily understood that in charged bodies the particles of the fluid in excess, flying as far as possible from each other, will accumulate on the surface, and especially on points and edges.

If B and C were brought into contact, the excess of positive fluid in B would go to C, receiving in exchange the excess of negative from this last; and so both would be left in the condition of A.

The amounts of the fluids which we can displace in bodies it must, however, be remembered, are very small as compared with the total quantities which they contain.

12. Some bodies allow the electric fluids to pass freely from particle to particle, while others resist their transfer, and allow them to move from one to another only when a certain change or "polarization" (to be more fully considered under "Induction") has reached a high degree of intensity.



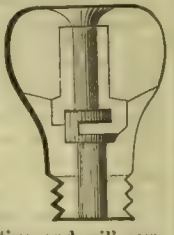
Bodies of the first class are called conductors, and of the latter, non-conductors or insulators. This, however, is a distinction of degree, since no known body is either a "perfect" conductor or insulator, while every degree of perfection in one property or the other may be found among existing substances.

13. When the electric fluids, by reason of excessive accumulation of single kinds at certain points, acquire power enough to force their way through a resisting material, their passage through is always accompanied by an evolution of light and heat. This is not the result of the mingling of the opposite fluids, but of the resistance offered to their mutual approach.

Sources of Electricity.—14. Friction, as we have already seen, is the most evident source of electric action; and in order that it should be developed by this means with the greatest facility certain *electrical machines* have been from time to time devised. We will select typical forms of the most important classes.

The Plate Electrical Machine.—This consists, in the first place, of a glass disk A mounted on an axle and turned by a handle. Against this is caused to press a "rubber" (below and to the right of B), which is made of two brass plates covered on their faces with leather sprinkled with "mosaic gold" (bisulphide of tin), and held against the opposite sides of the plate by a stiff brass spring sustained by the column under B. At F are two brass rods, armed on their inner sides with points, which are turned towards the surfaces of the plate rotating between them. These are supported from the end of a metal cylinder G, resting on a glass column, and called the prime conductor.

Fig. 2.



The operation of the apparatus is as follows: The glass plate, by friction, takes positive fluid from the rubbers, giving them negative in exchange, and passes in the direction BEF inside of a silk bag or apron. When the plate comes between the points attached to F, it gives to them positive fluid, receiving negative at the same time until it has been restored nearly to a normal state. The positive fluid thus brought to F passes into G, and is diffused generally over it. If B were allowed to remain insulated, of course the amount of positive electricity which it could give up would be soon exhausted; we therefore connect it by a chain or wire with the ground, which is best done by passing the chain over a gas or water pipe. If we desire to collect negative electricity, we connect the "prime conductor" G with the ground, in place of B, and then get our supply of negative fluid from B.

A cylinder of glass is sometimes used in place of the disk, but the principle and mode of action are identical in the two cases.

The Hydro-Electrical Machine.—15. An accidental observation with a leaking boiler, followed up by Armstrong, led to the construction of this curious machine. (*Phil. Mag.*, 1840, vol. xvii., pp. 370–452, etc.) It was afterwards thoroughly investigated by Faraday (*Phil. Trans.*, 1843, p. 17), who showed the true source of the very powerful effects which it develops. It consists essentially of a steam-boiler placed on insulated supports, and provided with a series of outlets or jets, by which wet steam (*i. e.* steam carrying particles of water) may be made to escape with much friction. Fig. 3 shows the structure of the individual jets. The particles of water carried by the steam play the part of the glass plate in the ordinary machine, while the metal surfaces of the jets act as the rubber. The jets and boiler thus become negatively charged, while the water-spray is positive, and will communicate that electricity to a set of points presented to it.

Fig. 3.

16. The electrophorus and its development, the Holtz machine, will be explained under "Induction," as this action is essentially involved in their operation; and the induction coil will be fully described after the points in galvanism and electro-magnetism necessary for its explanation have been handled.

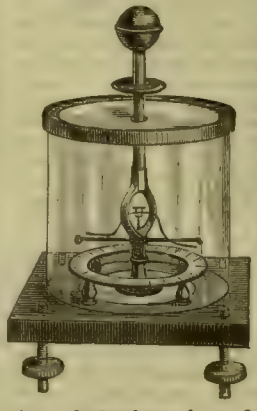
17. Not only does actual friction tend to develop electricity, but anything resembling friction, such as the splitting or fracturing of crystals, or the act of solidifying in certain instances. So likewise does a change of temperature in some crystals, such as the tourmaline. Chemical action, as we shall presently see in connection with galvanism or dynamic electricity, is another fertile source.

18. All are familiar with the existence of electrical disturbances in the atmosphere, but their cause is rather a subject of conjecture than knowledge. (*De la Rive, "Électricité,"* Walker's translation, vol. iii., p. 116.)

By attaching to an arrow a fine wire whose farther end terminated in an instrument for measuring electricity, Becquerel showed that positive tension was manifested when the arrow was shot up, but none appeared when it was shot in a horizontal direction.

The connection which, in the opinion of many, has been shown between the auroral displays and solar disturbances gives a cosmical interest to this special portion of our atmospheric excitement.

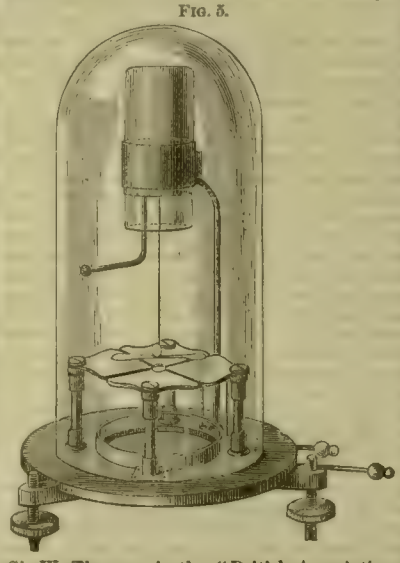
Animal electricity is noticed under "Galvanism," farther on.



Apparatus for the Recognition and Measurement of Electricity.—19. The gold-leaf electroscope is one of the simplest of these, and consists of two strips of gold-leaf hung side by side from an insulated metallic support within a cylinder of glass, on whose inner surface are attached strips of tin-foil. When an excited body is brought in contact with the metallic support, the fluid, entering both strips of gold-leaf alike, causes them to recede from each other; and lest they should be in danger of touching and clinging to the glass, the strips of tin-foil are placed there to discharge them and make them fall back.

20. In the modification known as Bohnenberger's electroscope a single strip hangs between two plates which form the terminals of a "dry pile" (see farther on, under "Galvanic Batteries"), and are therefore feebly and constantly charged in opposite senses. If, then, the leaf receives any charge, it will strongly incline towards the plate of the opposite kind.

21. The electrometer of Coulomb consists of a light rod carrying pith-balls at each end, or one ball with a counterweight suspended by a silk thread within a glass case. A rod with brass balls at each end enters through the side of the case. This being charged, attracts one of the pith-balls, or after contact repels it, the force being measured by the amount of twist necessary to give the thread in order to keep the ball at a certain distance. This instrument was much improved by Snow Harris.



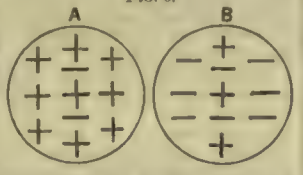
22. Peltier's electrometer, shown in the figure, consists of a convenient support, etc. carrying a light bent rod of aluminum turning on a pivot, and having a small compass-needle attached to it. The needle gives it a delicate directive force, and a charge communicated to the central part, which is insulated, will cause the aluminum rod to be repelled from the heavier brass one. The amount of displacement is read directly on the graduated circle.

Fig. 4.

23. Thomson's quadrant electrometer consists of four metallic segments supported in the same plane, but not in contact. They are connected alternately with the two projecting rods and balls at the right. Over these hangs a piece of aluminum by a fine wire from the inside of a Leyden jar feebly charged. If, now, one pair of sectors are charged, while the others are connected with the earth, the strip will move towards them if the charge is opposite to that of the jar; or away from them and over the others if the charge is the same in kind as that of the jar. To give directive force a small magnet is attached with the aluminum strip, and for measurement a minute mirror (a) is also fastened above it, and a ray of light reflected by this upon a scale. A much more delicate and elaborate instrument is described by Sir W. Thomson in the "British Association Reports" for 1867, part i., p. 489.

Fig. 5.

INDUCTION.—24. Next in importance to the simple yet fundamental facts of attraction and repulsion between electrically excited bodies, or, in the words of theory, between bodies containing excess of the positive or negative fluids, we come to the action of induction.



Induction is the general term used to designate the mutual or reciprocal action of the electric fluids in adjacent but electrically separated bodies, and is sometimes described as "action at a distance" or "excitement by influence." All the effects produced by this means are called inductive. This force is not like that of gravity, unaffected by the interposed material, but acts with different amounts of energy through different substances. This difference in the power of transmitting this influence is designated as specific inductive capacity; and by Faraday and Harris the following values have been assigned to different substances:

Air	1.00	Wax	1.86
Spermaceti	1.45	Glass	1.90
Resin	1.76	Shellac	2.00
Pitch	1.80	Sulphur	2.24

The higher the inductive capacity of a substance, the greater will be the action which it transmits.

25. Passing now to a study of the action of induction, we will at once take an illustration, as an example will be worth more than any amount of general definition in such a case. Let A and B be metal spheres suspended by silk threads or sustained by any other non-conducting supports, and let A be positively charged (*i. e.* have some of its normal negative electricity replaced by positive). Let B, however, be in its normal state, or charged with equal quantities of both fluids. We know that the positive fluid in A will strongly attract the negative in B, and as strongly repel its positive; hence, we may well figure B as having all its negative on its left, and all its positive on its right side. This representation must not carry us too far, however, and make us think that these exact locations have any special meaning; rather we should regard the positive fluid as put in the condition of trying to escape, and the negative as so contracted or drawn together as to allow room for more. The mode of representation used is, however, convenient for expression.

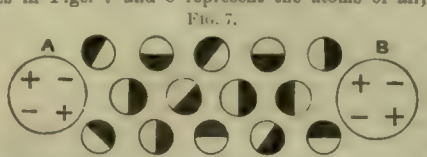


FIG. 6.

Let us now suppose that for a moment B is put in connection with the earth, a practically infinite reservoir of both electricities. Evidently, the repelled positive fluid will escape, and its place will be supplied by negative, and the body B will be now negatively charged. But will its condition be exactly that of a single body with a negative charge? The negative fluid added to B was brought there solely by the mastering attraction in A, and if it had had any power of repulsion under that influence, it could not have been forced against its nature to enter with the negative fluid already in B. It is simply because it has been seized, captured, and bound by the positive A that it is now in B, and therefore cannot, while under this influence, exert its natural powers like a free agent. If, however, A is removed, then B will become in all respects a body negatively charged, and capable of giving out its excess of negative fluid, and influencing other bodies in its turn. The negative fluid in it, however, while A is present, is very appropriately called "bound electricity."

26. The subject of induction owes its thorough exposition to Faraday, according to whose view it is an action propagated or conveyed through the substance separating the bodies under consideration by successive polarization or forcible rearrangement of its particles. Thus, in the case just given the attractive and repellent influence of the fluid in A is transmitted to B by a successive change in the particles of the intervening air. This change might be considered as identical in character with that already described in B before it was connected with the ground, though it is usual to associate it with a change of position or polarization in the material particles. Thus, if the little circles in Figs. 7 and 8 represent the atoms of air, and

FIG. 7.

their black halves the negative fluid, we may imagine them when between two normal bodies, as in Fig. 7, to have these negative sides turned in all directions. If, however, as in Fig. 8, A is positively charged, then in the adjacent particles the negative sides or negative fluids will be turned towards A by reason of their attraction for the positive fluid in it, and, as a consequence, their positive sides will

FIG. 8.

face the other way. The positive fluid in these will then exert a similar influence upon the next row of particles, and so on. This change, it should be remembered, may be regarded either as a rotation of the particles, with fixed positions for their fluids, which is the stricter idea of polarity, or as a shifting of the fluids in the particles, exactly as in the case of B in Fig. 6.

27. When this action has reached a certain intensity, a transfer of the fluids occurs bodily from one particle to another, and this is conduction; the difference between good and bad conductors consisting simply in this, that in the former but little inductive excitement is needed to bring about the transfer, while in the latter this must reach a high degree of intensity, and a large amount of the opposite fluids must be brought to the adjacent surfaces of the particles before this transfer or discharge can take place.

28. Induction plays an important part in almost every action connected with electricity, and, simple as it is in principle, develops some complex results. We will briefly consider a few of the more important cases, beginning with the simplest.

Induction concerned in Simple Illustrations of Attraction and Repulsion.—When an excited body is brought near to a neutral one, the unlike fluid of the latter is drawn near, and its like fluid repelled, and even expelled if any outlet is available; and thus the effectiveness of the attractive force is increased. Moreover, the "induced" excitement of the second body will react upon the "mixed" fluids which still exist, as we have before mentioned, in even the most powerfully charged object, and by separating them in the same manner as its own were before separated will yet further intensify the action.

29. It is in consequence of this reaction or reinforcement of action that the attractive forces in excited bodies do not always vary, like those of gravitation, light, heat, etc., inversely as the squares of the distances, but according to laws which depend upon the conditions by which this reinforcement or the reverse action is controlled. Thus, as has been shown by Snow Harris, if a small surface which is maintained at a constant degree of charge is caused to act with another which is insulated, so that its repelled electricity cannot escape, the force of attraction will vary inversely as the square roots of the distances. (*Phil. Trans.*, 1834, part ii., p. 213.) If, however, the charge of the first surface could be kept constant, while the other was allowed to give up its repelled fluid and take the opposite, but not to cause a rise of charge by reaction in the first, the attraction would vary inversely with the squares of the distances. Again, if the reaction, as well as action, were allowed full play, the force would vary inversely with the cube of the distance. These last points have been developed, and Harris's results in the same connection corrected, by Sir William Thomson. (See "Phil. Mag.," 1854, vol. viii., p. 42.)

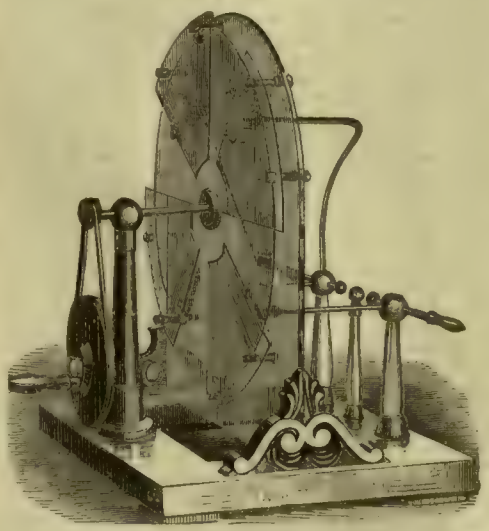
The same laws hold good with reference to repulsion, although much greater difficulties are experienced in making the measurements. If an excited ball were placed in the centre of a hollow sphere, its inductive force would be equally distributed on all sides, and would decrease outward as the square of the distance increased; but if the ball be made to approach one side of the globe, almost the entire inductive force will be concentrated on that point, to the neglect of the other and more distant parts.

As we have already noticed, a large part of the apparent repulsion exhibited by excited bodies is due to the attraction of surrounding objects excited by induction. This is well shown by the following familiar experiment: To an ordinary electrical machine is attached a doll's head covered with long hair; on working the machine the individual hairs stand out in every direction by their mutual repulsion. If now the hand or any other conductor connected with the ground is brought near, all the hairs in its vicinity turn towards it, and even crowd upon each other to approach it. The same actions of induction, and consequent exhibitions of attraction and repulsion, are illustrated in the numerous electrical toys with which most collections of apparatus are profusely furnished, such as the chime of bells, the sportsman and birds, dancing figures, dancing pith-balls, etc.

The Electrophorus.—30. One of the most important in-

struments in which induction is largely involved is the electrophorus. This consists of a metal dish filled with rosin or shellac, or similar non-conductor easily excited, and also of a metallic plate smaller than the dish and provided with an insulating handle. To use this apparatus, we first beat the shellac with a cat skin or other appropriate rubber, and then, setting the plate on the surface of the shellac, touch it with the finger. After this, if the plate is lifted up by its insulated handle, it will be found to have acquired a positive charge.

Fig. 9.



31. The theory of its operation is as follows: The friction with the fur excites in the shellac negative electricity. When the metal plate rests upon it the repulsion existing between the negative electricities causes that of the brass plate to be repelled, and to escape in part when the plate is touched with the finger, its place being supplied by an equal amount of positive entering from the hand at the same time. This, however, as long as the plate is near the shellac, is "bound," exactly as was the case in the first instance of induction, which we illustrated with the bodies A and B in Fig. 6. But when we raise the plate by its handle, the restraining force is escaped as the plate recedes from the shellac, and the lately "bound" fluid exhibits its properties as free positive electricity.

As often as we please we can discharge the movable plate, and by merely placing it on the shellac and touching it can restore its charge; for, taking nothing from the shellac, it in no way exhausts its charge. The plate is of course attracted by the shellac, and the force expended in pulling it away is the full mechanical equivalent of the electric action developed.

32. A pretty application of the electrophorus is found in the many effective and artistic contrivances for lighting gas by its means which have been devised by Mr. Robert E. Cornelius of Philadelphia; and a development of the same principle, which is one of the most striking discoveries in connection with this subject, is exhibited in the Holtz machine, which may be well defined as a *continuous electrophorus*.

A convenient form of this machine is that shown in the figure, which represents a modification devised and con-

Fig. 10.

structed by Mr. E. S. Ritchie of Boston. In this a large vertical plate of glass serves as the support for the various parts of the machine. From its edges are sustained four glass sectors, and between these and the plate is a glass disk capable of rapid rotation, and driven by the pulley seen at the left. Between this disk and the large plate, moreover, are four combs, corresponding to the sectors, and connected with the discharging posts by wires piercing the plate. On one edge of each sector is a narrow strip of varnished paper with a projecting point.

33. The action of the machine is briefly as follows: We set the disk in rotation, and at the same time hold an excited body, such as the plate of an electrophorus, a piece of charged vulcanite, or the like, against one of the paper slips. This gives the paper a charge—let us say, of positive electricity; this, acting upon the disk, repels the positive electricity from the corresponding part of its farther surface into the metallic combs which are there located. If the disk stood still, this would happen, once for all, at a single point; but as the disk rotates, every point is in succession brought under the same influence. The portions of the plate passing away from this place as it rotates are therefore negatively charged, having lost some of their positive, and therefore having acquired a corresponding amount of negative fluid. As soon, however, as they pass the farther edge of the first sector, or that one on whose edge was the paper we began with, they experience the following action with the point attached to the paper of the next sector: Being negatively charged, they tend to repel negative electricity, and thus this negative charge, being on the farther side of the disk, repels some negative from the nearer side, and drives it into the paper strip, so making it negative. Thus, while the first paper was positive, the second will be negative; hence it will tend to drive out of the rotating disk into the second comb exactly that negative fluid which had been drawn from the first comb; and so, the first comb being made positive, this will be negative.

Exactly the same action will be observed in the case of the other sectors, which will be successively positive and negative, and each will feed the paper strip of its successor, so that the action being once started will continue indefinitely without further assistance. Here, however, as in the case of the electrophorus, the reacting bodies attract, and the force required to maintain the motion in opposition to this is an exact expression of the mechanical equivalent of the electric force developed; not all of which, however, is necessarily available.

There are many curious reactions involved in this machine, and many improvements or modifications in its structure, which we cannot even enumerate here, but will refer the reader to the following papers, in which he will find the subjects extensively discussed: "Cosmos," 1865, p. 689; "Journal of the Franklin Institute," vol. lii., pp. 281–420; vol. liii., pp. 36, 119, 121, 253, 255, 344; vol. lvii., p. 335; vol. lviii., p. 32; vol. lx., pp. 58, 117. Also to Poggendorff's "Annalen," vol. cxxv., p. 469; vol. cxxvi., p. 157; vol. cxxvii., pp. 177 and 320; vol. cxxx., pp. 287 and 518; vol. cxxxi., pp. 215 and 495; vol. cxxxv., p. 120; vol. cxl., pp. 168, 276, and 560; vol. cxliii., p. 285; vol. cxlv., pp. 1 and 333; vol. cxlvi., p. 288. Also Ganot, "Traité de Physique," edition of 1870.

34. The next application of induction is found in the Leyden jar. This consists of a glass jar coated inside and out to within a few inches of its edge with tin-foil, and having a wooden cover, through which passes a metallic rod terminating above in a knob or ball, and below being in connection with the inner lining of tin-foil. Suppose this jar to stand on a table and within a short distance of an electric machine, so that a spark might go to its knob. If a spark of positive electricity enter, it will diffuse itself over the inner surface of the glass by aid of the conducting power of the tin-foil, and by induction it will draw into the outer coating and surface of the glass a nearly equal quantity of negative fluid. The mutual attraction of these, acting through the glass, will cause each to bind the other to a great extent, and thus the original positive charge, in place of having a tendency to escape to surrounding objects, is largely confined by this attractive action to the inner surface of the glass.

Fig. 11.

In acting through the glass a certain resistance is encountered, and thus the charge drawn to the outside must be always less than that drawing it; and again, this exterior charge will lose some of its power in transmission. If, for example, this difference amounts in all to one-tenth, then evidently nine-tenths of the interior charge will be bound, and only one-tenth will be free. The tendency to escape and resistance to the entrance of additional fluid depends only on the free electricity; therefore in such a case ten times as much electricity can be stored in a given space as if no such action were made available.

The form of a jar is of course in no way essential for the principle here stated, and in fact plates of non-conductors coated with tin-foil are largely used when we want to store electricity in a small space for any purpose.

35. The same principle of induction is similarly involved in the case of that attachment to an electroscope known as a condenser. In this case the upper cap of the instrument carries a varnished metallic plate, on which can be placed another plate of equal size having a glass handle. The plates being superposed, if a feeble source of electricity is connected with the lower one, and the upper one is connected with the ground by being touched with the finger, a charge of "bound" electricity will accumulate, just as in the case of the Leyden jar above described. On removing the upper plate this charge will be set free, and will produce its effect upon the indicating parts of the instrument.

Sir William Thomson has devised a number of beautiful applications of induction as a means of developing electrical charge, such as a series of drops of water falling within a cylinder, a flame similarly placed, copper filings running from one vessel to another, and various more complex instruments. (See "Proc. Roy. Soc.," June 20, 1867; "Phil. Mag.," Jan., 1868.)

TRANSFER OF ELECTRICITY.—36. There are three methods by which electricity may pass from place to place—namely, Conduction, Convection, and Discharge.

Conduction has already been discussed to some extent (see §§ 3 and 27); and in addition we may say that it might be defined as the passage of electricity between particles sensibly in contact.

When the conducting substance is of such a nature and amount as to carry the electric force without much resistance, no visible effect is produced; but if this is not the case, striking phenomena of heat and light may be exhibited. Thus, if the united charge of several Leyden jars is caused to traverse a strip of gold-leaf enclosed between slips of glass, the gold will be fused into the glass, causing a purple stain, and a flash of light will at the same moment be seen. Fine wires similarly treated may be fused, and the effects of lightning on bell-wires and other small conductors illustrate the same thing.

Different substances possess this property of conduction in the most various degree, but this action will be more fully discussed under "Galvanism," or dynamical electricity, where the means for its accurate measurement will be described.

37. The velocity with which an intense charge of electricity travels in a good conductor under certain conditions was shown by Wheatstone (*Phil. Trans.*, 1834, p. 589) to be 288,000 miles in a second. His method, which was a very beautiful one and most fruitful in applications, consisted in viewing in a rapidly rotating mirror the images of three sparks taken at the ends and in the centre of a long line. The displacement of any image as compared with the others gave a means of finding the time of its occurrence when the velocity of the mirror was known. It was shown by Faraday that the velocity of conduction varied with the intensity of the charge and with the nature of the conductor.

38. *Convection* is the transfer of electricity from one body to another by moving particles of an interposed fluid. Thus, if a charged conductor stands exposed in the air, particles of that fluid touch it, are charged, are repelled, and travel off to distant objects, to which they give up their charge, and then are ready to return for more. This action can be well illustrated by holding a candle near a point projecting from an electrical machine. The flame will be almost blown out by the current of charged particles flying away.

39. *Discharge*, which may be of various kinds, consists in general of the simultaneous transfer of the electricity developed by induction along a line of resisting particles between two conductors, and is always accompanied by some development of light and heat. The passage of the fluids may be variously resisted, and thus the character of the discharge be modified to any extent; but we may conveniently divide discharges into two kinds—the flash, spark, or disruptive discharge, and the flame, or diffused discharge.

40. *The spark discharge* is illustrated in its simpler form by the flash which passes from the prime conductor of an electrical machine to the hand or any other conductor brought suddenly near to it. It then appears, through persistence of vision, as a blue, irregular line. When a greater amount of electricity is accumulated, as in the Leyden jar, the spark or flash looks whiter. By modifications of Wheatstone's revolving mirror and other methods its character, duration, and composition have been studied by Feddersen (*Pogg. Ann.*, vol. ciii., p. 69) and Prof. O. N. Rood. The last-named physicist, who has carried out his researches in a most complete manner, has proved that the discharge of a jar charged by an induction coil consists of a series of acts whose total duration varies with the area of coated surface, the distance of the electrodes, etc., but that the first and brightest portion does not last, with a jar having a surface of 114.4 square inches, more than the 175-billionth of a second. Prof. Rood has also proved that with a jar having a surface of 11 square inches, the duration was only 40-billionths of a second. The successive discharges or other steps involved in this act have been made the subject of extended investigations by Prof. Rood, published with the above in the "Amer. Jour. of Science" for 1872, vol. iv., pp. 249 and 371; 1869, vol. xlviii., p. 153; also 1871, vol. ii., p. 160, and 1872, vol. iv., p. 249.

41. The spark is in all cases found to carry away with it minute particles of the bodies between which it leaps, which are intensely heated by the action; and it has thus become a very useful means for the spectroscopic study of certain substances. (See Huggins, "Phil. Trans.," 1864, part ii., p. 139.) By taking the spark between a platinum wire and the surface of a solution, metallic elements present in the solution may in many cases be recognized by the aid of the spectroscope.

With powerful sources of electricity, such as the Holtz machine or the induction coil, which will be subsequently described, many beautiful illustrations of spark discharge may be exhibited. Thus, if the terminals of a large coil are brought near the extremities of a long sheet of metallic paper, such as is often used for enveloping tea and coffee, and whose surface has been broken by rumpling, at each discharge brilliant flashes of light will stream across in lightning-like paths. Again, narrow strips of tin-foil having been attached in a convoluted but continuous line to a plate of glass, a knife is drawn across them at points corresponding to the outlines of some design, such as a bird or flower. When this is made the line of a series of discharges, the design appears pricked out in stars of light.

42. Besides the influence on the duration of the spark exerted by the size of the charged surface, as shown by Rood, an effect is produced by the nature of the transmitting material. Thus, the spark from a Leyden jar carried directly to points immersed in loose gunpowder will scatter the powder without igniting it; but if part of the circuit consists of a wet string or like imperfect conductor, the spark will pass more slowly, and will ignite the powder.

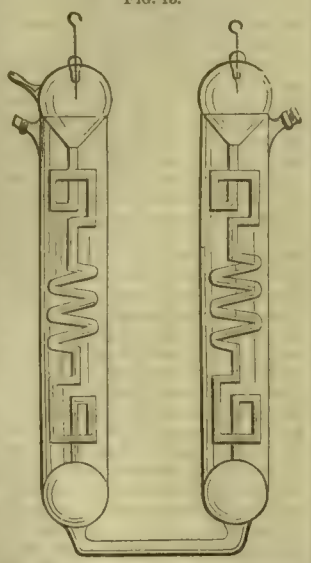
43. The most magnificent display of the disruptive discharge is, however, furnished in the lightning. Here flashes occur as much as three miles in length. The failure of some attempts to measure their duration has occasioned a general impression that they are exceedingly brief. Faraday, however, in 1857 noticed that some flashes seemed to him fully as long in duration as one second, and Prof. O. N. Rood, with a very efficient form of apparatus, has extensively investigated the subject, with the following result: He finds that lightning-flashes generally consist of several acts, varying individually in duration from less than one one-thousandth of a second to more than one-twentieth of a second; even these extreme varieties being found at times in a single flash, whose total duration may be fully one second.* The cause of this great duration is probably to be found in the extent and character of the electric distribution in the cloud.

The brush and glow discharges are simply aggregations of numerous and very minute sparks. The glow sometimes seen on the spars of vessels, and called Saint Elmo's fire, is of this character.†

44. While air at its normal density and temperature offers so great a resistance to the passage of electricity, it is found that when highly rarefied its power of transmission is greatly increased, and that under these conditions the discharge passes in a diffused and flame-like form. To exhibit the characteristics of this discharge in various gases and at various degrees of rarefaction, we employ glass vessels, either of an egg shape or globular form, provided with metallic caps securely cemented to their ends, and sliding rods, stopcocks, etc. These may be exhausted with the air-pump, and the flashes of a coil being passed through, the appearances of the discharge may be studied. Under these conditions we find that the color of the discharge varies in different parts, being usually blue near the negative pole, and pinkish near the positive, and variously tinted, moreover, according to the degree of the rarefaction and the nature of the gas. Thus, under certain states of rarefaction, nitrogen gas gives a light of a pink-purple, carbonic acid of a green, hydrogen of a violet, and oxygen of a peach-blossom tint.

FIG. 12.

45. Moreover, at a certain degree of exhaustion the discharge is seen to be crossed by dark layers or strata, as shown in Fig. 12. These have been elaborately studied by De la Rive, who considers them to be due to variations in density produced in the rarefied gas by the electric force prior to the actual passage of the discharge. (*Ann. de Chem. et de Phys.*, Aug., 1866, vol. viii.,



* "American Journal of Science," 1874, vol. v., p. 265.

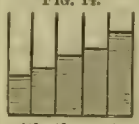
† "Spectrum of Glow," "Am. Jour. of Science," 1867, vol. xliii., p. 394.

p. 437.) Plucker found that these strata, and also the streams and glows of the discharge, obeyed magnetic influences in a remarkable way. (*Phil. Mag.*, 1858, p. 119.) These discharges were also studied by Gassiot, and produced by a galvanic battery, as well as by other forms of electrical generators. (*Proc. Roy. Soc.*, 1859, p. 36.)

46. Geissler, a very skilful glassblower in Bonn, was employed by Plucker to make some permanently exhausted tubes for such experiments, and, enlarging on the idea, has developed one of the most beautiful illustrations in the whole range of the subject. These instruments, called "Geissler tubes," are of an infinite variety in pattern, containing different gases variously rarefied, thereby giving every imaginable tint. They are also often made of fluorescent glass, or are surrounded with glass jackets (as in Fig. 13), which are filled with fluorescent solutions, thereby yet further increasing the brightness and beauty of their appearance.

Fig. 13.

Dynamic Electricity, or Galvanism.—47. To the accidental observation that a frog's leg made a convulsive movement when brought in contact with two dissimilar metals, this subject owes its introduction into the world of science, and from Galvani, professor of physics at Padua, by whom the observation was made and followed up, it has derived its name. Without following the history of the steps by which the true nature of the action observed by Galvani, and soon afterwards much further developed by Volta, has been elucidated, we will pass at once to a consideration of this as a condition of those electric fluids which we have already assumed as the cause of electric phenomena in general.



48. If a plate of zinc, or other metal having a strong affinity for oxygen, is immersed in some such liquid as water, which contains oxygen and is capable of being decomposed, the metal will, by reason of its superior chemical attraction, take a certain portion of oxygen to itself, so liberating a corresponding amount of hydrogen. In this act of separation, however, not only are the material particles of the oxygen and hydrogen drawn asunder, but the electric fluids also are divided, the negative going with the oxygen to the zinc, and the positive with the hydrogen being repelled.

49. We may make a material illustration of this by comparing the water to a mixed mass of spun glass and silk fibres. If the silk could be pulled out at one side and the glass threads at the other, we should evidently have the silk powerfully excited negatively by the friction involved in this act of separation, and the glass as highly charged with positive fluid. Returning to our actual case of the water, the force which was able to separate the electricities would evidently be able to keep them apart, but yet there would be a strong tendency towards a return and recombination, and this would render it more and more difficult for the zinc to decompose successive portions of the water, since it would be obliged to force the hydrogen and positive fluid into a surrounding region, getting more and more highly charged with this same fluid. A point would therefore soon be reached where the power of the zinc to decompose more water would be annulled by the tendency of the positively charged and liberated hydrogen to return into combination.

Under these conditions, suppose that some good conductor which is entirely without chemical action on the solution is introduced in some other part of the vessel, and connected by a wire with the zinc. It will at once share with the zinc its negative charge, and so become as attractive to the hydrogen and positive fluid as the zinc, but will be without any of that chemical force which acted as a repellent influence in the case of the zinc and hydrogen. The freed hydrogen will therefore run to this conducting plate with its negative fluid, discharge itself, and relieve the tension in the liquid, so that the action of the zinc upon the water may go on freely again. The power of separating the electricities of the water possessed by the zinc or other active metal constitutes what is called the "electromotive force" of the system. This evidently is due to the difference between the attractive energies of the zinc and the hydrogen of the water for the oxygen; they pull against each other, and the resulting available force is simply their difference. To this we can even give a numerical expression in any case; thus, the total mechanical equivalent of zinc being 42.575 units per atom, and that of hydrogen being 33.808, the available energy, or "electro-motive force," would be 8.767, or, in other words, about one-fifth of the total amount residing in the metal consumed. The electromotive force would of course vary with the nature of the liquid and active element used, depending upon the relation of their attractive forces.

50. The above considerations will show us at the outset what is the relation between the conditions of the present subject and of that before discussed. We have here the fluids separated by a relatively feeble power of dissociation, but in quantities which will be very great if the resistance opposed to their reunion is slight. To give a physical illustration, we may regard this action of the metal on the liquid with reference to either of the electric fluids as a power of raising its level. Thus, suppose that a sieve placed vertically in a trough of water had the power of pushing the water towards one end, and so raising the level a very little on one side. When the water had reached the full height at which the power of the sieve would maintain it, all further action would cease; but if we now made a communication by which the water from the higher side could run around to the lower, then the sieve would continue to keep up the head, and a constant current would result. Again, if several sieves were placed in series, then each in turn starting with the water which had been raised by its predecessor, and raising it higher, the level at the end of the tank would be as much higher as the sieves were more numerous.

Fig. 14.

This is not, of course, intended to be a statement of fact about sieves and water, but to be a purely imaginary illustration, which may aid us in remembering the general fact that the nature of the action of the elements in a galvanic couple on the electric fluids is to accumulate, each one slightly on opposite sides; in consequence of which they act in all respects as would material liquids in whose level a similar slight change had been effected. It will, in fact, be found to be of the greatest convenience to acquire the habit of thinking of the electricities developed in galvanic actions as fluids with certain "levels," which give the corresponding tendencies to flow.

51. Carrying this view back into our former subject, we would regard the fluids in charged bodies as having a great "head" or high level. It will be evident on this view that a sufficient number of galvanic elements in series (as illustrated above by the succession of sieves) should give us a "head" equal to that of a statically charged body. In fact, Gassiot, with a battery of 3400 pairs of zinc and copper plates in distilled water, produced all the effects of attraction, repulsion, discharge, etc. which are obtained from bodies excited by friction (*Phil. Trans.*, 1844, p. 39), and the present writer, with a series of 15,000 such cells, made by Mr. Charles T. Chester of New York, has obtained similar results in a yet more striking manner. Indeed, with the delicate instruments now at command we can readily exhibit the actions of attraction and repulsion with the electricity set free by a single galvanic couple of the simplest description, thus proving the identity in nature of the two actions of frictional and chemical "excitement."

52. Such being a general view of the condition of galvanic electricity, we will next pass to the methods used for its development. We have above spoken only of a metal (say zinc) and water as the active agents; but in fact there would be practical difficulties in using these alone, among which we will first consider only the fact that the oxide of the metal would soon cover its surface and cut off all action. For this reason, as well as others, we introduce with the water, some acid capable of dissolving the metallic oxide, but not able to attack the other conductor. This introduces another element. The solution of the oxide in the acid furnishes another source of force, and our numerical relation of energies thus takes a new shape, which is well expressed by Rankine as follows:

Total "equivalent" due to oxidation of zinc and solution in sulphuric acid and water	3006
Total "equivalent" consumed in liberating hydrogen from the dilute acid	2106
Total "equivalent" of force developed	900

These numbers, expressing "British thermal units," we can easily reduce at once to a practical expression, and say that the total force which can be developed by a pound of zinc in such a combination would be $900 \times 722 = 694{,}800$ foot-pounds, or about one-sixteenth of that developed by burn-

ing a pound of pure coal or carbon. We of course have neglected all causes of loss in both cases, but this is the highest result possible with all causes of loss excluded.

53. There are evidently two directions in which this result can be improved: 1st. By increasing the relative attraction between the active element and the liquid which is the first cause of the action; 2d. By reducing the attraction to be overcome in separating the expelled element from the liquid.

For the first object we may use in place of zinc some more chemically active body, such as magnesium or sodium, or substitute some other fluid for water. But in practice it has been found that no substance which by reason of its cost or other considerations is available will give us better results than zinc and water acidulated with sulphuric acid.

With reference to the second point, however, much may be done. Thus, if sulphate of copper were mixed with the acidulated water, that compound would as a final result be decomposed, its copper being deposited on the inactive element as a substitute for the hydrogen. Now, the expulsion of copper from this compound does not require as much force as does the liberation of hydrogen from water, and thus we get an obvious increase of effect, as follows:

Total equivalent of combination of zinc with oxygen, sulphuric acid, and water	3006
Total equivalent consumed in expelling copper from solution of sulphate	1587
Total equivalent of force developed	1419

$1419 \times 722 = 1{,}025{,}468$ foot-pounds per pound of zinc;

which is, however, less than one-tenth of the total force developed by the combustion of a pound of pure coal or carbon.

54. The decomposition of nitric and chromic acids requires still less force than does that of sulphate of copper, and thus by substituting these still better results may be obtained; but we must not forget that the upper limit, or *highest attainment of theoretical perfection*, would be to gain the whole 3006 units due to the combination and solution of the zinc, which would, after all, amount to but one-fourth the total energy developed by a pound of pure coal.

Passing from these general considerations to questions of detail, we notice, in the first place, that if in the simplest form of galvanic apparatus we employ a plate of ordinary zinc and one of copper immersed in a vessel of diluted sulphuric acid, as was at first done, several difficulties are encountered.

55. In the first place, impurities, in the shape of specks of iron, cadmium, etc., scattered through the zinc, impair the action by establishing "local circuits," in which the impurity acts as the second element, and sends a part of the current back to the zinc without traversing the connecting conductor, so causing it to elude our use. This difficulty is remedied by coating the zinc with mercury. This substance dissolves a portion of the zinc and forms a sort of metallic varnish, which is of course perfectly homogeneous and covers up all irregularities. The mercury does not dissolve in the acid, but yields the zinc, itself dissolving a fresh supply as fast as it is required.

56. Secondly, the hydrogen going to the copper plate collects on it in a layer of bubbles, by which the contact with the liquid is diminished, and which, moreover, by reason of its strong negative condition, tends to combine with oxygen and reverse the battery action. (See "Gas Battery," farther on.) To remedy this difficulty, Smee proposed the use of platinum plates covered with fine particles of platinum, obtained by electric decomposition (see "Electrolysis," farther on), which "shed" the hydrogen bubbles. He also used silver plates coated with platinum, or plates of lead first silvered and then coated with platinum. The silver plates in time become brittle, and the others lose their coating; and this has led to the adoption of plates of compact carbon, made from the graphitic deposit found in coal-gas retorts. These are also platinized by painting them with a solution of platinic chloride, and then immersing them in their own solutions, with the circuit closed for a few minutes.

57. The present writer has used with good effect, where a continuous, uninterrupted action for a limited time was required, and where the first cost of the apparatus was important, a combination of zinc and sheet-iron plates in acidulated water. A battery of this sort, having a zinc surface of about 240 square feet, was used on several occasions for twelve hours at a time, with a very satisfactory result.

58. The employment of sulphate of copper was first introduced by Prof. Daniell, and in order to prevent the copper from depositing on the zinc, and thus establishing local circuits which would soon have interfered with the useful action of the battery, he divided the vessel into two parts by a porous partition made of parchment, bladder, leather, or porous earthenware. In one part was placed the zinc surrounded by acidulated water, and in the other a copper plate immersed in solution of sulphate of copper. We may here explain that it is not supposed, when a molecule of water is decomposed by the action of the zinc, that its hydrogen atom travels bodily across to the other plate, but that it simply displaces the hydrogen in the next molecule of water, and this in turn acts on the next, and so on. Thus, in the Daniell battery the liberated hydrogen travels by such successive displacements through the acidulated water, with which the porous partition also is soaked; and when the copper solution is reached, the displacement of a copper atom is substituted for that of hydrogen, the hydrogen atom taking at its entrance oxygen from a molecule of oxide of copper, and so setting free the copper atom, which is thenceforth "exchanged" on, until the last in the series is reached, when a particle of the metal is thrown down on the copper plate.

59. This form of battery has many advantages, but is open to two serious objections: the porous cell or other partition, while allowing the transfer of elements to take place through it, does not do so without offering a considerable resistance; and again, the copper is liable to deposit in its metallic state in the porous part, so closing it, and finally, getting upon the zinc, destroys its efficiency by local circuits or local action. To remedy these defects a great variety of modifications have been adopted, which may be called as a rule gravity batteries. These depend upon the difference in density of the solutions, to maintain their separation. One of the earliest of these, invented by Meidinger, consisted of a plate of copper attached to an insulated wire and placed at the bottom of the jar; upon this was thrown a quantity of sulphate of copper. The jar was then filled up with water, with a little sulphate of zinc to give it conducting power, and in this was hung the zinc. The superior weight of the sulphate of copper solution was relied upon to keep it away from the zinc.* This has been modified in detail, and is in many cases effective, so that such batteries can be left in closed circuit for months.

60. A recent modification of this gravity battery, known as the Lockwood battery, involving some action not fully determined, appears to be wonderfully efficient in practice.

61. When nitric acid was introduced by Grove, a porous cell of earthenware became absolutely requisite, and a plate of platinum for the negative element. For this last, Bunsen substituted gas carbon to diminish the expense; then Poggendorff proposed a mixture containing free chromic acid to replace the nitric. This mixture is obtained by mixing 1 part by weight of bichromate of potash with 10 of water and 3 of common oil of vitriol. This has the advantage of cheapness, and also of avoiding fumes, as chromic acid reduces to a solid sesquioxide of chromium, which of course remains in the solution. Its disadvantage is that it is less efficient than the nitric acid, and soon loses effect in closed circuit through the accumulation of sesquioxide of chromium upon the negative element, this body requiring time to dissolve. This difficulty has been met by the addition of nitric acid to the solution. In this case the nitric acid first loses its oxygen, but immediately takes it again from the chromic acid; thus, while no fumes of nitrous acid are developed, the action on the chromic acid is diffused more generally, and we have the quickness of the nitric acid, combined with the good qualities of the other material.

62. The above chromic-acid mixture, without nitric acid, may be used in a battery of zinc and carbon plates, provided these be only immersed when in use. The convenient "French flask batteries" are thus made, and for use with the large electro-magnet of the Stevens Institute of Technology, and his own induction coil, where great power in a compact form is needed for a short time, the present writer caused to be constructed four sets, of three cells each, on the same general principle. These expose surfaces of about five square feet of zinc in each cell, or sixty feet in the aggregate. During three years' constant use they have given entire satisfaction for the purposes named.

63. A battery of zinc and carbon, in which the exciting fluid is a strong solution or paste of acid sulphate of mercury, is very convenient for medical use. The present writer pointed out some years ago that this substance could be replaced with advantage by a mixture of glauber salt and chloride of mercury, and that even glauber salt, a harmless and non-corrosive substance, would in many cases answer very well alone. (*Jour. Franklin Inst.*, vol. l., p. 68.)

64. The Maynooth battery, in which the elements are zinc and cast iron, the iron being in contact with a mixture of strong sulphuric and nitric acids, makes a very powerful combination, but the fumes evolved in filling and emptying it are very objectionable.

65. For running electric clocks and such work, not re-

* Though this is often quoted as the first, one was patented in England some years earlier by C. F. Varley, Dec. 8, 1858, No. 2818.

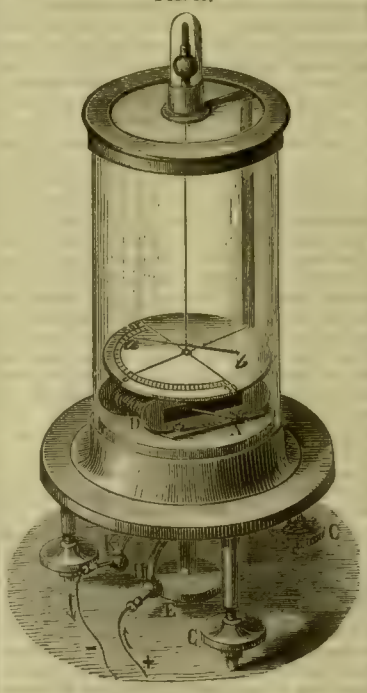
quiring much force, the Leclanche battery is found to be very convenient. This consists of a square-shaped glass vessel, within which is set a porous cylinder containing a plate of carbon, and small fragments of black oxide of manganese packed tightly around it. In one corner of the square vessel is placed a rod of zinc, and the vessel is partly filled with a strong solution of sal-ammoniac. (*Les Mondes*, 1868, vol. xvi., p. 532.) Chloride of zinc is formed in this battery, and the hydrogen liberated is taken up by oxygen of the oxide of manganese, or escapes.

Dry Piles.—66. The slight amount of moisture which even ordinary paper will retain is sufficient to produce a galvanic action with dissimilar metals, and this may become quite appreciable if a sufficient number of elements are used. Thus, if we take silver paper and paint one side with a mixture of black oxide of manganese and gum, and when dry fold it up and with a wad-cutter strike out many thousand disks, these, placed in a tube to keep them in position, will exhibit opposite electric excitement at their opposite ends. This arrangement was devised by Zamboni, who found that such an arrangement, containing some 20,000 disks of paper, would keep a light ball in motion between brass balls connected with its poles for years. A thorough drying caused all action to cease, but exposure to moist air restored it. As before mentioned, a dry pile is used in Bohnenberger's electroscope.

Grove's Gas Battery.—67. We have already mentioned that a plate of platinum covered with hydrogen was strongly positive, and, following out this principle, Grove constructs what has been called a gas battery. In this a number of vessels are provided each with two platinum strips. The vessels contain acidulated water, and the strips, partly immersed in this, are covered with bell jars, one containing oxygen, the other hydrogen. Under these conditions the hydrogen in contact with the platinum acts like zinc, and combines with some of the oxygen of the water, setting free other hydrogen, which, passing to the other strip, there combines with some of the free oxygen.

68. On a principle suggested by this action and some of its relations are constructed what are called *Secondary Piles*. If, for example, we immerse two or more plates of lead in a solution of glauber salt, and pass the current of a small battery for some time between the plates, there will be formed on one plate a film of oxide of lead, while the other will acquire a layer of excited hydrogen. If the charging battery be now removed, and the terminals of the other arrangement brought together, a brief but very powerful current will be developed by the combination of the hydrogen at one side and the oxygen at the other.

(For a full discussion of this subject, see J. Thomson, "Pogg. Ann.," 1865, vol. cxxiv., p. 498, and of an improved form by G. Plante, "Phil. Mag.," 1868, vol. xxxvi., p. 159.)



Instruments for the Measurement of the Galvanic Current.

The Voltameter.—69. This instrument is based upon the principle that a current can only pass through such a substance as water by decomposing it, and that thus the amount of water decomposed or of gas liberated will afford a true indication of the amount of electricity transmitted. For all practical purposes this is strictly true, and we employ a vessel with two strips of platinum entering it from below, partly filled with slightly acidulated water, and a graduated bell-jar or closed tube filled with water placed over them. When a current passes, bubbles of oxygen and hydrogen gases will rise, and the quantity collected in a minute will give us an indication of the amount of the electric current that has passed. The amount of force required to carry an electric current through the resisting liquid is, however, very great, and thus for very many purposes this instrument would not be available.

70. In 1820, Œrsted discovered that when a galvanic current was passing through a wire a magnetic needle tended to set itself at right angles to the wire.* The direction in which the needle turned from a position parallel to the wire depended upon the direction of the current and upon the location of the wire (*i. e.* whether it was above or below the needle). It thus came about that if a needle was suspended in a coil, the parts of the coil above and below would reinforce each other in their action on the needle, and that a reversal in the direction of the current would be indicated by a reversal in the position of the needle. Moreover, certain relations may be established between the amount of angular deflection of the needle and the quantity of the current by means of which this last may be determined.

A galvanometer, then, in general consists of a magnetic needle suspended in a coil of wire, which is placed in the magnetic meridian (*i. e.* N. and S.), or in the same direction as the needle. To the needle is attached a pointer, by which the angular displacement which it suffers may be read off on a divided circle.

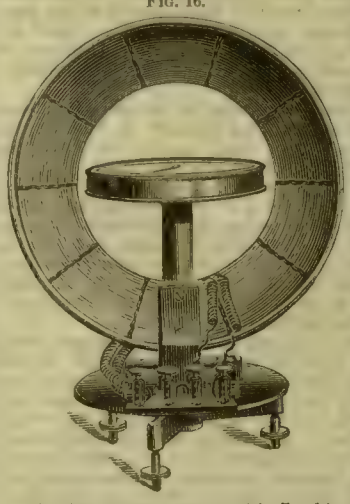


Fig. 15.

For various uses different forms and combinations are adopted, of which we shall mention the principal.

The Tangent Galvanometer.—71. A simple trigonometrical discussion (see Sabine on the "Electric Telegraph," p. 237) will show that if the needle is very small in comparison with the size of the coil—say, one-fifteenth of its diameter—the force of the current will vary as the tangent of the angle of deflection for small displacements. With a coil so distant from the needle as this condition involves it would only be possible to measure very powerful currents in this way; but Gaugain has shown that if the coil be wound in the surface of a frustum of a cone whose apex passes through the centre of the needle, the same relation between the current and deflection will be maintained, even when the diameter of the coil is but five or six times the length of the needle. For certain purposes the coil in this instrument is made in two equal parts, so that either half or all of it may be used at pleasure. Fig. 16 shows one of these instruments, as made by Messrs. Knox & Shain of Philadelphia.

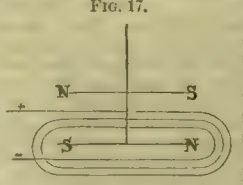

Fig. 16.

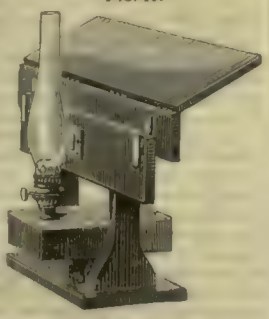
The Sine Galvanometer.—72. In this instrument the coil is movable, and in making observations it is rotated until its plane coincides in direction with the needle. Under these circumstances it may be shown that the force of the current varies with the sine of the angle of deflection. (See Sabine on the "Electric Telegraph," p. 241.)

The Astatic Galvanometer.—73. Yet further to increase the delicacy of this instrument we diminish the directive force of the needle without diminishing the influence of the coil upon it, by uniting two needles rigidly, but at a distance, one over the other, with their poles reversed. By this means, if the needles were absolutely equal they would stand E. and W.; and if not absolutely equal, they take some intermediate position between this and the magnetic meridian, with a directive force which is diminished as their complete equality is approached. The astatic combination is then so introduced in the coil that one of the needles is inside, and the other outside. If we now bear in mind that the direction in which the needle tends to

Fig. 17.

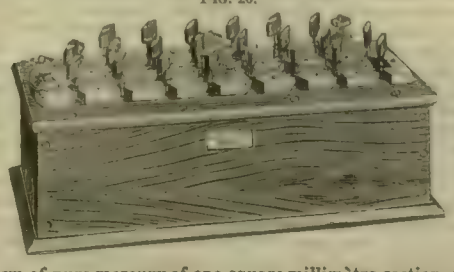
* It appears, however, that this fact had been observed by Romagnesi of Trent, and was published in the "Manuel du Galvanisme, etc., par Joseph Izaru," Paris, 1804.

move is reversed—1st, by a reversal of the current; 2d, by a reversal of the magnet in relation to it; and 3d, by reversal of its relation with reference to being above or below—we will see that the action of the currents on the two needles will coincide in direction, and so assist each other in producing the deflection.



74. One of the most complete instruments of this type is Sir W. Thomson's double coil astatic galvanometer. In this instrument we have two coils, which are exactly equal in resistance and in their effect upon the included magnets. These two magnets are rigidly connected with reversed poles, and the upper one carries a small mirror. Above them is a bar magnet, which serves to regulate their sensitiveness by counteracting more or less the influence of the earth's magnetism, and also to give us a means of bringing them to a fixed position. The binding screws at the base allow us to bring the two coils into any relation we please, either to use them in combination or opposed to each other. The instrument here represented has its coils composed of very fine wire in very many turns, but it is also made with a short thick wire for other purposes.

Fig. 18.



The movements of the astatic combination of needles is read in the following manner: At a distance of about two feet in front of the instrument is placed the frame and lamp shown in Fig. 19. (The instrument would be to the right, as this is shown in the cut.) The light from the lamp, passing through the vertical slit in the frame, falls on the mirror in the upper part of the galvanometer, which is curved so as to throw an image of the flame back upon a scale attached to the other side of the frame. The motion of this image indicates the movement of the needles.

Fig. 19.

Resistance Coils.—75. For use with these various instruments we have sets of "known resistances," consisting of bobbins of insulated German silver wire, carefully graduated to correspond with fixed standards. These bobbins are placed in a box with their terminals attached to a series of heavy brass pieces, between which fit conical plugs. When these plugs are in place they form with the brass pieces a conductor of inappreciable resistance, but by taking out any one, the current is obliged to pass through the corresponding coil, and so experience its resistance. These resistances are expressed in "units" or in "ohms." These two terms express standards slightly different—one, known as Siemen's unit, defined to be the resistance of a

Fig. 20.

prism of pure mercury of one square millimètre section, and one mètre long, at 0° C.; the other, known as the British Association unit, or B. A. unit, is founded on an absolute determination of the relation of resistance to work or energy through the production of heat. The unit first obtained, and known as the $\frac{\text{metre}}{\text{second}}$ unit, when raised to the seventh power, gives us the B. A. unit, or ohm, whose relation to Siemen's unit is as 1.0456 to 1. One million of ohms make a megohm; one-millionth of an ohm is a microhm.
